THE  
COLONIAL OFFICE  
JOURNAL.

---

---

VOL. I.

JUNE, 1907.

No. 1.

---

---

EDITORIAL NOTES.

THE main purposes of this JOURNAL are to review recent books and reports relating to the Colonies and to discuss administrative questions. The Secretary of State for the Colonies has approved of its institution, but it is unofficial, and the editors and contributors are entirely responsible for whatever it may contain. The idea of an official publication has been mooted, but it is obvious that in such an organ there could be little expression of personal opinion. It is hoped that this JOURNAL will be supported by contributions and letters from colonial officers, and that questions in which they are concerned will be freely discussed. The name of the writer, in accordance with the practice of the Press, will not be given unless this appears to be desired.

---

The JOURNAL is not intended to be in any sense a newspaper, and our main purpose in referring to current political subjects will be to extract points of constitutional or administrative interest. Our business is with the methods and objects of ordinary executive work, and we propose to devote our pages largely to the systems of government offices, the products and trade requirements of the Colonies, and the regulations and practices by which colonial officers are governed. We shall have occasion to discuss technical and manufacturing points which perhaps have little interest to the ordinary reader, but are very important to all who are concerned with the industrial undertakings, the health, and comfort of the Colonies.

---

We hope by suggesting subjects and raising questions to initiate useful discussions. We cannot carry matters far by our own

observations, for the actual experience of results lies in the Colonies, and if the JOURNAL is to flourish it must rely largely on information and opinions supplied from the Colonies. As an organ for bringing together views from different quarters on similar subjects we believe that the JOURNAL will supply a want. We trust also that the Press of this country will make use, the more freely the better, of the materials which we collect.

---

The *Imperial Conference* which began its sittings on the 15th of April is the descendant of the Conference of 1887. Lord Knutsford, who presided with admirable tact and skill on the first occasion, will watch with interest the results of the last. Mr. Deakin, now the representative of the Australian Commonwealth, was then one of the delegates from Victoria. The institution of the first Conference was due to Mr. Stanhope, Secretary of State for the Colonies at the time of the invitations, though he had gone to the War Office at the time of the Conference, and some of our readers may remember the enthusiasm with which the mention of his name was received at the first meeting. The patriotic action of the Colonies in offering contingents of troops for the Egyptian campaign had much to do with Mr. Stanhope's idea.

---

The opening speech of the Secretary of State for the Colonies in 1887, when compared with present day discussion, illustrates the vitality of colonial questions. In South African matters he referred principally to the fact that "the grant of responsible government has gradually and steadily improved the material welfare and the domestic administration of the Cape Colony." The same congratulation will no doubt be paid on some not far distant occasion to the Transvaal. He referred to the Newfoundland fishery question and to the dissatisfaction caused by the position in the New Hebrides—two matters which have been prominent in recent Parliamentary debates. The principal subject was that of defence, and the discussion resulted in a substantial contribution by Australasia to the cost of the Navy.

---

The chief contribution of South Africa to the proceedings was Mr. Hofmeyr's speech advocating the imposition of a special 2 per cent. on all foreign imports entering the Empire, the proceeds to be devoted to the general defence. He calculated this would yield £7,000,000. He explained that he did not aim at protection, but "at something that shall supply a cohesive force to the Empire, and shall at the same time provide revenue for defensive purposes." There was, however, no discussion on the suggestion.

The Conference at Ottawa, which followed in 1894, was a very business-like affair. There were at the time two treaties in existence with Belgium and Germany, which prevented Great Britain from receiving better terms from any Colony than she received from those countries. The Imperial Government, as a result of a resolution passed by the Conference, took steps to determine those treaties; but for this, such preferences as those now given by the South African Customs Union, Australia and Canada could not have been accepted. Another resolution was passed in favour of a Customs arrangement between Great Britain and the Colonies by which trade within the Empire might be placed on a more favourable footing than that with foreign countries. But there was no general anticipation that England would consent to put a tax on foreign produce to favour colonial produce, and some of the colonial delegates were against any such idea, generally on the ground that it would be no advantage to the Colonies if the trade of England were hampered in any way.

---

The proposal for a Pacific cable was warmly taken up by the Ottawa Conference, and in the result the Canadian Government called for tenders. The tenders greatly encouraged the scheme, but it was not till 1899, after prolonged negotiations and fresh tenders, that the three parties—England, Canada and Australasia—agreed to carry it out. It may seem remarkable what little co-operation there has been between the Mother-country and the great Colonies for common purposes of this kind. The Pacific cable, as an enterprise, stands alone; and with the exception of certain mail subsidies, we can recall no other substantial example of co-operation.

---

The present Conference lost little time in arriving at the resolution which establishes the principle of a permanent Secretariat “charged under the direction of the Secretary of State for the Colonies with the duty of obtaining information for the use of the Conference, of attending to its resolutions, and of conducting correspondence on matters relating to its affairs.”

---

This resolution expresses the claim of the Governments of the self-governing Colonies to be associated directly and on a footing of equality with the Government of the United Kingdom for the discussion of common interests. In the intervals which separate the meetings, the Secretariat will maintain the permanency of this association and prepare material for the next discussion. Its first function will be to collect information, and for this purpose it must rely on the co-operation which we have no doubt will be readily given of the

home departments. As at present defined, it would apparently not displace or interfere with any existing machinery, but would watch and report on the progress of events. It would however be an easy transition for it to pass from this position to one of more active dealings with the general questions with which the Colonies are concerned.

---

The Colonial Office is divided into geographical and not subject divisions, and it occasionally happens that the same questions are under discussion simultaneously in two different places, or that a decision in the work of one department would be useful to another department. There is an opening for some more thorough method than at present exists of centralising subjects of more or less general application or of collating results from the different departments, and it seems possible that the Secretariat might find a useful field in this direction.

---

The arrangement, whatever it may work out to ultimately, is largely due to the feeling that colonial Governments have not been adequately informed of the progress of matters in which they are concerned. No doubt it is a weak point in the home departments that the colonial authorities are not always kept acquainted with the march of negotiations and the discussion of points. It is by no means an easy thing to do, and much apparent neglect would be forgiven if the care and pains actually spent on the work could be realised. At the same time the fact should be realised on this side that, however thoroughly a matter is being handled here, our partners overseas do not know it unless they are supplied with the necessary particulars. "Progress" reports are as opportune in administration as in engineering matters, and the new Secretariat would, we imagine, find plenty of material to handle.

---

There have been sitting lately two bodies which virtually represent Conferences with colonial representatives, one the Royal Commission which deals with shipping rebates, the other, the Committee (Australasian, Colonial Office, and Board of Trade) on Navigation and Shipping. The Royal Commission is no doubt confronted with a difficult problem, as many merchants side with the shipowners on the ground that settled rates are an advantage to them. Colonial Governments can hardly adopt this consideration so far as their own shipments are concerned, as their interest is simply to get the lowest possible rate in each case. On the other hand, they are greatly concerned with the maintenance of fast and regular services which the rebate system protects.

The general enquiry on which the Royal Commission is engaged is the result of the report of the South African Shipping Freights Conference (Jan. 1906), which itself followed a Conference held in Johannesburg in 1904. The complaint was that excessive rates of freight were charged, and the London Conference appeared willing to waive the question of rebates if substantial reductions were made in the rates. The Conference, however, failed to arrive at any agreement with the shipowners for this purpose, and accordingly drew attention to the Draft Bill which had been previously drawn up to prohibit rebates and discriminations. The Home Government could not accept the principle of this Bill without full consideration. Rebates have been prohibited in the United States, but as most of the overseas trade there is carried in foreign bottoms, the subject is far from being so difficult and delicate there as here.

---

In some cases it is not so much the rebate system that prevents competition as an organisation which includes the handling arrangements at the places of discharge, as well as the sea transit. A steamer's business is finished when the cargo is put over side, and if the lighter or branch boats are monopolised by one firm of owners, there is little chance for an outsider. Every improvement made by a Government in its ports and landing facilities tends to encourage competition. If the facilities are good, there may be a ring supported by a rebate system. But at any rate the ring will be a comparatively wide one, and always under the fear of competition.

---

Most of the coasting lines in this country belong to the Short Sea Traders' Association. When any competition arises it usually ends as it does in the case of ocean lines—it is either driven off the field or admitted into the Association. But, we believe, the rates are by no means unduly high. They are kept down by railway competition, and have, in fact, fallen as much as 50 per cent. in the last ten years. These lines do not to a great extent feed the ocean liners, as the latter will readily go considerable distances to pick up any substantial freight. The material factors in the export and import trade are the railway and the ocean rates.

---

Mr. Lloyd-George at the Imperial Conference made suggestions to encourage the consideration of "co-operative projects," and it appears probable that any scheme of the kind which would be supported by the Imperial Government would be one in aid of carrying services. The German plan is to help exports by conveying them to the coast at reduced railway rates, which is equivalent to

giving them a bonus. Similar reductions might conceivably be arranged on the English railways in favour of the Colonies, but the cost of them would have to be borne on the taxes and no new facilities would be created. A subsidy to a steamer is a bonus, and where there is competition it is open to the objection which may be raised to forms of preference; but such a subsidy may have the effect of creating a service which at present does not exist, or of instituting improvements which otherwise would not be made. In some cases, for instance, a steamer may be diverted from a foreign to a colonial port at a comparatively small cost. In the consideration of such schemes business details would have to be carefully weighed, but the bond of sympathy between the Mother-country and the Colonies would go far to help them through.

---

A scheme of this kind was much discussed at the Ottawa Conference. The proposal was that a service between England and Australasia, viâ Canada, should be subsidised. The time of transit was put at 28 days between London and Sydney. An annual subsidy of £300,000 was asked for four 20-knot steamers, giving a weekly service between Great Britain and Canada, and five 16-knot steamers, giving a fortnightly service from Canada to Australasia. It was suggested that of this subsidy Canada should pay £175,000, Great Britain £75,000, and Australasia £50,000. Canada was willing to pay £175,000, and Great Britain could have diverted to this purpose part of the amount (£104,000) paid to the New York lines. Her Majesty's Government did not support the scheme and it was abandoned.

---

The Report of the Australian Royal Commission on the Navigation Bill of the Commonwealth, on which the proceedings of the Navigation Committee are principally founded, begins by establishing the fact of the decline of British seamen. The proportion of foreigners (not including Lascars) was, in 1900, 21·14 per cent. The cause of the decline is traced to the various points in which the sailor's life lacks ordinary comforts and decencies. Detailed suggestions are made on these matters, and means are indicated of preventing "crimping" and other abuses. It is noteworthy that many of the suggestions made were anticipated in the Imperial Merchant Shipping Act of 1906.

---

The able Australian Report (No. 36, 1906) on the ocean shipping service, is a striking example of the extent to which proposals for state enterprise go. The Commissioners boldly advocate a National

Fleet, to consist of eight steamers costing £3,000,000, and put the annual cost at £1,207,000, and the earnings at £1,319,900. There are rebates on the trade from England, but not on that from Australia.

---

The riots which recently occurred at St. Lucia were of a type with which the West Indian Colonies are unhappily familiar. In a pamphlet published by the Institute of Jamaica last year, Mr. Frank Cundall enumerated twenty-two disturbances of this character which have occurred since the date of Emancipation, and the list is not exhaustive. The most serious riots of recent years were that which took place in Trinidad in March, 1903, when the public buildings were burned down and sixteen lives were lost, and the strike riot at Georgetown, British Guiana. It is easy to attach too much importance to these occurrences. They have been due, as a rule, to temporary and accidental causes, to misunderstandings operating on an excitable population, hardly at all to serious political discontent. In almost every instance the local force of police has been able to suppress the disorder, and the part played by Imperial military or naval forces has been limited to the restoration of confidence. But the inhabitants of St. Lucia will no doubt draw the moral that the withdrawal of the troops, and the abandonment of Castries as a defended coaling depot in 1905, has left them without adequate protection; and the announcement recently made that the Admiralty have decided to detail a second cruiser for special service in the West Indies will be welcomed.

---

The Imperial Government has decided to make a free grant of £150,000 and a loan of £800,000 to the Government of Jamaica, in order to assist in repairing the damage wrought by the earthquake which laid Kingston in ruins last January. In view of the great destruction of property, and of the scarcity of capital and credit in the island some such assistance was inevitable. Good precedent exists for it in the grants and advances made by the Imperial Government on the occasion of West Indian hurricanes in previous years, and it will be generally approved. But there is no need to fear that the economic prosperity of Jamaica will be permanently impaired by the disaster, terrible and overwhelming as it was. The resources of the island are purely agricultural, and the fruit and sugar plantations have, it is understood, suffered little from the earthquake. The West Indian Colonies have shown remarkable recuperative powers in the face of a succession of natural calamities, which have included hurricanes, volcanic eruptions and earthquakes, and the prospects of Jamaica before this recent misfortune overtook

her had seemed to be unusually bright. It is fortunate that the new Governor is thoroughly acquainted with the needs of the Colony, and is regarded by its inhabitants, as well as by Downing Street, as the right man to deal with the emergency.

---

The meeting convened by the Lord Mayor on the 23rd of April, to discuss the subject of Empire education received exceedingly strong support. We trust that the result will be that the educational authorities in this country will be able to admit into the curriculum of the primary schools a larger amount of study of the Empire. As Lord Milner observed, the object cannot be obtained unless Empire education becomes a recognised and normal part of the education of the children in all public schools. The subject is indeed, from an educational view, admirably adopted to foster the wide vision and large sympathies which, in other places, are the best results obtainable from a classical education, and the facts themselves would be congenial and interesting to the children.

---

We do not however think that the terms of the resolution which was passed are altogether happy. It runs as follows :—

“That in the opinion of this meeting of citizens of London and others, the education of the people of Great Britain on the subject of the Empire is deplorably backward, and that as an illustration of this fact it may be pointed out that no official map or text book in regard to the Empire is available for teachers and the public ; that the teaching of Empire subjects with the aid of official maps and text book should be obligatory in all elementary and secondary schools in Great Britain ; and that the Government be requested to lend official assistance in the preparation of such maps and text books and to sanction the permanent display of Empire maps in all schools post offices, and public buildings.”

Surely it is hardly necessary to press for the preparation of an official map of the Empire for the purpose of the extremely simple handbook which would be wanted. Are there not many suitable maps, both large and small, already in existence? We might instance the map given in the Colonial Office List. What would be thought of a Government office which, having to prepare a handbook for children, began by calling upon the Ordnance Survey at Southampton to construct a new map of the world? Some indignation has been shown at a statement made by the Education Department that it is not their business to make maps or school books. It certainly is not, and no reason has been shown why it

should be. The composition of elementary hand-books is a special art. There are many practised writers who would have no difficulty in producing what is required in a form adapted to children's requirements. This is their role, and neither officials nor professors could equal them at it.

---

As soon therefore as the authorised curriculum calls for the elementary hand-book it will be forthcoming. The market would be an excellent one, and there seems to us to be no need for any subscriptions to help authors. Of secondary hand-books there are already several.

---

At this period of the year a very large number of visitors from the Colonies are in this country. One of the domestic questions in which some of them are compelled to take more than a passing interest is the payment of income tax. If they reside here for six months in any one year they are liable. The point is of importance to Government officers particularly, owing to the special facilities which the Inland Revenue enjoy of ascertaining their income, and some remarks may be found interesting.

---

The archives of the departments concerned deal with many points which have been raised, but, as a rule (as might be expected from the formidable mass of legislation on the subject), the official assessor is too much for the complainant. Thus a visitor urged that at no time had he resided here for six months continuously; but this is immaterial if he has resided "at one time or several times for a period equal in the whole to six months in any one year." Nor does it matter that a person comes here for a temporary purpose, and without any intention of establishing a home here. In other words the question is not one of domicile, but simply of residence.

---

It will be observed, however, that the six months is to be "in any one year." This is a point worthy of the consideration of the far-seeing officer. "Any one year" means (to the Inland Revenue) any one financial year. Thus you may have completed five months, residence at the end of March. But you start fair again the next month (viz., on 6th April). The utility of apportioning a long holiday duly over two financial years is obvious. If you reach England in the course of October, you are exempt for the current financial year and you can reside five months in the next without liability.

A point which occasionally arises is whether an officer can be relieved from payment on the ground that his residence here for more than six months has been caused by official requirements. He may have been detained by instructions from the Secretary of State, and frequently (as it happens) the necessity for these detentions is, only discovered towards the end of the usual leave. In such cases the Inland Revenue have, on application from the Secretary of State, relieved the officer from liability.

---

Prior to 1905 income-tax was levied on the whole sum paid to an official, including salary which had accrued due before his arrival and any advance made to him in anticipation of salary payable after departure. This was no doubt in accordance with the strict interpretation of the Income Tax Acts, which lay hold of all payments of this kind without distinguishing the periods for which they are payable. But in the above year a correspondence took place between the Crown Agents and the Inland Revenue, the result of which was that salary accrued due before arrival and advances made before departure are exempted.

---

The case of gratuities is sometimes open to question. On a case which occurred in 1905 the Inland Revenue stated that "the general rule in such cases as laid down by the Treasury is that all gratuities or payments in the nature of gratuities made to officers in respect of the performance of their duties in the public service and in consideration of those duties, shall be charged to income tax; but when the gratuity is given by way of reward for special services outside the ordinary duties of that particular office liability does not arise. Moreover, no liability attaches to gratuities granted on retirement to officers who are not entitled to pension."

---

A gratuity given to an officer for proficiency in a foreign language was held to be exempt, "being in the nature of a return of out-of-pocket expenses incurred by the officer in the acquirement of the language." The reason given does not perhaps represent the usual facts, but as the decision is satisfactory there is no occasion to discuss it.

---

If the officer has come here for a temporary purpose, there is no liability until the six months' residence is completed, and the Crown Agents pay salaries in full till then. The deduction is made when the period is complete. But, if the officer has not come for a temporary purpose only, the proper deduction must be made from each payment.

It follows in the first case that an officer on leave may draw salary for say five months without paying income tax, and that if he draws no further salary in this country he will escape payment, however much longer he stays here. We do not suggest that advantage should be deliberately taken of this circumstance, but if it is no official notice will be taken.

---

The rule that six months' residence entails liability does not, unfortunately, imply that less than six months' residence always avoids it. If an officer does anything which shows an intention of establishing a residence here, such as taking a lease of a house, he is liable, because it is inferred that he has not come for a temporary purpose only. Thus it has been held that a master mariner, who had a house in the United Kingdom in which he lived occasionally, and in which his family lived regularly, was liable. It would seem fairly arguable that the case of the civil servant, who takes a house for his family here, is distinguishable, as he really resides in the colony himself. In a recent decision, however, the Inland Revenue wrote as follows to an officer of Southern Nigeria who had been assessed by the District Commissioner of Taxes: "As the Board understand the facts of your case, you have returned home from Nigeria on leave during some portions of each year since your appointment, while you also rent a house in this country in which Mrs.—— lives from time to time, and on these facts the Board consider that for Income Tax purposes you are not a temporary resident in the United Kingdom for a period of less than six months, but a temporary absentee from the country, such as is specially directed to be charged by s. 39 of the Income Tax Act of 1842." Whether this decision would apply to officers who only come home at long intervals is possibly open to doubt, but the principle is that all officers who are "temporary absentees," for whatever periods, are liable if they take a house here.

---

It is useful in some cases to know that, when a change is made in the rate of income tax, the new tax is chargeable on the dividends or interest paid by foreign or colonial companies or governments, and sent to an agent here for payment on or after 6th April; but in the case of dividends of companies in this country and income derived from property or business, the tax charged is that in force at the time when the money was accruing.

---

If a pensioner agrees to devote a specified part of his pension to the payment of debts, or if part of it is assigned to the Official Receiver, income tax is still chargeable on the whole of the pension.

## NOTES ON THE TRANSVAAL LETTERS PATENT.

IN view of the recent establishment of responsible government in the Transvaal it may be worth while to draw attention to certain points of constitutional interest arising out of the Royal Letters Patent of December 6th, 1906.

### The Second Chamber.

The legislature of every self-governing Colony in the British Empire at present consists, like that of the United Kingdom, of two chambers. But in the relationship subsisting between the two chambers there is a wide diversity. The cases in which the Upper House is elective, and those in which it is nominated, are almost equal in number, and we find to-day an elective Senate in the Commonwealth of Australia side by side with a Senate whose members are nominated for life in the Dominion of Canada. Even in South Africa there is a diversity of practice: in Cape Colony the Legislative Council is elective; in Natal it is nominated. By the Transvaal Letters Patent, the choice between the two systems is practically left open to the people of the Colony. The Legislative Council is in the first instance to consist of fifteen members nominated by the governor. But the Legislature is empowered, at any time after four years from the date of the first meeting of the Council, to pass a law providing for an elective Council, and on such a law coming into operation the nominated Council is to be dissolved and to be replaced by the new elective body. Failing such a law, the Council will be dissolved at the end of five years, and a fresh Council will be summoned by the Governor-in-Council—*i.e.* by the Governor acting upon the advice of his Ministers.

### The Speaker of the Assembly.

The Letters Patent contain an interesting and unusual provision with regard to the Speaker of the Legislative Assembly. The House, of course, elects its own Speaker, but on his election he ceases to be a member of the Assembly, his seat becomes vacant and a fresh election is held to fill the vacancy. The reason for this provision is to be found in the comparatively small size of the Assembly. In a

house of only 69 members, parties might be so evenly divided that the majority would be unwilling to elect one of themselves as Speaker at the cost of losing a vote for their party. Everyone will agree that the selection of a Speaker should not be influenced by considerations of this kind, and the provision made in the Letters Patent affords a convenient safeguard.

### Language.

By Clause XXXI. of the Letters Patent, English is made the language for Parliamentary records, but English and Dutch are placed on an equality in debates, and copies of the votes and proceedings and of all proposed laws are to be printed in both languages.

### The Prevention of Deadlocks.

The provision made in the Letters Patent to avoid the continuance of a deadlock brought about by a difference between the two Houses is of considerable interest. The text of the Clause is as follows :—

“ XXXVII.—(1.) If the Legislative Assembly passes any proposed law and the Legislative Council rejects or fails to pass it, or passes it with amendments to which the Legislative Assembly will not agree, and if the Legislative Assembly, in the next Session, again passes the proposed law with or without any amendments which have been made, suggested, or agreed to by the Legislative Council, and the Legislative Council rejects, or fails to pass it, or passes it with amendments to which the Legislative Assembly will not agree, the Governor may during that Session convene a joint sitting of the Members of the Legislative Council and Legislative Assembly in the manner hereinafter provided, or may dissolve the Legislative Assembly, and may simultaneously dissolve both the Legislative Council and Legislative Assembly if the Legislative Council shall then be an elected Council. But such dissolution shall not take place within six months before the date of the expiry of the Legislative Assembly by effluxion of time.

(2.) If after such dissolution the Legislative Assembly again passes the proposed law, with or without any amendments which have been made, suggested, or agreed to by the Legislative Council, and the Legislative Council rejects or fails to pass it, or passes it with amendments to which the Legislative Assembly will not agree, the Governor may convene a joint sitting of the Members of the Legislative Council and of the Legislative Assembly, at which the Speaker of the Legislative Assembly shall preside.

(3.) The Members present at any joint sitting convened under either of the preceding sub-sections, may deliberate and shall vote together upon the proposed law, as last proposed by the Legislative

Assembly, and upon amendments, if any, which have been made therein by the one House of the Legislature and not agreed to by the other, and any such amendments which are affirmed by an absolute majority of the total number of the Members of the Legislative Council and Legislative Assembly shall be taken to have been carried, and if the proposed law, with the amendments, if any, so carried, is affirmed by an absolute majority of the total number of the Members of the Legislative Council and Legislative Assembly, it shall be taken to have been duly passed by the Legislature."

As the Council only consists of fifteen members, while the Assembly has 69, it will be seen that the predominance of the Lower House is assured. The provision is borrowed from the Commonwealth of Australia, where, however, it has not yet been necessary to have recourse to a joint sitting.

### The Reservations.

The Governor is required to reserve for the signification of the King's pleasure :—

- (1). Any law whereby persons not of European birth or descent may be subjected or made liable to any disabilities or restrictions to which persons of European birth or descent are not also subjected or made liable ;
- (2) Any law which may repeal or alter any of the provisions of the Letters Patent or of any Letters Patent or Orders in Council relating to the Colony ; and
- (3) Any law providing for the introduction under contract, indenture or licence, of labourers into the Colony from places outside South Africa ;

unless he shall have previously obtained the King's instructions through a Secretary of State, or unless such law contains a suspending clause. The Royal Instructions also require the Governor not to assent to certain classes of laws ; but the effect of this provision is not the same as that of the Clause in the Letters Patent summarised above. For the validity of legislation depends on compliance with the requirements of the provisions of the Letters Patent, and if the Governor were to assent to a law which the Letters Patent required him to reserve, the law itself would be void and invalid. Failure to comply with the Royal Instructions, on the other hand, would not affect the validity of a law, which would remain operative unless and until disallowed by the Crown. It is interesting to note that the Transvaal Parliament has already, in its first brief session, amended the Letters Patent to which it owes its existence, by defining the nature of the "offices of profit," which disqualify for a seat in Parliament, and that the Governor, acting on instructions received through the Secretary of State, has signified his assent.

## TRANSVAAL NATIVE AFFAIRS

*SIR G. LAGDEN'S REPORT.*

THE establishment of responsible government in the Transvaal gives special interest to the Report of the Transvaal Native Affairs Department for 1905-6. The retiring Commissioner, Sir Godfrey Lagden, has taken the opportunity to give a brief record, in the introduction to the Report, of the general conduct of native policy under Crown Colony Government. We append some extracts.

"My Report for the past year may be more lengthy than usual because, in view of the impending change of Government, it seems desirable to offer, in a preliminary chapter for public information, a brief retrospect of the conditions and policy of the last few years since the assumption over the Transvaal Colony of British rule in 1901.

The state of things in that year may be described as chaotic. The war was still raging, the natives were scattered and bewildered, and there was an entire absence of law and order. At the centres of industry great attempts were being made to put machinery in motion to admit of the employment of white skilled labour which was clamouring to return to the Colony. For that purpose native labour was required and had to be brought here in trains under military escort. It was necessary to frame or amend and bring into operation regulations for labour districts in respect of passes, labour recruiting, and compound management, so that imported labour could be more effectually controlled and supervised. It was necessary to further the efforts of those who were recruiting labour so that the supply might be augmented to meet the increasing demands, and to do this it was necessary to appoint officers in the labour districts whose special duty it should be to look after labour questions, and to employ Native Commissioners in the various districts of the Transvaal whose particular purpose then should be to re-establish order amongst the natives, to re-settle them where they had been disturbed, and to restore confidence in the native mind."

"The question of wages is particularly one of economics, with which I only propose to deal briefly. During the war an order was issued under Martial Law which had the effect of limiting the amount of wages to be paid to native employees. Until this order was rescinded it left employers, therefore, no option. Whilst contending that all

natives are entitled to a fair wage for their labour, I have never advocated an excessive rate. Natives as a rule set themselves the task of acquiring a certain amount of money to gratify certain wants, and, having acquired it, retire and rest. Were they to gain very high wages they would retire to rest at an earlier period, and thus spend a greater time in repose. I have always preached to them the religion of continuous work. But the exhortation falls on barren ground if the native has more money than he requires for his immediate wants. He is not like the European, who as a rule continues to work every day of his life in order that he may put something by for the future, and it will be a long time before he assimilates that idea. It is not, in my opinion, a friendly act towards the natives to advocate that they should be paid to an extent which will encourage them to idleness. Their best friends, should, I think, urge them to work continuously, and cultivate thrift as being one of the first steps towards civilisation. The cultivation of a higher standard of living, which induces to increased wants, is the best stimulant to regular and continuous labour.

This leads me to reply to questions which have been sometimes asked as to what Government has done for the natives in this Colony. It has been urged that we have disarmed them and that they have been treated more harshly than formerly. It is true that they were disarmed. It was done by the Native Commissioners without the aid of a single white policeman. The whole country was disarmed after the war, and no exception could be made. What has appeared harsh to them and to some people may be that officers under the British Government are bound to carry out effectively the laws of the land. And there is no doubt that they have done so. The police have been exceptionally keen and active in their duty. It is certain that the Pass Laws have been more rigorously administered than they were formerly, and that defaulters in the matter of taxation, or in any matter, have been more speedily and effectively brought to book. This kind of activity has, I know, given rise to native discontent and to unfair comparison, such as would come to the lips of those who apparently suffer on account of the zeal of officers of the law; but that is a thing which the natives have got to get used to. The same law which gives them unstinted justice and freedom from harm has to run its course severely in other respects.

It must be borne in mind that Government has done much on their behalf in protecting them not only against their enemies but against themselves. It is but a few years ago since they lived in a state of perpetual terror, arising from internecine strife, murder, and spoliation. Barbarism in its worst form had full play; witchcraft and smelling out did their deadly work. All that has been swept away, and the natives now live under a law which admits of their progress if they are willing to progress. In putting a stop to this

wild life Government has been truly paternal, and at the same time has not disturbed the continuance of those habits and customs which the natives cherish so much and which are not repugnant to civilised ideas. It has been the policy of the Government to place amongst the natives in all populated areas officers of experience and training, whose functions are to extend to them sympathetic treatment which is commonly described as kind but firm. These officers give their undivided attention to native matters and are in my opinion for that reason essential no less to the contentment of the natives than to the peace of the country."

"There is no occasion for despondency about the progress of the natives. The ordeal they are going through, *i.e.*, the struggle between progress and barbarism, is most trying, and is intensified by eager clamour for signs of improvement which are and ought to be at this stage almost invisible. Meanwhile, tolerance should be displayed towards their errors in the same spirit in which it is shewn to growing children. It is necessary in native affairs to guard against the tendency of being hypnotised by present-day 'energy,' which demands immediate results and is impatient of slow development."

"Questions have at times arisen as to the interpretation of Law 4 of 1885 and the power of chiefs under it to maintain order in their tribes. It will, I believe, be necessary to amend the Law and to more clearly define the power which chiefs may usefully exercise in tribal matters. We look to the chiefs to maintain order, to assist in the collection of taxes and in the repression of crime, and we must support them in so doing. At the present time they perform many duties of great value to the Government. If they are deprived of their power and position, or are not supported in the reasonable exercise of power, it will become necessary for Government to employ costly and extensive machinery in their place.

The feeling of the natives towards their chiefs is one of traditional loyalty and respect. The people are willing and anxious to obey their chiefs in all lawful ways, and if we exact from them certain duties it is desirable that we should subsidise them for their labour. In so doing, Government ensures their loyalty and attachment. The policy has been not to interrupt a system which serves as a means of government and of contentment. No more fatal error could be committed than to pull down chieftainship until the people were prepared for the change and the Government was prepared to put something better in its place. The chiefs are amenable to advice and guidance, and, if supported, can control their people.

It is true that the natives are beginning to think. Increased contact with civilization, native newspapers, easy means of communication and correspondence have been factors in creating thought. But beyond these lie the sturdy effects of education and religious inspiration engendered by missionaries who have done a great work

for good but have not as yet had time to see the true results of their labours. In some parts of South Africa native thought has taken a distinct shape. In the Cape Colony for instance, where they have equal rights under the franchise they feel themselves to be almost a political power. In the new Colonies it is not so, but there is clearly a significant wave of thought which requires to be realised and recognised.

The South African Native Affairs Commission, constituted as it was of representatives from each of the Colonies and Territories of South Africa, in its Report of 1904 exhibits the true condition of native affairs in South Africa to-day, and offers recommendations upon nearly every subject which politicians may have to confront. With the spirit of those recommendations I wholly agree, and, although it may not be possible for years to come for the Colonies to adopt a common policy, I believe that most of the recommendations of that Commission may be found applicable to the Transvaal. The Report breathes the spirit of tolerance which is so essential in dealing with natives and, while advocating no heroic measures, offers certain suggestions commensurate with the natural evolution of the native. We may admire the zeal and lofty ideals entertained by many people on behalf of the natives. But Government cannot be idealistic; its policy must be liberal and sympathetic but sane. To disturb the natural order of evolution is to arrest the true course of progress. It must be remembered that, as regards native policy, we are daily face to face with extreme opinions. If the best interests of the natives are to be consulted, it will always be necessary to balance these extreme opinions and steer a course between them. The problem is admittedly a great one, concerning which public opinion has undergone a great change during the past few years, and it is emphasised in those Colonies where the government of Europeans and natives has to be combined."

"In a previous paragraph I alluded to a pervading wave of thought. That thought should in the absence of any direct representation of the natives in the Legislature under Responsible Government find some expression. In municipal locations it can be best found by admitting elders of repute to conference and vesting responsibility in them for village management. At the present time it is ventilated amongst the masses in the populated districts through the Native Commissioners who hold periodical meetings of chiefs and headmen at which grievances are expressed and representations made which reach the Commissioner for Native Affairs and the Supreme Chief, *i.e.*, the Governor. But I think the time has come to consider the question of forming a Council entirely of natives who should be selected for their influence or ability, and should be summoned to meet annually under the presidency of an officer of the Native Affairs Department. The functions of such a council should be purely consultative, *i.e.*,

it should be permitted after conference to make representations for communication to the Government as regards its feelings in respect of existing laws, of laws requiring amendment, and of any matters which have a material bearing upon native welfare. That will, I believe, be the best outlet, and in that way the legislature of the country may learn the mental condition of the natives. I have not urged the establishment of such a council up to the present time, because I have not felt that the natives were sufficiently prepared for it. Moreover, in Crown Colony Government there are no sudden changes of personnel and policy. But under Responsible Government where the party system obtains there is the risk of sudden and repeated changes, and this, in my opinion, makes it more important that opportunities for the expression of native opinion should be afforded."

"As regards taxation, it has for generations been the policy of South Africa universally to impose a direct tax on natives. No sound reason has been advanced for reversing this policy. On the contrary, the South African Native Affairs Commission recommended continuance of the system. The personal tax fixed by the late Government under Law 24 of 1895 is higher than in other Colonies, the reason urged having always been that the Transvaal natives had near their homes a splendid labour market offering high wages.

The Amended Ordinance No. 20 of 1902 provides, with certain exceptions, for a common tax of £2 upon every male adult. It was found, however, that this pressed most hardly upon farm labourers who, though in the enjoyment of only small wages, were tied to farms, and were thus unable to get away and earn high wages as others could do, the result being that the farmers in many instances paid the tax themselves. The law has therefore been altered to the extent that the tax on *bona fide* farm labourers who have worked continuously for a certain period will be partially remitted. Similar relaxation has been afforded to natives residing by permission and working within Municipal areas, and who pay Municipal taxes. Furthermore, it was found that the cumulative tax of £2 upon each wife additional to the first was an intense burden upon men who acquired wives formerly, when they were easily obtained and easily kept in the days when land was plentiful and the wants of wives less exacting than they are to-day. This cumulative tax has been removed. It will not, in my opinion, affect polygamy in any appreciable degree, because the natives to-day are quick to realise that their lands will no longer support the number they used to, that new lands are now no longer available, and that the women themselves demand clothing and other luxuries which have come into modern use."

"The resolutions passed upon the subject by the South African Native Affairs Commission after critical enquiry in each colony put the case so well that I reproduce them and endorse them fully.

‘That in the opinion of this Commission, the Ethiopian Movement, now represented by the African Methodist Episcopal Church, the Ethiopian Order in the Church of England, and the numerous semi-organised schismatic fragments detached from every denomination operating to any considerable extent in this country, is the outcome of a desire on the part of the Natives for ecclesiastical self-support and self-control, first taking tangible form in the secession of discontented and restless spirits from religious bodies under the supervision of European Missionaries without any previous external incitation thereto. Further, that upon the affiliation of certain of these seceders and their followings to the African Methodist Episcopal Church lamentable want of discrimination was displayed by the first emissaries to South Africa in the ordination to the ministry of unsuitable men.’

‘That the Commission is not disposed to condemn the aspiration after religious independence, unassociated with mischievous political propaganda, but at the same time does not fail to recognise that in the case of a subject race such an aspiration misdirected on the one hand by the leadership of ignorant and misguided men and repressed by misunderstanding or harshness on the other might be fraught with the seeds of racial mistrust and discontent.’

‘That the Commission cannot but regard with concern the fact that many who have been prominently connected with the movement in its various phases are men lacking in the breadth of view, wisdom and forethought necessary properly to foster and direct the fledgling ideals of a people just emerging from ignorance and barbarism into a state of semi-enlightenment.’

‘That, reviewing these resolutions, the Commission would not advise any measure of legislative repression, unless unforeseen developments render it necessary, considering that effort should rather be directed towards securing efficient constitutional control and organisation in order that the influences at work may be wisely directed, and any individual cases in which pastors abuse the trust reposed in them, may be amenable to authoritative discipline. To this end the Commission would deprecate the recognition of detached secessionary fragments acknowledging no efficient central authority.’

Although this report purports to be brought up to the 30th June only, it is written on a date which enables me to record the result of recent journeys made by me through the thickly-populated parts of this Colony.

I found that almost without exception the natives were happy, contented, and law-abiding. It is true they complained of their taxes, as all people do. But as a rule they were prosperous and well-disposed. A series of bad seasons have made them feel the pinch of want. Drought, locusts and murrain have been the common enemy of all. Many have lost their entire herds of cattle,

and their health has probably suffered in consequence of the loss of milk diet to which they were habituated. My meetings with the natives followed closely upon the termination of the disturbances in Natal and Zululand. There is no doubt in my mind that these disturbances had a reflective action upon the natives of the Transvaal who were undoubtedly approached by emissaries from the rebellious centres. Rebellions are always far-reaching and cause a wave of unrest. We felt it in this Colony. In some quarters alarm was felt by the Europeans, but in no single instance did any tribes in this Colony commit any disloyal acts. They may have coquetted as they will always do; but they obeyed the orders of Government to remain quiet, and they listened to the counsel of their officers whose business it was to advise them. It was a period of anxiety for the Government and people of this Colony, but I felt secure in the knowledge that we had trustworthy officers placed over the natives who would compose and guide them, and to those officers I consider the highest tribute is to be paid for the way they did their duty. As during that eventful period, so during other anxious periods in the past few years they have performed a signal service to the Colony, which it is my high privilege to place on record to their credit."

"The fall in the supply on mines and works has been almost entirely consequent upon the shortage in the supply from the Transvaal, Cape Colony, Portuguese East Africa and Rhodesia.

The decrease so far as the gold and coal mines are concerned is partly attributable to the deflection of labour to other classes of employment, and to the diamond mines in this Colony and at Kimberley.

The apparent facility and success with which recruiting operations are carried on by the agents of diamond mines points to the fact that the gold and coal mines now have in them powerful recruiting rivals with whom, as regards wages and inducements generally, they are unable to compete, and that where and so long as recruiting for the former industry is actively prosecuted, and until its requirements are satisfied, no material supply can accrue to gold mines and other industries."

"Recruitment in Tropical Areas.—As a result of the exceedingly high rate of mortality amongst natives recruited for the mines from tropical areas it was decided in December last upon the authority of His Majesty's Government and by arrangement with the Witwatersrand Native Labour Association to suspend all recruiting operations north of latitude 22 in the territories of British Central Africa, Quilimane, Mozambique and Portuguese Nyassaland."

"On the 31st December, 1905, there were employed on Mines in all the labour districts of the Colony:—

Natives (exclusive of those recruited from tropical areas)	84,167
Natives recruited from tropical areas ... ..	10,570
Chinese ... ..	47,217

If it were decided to suspend recruiting in tropical areas, and if the recruitment of Chinese labour is discontinued, a serious position would present itself, and the mining industry would be left dependent for its supply upon the non-tropical areas, which (although they may not at present be exploited to their fullest capacity) might be quite unable to supply the deficiency. Again, if such a position did arise, and it were necessary to revert to recruiting in tropical areas, it would be months before the recruiting machinery at present in operation could be reorganised. The labourers now drawn from Portuguese East Africa, south of latitude 22 degs., are admittedly of superior physique to those who were recruited in the early days of the mining industry, and to account for this there is evidence that of the recruits from that area during the past year, over 50 per cent. were 'old mine boys.'

It is reasonable to suppose that the improved physique among these natives is, in a measure, due to the opportunities which have been afforded them to come out for work and to the increased circulation of money amongst them which has enabled them to better their living conditions at their kraals with the result that a valuable supply area has now been formed from which 60 per cent. of the native labour employed on the mines, and 80 per cent. of the total underground native labour supply, is drawn.

If such an improved condition of things has been evolved in respect of the natives recruited from Portuguese East Africa, south of latitude 22 degs., a similar result might possibly be obtained, in course of time, in respect of natives recruited from Quilimane, Mozambique, Rhodesia, and British Central Africa.

Although it is to be regretted that the efforts of the Government and the mining industry have failed to appreciably reduce the rate of mortality among the natives recruited from tropical areas, it is gratifying to notice the marked fall in mortality in respect of those recruited from areas south of latitude 22 degs.

That result might be ascribed to the improved recruiting organisation and arrangements for the conduct of natives to the goldfields, and to the improved conditions of life now obtaining on the mines.

It will be seen from this short retrospect, that from the very outset active efforts have been made in the care and welfare of the native labourers on the mines, whilst the records published in the Annual Blue Book Reports of this Department illustrate that the standard of living has been raised since 1902 to a useful, if not high level.

No one realised a few years ago what is now known to us from actual experience, that the employment of labourers from tropical regions is the principal cause of the high death rate."

## ADMINISTRATION OF NORTHERN NIGERIA.

A SERIES of memoranda by Sir F. D. Lugard on administrative questions has been printed for the confidential use of the Protectorate officers. They show the care and pains which have been lavished on the problems of Northern Nigeria. There is hardly any matter of interest in such a country which Sir F. D. Lugard has not studied, and it is fortunate that he has been able to use the brief period between his two administrations in collating and revising these memoranda.

The greater part of the territory is practically under a feudal system. The land is parcelled out into estates held by the principal chiefs as fiefs from the Emir. The taxation was originally Koranic in character, but irregular taxes were invented. Every form of handicraft had its special tax, and in many places the collection was "farmed out." The object of the administration is to retain, as far as possible, the ancient forms of taxation and the old jurisdictions while preventing abuses.

We append some extracts:—

"A Resident, as the name implies, is an Officer charged rather with Political than with strictly Administrative functions, and the degree to which he may be called upon to act in the latter capacity will depend upon the influence and ability of the Native Chiefs in his Province, or in different parts of his Province. Generally speaking, it will be his endeavour to rule through the Native Chiefs, and to educate them in the duties of Rulers according to a civilised standard; to convince them that oppression of the people is not sound policy, or to the eventual benefit of the rulers; to bring home to their intelligence, as far as may be, the evils attendant on a system which holds the lower classes in a state of slavery or serfdom and so destroys individual responsibility, ambition, and development amongst them; and to inculcate the unspeakable benefit of justice, free from bribery, and open to all.

In those Provinces, or rather in those parts of Provinces, which are under the rule of a Chief of the first or of the second grade, this will be a Resident's primary duty and object, though the institution

of direct taxation, and the consequent duty of assessing all the towns and villages himself, will throw upon him a considerable amount of purely Administrative work, even in such districts. In this work he should invite the co-operation of the Chief, and endeavour to enlist his cordial assistance by making it clear to him that his own interests are deeply involved. In Provinces where there is no Chief of the first or second grade, a Resident's functions become more largely Administrative, and among uncivilised Pagan tribes he must assume the full onus of Administration to the extent to which time and opportunity permit."

"It is an important part of the duty of District Officers to encourage trade by every means in their power, informing the people of the nearest European trade-centres, and the products they should bring to market especially encouraging the growth of cotton, and reporting fully as to the output and the possibilities of increase of all products sylvan or agricultural. They will forward samples of actual and possible economic products for transmission to the Imperial Institute; will make full suggestions and proposals having for their object the increase of trade; and will report where the collection of sylvan produce is only partial, and is capable of development and extension; they will report also on the nature of the requirements of the people; what facilities for, or improvements in, means of transport of produce can be given by Government; and what openings there are for new trading-stations; what ferry tolls are collected; and whether the markets are well attended, and caravans frequent. For this purpose, as well as for administrative reasons, they will do their utmost to promote road-making throughout their Provinces. Residents should do their utmost to promote the planting of trees of economic value in their Provinces, especially of Shea, Kola and Rubber, according to the locality and suitability of soil and climate. At their Headquarters they should plant fruit trees (Mango, Limes, Oranges, &c.), as well as Eucalyptus and flowering shrubs. Seeds or seedlings of these will be supplied, when available, on application to the Forestry Officer. The necessity of preventing deforestation of the country, and of replacing trees of economic value, will be impressed on the Chiefs, and the damage done by forest fires will be pointed out to them with a view to their prevention."

"The question of sanitation of Native towns is of sufficient importance to merit a word here. Beyond doubt the insanitary condition of Native towns and villages increases the prevalence of disease, and is a primary cause of the great rate of infant mortality, which is estimated by Dr. Miller, C.M.S., at perhaps 50 per cent. Residents are authorised to deal with this matter 'administratively,' first by clear orders and cautions, and later (if the warning is disregarded) by a

fine. Headmen may be warned that the tenure of their position will depend on their ability to enforce reasonable reform in these matters. Large cities, should, according to custom, be divided into Wards (*Ungwa*) the Chief of each Ward being held responsible for its sanitation (as well as for other matters, such as originating of false reports and alarms). Refuse heaps should be placed in selected situations at a distance from the water supply, and frequently fired, and an area of at least 100 yards all round each village should be kept entirely free of high grass and bush, and special precautions taken to preserve the water supply from contamination, which produces infantile enteritis and dysentery. If possible, Incinerators and Latrine pits should be introduced, and steps taken to establish regular cemeteries where they do not exist."

"Mohammedans of the better class are apt to consider it insulting to them, and a slur on their character to be called upon to swear to the truth of all evidence that they are about to give, and in consequence to become sulky and unwilling to tender it, or to respect the Oath that they will speak the truth. The Native (Mohammedan) custom is only to swear a man to a particular point if his statement on that point is challenged, and it is stated that in such circumstances self-respecting Mohammedans will rarely lie."

"In a country where the manufactures are limited to the most primitive wants of every day life, and are not for export, and where, in consequence, the exports are limited to raw material in payment for the manufactured goods received, it is obvious that indirect taxation in the form of customs is the simplest and cheapest mode of taxation. The disadvantage of limiting taxation to this source lies in the fact that, when a further stage of progress has been reached, it becomes difficult to inaugurate those direct contributions towards the cost of the Administration, which are recognised among all civilised nations as justly due from the individual, in proportion to his wealth, and the protection and benefits he receives from the State. This principle of direct taxation has been, I think, adopted by the French in all their African Colonies, and by the British in South and East Africa, but not, hitherto, in West Africa, except in Sierra Leone, where (probably because of its introduction at a late stage, instead of simultaneously with the assumption of rule) it produced trouble. If then it be assumed that direct taxation ought in some degree to be introduced at some not remote time, it appears to me to be the more far-seeing policy to introduce the principle simultaneously with the inclusion of the country under British control, when it is looked upon as a natural corollary to the assumption of rule.

On the other hand, direct taxation is unsuitable to a people who are held in a state of slavery or serfdom, for the responsibility of

the individual is then assumed by the slave-owner. A serf or slave cannot be expected to recognise or understand his obligation to the Government when the results of his labours are not his own, and the produce of his fields belongs to his master. He ceases to have an individual responsibility to the State for his actions, or an obligation to maintain the efficiency of the State by his contributions, however small; these obligations pass to his Overlord.

Direct taxation, therefore, as being the State recognition of the rights and responsibilities of the individual, is the moral charter of independence of a people. Communities, however, who have only recently emerged from such a state of servitude, are not, at first, wholly fit to appreciate those rights and to assume those duties, and they take some time to acquire the sense of responsibility and its obligations.

“Experience (I wrote in a former Memo.) seems to point to the conclusion that, in a country so fertile as this, taxation is a moral benefit to the people, by stimulating industry and production. Hitherto the male population has been largely engaged in tribal war, and the men have depended on the labour of their women and the great fertility of the soil to supply their needs in food. Where taxes were formerly paid (as in the Kabba Province) and have lapsed, I am informed that large areas have gone out of cultivation, and the male population, deprived of the necessity for producing a surplus to pay their taxes, and of the pastime of war, have become indolent and addicted to drinking and quarrelling. The pressure of population is the corrective in most countries, but in this country, devastated by years of war and slave raids, no such pressure at present exists.’

That it was wise to introduce the scheme tentatively, as soon as possible after the conquest of Sokoto and Kano, has, I think, been proved by the reports I have received from all sides of its ready acceptance by the Chiefs, and of the quieting effect that its inauguration has had upon the people. It has been welcomed by the former as moderate and just, and as evidence that the Government desires to support their position, to associate them with ourselves in the government of the country, and to secure to them an adequate revenue which they recognise that they are no longer able to wring from the people, and it has already relieved the almost desperate straits in which the upper classes found themselves in almost every Mohammedan Emirate, by providing an income for those who *earn* it by taking a share in the Administration of the country. The peasantry, on the other hand, are reported to be greatly pleased at the relief from the uncertain exactions of the past, and have

benefited much. Both classes were expectant that the new rulers would impose taxation of some kind to pay for Administration, and they have found the burden less heavy than they feared it might be. The returns of revenue have meanwhile increased rapidly."

"The forms of taxation, which were in operation formerly in the Fulani States, were many of them based on the Koranic law."

"The fanatical Fulani herdsmen, who had spread the Faith throughout Nigeria, had professed to institute the strict Koranic system of taxation. By this they were bound to pay the annual tithe themselves, and to devote it wholly to religious purposes or to the maintenance of the State, and to contribute annually to the support of the centre of their organisation at Sokoto and Gando, while they levied a fixed and proper tribute from the Unconverted.

As the desire for wealth and power, however, gradually supplanted the early religious zeal, the efforts to convert the Pagan races to the Faith, which are enjoined by the Koran, ceased, and the collection of Kurdin Kasa from all of them, irrespective of any nominal adhesion to Islam, became universal. The annual razzias were no longer wars waged for the extension of Islam, in which the vanquished are given the option of becoming one with the victors if they embrace Mohammedanism, but degenerated into mere raids for slaves. The rulers thus grew to look upon the peasantry merely as a means of acquiring wealth, and these, for the most part, remained Pagans. Latterly, when the ability to raid distant districts for slaves was curtailed in the Southern Emirates by the advent of Europeans, they even took to selling their own peasantry, while the levies upon the Pagans grew so heavy that they could only be met by payment in human-kind.

Irregular taxes were invented, or obsolete taxes of the Habe were revived, according to the need or the greed of each Emir, and these were imposed regardless of creed, while extortion and corruption increased in every grade. The Emirs came to regard themselves as Rulers first, and only afterwards as Moslems. Many of them were of very mixed blood, and though they one and all professed themselves to be devout Mohammedans, the primary object of their rule was to aggrandise themselves, their personal entourage and satellites, and their clique of office-holders, dignified with high-sounding titles, at the expense of the people whom they misgoverned. The extent to which the misgovernment, and the perversion of the original conception of Koranic taxation, took place, varied, of course, in different Emirates."

"As I have said in a previous paragraph, the abolition of the arbitrary impositions, together with the exactions of the Collectors (which, in some cases, probably equalled the regular taxes in amount,

and was incomparably more vexatious in its incidence), form together so great a relief to the peasantry, that they would welcome an increase of the nominal tribute, the extent of which they know, and which, when once paid, absolves them from all further dues. The object in view is not, however, to increase the incidence on the peasantry at present, but to render it less burdensome to the taxpayers and more remunerative to the Administration by a better system of assessment and collection. On the other hand, the Native Rulers, from lack of organisation and owing to frequent revolts, were in many places unable to collect the full taxes, and even where they were fully collected received less than half of the nominal amount. It appears, therefore, that even if the nominal tax is somewhat increased, and the Native Administration and Government take half each, the peasantry are well pleased, while the Principal Chief has practically as large a revenue as he ever had, and even, in some cases, as Emirs have frankly stated, much more. Out of the moiety assigned to the Native Administration, the Principal Chiefs will pay their allotted shares to the recognised Office-holders and to the District and Village Headmen. The amount assigned to each Native Official is at present a definite percentage of the tax, but later on when, on the one hand, the system has become fully established and effective, and, on the other hand, it has become more clear what incomes are required by the various grades and individuals in order to maintain their position, these percentages will be converted into fixed salaries, and the Native Administration will, then, as in India, become incorporated with the British. The total tax can then be shown on the Estimates as revenue, and the salaries of the Native Officials will appear under the Expenditure as personal emoluments of officials. Until the reform is more matured, however, this is not feasible."

"The general result of these reforms, as they gradually become fully operative, will, I trust, be as follows:—

(a) A substantial revenue will be secured to Native Chiefs to replace the loss by slave raiding and slave trading, and the levies on traders which crushed trade. This (taking into consideration the expenses they have no longer to bear) will leave them sufficiently well off, and in future they will *earn* their salaries by discharging responsible duties for the Administration.

(b) A considerable and increasing revenue will be secured to Government, partly due to better organisation and economy in collection, partly to the greater universality of the collection, and partly to increased taxes on certain wealthy classes. And coin currency, with its immense influence for progress and trade, will be greatly promoted."

"A Capitation or Poll-tax (misnamed a 'hut tax,' since it is levied upon each adult, and not on his house) is a class of taxation

applicable only to the lowest forms of human society, where every individual is practically on the same level, and such forms of wealth as exist are held in communal ownership. But as soon as a tribe emerges from this primitive stage, and individual ownership of property is recognised, a capitation tax should develop into an income-tax, so that each individual may be called upon to pay in proportion to his wealth and means, and in consequence, in proportion to the benefit he derives from the security afforded by Government. I concur, therefore, in a poll-tax only among the more savage and uncivilised Pagan tribes, where it takes the place of the tribute in slaves, or of annual raids. Where it is necessary to levy the tribute by such means, women, who are (at least equally with men) the manual labourers of Africa, should, I think, be assessed. The tax should, I propose, be calculated upon every male between 14 and 50 years of age, and on every female between 20 and 40 years. The rate should be low—say, a maximum of 3s. per annum for men and 2s. for women. But in many tribes recently brought under control it may not be feasible to fix a higher rate than 6d. per adult. The tax would be subject to slight increase or decrease according to the wealth of the community. The Germans in the Kameruns levy 3s. per man or woman, I think, but each married woman (except the first wife, who is untaxed) is charged 2s. only. I think this is a good plan. It is very low as compared to most African Colonies.”

“It is not infrequently urged (especially by those who are new to Africa) that Slavery is an institution well suited to the African, affording conditions under which he is, as a rule, happy, and that its supersession is a mistake. It is not possible in the compass of this Memo. to adequately discuss the reasons which have led thinking men to condemn the system of slavery, but the following are, in brief, among the principal ones. In the first place, slavery cannot be maintained without a supply of slaves, acquired under all the horrors of slave-raids, and transported with great loss of life from their original habitation; this results, not only in much human suffering, but also in a decrease of the population, and consequently in a decrease of the productive capacity of the country; secondly, no people can ever progress if personal initiative and personal responsibility is denied to them, as is the case with the slave class. That existing slaves may be happy in their lot is no argument to the mind of anyone who aims at the progress of the race in a remoter future.

Section 2 of the Proclamation abolishes the “legal status.” This means that, in the eye of the law, property in persons (as slaves) is not recognised, and that a “slave” is accounted to be personally responsible for his acts, and competent to give evidence

in Court. The institution of Domestic Slavery is not thereby abolished, as would be done by a decree of general emancipation, and, while as a matter of fact it gives the slave the means of asserting his freedom, it does not constitute it an offence for a native to own slaves. A master is not compelled to dismiss his slaves, and, so long as the two work harmoniously together, the law does not interfere with their relations towards each other. A slave has, however, the power of asserting his freedom at any time, for, if he leaves his master, the latter can enforce no claim to seize him, and is actionable if he resorts to force. It should not be made a necessary antecedent to the recognition of freedom that a slave should claim his freedom before a British Court, and be able to show proper means of subsistence if liberated. This has been done elsewhere in Africa, with the practical effect of nullifying the law. The right of a slave to assert his freedom when the Legal Status is abolished cannot be made dependent on such conditions, and no such limitation (not sanctioned by the law) can be legally enforced. The attempt to thus restrict the operation of the law appears to me to be neither logical nor just, for since the law does not recognise the Status of Slavery, it cannot detain a man in that status pending its own act of liberation.

If, however, slaves were to be encouraged to assert their freedom unnecessarily in large numbers, or if those so asserting it, by leaving their masters without some good cause, were indiscriminately upheld in their action by Political Officers, a state of anarchy and chaos would result, and the whole social system of the Mohammedan States would be dislocated. It might even become necessary to legalise the institution under some other name. It is, moreover, hardly necessary to point out that such a sudden repudiation of their obligations to their employers by the mass of the slave population would involve equal misery to the slaves and to their masters. The former would have no immediate means of livelihood, while the latter would be reduced to beggary, and to detestation of British rule which had brought this result about. The great cities would be filled with vagrants, criminals, and prostitutes; even now the large majority of the criminal class consists of runaway slaves.

Moreover, to prematurely abolish the almost universal form of labour contract, before a better system had been developed to take its place, would not only be an act of administrative folly, but would be an injustice to the masters, since Domestic Slavery is an institution sanctioned by the law of Islam, and property in slaves was as real as any other form of property among the Mohammedan population at the time that the British assumed the Government, a nullification of which would amount to nothing less than wholesale confiscation. This is equally true of both household and farm slaves. The status of the latter differs from that of household slaves, and they appear

to be rather serfs attached to the soil than slaves, that is to say, they have certain rights as regards produce, the houses they live in, and the hours or days during which they are allowed to work for themselves. It is important that these farm slaves or serfs should not leave their traditional employment in agriculture, and be induced to flock into the big cities as 'free' vagrants without means of subsistence. Residents will therefore do their best to discourage wholesale assertion of 'freedom' by such persons, pointing out to them, when occasion arises, the liberality, and from some points of view in present circumstances, the advantages of the form of labour contract under which they serve."

"Meanwhile, another result is already becoming manifest. The slave-owner, realising that he is powerless to retain or to re-capture his slaves by force, finds it necessary to treat them in such a way as to induce them to stay of their own free will. Their condition is thus improved, and the way is paved for the ultimate change to free labour. 'The result (writes Major Burdon) is that the existing slaves, having no longer the fear of sale or transfer away from the connections they have made, have become more contented, and less inclined to run away; and on the other hand, the masters having no longer the power to sell, nor the fear of confiscation or desertion, have come to treat their slaves more as part of the family. Desertion has become less common, and the formerly prevalent custom of deserting in order to seek Government employ is now very rare.' Similar reports reach me from Kano, Yola, and many other Provinces."

"In my view, it is infinitely better for the country that Government should acquire the sole right to minerals, and control their exploitation, than that Native Chiefs should dispose of rights to concession-hunters, which by Native law, they have, as a rule, no right to sell or give away. A lack of foresight in this matter has resulted in lamentable chaos in many British possessions, and Native Chiefs have sold concessions for a mere trifle in ignorance of their value, and have sold the same area, wholly or in part, to two or more different persons, thereby involving endless litigation and difficulty in settling titles. It appears to me also to be just that Government should share the profit on mineral industries with the actual promoters alone, awarding to the Natives only such compensation as, in the circumstances of the case, may seem just and right. The industry is thereby freed from the initial incubus (which has so hampered it in other countries) of large payments to the concessionaire from whom a syndicate may have purchased, and who had done nothing to earn his profits. Since the Company which actually takes in hand the development of a mineral field, has

been freed from this initial outlay, it can afford to pay a higher proportion of its profits to the Administration, and the share that thus accrues to Government is spent as a portion of the Revenue in lightening taxation, and for the development of the country. In other words, the country itself retains a direct share in the profits accruing from the development of its minerals. Government controls the prospector and the miner, and their relations with the natives whose interests it safeguards, while issuing to the *bona fide* miner a clear title, free of liabilities to any concessionaire. By the elimination of the middleman, the profits of the mining company (and the Government share of these profits) are increased, and both have a joint interest in the development of the industry."

"Crown lands are the private property of Government, and any person entering or building upon them commits a trespass. Public lands are held administratively by the Government, which in no way interferes with private titles, transfers or sales between individuals, but Government has the right at any time to take up any public land for public purposes, and Government can alone grant a title to a Non-Native or a Native who is not a Native of the Protectorate, for any public land. Money accruing from rentals and sales to persons other than Natives of the Protectorate forms part of the Revenue of the Protectorate."

"In Bornu a farm slave has to work five days in the week, and has two to himself, on which he can earn money privately or farm for himself, and out of these earnings he has to clothe, house, and feed himself. He has, in addition, to make certain small gifts to his master, *e.g.*, a portion of the produce of his own farm before sale at market. On the other hand, he is entitled to a small allowance of grain when it is being stored. He may own a farm of his own, and sell its produce, but pays dues to the Village Headman for it. Such slaves belong to their master, and do not pass with the transfer of the land. By law their property is their master's, but by custom it is seldom confiscated. Similarly a slave could formerly be sold or pawned, but this was never done unless the master was in great straits, or the slave was incorrigible. The slave often became very prosperous and owned cattle, &c., being sometimes in a position to help his master with a loan."

## ADMINISTRATION OF BRITISH NEW GUINEA.

A VOLUMINOUS report upon "The Present Conditions, including the Method of Government of the Territory of Papua" (until recently known as British New Guinea), has been presented to the Commonwealth Parliament by a Royal Commission. It will be interesting to see how the Commonwealth—in which the principles of responsible government and democracy have obtained their fullest expression—will handle this problem of "Crown Colony" administration. It has begun, in the usual Australian fashion, with a full examination of the facts and much plain speaking. The conclusion that Australians are the men who are most likely to succeed there will command a ready assent. We shall not be so sanguine that men retiring from the Indian Army and Civil Services, "in the latter case, usually with good pensions," will be induced in any numbers to settle, or start their sons in Papua. Even if Cheltenham and Harrogate ceased to attract, such men are hardly of the class which is suited for agricultural work. But, no doubt, as the world's demands for tropical produce increase, as they are constantly doing, the Possession will become a valuable asset. We append extracts dealing with its character and resources.

"The white population at present consists of miners, the major part of whom are settled in three centres, namely, Woodlark Island, and the Yodda and the Gira fields. Digging to a small extent is also carried on at Milne Bay, and on the Island of Sudest, and there are doubtless odd prospectors in other parts of the Territory. Approximately, the digging population may be put down at 200. The rest of the population consists of Government officials, missionaries, storekeepers, traders, labour recruiters, and planters, but your Commissioners regret to state that the latter class are in a distinct minority, nor do they believe that there are at present more than ten plantations in the whole Territory, and of these only four or five at the most are being worked on lines which make for ultimate success.

This state of affairs is in no sense due to a want of proper natural advantages, for the soil of Papua is rich, virgin and easily worked, while its infinite variety makes the successful cultivation of almost all tropical products possible. Climatically, it may unhesitatingly be

said that the country has been much maligned, and Your Commissioners have no hesitation in stating that in this respect it will compare not unfavourably with any other tropical Possession of the British Empire. It is true there are very bad patches, and that, particularly in the Northern Division, an alarming mortality has prevailed in the past; but it must not be forgotten that this took place among officials whose duties led them into the worst parts, and diggers, who, in search for gold, accepted risks which need never be taken by agriculturists. We believe that even the worst areas, when cleared of mosquito harbours and opened to the sunlight by cultivation, will, as in Northern Queensland, become at least comparatively healthy. But at the present moment there is no necessity for settlers to risk their health in creating better conditions for a later generation. Papua possesses thousands of acres where a man who exercises ordinary care may live with no serious risk to his health."

"So far, the gold discovered in Papua has been almost all alluvial, but there is every reason to believe that in the ranges whence this gold must have come, reefs will yet be discovered. Indeed, Mr. Monckton, the Resident Magistrate of the Northern Division, who lately ascended Mount Albert Edward, has pointed out, in his evidence, that he saw well-defined reefs on its slopes. The geological formations give promise that other valuable minerals will yet be discovered, and Your Commissioners have every hope that, given proper encouragement, mining will yet provide employment for a large number of men. But, no matter how fruitful the soil of Papua may be, or how rich the deposits beneath its surface, Your Commissioners recognise that, owing to its tropical climate, it would be idle to ask white men to attempt its development if an ample and suitable unskilled labour supply was non-existent. Fortunately, this problem has not to be faced, for here the question of importing coloured labour need never arise, owing to the plentiful local supply, and mines and plantations can consequently be worked under natural conditions in no way antagonistic to the policy of the Australian Commonwealth.

While Your Commissioners have no doubt as to the practicability of converting Papua into an agricultural and pastoral asset of great value to the Commonwealth, they recognise that all its natural advantages and exceptional labour supply are alike useless unless the right type of white man can be induced to settle there and wake its dormant possibilities into fruitful life. How settlement, in our opinion, can be best encouraged is dealt with under the various sub-headings of this Report, but here Your Commissioners think it is opportune to point out the class of settlers most likely to be successful and to suggest where they may possibly be obtained. From our point of view, the average Englishman, unused to dealing with native races, and totally ignorant of tropical agriculture, apart from having to take the risk of acclimatization, is not the ideal pioneer.

Furthermore, Your Commissioners recognise that this type of man is wanted for Australia. For similar reasons, the southern Australian should not, in our opinion, be specially encouraged to leave his own country, even to develop the Commonwealth's first-born child. But, at any rate, as regards similarity of conditions, there is no reason why our northern Australians should not do admirably as colonists. Indeed, in our opinion, any Australian would be more likely to succeed than a settler fresh from the Old Country, and while we would regret to see any man contented with his lot here leave for Papua, still we recognise that there are a number of Australians who, rightly or wrongly, are dissatisfied with existing conditions, and who, as a consequence, are leaving for various parts of South America, where they are practically lost to their own country for ever. These, we think, should be, if possible, induced to settle in Papua, where they will still be citizens of the Commonwealth, and under possibly more congenial conditions can do good work, not only for themselves, but for their Motherland. There are other Australians who might be induced to settle in Papua, but who are at present drifting away to South America. Your Commissioners refer to men who either remained in South Africa after the war, or, having gone there since, are now realizing that it is not the El Dorado they anticipated.

While in no sense suggesting that anything but encouragement should be offered to suitable colonists from any part of the Western World, Your Commissioners would naturally like to see the future guiders of Papua's destiny British in blood and sympathies, and it appears to them that such could be obtained in India if Papua's possibilities were judiciously and generally advertised in that country. Men are constantly retiring from the Army and the Civil Service, in the latter case, usually with good pensions. Already many of them are turning their eyes towards Australia as a future home. We think that they would probably find an outlet for their small capital under more congenial conditions in Papua than here, and, even if they themselves decided to live in Australia, they would probably gladly seize the opportunities offered for giving their sons a start in a country close to home, and yet having more in common with their life-long point of view than Australia can ever offer. Speaking generally, it appears to Your Commissioners that the East should be exploited for colonists, and we believe, when they clearly understand the conditions about to obtain in Papua, that a fair number of British will be found with some knowledge of tropical agriculture and native management ready to help in building up a country under their own flag, in preference to that of some foreign power."

"The aboriginal population of the island consists approximately of from 300,000 to 400,000, split up into innumerable tribes, and

speaking many languages. They are to a greater or lesser extent agriculturists and traders. Those inhabiting the sea coast and islands, and certain of the inland tribes in the Central, Eastern, North-eastern, and Northern Divisions may be said to be under Government control, to an extent which varies from perfect safety for white settlement on the South-east coast, to practically the mere shadow of magisterial authority in parts of the Gulf and nearly the whole of the Western Division."

"At present, the coastal native need only work to eat, and his wife does most of the little labour that suffices for his food supply. Government protection has plunged him into a condition of peaceful sloth. To-day, thanks to imported implements, the Papuan can do what little labour he still finds necessary with less exertion and in half the time formerly demanded; so, not by the path of gradual and natural development, but as a consequence of trade tomahawks and knives, the native has stepped—in the short space of twenty years—from the stone into the iron age. This transition would have been too sudden, the gap to be bridged too wide, for beings of far more advanced mentality to have faced successfully. Naturally, the Papuan has failed. He can now obtain sufficient food at the cost of much less personal exertion than formerly, and having no fear of hostile attack, need not attend to his physical development; while, at the same time, his desires and wants have remained those of the stone age. Consequently, the net result of hurling him into the iron period has been to render him more effeminate, and correspondingly indolent and wanting in proper manly self-reliance.

To awake the Papuan from this lotus-eaters' dream is an imperative and immediate necessity if he is to be saved from the fate of most aboriginal races. White settlement has created new wants and aspirations among the black races of South Africa; Your Commissioners believe it will in Papua. To satisfy the wants so created, money will be required. Money can only be obtained either by working for others or for himself; *ergo*, the native must, by an inflexible law, either become more industrious, or remain impervious to the temptations of the white man's stores. The history of all native peoples of similar development gives a direct negative to this last supposition. Consequently, Your Commissioners suggest the encouragement of white settlement as one of the surest and most practical methods of arresting the present indolent, apathetic state into which Government protection is sinking a race capable of a more useful and worthy destiny.

As a further means of forcing the native to recognise the obligations he owes to Government, and his own personal responsibilities, Your Commissioners are strongly of opinion that the time has arrived for the imposition of some system of taxation, so far as those natives are concerned who are under recognised Government control, the

system to be applied (in a manner to best meet local conditions) to other tribes as they are brought within the sphere of Government influence, and so become partakers of its protective advantages."

"While Your Commissioners desire in no way to detract from the importance of mining as a factor in the future development of Papua, they yet feel that to agriculture the Government must chiefly look as a means of providing a stationary and steadily revenue-producing population."

"While freely admitting that up to the present the intending settler has had to struggle against disabilities often inexcusable, and under any circumstances certain to prove fatal to general development, Your Commissioners could not fail to note that another cause has been at work, which would have rendered failure almost a certainty even had other conditions been in every sense favourable, and they would like to point out most emphatically that this cause must be removed if tropical agriculture is to be successful. The old adage that what is worth doing is worth doing well has apparently had little application, so far as plantations are concerned in Papua. Men have been picked to create or manage plantations for apparently every other reason than the one that they could reasonably be supposed to know anything about the work they were called on to supervise. It was found that the destiny of a majority of the few plantations started had been handed over at different times to a private soldier, a pearl sheller, a storeman, a saddler, and a valet. Under these circumstances Your Commissioners have no hesitation in saying that they consider the poor results so far obtained inevitable, and in no sense indicative of anything more than a want of ordinary common sense. To sum up the whole position, in planting as in most other things, amateurism has been the curse of Papua, and until this fact is fully realized, no effort on the part of the Government can bring out its potential natural possibilities.

The products which, in the opinion of Your Commissioners, have stood the test of experiment, and may now be regarded as safe investments when intelligently worked, and the word 'intelligently' is used advisedly, are copra, rubber, and coffee."

*Sugar.*—As sugar has not yet been cultivated by white men in Papua, Your Commission has not included it amongst those products which, in their opinion, have passed beyond the stage of experiment. At the same time, both by reason of the character of much of the soil and the fact that it is indigenous to the country and largely used as an article of food by the natives, they feel justified in expressing the opinion that sugar production will yet be one of the most profitable and extensive industries carried on in Papua."

"Being convinced that much of the country is peculiarly adapted to the growth of coffee, Your Commissioners consider that every effort

should be made to foster this industry, and in view of the fact that the Commonwealth uses 1,000 tons of coffee per annum, of which all but 34 tons was last year imported from abroad, they think that the Commonwealth Government should give this industry the advantage of a certain Tariff preference as against the outside world, and that when the production warrants it the local Administration should see to the hulling, grading, and branding of the product for the grower, as is now done, they understand, in Queensland.

*Tobacco.*—Tobacco is another product indigenous to Papua, to which, in the opinion of Your Commissioners, the attention of growers should be directed. So far, it has only been cultivated in a most primitive fashion by the natives themselves, but, at any rate on the Fly River, its natural quality seems to be of a highly satisfactory order.”

#### MINING.

##### *Prospecting.*

“ On the whole, the condition of the gold-mining industry in the Territory is of an encouraging nature. During the last six years the gold exports have steadily increased from £32,926 in 1900, to £58,496 in 1905-6, and this result has been attained notwithstanding the fact that but comparatively little of the country has been even roughly prospected.

With the exception of the mining carried on on Woodlark Island, the gold-mining of the Territory is almost solely confined to alluvial work, and the present developments upon the alluvial fields do not indicate their capability of supporting a greater number of men than are now engaged upon them. This suggests the necessity for discovering and opening up new fields if the industry is to be fostered and encouraged.

Gold is found and worked for along the North-eastern portion of the Territory from Milne Bay in the south, to Mambare River in the north; and the more recent reported discovery of gold on the Waria River further north, and close to the German boundary, points to the conclusion that the trend of this known gold-bearing belt is towards German Territory. In some minds, indeed, there appears to be a doubt whether the Waria discovery is in our Territory or in that of Kaiser Wilhelm land. Already some of the best miners in the Northern Division of Papua are on the Waria field prospecting.

It is, therefore, important that the country generally should be examined, and the gold in our Territory located in order to prevent the exodus into German territory of our miners, which would otherwise inevitably result from the discovery of payable gold-fields in the latter country. Existing circumstances plainly require that the necessary search and examination of the country

should be made by the Government by means of a well-equipped party comprising a geologist and practical miners. This method (of Government prospecting) would recommend itself to Your Commissioners above all others under any circumstances, but more particularly so in the present instance, for the reason that there is great danger attending prospecting by small private parties in districts not under—or only partially under—Government control, by reason of the hostility of the natives; whilst prospecting by large private parties, on the other hand, is a menace to the natives themselves if collisions should, as they almost certainly would, take place.”

#### NATIVE LABOUR.

##### *Recruiting.*

“The recruiting of native labour for all purposes is regulated by the Native Labour Ordinance of 1900. Such labour is obtained through the medium of licensed recruiters. The number of natives recruited last year was—for miners, 1,000; for others, 783; and probably if recruits had been available another 400 boys could have been engaged for miners. It is thus safe to compute the present labour supply at 2,000 recruits.

There are objections to the present system of private recruiters, and all the evidence taken favours the removal of the middleman and the initiating of a Government system, and with this evidence we agree. Among the objections to the present system may be mentioned the abuse of their licence by certain recruiters; boys have been threatened by recruiters with the wrath of the Government if they did not recruit. Village constables, too, whilst they are instructed to hold aloof, and remain entirely neutral between the recruiter and the natives of the villages, seem to be unable to comprehend or realise the real meaning of their instructions, and there appears to be a tendency on their part either to advise the natives against offering themselves as recruits generally, or they distinguish between recruiters who are, and who are not, *persona grata* to them individually, and assist or prevent recruiting accordingly.”

“Amongst the advantages accruing under a Government system of recruiting are the following:—Government officers would, we think more readily obtain recruits. The natives would place greater reliance, and we think, properly so, upon receiving fair treatment from their employers if the Government were the go-between; the Government, by monopolising the right to recruit, and desiring to make no profit thereby, could afford to do so at a less cost to the employer, who would consequently be benefited; the Government would be in more constant touch with coastal native tribes; the decreased cost of recruits would enable the imposition of a fee for supervision and

should be made to foster this industry, and in view of the fact that the Commonwealth uses 1,000 tons of coffee per annum, of which all but 34 tons was last year imported from abroad, they think that the Commonwealth Government should give this industry the advantage of a certain Tariff preference as against the outside world, and that when the production warrants it the local Administration should see to the hulling, grading, and branding of the product for the grower, as is now done, they understand, in Queensland.

*Tobacco.*—Tobacco is another product indigenous to Papua, to which, in the opinion of Your Commissioners, the attention of growers should be directed. So far, it has only been cultivated in a most primitive fashion by the natives themselves, but, at any rate on the Fly River, its natural quality seems to be of a highly satisfactory order.”

“Amongst the advantages accruing under a Government system of recruiting are the following:—Government officers would, we think more readily obtain recruits. The natives would place greater reliance, and we think, properly so, upon receiving fair treatment from their employers if the Government were the go-between; the Government, by monopolising the right to recruit, and desiring to make no profit thereby, could afford to do so at a less cost to the employer, who would consequently be benefited; the Government would be in more constant touch with coastal native tribes; the decreased cost of recruits would enable the imposition of a fee for supervision and

thus provide more effective supervision of native employes, for which the present fee is inadequate. The foregoing and other minor advantages seem to Your Commissioners to be apparent. The system recommended is one which could do away with the holders of recruiting licences, and substitute for them the Government."

#### EDUCATION.

"Sir William MacGregor, fully realizing towards the close of his administration the many unanswerable reasons in favour of teaching the English language to the natives, made every effort towards the furtherance of this end. Your Commissioners regret that up to the present it appears to them that successive Administrators have done little or nothing towards the carrying out of his wishes, nor can they hold the various Missionary Societies, which have had the whole matter largely in their hands, blameless in this regard. It appears to us that they have, in the main, been more anxious to cultivate local dialects than to introduce one common language, and that the one spoken by the Empire to which they belong. Nor can we hold many Government officials individually blameless in this connexion. It is evident that a majority of them have taken little trouble in the past to teach either police or prisoners the English language, and our experience in Papua leads us to the conclusion that most of them still attach small importance to this matter.

Motuan, possibly because it is of itself a well-defined language, probably for the reason that it was the tongue spoken by the natives round Port Moresby, has practically been constituted the official language, and Your Commissioners understand that Government officials are supposed to be proficient in its use. Considering that the natives outside a moderate radius of Port Moresby speak an infinite variety of tongues totally apart from Motuan, and that, as a matter of fact, the official who wishes to make himself understood in any other Division, save in parts of the Central, must learn the dialect or dialects spoken in that particular Division, Your Commissioners can see little virtue in giving official significance to any particular native language. In their opinion, it would be wiser for officials to make themselves acquainted with the particular dialect which obtains where they may happen to be stationed, but at the same time to, on every occasion, accustom the natives to the use of English words which, it is felt sure, would at least result in their obtaining a sufficient smattering to enable them to understand and to be understood by white men."

#### NATIVE TAXATION.

"The question, alike of the justice and advisability, of taxing, in some form or other, the native population of Papua at present under control, has had the earnest consideration of Your Commissioners.

They have been impelled thereto by reasons widely different in themselves, yet they believe all working towards one common end, and that the ultimate good of the natives themselves.

Revenue is urgently required for the proper development of the country, and so from that stand-point alone the question of asking men who have received so much from the Government, to in their turn make some reasonable return, is in itself sufficient to command serious investigation.

It may be argued that the natives are already, in an indirect way, paying a certain amount of taxation in return for benefits received through the trade which they buy from Europeans, but in the opinion of Your Commissioners this is a totally inadequate *quid pro quo* for the money spent and being spent on their behalf, and therefore from the stand-point of payment in return for services rendered, Your Commissioners consider it would be only fair to ask the natives within the sphere of official influence to subscribe directly towards the upkeep of Government.

But there is another, and from the stand-point of Your Commissioners, far more important aspect of the question than that of revenue, which is, Will it operate towards the improvement of the natives themselves? We believe it will, for its tendency must be in the direction of making them work. If Papua is only to be considered as a natives' country, in the sense that they are to be allowed to work out their own destiny in their own way, then we have already gone too far, for in giving the coastal tribes a guarantee of peace we have removed the necessity for their being constantly prepared for war, and as a result they are rapidly falling into slothful and evil habits, sure twin companions of idleness in any country. That in the opinion of almost every witness, this picture is not overdrawn, is amply proved by the evidence given before Your Commissioners."

#### THE TARIFF QUESTION.

"The existing war of tariffs between the Commonwealth and Papua is such a glaring inversion of one of the Constitution's basic principles that Your Commissioners would feel no hesitation in recommending its immediate cessation were it not for the fact that the carrying out of a theoretical right might in this instance have the effect of inflicting practical wrong. The problem, they recognise, has to be solved, not on abstract principles, but along the lines of what may be most expedient alike in the interests of Australia and of Papua.

The Commonwealth having taken over the country, and created it into a Territory, we presume that this is the first constitutional step towards admitting it as a State. Meanwhile, Australia has made itself responsible for Papua's internal integrity and outside defence; and, further, now appoints its Lieutenant-Governor and all the

officials necessary for its proper government, and towards the upkeep of the Administration it has every year since it accepted these responsibilities paid £20,000 out of the general revenue.

Should our recommendations be given effect to, it will be necessary, in the interests of development, and in order to later receive a corresponding return, to spend further large sums of Australian money. Yet, in face of this fact the Commonwealth is retarding, if not killing, the development of Papua by placing its products on the same footing (from a Customs standpoint) as those of the outside world.

It may be argued that, owing to the supply of cheap labour, the Papuan settler will be in a position to face this handicap. The evidence of men on the spot does not, however, in the main support this contention, nor must it be forgotten that the cost of pioneering, and the risks inseparable from opening up tropical country, both from a health standpoint and the presence of a large and in many cases as yet uncivilized native population, have to be put against this argument of cheap labour. Further, it has to be remembered that other nations are doing all in their power to push settlement in the islands under their control, and that they, so far from discouraging their colonists by hostile tariffs, are in many cases paying them heavy bonuses. Consequently, we cannot hope to tempt men from purely patriotic motives to ruin themselves, or at best make a bare living, while it is possible under another flag to meet with more favourable treatment.

Three of the industries to which, in our opinion, every encouragement should be given, on the ground that they can be successfully carried on in Papua, viz., coffee, tobacco, and sugar, are all weighted with an import duty, while a number of other articles peculiarly adapted to its soil and climate are placed at a similar disadvantage; while other products, such as sandal wood (which is practically worked out), mangrove bark, and Natural History specimens, which are not likely in themselves to awaken enthusiasm in the minds of intending settlers, have generously been put on the free list."

"Your Commissioners recommend the introduction of a preference Tariff in favour of Papuan products as against those of the outside world, not as a permanent solution of the difficulty, but as a present means of encouraging and fostering settlement until such time as agricultural success and the payment of the rents of Crown lands open up new sources of revenue, and so make it financially sound to substitute for it freedom of trade between Australia and Papua."

#### FINANCIAL SUGGESTIONS.

"In the opinion of Your Commissioners, it is absolutely necessary for the successful development of Papua, and the eventual removal of

it from the category of a burden on the resources of the Commonwealth to that of a self-supporting and prosperous Territory, that a considerable sum of money be made available as required towards the furtherance of this end.

It may be argued that, in view of Papua's large native population, it is not fair to further tax the white ratepayers of Australia, even to bring about such a condition of affairs, but apart from the purely financial aspect of the question already touched on when dealing with the Tariff, Your Commissioners would point out that other considerations have to be faced separated altogether from mere monetary loss or gain. The Commonwealth, having undertaken the responsibility of governing Papua, admittedly under possibly premature pressure from the Imperial Government, it is nevertheless its bounden duty to rule its first and only Territory in such a way as to prove that it is not unworthy of the trust so accepted. In a sense the Commonwealth is on its trial as a governing power, and on the verdict which must soon be pronounced in this connexion will depend issues of the gravest import as regards her own future; for should she give practical assurance to the Imperial Government that she is capable of ruling Papua wisely and well, it is not unreasonable to suppose that other island possessions at present held by Great Britain may be handed over to her charge.

Your Commissioners, feeling that the true destiny of the Commonwealth is to be the paramount power in the Southern Seas, feel that this is not only a consummation to be earnestly sought after, but also that should it become a reality it must inevitably increase the respect in which Australia will be held by outside nations, and will also cause her voice to be listened to with deeper attention in the councils of the Empire."

"In the opinion of Your Commissioners, the sum at present authorized to be paid by the Commonwealth Treasurer in any one year, viz., £20,000, will not be sufficient, even in conjunction with local revenue, to meet all the extra initial cost of administration and development if their recommendations be carried into effect; nor is the present method sufficiently guarded against Parliamentary caprice to lift any systematic attempt at development beyond the realm of possible wreckage. The fact that there is no provision for eventual repayment by the Administration of Papua to the Commonwealth Treasury for sums advanced by it, is also, in the opinion of Your Commissioners, both financially unsound and calculated to encourage non-reproductive expenditure and want of a proper sense of responsibility on the part of the Papua Administration."

## RAILWAY NOTES.

A CONSIDERABLE amount of discussion has been proceeding lately as to the effect of the adoption by the British Standards Committee of certain standard sections of rails. These standards all go in variations of weight of 5 lbs. per yard. There is reason to believe that in future manufacturers will, as a rule, only make and keep rolls for these standard sections, and that governments which continue to require other sections will find a difficulty in obtaining them and will have to pay a considerably enhanced price. There are a number of colonial railways which at present use several sections, none of which correspond to the standards. It will, it would seem, be necessary eventually to adopt the standard sizes. The transition will not really be difficult, as the new sizes can be joined to the old if properly designed fishplates are used. But there is some reluctance at present to admit that changes will be required.

---

The supply of hardwood sleepers is an important business, and the Australasian colonies have issued several handbooks on their forestry products: one published by the Western Australian Government in 1906 may be specially mentioned, as it gives the economic uses of the various timbers. It has always been difficult to decide among the conflicting claims, but a report by Mr. Adams, A.M.I.C.E., printed by the Indian Government, will be found a useful guide. Mr. Adams states that the species recommended by the various Australian governments possess ample strength and compare very favourably with teak; their specific weights are high (65 to 75 lbs. per cubic foot) and they hold the spikes well. The Governments inspect and have a system of "true-to-name" branding. Mr. Adams estimates the life of good "jarrah" sleepers in India at about 18 years, and that a reasonable price for ordinary broad gauge sizes is about 2s. per cubic foot c.i.f. main Indian ports. "Ironbark," coming from New South Wales and Queensland, appears to be equally durable.

---

Steel sleepers are however required in climates which are very hot and moist. These alone are used on the Port Darwin Line, Northern Territory.

Last year the Lagos Government procured a number of reports from railway administrations as to the comparative merits of metal and wood sleepers and cross-ties. On the whole the reports were in favour of wood. In Natal and the F.M.S. for instance, the use of metal sleepers has been discontinued. The men find it easier to keep the lines in order with wood, which, where there is regular traffic, is damaged little by white ants.

The following are some of the particulars of imported sleepers furnished :—

Railways.	Timber.	Cost per cubic foot, c.i.f.	Life in Years.
Beira, Mashonaland ... ..	Yellow Pine	—	15
	Baltic Pine	—	6 to 8
	Jarrah	2/3	15
Cape ... ..	Jarrah	2/2	—
	D'Jatti	2/2	—
	Pine Creosoted	2/4	10 to 13
Ceylon ... ..	Jarrah	2/1	10 to 12
	Baltic Pine	1/9	8 to 9
North Western... ..	Jarrah	1/9	26
	Pine Creosoted	1/6	12

On the whole it seems that traffic wear and tear are responsible for more injury than rot is. The cost of seasoning hardwood is ordinarily not justified, and the general opinion is that preservations are not necessary except in special circumstances.

On the other hand at the Washington International Railway Congress, 1905, the pickling of sleepers was generally recommended. We extract the following :—

“The proper seasoning of sleepers in the open air was generally advocated. On the Paris-Lyons and Mediterranean Railway Company's line, France, creosoted sleepers have been used for many years with excellent results. Creosote (oil of tar) containing from 10 to 15 per cent. of naphthaline and 67 per cent. of phenol is used. The cost per sleeper is about 5s. 4d. Gauge of tracks 4 ft. 8½ in.

The ties are subjected to vacuum in a cylinder and then the creosote is injected under a heavy pressure. The quantity of creosote used varies according to the density of the wood. For oak sleepers 14 lb. to 15 lb. of creosote per sleeper is used, while in the case of beech it is possible to inject from 45 lb. to 50 lb. per sleeper.

Naphthaline is considered beneficial, some of it being added to all creosote which lacks the standard proportion. A considerable discussion arose as to what proportion of naphthaline should be used. The practice of the Paris-Lyons and Mediterranean Railway Company was generally approved.

The Dutch Railways have used the zinc treatment for 15 years, and have got a life of 15 years for beech sleepers."

"The uncovering of sleepers by removing the ballast from the top surface does not appear to diminish the life of the wood even for untreated timber, and it has the advantage of enabling the track inspector to discover at once any defects in the track-fastenings, etc., and to apply a remedy. In some special cases, and especially in warm climates, it may be desirable to cover the timber with ballast.

It is of importance to combine rigid inspection in accepting sleepers with great care in the selection of ballast. The latter must be permeable, must be capable of being well packed and the packing well maintained, and give good adhesion between the sleeper and its seat. As far as this is concerned, the measures which are best for the preservation of the wood are also best for the stiffness of the track.

In order to prevent deterioration of the ballast, and at the same time help to preserve the sleepers, the careful drainage of the road-bed cannot be too carefully insisted upon, in order to ensure that water may run off properly.

To prevent mechanical wear of the rails upon the sleepers it is of the utmost importance to fasten the rail to the sleeper in such a way as to prevent as much as possible all vertical, lateral, and horizontal movement between the two. The old American method of using spikes only will not suffice. Lag screws seem to be necessary to obtain satisfactory results."

A valuable report on this congress, dealing with locomotive and many other railway questions has recently been issued in New Zealand in a Parliamentary Paper, 1—D.4. (1906).

In connection with the foregoing we append an extract from a letter sent by the Director of Fortifications and Works to General Officers Commanding Stations Abroad :—

"It has been found that a treatment of 'blue oil' protects wood against the attack of white ants besides acting as a preservative generally.

The specification governing the supply of 'blue oil' to the War Department contains the following provisions :—

- (a.) The oil to be a shale product.
- (b.) Its specific gravity (at 60° F.) to be 0.873 to 0.883.
- (c.) Its flashing temperature to be not lower than 275 F. (close test.)

An extract from the Report of a Trial of the 'blue oil' treatment of wood as a protective measure against the white ant is appended hereto.

The boxes treated with blue oil have been placed during the wet season in various positions in the open, and there is no sign

of their having been attacked by white ants, although a quantity of timber in close proximity to them was considerably damaged by these insects.

The blue oil has also acted as a preservative to the wood, which shows no sign of rotting from the extreme damp to which it has been exposed.

One of the ammunition boxes was lent to the O. C. West African Frontier Force, for trial in his magazine, which is infested with white ants. On returning the box, he stated :--

‘Herewith ammunition box and a piece of wood. Both have been lying in the same place ever since you lent me the box. When I placed the box in my magazine, this wood and the ground in close proximity was swarming with white ants. I placed the box under the wood, between it and the ground. Since then the ants have disappeared from the wood and the ground referred to ; the box is not touched.’”

We learn from the War Office that the price of blue oil used in this treatment is 4d. per gallon. The best plan is to soak the material to be rendered proof in a tank containing the blue oil for a day or two.

---

**Notes on West African Timber with reference to its adaptability for Railway Work. (S. Nig. Public Works Department.)**

The points of reference are :—

- (a.) Can native hard wood timbers in West Africa be used for Railway work, bridging, sleepers, etc., as they are in India, where the white ant has also to be contended with ?
- (b.) The cost of conversion of the timber.

With reference to (a) timber can be found in the West African forests suitable for all classes of Railway work, where wood can be used, e.g., bridgework, sleepers, carriage work, station buildings.

There is a variety of timbers known to the natives which resist the white ant. These are used for verandah posts for their palaver shed, for house building, for doors, and for the simple articles of furniture that are made by the natives. There is at present a difficulty about the names for the various timbers thus used. The native names are different in each district, and on account of the timber thus used being as a rule very heavy and non-floatable, little attempt has been made by the owners of concessions to export them.

**Bridgework.**

I would not recommend native timber for permanent bridges in West Africa for the following reasons :--

- (a.) Too little is yet known about the timber.
- (b.) The timbers which appear to be suitable are very hard and heavy, entailing great expense in handling, conversion, and for transport.
- (c.) The skilled native labour is very inferior and difficulty would be found in getting the work properly put together. The first cost of such erections in West Africa is very heavy, and it pays in the end to put down permanent work from the beginning.

**Sleepers.**

There would be no difficulty about finding suitable timbers for railway sleepers in West Africa, provided the wood is impregnated with creosote or other reliable preservative.

My experience with the white ant is that ordinary sound native timbers are not touched until decay sets in. I have found that ordinary Mangrove posts if charred at the bottom, and coated with Stockholm tar will last in the ground for many years, whereas if the posts are used without such precautions they become a prey to the white ant in two or three years.

At Calabar I had samples of native timber, some of them soft and porous, coated with a preservative called "Stop-rot". The samples thus coated were buried in the ground and left for six months. When examined at the end of the six months there was no trace that the white ant had touched them, whilst in some cases the pegs which marked the places where the samples had been deposited, and which were uncoated with the preservative were nearly wholly destroyed by white ants.

In connection with Pitch Pine, which is said to be ant proof, I have often found that when the timber shewed signs of decay, the white ants were all over it. On the other hand I have never had any trouble with creosoted Pitch Pine from the white ant. In damp and exposed places creosoted Pitch Pine has three or four times the life of the same timber in its natural state.

Provided that the timber is impregnated with creosote or other reliable preservative there is, I think, but little reason to doubt that durable railway sleepers could be obtained from the Mangrove.

Mahogany and other floatable woods could also thus be used. On the Niger, in the vicinity of the Alabela creek, there are forests of an excellent timber of the sabine species. It is like Mahogany but is much heavier and tougher. This is the timber mostly converted at the Onitsha sawmill and is excellent for building and joinery

purposes. This timber will not float but is not difficult to saw or plane. There are other very hard and durable timbers found near Onitsha, called "Orachi" and "Ogbi" by the natives. Both are very heavy and hard to saw. "Orachi" appeared to me to be the strongest timber I have seen in the country. "Ogbi" is a red timber like the heart timber of the Mangrove, quite as hard and as durable. It splits very easily and is an excellent firewood. It is very plentiful in all the rivers in the reaches above the Mangrove belt. These timbers would make durable sleepers without being treated with a preservative, but I fear the cost of handling and sawing them would make the cost of the sleepers prohibitive.

The well-known "Oroko" is one of the best timbers in the African forests but it is not very plentiful; is not found near the river banks; is isolated in its growth, and is much too valuable for furniture and joinery to be used for railway sleepers.

The railway department in Lagos have some experience with sleepers from native timber. At present there is an European called Moody who makes a living at pit-sawing timber for the Lagos Railway. It is mostly "Oroko" which he saws and this timber is used for sleepers for points and crossings.

Mr. Cowan, Chief Inspecting Agent for Messrs. Miller Brother and Company, told me that he had on one of the concessions belonging to his firm, in the Benin country, a timber which appeared suitable for railway sleepers, and that if there was a demand for them he thought his firm was prepared to send out sawing plant to have the timber converted on the spot. The timber in question does not float and the only practicable method of dealing with it is to have it converted in the forest so that it can be possible for the sleepers to be carried to the waterside by porters and from thence to the steamers in the Benin Rivers in canoes.

### Carriage Work.

"Orachi" could be recommended for frames, and "Oroko" and Mahogany for panelling and fittings.

### Station Buildings.

There are many hard woods suitable for posts and framing and "Oroko" and Mahogany are suitable for joinery and furniture.

With reference to (b), the cost of conversion of the timber, there should be little difficulty in obtaining sawn timber at 2s. 6d. per cubic foot, provided that suitable plant is put down and the right kind of men are obtained to handle the timber and work the plant.

There are two Government saw-mills in Southern Nigeria, one at Onitsha on the Niger and the other at Elehetem, on the Cross River, about 40 miles up river from Calabar.

Until lately the working of the timber at Onitsha has been somewhat hampered for lack of transport for bringing the logs down from the Alabela Creek, and the cost of conversion was somewhat high on that account.

The conditions were more favourable at Elehetem and we were able there to fell timber in the vicinity of the mill and convert it for 2s. 6d. per cubic foot. This included all upkeep and working expenses, including European supervision but exclusive of any allowance for depreciation of plant.

At Lagos, Messrs. McIver and Company have a sawmill and sell the best native timbers, "Oroko" and Mahogany, sawn into boards and planks for from 3s. 6d. to 4s. per cubic foot. This, I understand, ensures a good working profit in spite of the fact that, owing to there being little timber near Lagos, the cost of the logs by the time they reach the mill is considerable.

Before I left Lagos, Moody, the European already mentioned, offered to supply sawn "Oroko," at Iddo Wharf, to the Lagos Public Works Department at 3s. 6d. per cubic foot. The timber is sawn at about 100 miles up country and Moody's offer included the cost of railway freights.

Native sawyers can make a good living at pit-sawing Mahogany and "Oroko," and selling at 2s. per cubic foot. Supplies from this source are, however, very unreliable as the native has little ambition to work at this calling. The work is too hard for him to persevere at.

It can, however, hardly be considered that the results as to the cost of conversion as indicated above are representative of what could be attained if an organised effort was made to produce converted timber on a large scale such as would be required for railway work.

The Government sawmills mentioned are not on a large scale and were put down as a tentative effort to obtain sound native timber for the manufacture of furniture and joinery and to obviate the high freights of such articles when obtained from England. The limited amount of European supervision available had to be considered and also that the power provided could be used for other purposes. At Onitsha the installation consists of brick-making machinery, wood-working machinery in addition to the sawing machine, and the engine power is also used for working a cable tramway. On the Cross River power is provided for brick making as well as saw milling.

There is one European in charge at each place and, having to give his attention to other work than the sawing alone, it necessarily follows that the results cannot be the same as if the conversion of timber and nothing else had to be attended to.

In the case of timber being required on a large scale it would be necessary to put down the plant in the middle of the forest, to have

portable plant, and to employ men who have been trained for such work from their youth.

There should be as little handling of the heavy logs as possible. Everything has to be done by manual labour and the timber should, as near the spot as possible where it is felled, be converted into the smaller pieces required for the work in which it is to be used.

It is only by such a method that the major cost in dealing with the timber, viz., that of transport, can be reduced to the minimum.

If Mangrove was being worked, it would, of course, be impossible to put down the sawmill in the swamp.

In this case, however, there would be no forestry restrictions as to the size of the trees to be felled, and trees would be selected which would saw up into two sleepers in section, or about 15 to 18 inches in diameter near the bottom. The trees would be cross-cut into sleeper lengths in the swamp and there would not then be any difficulty in getting the pieces into canoes for transport to the site of the mill."

### The Management of Government Railways.

An interesting report on this subject by a Commission of which Dr. T. W. Smartt, Commissioner of Public Works, was Chairman, has been presented to the Cape Parliament. The most important recommendations are contained in the paragraphs printed below:—

"3. The Commission has carefully considered the important subject committed to it, and has compared, as far as possible, the different systems of control of Railways adopted in other countries. It is impressed with the necessity of removing as far as possible the Management of the Railways from the influence of Party politics, without at the same time lessening the legitimate right of control which must be exercised by Parliament as the representatives of the taxpayers; and with this object submits the following recommendations:—

#### *Formation of Advisory Board.*

4. That a Railway Board be established, to advise the Minister entrusted with the control and direction of the Railways in all important matters of policy, such Board to consist of:—

(a.) The Commissioner of Public Works or the Minister for the time being entrusted with the administration of the Railway Department, who shall be Chairman.

(b.) Four Members of Parliament, representing the Legislature, selected in accordance with the usual procedure adopted for appointing Select Committees.

(c.) Two Members (who may or may not be Members of Parliament) appointed by the Governor from a list of names to be submitted by the various Chambers of Commerce of the Colony, consisting of not more than six names, the names being selected for submission in such manner as may be determined by regulations promulgated under due authority.

(d.) Two Members (who may or may not be Members of Parliament) representing the Farming interest, appointed by the Governor.

(e.) A Secretary to the Board should be appointed.

*Terms and Conditions of Appointment.*

6. That the term of office of the Members of the Board be as follows:—

(a.) The Minister: during his term of office.

(b.) The four Members of Parliament: until a new Parliament is called together and its Representatives appointed, provided they have not ceased to be Members of Parliament before its dissolution: provided further that in the case of a vacancy occurring it shall be competent for the Governor to appoint a Member of Parliament to fill such vacancy *ad interim*.

(c.) and (d.) The four Members to be appointed by the Governor: a period of not less than three and not more than five years from the day of the publication of the notice of their appointment and at the expiry of the periods set forth the respective Members shall go out of office and a like number of Members shall be appointed in their places: provided that a Member going out of office shall be eligible for re-appointment if otherwise qualified: and provided further that, if at the expiration of the term of office of any Member of the Board a new Member has not been appointed, the retiring Member shall retain his seat and vote on the Board until his successor has been duly appointed.

9. That the Members of the Board appointed under Section 4, (b), (c) and (d), be paid:—

(a.) £2. 2s. per diem in respect of Members resident at or near the place of meeting, and

(b.) £3. 3s. per diem in respect of Members who are not resident at or near the place of meeting;

the payments to be made substantially on the lines adopted in regard to the payment of Members of Parliament, provided that in no one year a greater amount than £2,000 be disbursed in payment

of fees; and that where Railway communication does not exist between a Member's place of residence and the place of meeting, such payments as are necessarily made for road transport be refunded to him.

*Functions of the Board.*

10. That the Minister consult the Board, and that it be the duty of the Board to advise upon the following matters:—

(a.) The general policy of Railway Management in the Cape Colony, and the relations of the Cape Colonial to other Railways in South Africa.

(b.) Fixing rates and fares for all classes of traffic conveyed over the Cape Government Railways.

(c.) The Estimates to be submitted to Parliament.

(d.) All Bills providing for funds for Railway purposes.

(e.) The expenditure of any sum of money exceeding £5,000 in respect of any one work or service, for the purposes and within the sums from time to time appropriated by Parliament for the working, maintenance, or betterment of the Railways.

(f.) All expenditure proposed to be incurred on emergency works or services for which provision has not been made by Parliament.

(g.) All Contracts and Tenders of a value exceeding £5,000 proposed to be entered into by the Department.

(h.) Any change in the organization of the Department, or any change involving the abolition or creation of offices over £400 salary.

(i.) Alterations in the scale of salaries, wages, or hours of employment.

(j.) Alterations in the train service, both goods and passenger.

(k.) Measures of retrenchment of expenditure.

11. It is expressly recommended that the Board confine its labours mainly to large questions of policy, leaving the carrying out of all details of management to the Executive Officers of the Railway Department.

12. It shall be competent for the Board to require the attendance of any Officer of the Railway Department at any of its sittings; but, in order that there may be a minimum of interference in the actual management of the Railways, any request for information should be made through the Secretary to the General Manager.

*New Railways.*

13. (a.) That no proposal for a new line be presented to Parliament unless it is accompanied by a full and exhaustive report by the Board, setting forth, in detail, the capital expenditure to be incurred, estimates of the cost of working, of the probable volume of traffic to be influenced, and of the revenue likely to be earned, and also the probable effect on the traffic and earnings of existing lines which would be affected, and generally the Board should take such measures and procure such information as may enable it to inform or satisfy Parliament as to the expediency or otherwise of carrying out the extension in question. For this purpose the Board should have power to call for witnesses and papers.

(b.) All proposals for the construction of new lines must emanate from the Government.

*Railways proposed to be subsidised or acquired.*

14. That the conditions set forth in Section 13 apply equally in regard to lines in respect of which it is proposed to ask Parliament to give aid by way of subsidy; or which it is proposed the State should acquire.

*Local Contributions to New Lines.*

15. That it be competent for the Board to recommend that the construction of new lines shall be conditional on contributions from the inhabitants and landowners specially benefiting by the construction of such line towards:—

- (a.) Cost of construction;
- (b.) Maintenance and working;
- (c.) Interest on capital;

in terms of Act 33 of 1906.

*General.*

16. That where Parliament authorises, contrary to the advice of the Board, the construction of a new line which does not produce revenue sufficient to pay interest on cost of construction and cost of working and maintenance of the said line, the annual loss resulting be notified by the Board to the Auditor-General, who shall certify as to the correctness of the loss, such loss to be provided by Parliament in the annual Appropriation Act.

17. That in any case in which the Minister departs from the advice of the Board he shall record, in writing, his reasons for his action, which shall be entered upon the Minutes, and laid before Parliament at its next ensuing session.

18. That an Annual Report by the Board be laid before both Houses of Parliament within three weeks of the opening of each session.

19. That a measure be introduced in the next session of Parliament giving effect to the recommendations which have been set out broadly in this report."

In connection with these recommendations it may be of interest to point out that, in all the Australian states, the management of Government railways has been removed from political control and vested in a Commission or Board of Commissioners independent of party.

### Electric Lighting of Trains.

The following Report has been received from one of the Consulting Engineers :—

"There have been a good many different systems of electric lighting invented and tried, and one or two of them which are now in an experimental stage give promise of fair results, but up to the present the only system which has answered in practical working is Messrs. Stone's, and that has been largely used both in this country and on Colonial railways. The cost of electric lighting is, however, high, and judging as closely as we can from trains which have been lighted for other Colonial railways, we estimate that the cost of lighting one of your trains of six coaches would be £1,000; with this information you will be able to decide whether the advantage gained is worth the outlay. In the Stone's system the electricity is generated by a dynamo which is driven by a strap from the axle, and it is a mechanical defect in this system which has ensured its success, the slipping of the strap acting as a regulator. No system of direct train lighting by an engine and dynamo carried in the van has been successful. The Cape Authorities spent some thousands of pounds in endeavouring to perfect a system, but in the end they came back to the Stone's system, the others having proved failures."

### Ceylon Government Railway—Report of 1905.

The receipts during 1905 amounted to £646,043, an increase of over 53,000 on the results of 1904, and the expenses to £347,126, an increase of £11,058. Profit on working is thus £298,917, nearly 6 per cent. on the capital cost of rather over £5,000,000. After making allowance for the amount actually paid for interest and sinking fund, the railway thus makes a clear contribution of £172,800 to the general revenue of the Colony.

The receipts per train mile were Rs. 5·58 or Rs. 0·11 lower than for 1904. The lower rate is attributed to the increased open mileage consequent on the opening of the northern section, and to the pilgrim traffic at low rates run on that line.

Working expenses at Rs. 3 are Rs. 0·22 per train mile lower. Almost the entire credit for this reduction is due to the Locomotive Department, which shows a reduction of Rs. 0·15 per train mile. Although train mileage increased 175,000 miles, the expenses of this department were actually less than in 1904 by, roughly, £1,500.

Owing to an abnormal fall of rain, a portion of an embankment subsided, and an engine fell into the breach: two firemen were killed. No other serious mishap occurred.

It has been arranged that Mr. Oliver should enquire into the grading and curvature of the proposed Ratnapura extension, and furnish a fresh estimate of the cost of construction.

### WEST AFRICAN RAILWAYS.

The following statistical abstract shows the results of the working of the West African Railways for the latest period of 12 months for which complete figures are at present available:—

Colony.	12 Months ended.	Miles open.	Receipts.		Expenditure.	
			£	s. d.	£	s. d.
S. Nigeria (Lagos Railway)	Dec. 31, 1906	126½	72,649	2 2	56,775	13 2
Sierra Leone ... ..	June 30, 1906	225½	58,927	8 8½	52,834	1 9
Gold Coast ... ..	Dec. 31, 1906	168	171,918	5 1	77,266	14 10

### Southern Nigeria Lagos Railway.

During 1905 and the greater portion of the year 1906 the Lagos Railway extended inland from Lagos to Ibadan, a distance of 125½ miles. A further section of 62 miles to Oshogbo was opened for traffic on the 20th of April, 1907. The construction of a further section, namely, from Oshogbo to Ilorin, a distance of 61 miles, has already been commenced and should be completed within the next 12 months. By April or May, 1908, therefore a traveller will be able to take train at Lagos and travel by rail into the interior, a distance of 250 miles. Beyond Ilorin a satisfactory trace has been obtained, and is now being located and staked out for a further extension of the railway from Ilorin to Jebba, the point at which it seems certain the railway will eventually cross the River Niger.

North of the river railway activity has already commenced, and a railway reconnaissance survey from Jebba to Zungeru, the present capital of Northern Nigeria, has been carried out. A sign of the vigorous manner in which the problem of railway communication of

Northern Nigeria is being attacked is the appointment of such a railway expert as Sir Percy Girouard as the High Commissioner of the Protectorate.

### Gold Coast.

No railway construction has been undertaken in the Colony since 1903, when railhead reached Kumasi, a distance of 168 miles from Sekondi. The attention of the Government has therefore been concentrated on the improvement and development of the existing line and the satisfactory results of their endeavours are now becoming abundantly evident. Notwithstanding a reduction in the railway rates which took place in July, 1905, the receipts have shown a steady growth, and during the year 1906 reached the record total of £171,918, a sum which after meeting all working expenses leaves a margin which would be sufficient to pay interest at the rate of  $4\frac{1}{2}$  per cent. on the capital outlay. With regard to the future construction of a branch from Tarkwa on the main line to Prestea, a distance of about 20 miles, is contemplated. A survey has also been undertaken for a new railway with its terminus at Accra, which would serve the eastern portion of the Colony, and a trace has been obtained and will be located and staked out for a distance of about 40 miles inland.

### Sierra Leone.

The railway to Baiima was completed towards the end of 1905, and the latest figures available—to June 30th, 1906—show that the line which has a mileage of 226 miles is paying its way with a comfortable margin. The question of the railway rates is receiving the close attention of the Government. The construction of light branch or feeder lines to connect with the main line and thus to extend the trading area influenced by the line is under consideration.

## MEDICAL NOTES.

### Medical Expeditions to Central Africa.

CENTRAL AFRICA is shortly to be visited by two expeditions, organized by the Liverpool School of Tropical Medicine: one will study sleeping sickness, the other blackwater fever.

For some time past apprehension has been felt that sleeping sickness may spread into the British territories in Central Africa; it has, as is well known, devastated Uganda, it is prevalent also in the eastern portion of the Congo Free State. Consequently, the trade routes north to south and west to east, must equally be guarded. The sleeping sickness expedition will, therefore, have a dual object: first, it will study the questions still undecided as to the origin and treatment of the disease; secondly, it will advise what steps can be taken to protect Rhodesia and the British Central Africa Protectorate. Its attention will be concentrated especially on the Anglo-German and Anglo-Congolese borders. It will visit the head waters of the Kafue, the River Luapula, Lakes Bangweolo and Mweru, and subsequently it will turn east and traverse the country between Lakes Tanganyika and Nyassa.

The two doctors composing the expedition are Dr. A. Kinghorn and Mr. Montgomery. They left England for Kalomo, N.W. Rhodesia, on May 4th.

Both the British South Africa Company and the Government of the British Central Africa Protectorate, are contributing to the expenses of the expedition, by offering free transport in their territories to the doctors engaged upon it. In addition the Government of the British Central Africa Protectorate is contributing the sum of £100 to the cost of the doctors' passages.

The arrangements for the despatch of the blackwater fever expedition are not yet so far advanced. It will consist of two members, and its headquarters will be in the British Central Africa Protectorate, either at Zomba or Blantyre. The members of this expedition will try to keep in touch to some extent with the doctors engaged in investigating sleeping sickness, but it is too early to say how far this will be feasible.

The Governments of the three British Protectorates, East Africa, Uganda, and Central Africa, are each contributing the sum of £250 to the expenses of the blackwater fever expedition.

**Report of the Advisory Committee for the Tropical Diseases Research Fund for the year 1906.** Presented to both Houses of Parliament by command of His Majesty. [Cd. 3306.]

This is the first report of an Advisory Committee constituted by Mr. Lyttelton in July, 1904, with Sir West Ridgeway as Chairman. The revenue of the Fund in 1906, amounting to £3,000, was derived from contributions from the Imperial Government, the Government of India, various Colonial Governments, and the Rhodes Trustees. Of this amount £2,750 has been expended in grants to the London and Liverpool Schools of Tropical Medicine, the University of London and the Royal Society, leaving a balance in hand of £250. The grant to the London School has been devoted to the payment of the salaries of a teacher and investigator of protozoology, and a teacher and investigator of helminthology, and to the provision of suitable apparatus. Special attention is drawn in the report to the valuable investigation into Dracontiasis (a disease widely prevalent among native races in tropical Africa, which has twice during the last five years broken out in epidemic form among the West African Frontier Force), by the lecturer in Helminthology. At the Liverpool School, lectureships in economic entomology and parasitology, and in tropical medicine, have been established, both lecturers being required to devote their spare time to research. A Professorship of Protozoology has been established at London University; and the grant to the Royal Society has been employed in the research into sleeping sickness. Systematic arrangements have been made, and are now in operation, for the instruction in tropical medicine of Government medical officers in tropical Colonies, and medical laboratories have been established at Singapore, Colombo, Kuala Lumpur, Port-of-Spain, Hong Kong, Demerara and Mauritius. The Appendices to the Report contain correspondence with the Colonial Governments on the subject of the training of medical officers in research work, and reports upon researches into tropical diseases by the London and Liverpool Schools of Tropical Medicine and the Royal Society.

---

The Foreign Office has issued a Report (Miscellaneous Series, No. 656) by Consul-General Sir Cecil Hertslet on "Precautions taken in Belgium to combat Ankylostomiasis." The report should be of interest to medical officers in tropical Colonies, where the disease is widely prevalent.

---

The Government of Barbados has issued a report by Dr. C. J. Manning, Superintendent of the Lunatic Asylum in that Colony,

on certain cases of *Psilosis Pigmentaria* or Pellagra, which have recently occurred in the Asylum. Dr. Manning considers that the cause of the disease has not yet been definitely determined, but that it is, "without shadow of doubt, communicable," and he strongly recommends the isolation of all patients in a Central Home. The report is accompanied by a bibliography, a large proportion of the works mentioned emanating from Italy, where the disease is prevalent.

---

**Health and Sanitation on the West Coast of Africa.** (An address to the African Trade Section of the Liverpool Chamber of Commerce, by W. S. PROUT, C.M.G., M.B.)

Dr. Prout in an eloquent address bore testimony to the great improvement in sanitary conditions in the last twenty years, and urged the appointment of a Director of the West African Medical Staff, and of a West African Medical Council to sit in London.

We append some interesting extracts:—

**MOSQUITO-PROOF ROOM.**

"Another method of preventing mosquitoes is that to which I have just referred, a *Mosquito-proof room*. I have used one for over five years, and I can strongly advise its adoption from personal experience. It is not expensive, and it is a simple matter to have light frames fitted with brass wire gauze fixed to the windows, and swing gauze frames to the doors. It is less close than the mosquito net, of which some people complain, and it is a wonderful comfort to be able to read and write inside it after dinner. Where individuals have to reside in strongly infected localities, it is a great advantage to make the whole house mosquito proof, and I show you here photographs of one or two which were constructed for the railway staff at Cline town some years ago. The railway staff resident there used to have a much higher percentage suffering from malarial fever than the rest of the Government staff put together, and it has been found that the health of those who live in the mosquito-proof houses has much improved. For the outlying isolated factories, especially when situated in the neighbourhood of native towns, it is a precaution it would pay the firms to adopt."

**THE USE OF QUININE.**

"A second most important thing is the *use of Quinine* as a preventive, and it is one which I have recommended for many years. When I first went out, I took quinine regularly, and the longer I remained on the Coast, the more convinced I was that the habitual use of quinine was a most efficient preventive of malaria. Of recent years all Government officers, before going on leave, have had

to be examined by a medical officer, and a report sent in which had to pass through my hands. I made a point of getting my medical officers to note whether the individual had been in the habit of taking quinine regularly or not, and it was very striking to observe how frequently, in the case of those who took quinine regularly, the report stated, "has not been on the sick list during his present term of residence," as compared with the frequent illnesses of those who did not take quinine. This is not the place, nor have I the time, to enter into a discussion of some objections which have been raised against the habitual use of quinine, but you may take it from me that it is harmless—that its use does *not* imply that if you do get a dose of fever you will have to take a great deal more—and that taking it regularly will *prevent* blackwater fever by preventing that condition which predisposes to that disease. I have not seen a single case of blackwater fever in a man who has taken quinine regularly as a preventive. I take up a very strong position on this point. I consider that it should be insisted on that all newcomers should take quinine regularly, and that this should be made a condition of their appointment, and I suggest that quinine should be supplied free by all firms trading on the Coast. If any man refuses to take quinine, or is unable from some idiosyncrasy—but this is very rare—to do so, he should be regarded as medically unfitted for the Coast, and should be dealt with accordingly."

#### SANITATION.

"There is another source of danger in Freetown, namely, the three perennial streams which run through it. There is no doubt in my mind that it is these streams which bridge over the long gap between the end of one rainy season and the beginning of the next, and provide for the propagation of the mosquito. The water-courses used to be flat, irregular and full of pools, in all of which mosquito larvæ could be found. I am glad to say, however, that His Excellency, Mr. Probyn, who has shown a great and active interest in sanitation, took this matter in hand, and a system of canalising the water-courses was carried out. Along the centre of each stream a small cement canal has been built, which is sufficiently large to carry off the water during the dry season. I show you a photograph of a gully which has been dealt with, and I may state that in one stream, where during the previous dry season there were hundreds of pools containing larvæ, during the last dry season not a single pool could be found along its course. During the rains, the flow of water is sufficient to prevent mosquitoes breeding in these gullies. In the photo which I have shown you, for example, the water will be from three to six feet deep, and with a current sufficient to sweep an individual off his feet. Of course with such a flow, repairs to these gutters will have to be done every year, but I look upon this work

as one of the most important anti-mosquito measures yet undertaken in Freetown. In Hong Kong, with a somewhat similar configuration, Sir Matthew Nathan informs me that the canalisation of the nullahs, or water-courses, has been fraught with the greatest benefit to health."

"It is then, to the younger generation that we must look for progress. In 1905 I gave a series of lectures on elementary hygiene and sanitation, which were very well attended. At the end of the course an examination was held, and a number of prizes were offered, and I was astonished at the intelligence which many of the answers showed, and the grasp of the subject which was exhibited.

The scheme received the most enthusiastic support from the Governor, Mr. Probyn, who has since developed it, and elementary hygiene is now being taught in the schools of Sierra Leone, and a Government grant has been given, dependent on the position which the different schools take in the examination. In time, therefore, we shall have a number of young people growing up acquainted with the elementary principles of sanitation, who will appreciate the advantages of healthy surroundings, and to whom we can look for assistance in improving the local conditions of the various towns on the West Coast."

## STAMPS.

PRACTICALLY all Crown Colony stamps are manufactured in England, and a colonial officer has frequently to settle points relating to them without having, in the Colony, the means of ascertaining the technical processes. Some particulars may therefore be useful.

We propose to begin with a general survey of the subject, then to follow the different processes, from the making of the paper to the packing of the stamps, and finally to summarise any conclusions which we think may be deduced from the facts which have been set out. At the outset we will endeavour to place ourselves in the position of an officer called upon to arrange for a new issue of stamps.

There are three courses open, *i.e.*, to adopt—

- (1.) The head of His Majesty the King.
- (2.) The arms of the Colony.
- (3.) Designs illustrating the scenery, fauna, flora, or industries of the Colony.

When one of the above three courses has been decided upon, the next point which arises is whether the stamps shall be printed by the so-called copper plate or the surface printing method.

The former is the older way, and that by which the most artistically successful results have been obtained, as anyone who turns over the pages of a stamp album will at once perceive. The necessary plates are also cheaper, although the actual printing is a little more expensive, and, where large numbers of stamps of the same duty are required, much more expensive than the surface method.

The most important difference between the two kinds of plates is that, in case of the copper-plate the ink enters the sunk portions of the plate, and is completely cleaned away from the surface of the plate before printing takes place. In the case of the surface printing plate, which is really a stereo, the ink lies on the raised, engraved portion of the plate, and never touches the flat surface.

From this it follows that a very different kind of ink must be used for the copper plate. It must be of a thick, oily nature, and the paper on which the printing takes place must be wetted, so that

it may sink well into and extract all the ink from the lines engraved on the plate. The ink used for surface printing is, on the other hand, of a thinner kind, and the paper is used dry.

In ordinary copper-plate printing the plate, which is of steel, is itself engraved, every line being put in by hand, and a really artistic result is thus produced; but this method is not used in the manufacture of stamp plates, as not only would the expense be very great, but it would be impossible for any engraver to produce several absolutely identical engravings. Instead of directly engraving the plate a steel roll is pressed, when soft, upon the original engraving, which is of course of the size of a single stamp. When the roll has been hardened, it is in turn pressed 60 or 120 times on a sheet of soft steel, and this when hardened becomes the working plate, and according to the number of impressions which it will produce at one time, it is called 60 or 120 set.

The surface printing plate is made somewhat differently, but the details are a trade secret. The die is engraved in the same way as for copper-plate printing and the printing plate is prepared in much the same way.

There is only one Colony, *i.e.*, Falkland Islands, which has adopted a copper-plate design showing the head of H.M. the King. The more usual plan is to use the surface process and to print the body of the stamp from a keyplate bearing the King's Head and the words "Postage" or "Postage and Revenue," which is shared by all the Colonies and can be set up either 120 set or 240 set according to the set of the overprint plates which bear only the name of the Colony and the duty, and one of which is therefore required for each duty.

Colonies which issue large numbers of stamps of certain values often find it worth while to go to the expense of a special plate for each of such duties which prints the whole of the stamp at one operation and naturally therefore at a very much cheaper rate. Of course, the special plate costs a good deal more money than the overprint plate.

When pictorial designs are adopted each method of printing is freely employed. But there are two objections to printing stamps of high values by the copper-plate process, particularly if they are to be used for revenue as well as postal purposes:—

(1.) Such stamps are more easily forged than surface printed stamps.

(2.) As the paper has to be wet when printed on it is necessary to use ink of very stable character, with the consequence that ordinary ink cancellations can be removed without damaging the stamp.

Good examples of the different effects of the two processes in the case of views are the Dominica stamps (surface process) and the new

Brunei stamps (copper plate), and in the case of Colonial arms the Mauritius stamps (surface process) may be compared with those of Turks Islands (copper plate).

If it is decided to have stamps printed by the surface process it is necessary to decide whether such stamps shall be printed in singly or in doubly fugitive ink. This depends, for the reasons stated below, on whether the stamps are intended for use for postage only, or also for revenue purposes, and so are likely to be cancelled by ordinary writing ink.

The term "singly fugitive" ink means that if any attempt is made to remove a cancellation which has been applied by means of ordinary cancelling ink the colour of the stamp will suffer. "Doubly fugitive" ink is so sensitive that even if the stamp is cancelled with ordinary writing ink it was thought, until recently, to be impossible to remove the mark without injuring the appearance of the stamp. The duel between the fraudulent cleaner of stamps and the manufacturer is however similar to that between projectile and armour plate, and as will be seen below it is now necessary to make the surface of the stamp still more sensitive to manipulation.

The disadvantage of doubly fugitive ink is that it can only be obtained in three colours, *i.e.*, green, purple, and black. The existing universal keyplate (one example of which is to be seen in the Sierra Leone stamps) is almost the size of the whole stamp, narrow strips at top and bottom being left for the duty and the name of the Colony. It is of course unnecessary to print these strips in doubly fugitive ink, as they may easily escape cancellation altogether, but the body of the stamp must be printed in doubly fugitive ink. There are some objections to the use of black, so that only purple and green can in practice be used where the body of the stamp is of such extent as it is in the present universal keyplate.

If the bodies of all the stamps of a series are in either purple or green, it is extremely difficult to prevent confusion, even if a certain number of stamps are printed in doubly fugitive colours on red, blue, green or yellow paper. Printing on red and blue paper has, moreover, a very bad effect on the appearance of the stamp.

There is another disadvantage in having the bodies of many stamps in the same colour, *i.e.*, the possibility of fraudulent manipulation by substituting slips of high values for the low values.

This difficulty will be overcome in new issues of stamps bearing the King's Head, as the manufacturers are preparing a new keyplate showing only a central oval containing the King's Head, and this will be used with overprint plates bearing not only the name of the Colony and the duty, but also the words "Postage and Revenue," the whole of which will therefore be in one colour.

In the case of existing sets of stamps, the possibility of manipulation of the value can only be prevented by either purchasing a fresh set of duty plates for use with the keyplate mentioned in the last paragraph or by extending the use of singly fugitive ink further than the  $\frac{1}{2}$ d., 1d. and  $2\frac{1}{2}$ d. values, to which it is fairly generally admitted, possibly as far as 5d., and in this way diminishing the number of stamps which have to be printed in purple and green. The probability that anyone would find it worth his while to remove the cancellation from large numbers of stamps of comparatively low value, is one which each Colonial Government can alone estimate for itself. The regulations affecting the sale of stamps and the local labour conditions would probably be the main factors in the question, the danger being greater in countries inhabited by a clever population with a low standard of comfort.

The copper-plate process is not very suitable for printing stamps in two colours owing to the necessity of wetting the paper for each printing. Each time the paper is wetted it alters in size sufficiently to make it very difficult to make the second impression exactly fit the first. The result of this is that the cost of printing in two colours is considerably higher than that of printing in one colour and it will be generally found to be more economical in the long run to order a separate plate for each value, but this necessitates each stamp being printed in a single colour.

There is one class of stamp for which the copper-plate process is specially adapted. This is a series of stamps such as that of the Tonga Islands in which several designs are used.

It has recently been found that even the use of doubly fugitive ink by itself is an insufficient protection against cleaning, and all stamps which are printed in doubly fugitive ink are now further safeguarded by a special treatment of the paper before printing. The slightest tampering with stamps printed in doubly fugitive ink on paper so treated infallibly ruins the appearance of the stamp.

It is well known that all stamps of the Crown Colonies and Protectorates are printed on specially made paper, with a watermark showing a succession of devices, composed of a Crown and the letters C.A. standing for "Crown Agents." Each stamp shows portions of several of these designs. This paper was first introduced about four years ago in substitution for a paper which was intended to show one device on each stamp, but which was found not to fit all stamps, so that in some two nearly entire watermarks were found, and in others hardly any at all. The watermark is of course only a last resort in testing the genuineness of a stamp which has been affixed to a postal packet or document, as it is impossible to see it except by removing the stamp from the envelope, and looking at the back. A great advantage in using such paper is the check upon the production

of stamps, as the paper given out for each order will only enable a fixed number of stamps to be printed.

Before proceeding to the consecutive description of the processes of manufacture, the question of the colours of the stamps may be referred to. The Washington Convention recommended that every country in the Postal Union should adopt green, red and blue colours for the respective values of  $\frac{1}{2}$ d., 1d., and  $2\frac{1}{2}$ d., and their equivalents in other currencies, and the Rome Convention has now made these colours compulsory from the 1st October of this year. The colours of the other values have, until now, been chosen in the main arbitrarily, the intention in each case being to make a series of stamps as distinctive as possible *inter se*. There would, however, be some practical advantages in formulating a universal colour scheme for all the Crown Colonies and Protectorates. Further reference may be made to this subject in a future article.

*(To be continued.)*

## REVIEWS AND NOTICES.

**The Labour Movement in Australasia: A Study in Social Democracy.**—BY VICTOR S. CLARK, PH.D. *Constable & Co.*, pp. xii., 319.

THIS volume contains the most convenient account in a compendious form which has yet appeared of the progress of the labour movement in Australia and New Zealand, and the working of those experiments in the direction of the State control of industry which are attracting an ever-increasing attention at home. Dr. Clark visited Australasia in the years 1903 and 1904 upon a mission of investigation on behalf of the United States Government, and although this volume is addressed, not to the Government which commissioned him, but to the general public, it preserves to a large extent the impartial and disinterested tone which might be looked for in an official publication. The author states that he has endeavoured to write "from the standpoint of an agnostic in social needs," and he is so far successful that it is scarcely possible to detect any bias in favour either of socialistic or individualistic systems in his work. This quality is not in all respects an advantage; the keen adherent of a definite theory is generally able to make his descriptions somewhat more vivid, and his criticisms more incisive than Dr. Clark succeeds in doing, and there is something a little disappointing to the reader in a discussion of highly controversial questions ending almost invariably in an attitude of suspended judgment. But the book is nevertheless likely to prove an armoury for controversialists in both camps, and as such it will be of great value. The author begins with an interesting analysis of the conditions which have tended to promote the wide extension of State activities in Australia and New Zealand, among which may be noted homogeneity of race, and the remarkable concentration of the bulk of the population in a few cities, leading to a high centralisation of Government. He proceeds to trace the growth first of trade unionism, and then of the political organisation of labour, and points out how the old lines of political cleavage have been affected by the realisation of federal union. The most elaborate chapters of the book are devoted to a study of the operation of the laws relating to "minimum wage boards" and compulsory

arbitration in trade disputes, and these are followed by a sketch on a somewhat slighter scale of the extension of State ownership and industrial enterprise. Dr. Clark finds the Australian and New Zealander but little disposed to theoretic criticism. "Government ownership, so far as it has extended, is accepted as a matter of course, and is regarded as a debatable policy only in relation to new undertakings." Frequent and interesting comparisons are made with conditions affecting industrial workers in the United States of America. It will be remembered that the Home Government have sent out Mr. Ernest Aves upon a mission of enquiry not unlike that undertaken by Dr. Clark, and it will be interesting to compare his results with those achieved by an acute and competent foreign investigator.

**The Life of an Empire.** (By WALTER MEAKIN. *Fisher Unwin*, pp. x. 335, 6s.)

This volume represents the results of several years of travel and study on the part of the author. A merit which distinguishes it from the great mass of literature on imperial subjects is the very wide interpretation which is given to the term "Empire." Mr. Meakin deals with India and the Crown Colonies and Protectorates, as well as with the self-governing Colonies, and he does not omit the United Kingdom from his survey of the Empire. A brief narrative of the history of the development of the Empire, both internal and external, is followed by an interesting description of its component parts, while the remainder of the book deals with a number of topics such as the Native Question, Trade and Wealth, Schooling—a term which is made to cover a general estimate of the intellectual and social condition of the different countries described—and Foreign Relations. In a closing chapter Mr. Meakin appears as an advocate of Imperial Federation. The book is not an expert treatise or a work of reference, and no attempt is made to deal finally or exhaustively with the many highly controversial topics which are raised. But the author is unusually well-informed and is well qualified, both by enthusiasm for his subject and by the possession of a sound and well-balanced judgment for the performance of a difficult task. Readers with a close personal knowledge of individual colonies may find the author's method somewhat sketchy and cursory, but the book is admirably adapted to supply those who are familiar with a part or parts of the Empire with a more extended and correlated knowledge of the whole. Perhaps the chapter on Imperial Federation is the least satisfactory part of the volume. It is almost as easy as it is fascinating to sketch a federal constitution for the British Empire, but the very easiness of the task is a danger. The subject is one in which the practical details are of the very essence of the question, and the consideration of these details raises at once a

hundred difficulties as to which Mr. Meakin is silent. But this defect is one which, for the present, at any rate, is inherent in the nature of the subject, and it need not prevent us from cordially recommending Mr. Meakin's volume to all who are interested in Colonial questions.

### Old Age Pensions in Australia.

The following recommendations are made in the Report of the Australian Royal Commission on Old Age Pensions which has been reprinted at home as a Parliamentary paper :—

(1.) That old-age pensions should be provided throughout the Commonwealth, and be paid out of the Consolidated Revenue.

(2.) That a Bill for this purpose should be submitted by Your Excellency's Advisers for the early consideration of Parliament.

(3.) That the rate of pension should be fixed at a maximum of 10s. per week, subject to any deductions hereinafter recommended.

(4.) That the qualifying age should be 65 years, but that it may be reduced to 60 where an applicant is permanently incapacitated for work.

(5.) That residential qualification should be imposed as follows :—

In all cases a continuous residence in the Commonwealth of 25 years, provided—

(a.) that where the applicant is a native-born resident with an aggregate residence of at least 50 years in the Commonwealth such continuity shall not be deemed to be interrupted by absences totalling not more than six years; nor

(b.) that in all other cases such continuity shall not be deemed to be interrupted by absences totalling not more than three years.

(6.) That where otherwise qualified the following persons shall be eligible for an old-age pension :—

(1.) All natural born British subjects of a white race; and

(2.) All persons resident in the Commonwealth (not being aboriginal natives of Australia, Asia, Africa, or the Islands of the Pacific) who have been naturalized for the period of three years next preceding the date on which they make their pension claims.

(7.) That every pension granted should be held subject to review, amendment, suspension, and cancellation at any time by the authorities clothed with power in that behalf.

(8.) That payments to pensioners should be made fortnightly.

(9.) That payments should be made through the Post Office.

(10.) That the general administration should be by a Commissioner, responsible to a Minister of State. That a Deputy-Commissioner be appointed for each State; the States to be divided into districts, and each district to have a Registrar, to whom all applications should be made, and by whom pension claims should be prepared and placed before a Police, Stipendiary, or Special Magistrate for investigation. The Magistrate should make recommendations to the Commissioner or a Deputy-Commissioner with reference to the granting or rejection of applications.

That in the event of the rejection of any claim an appeal should be allowed to the Minister. The Magistrate should also have power at any time during the currency of a pension to recommend cancellation, amendment, or suspension. In all such cases there should be a right of appeal to the Minister. The power of granting, cancellation, or suspension should be given to the Commissioner and Deputy Commissioners.

(11.) That applications be heard in open Court, provided that the Magistrate have power, if he deem it advisable, to hear any case *in camera*; all evidence to be taken on oath.

(12.) That provision should be made to compel a husband, wife, or children, as the case may be, if in a position to do so, to contribute the amount of the pension.

(13.) That if an applicant or a pensioner be proved to be of disreputable or intemperate habits, the Magistrate should have power to recommend :—

(a.) in the case of an applicant that the application be refused, or granted conditionally on payment being made through an agent;

(b.) In the case of a pensioner the forfeiture of one or more instalments, or that payment be made through an agent, or cancellation of the pension.

(14.) That the yearly income of a pensioner from all sources, inclusive of pension, should not exceed £52 per annum.

(15.) That the deduction on account of income from other sources be £1 for every pound over £26 per annum.

(16.) That the net capital value of accumulated property held by an applicant should not exceed £310.

(17.) That the deduction on account of property should be £1 from pension on every £10 of net capital value over £50, excepting where the property of an applicant consists of a home in which he permanently resides, and which produces no income, then an exemption of £100 should be allowed.

(18.) That the property of a pensioner at death should vest in the Registrar of Probates or the Curator of Intestate Estates, as the case may be, as officer acting for the Commonwealth Government,

and the indebtedness on account of pension money paid should be liquidated therefrom in priority to all other claims.

Pension money received from time to time should be a continuing charge on any land acquired by the pensioner before or after the receipt of the pension, notice of such charge to be recorded by the Registrar of Land Titles as from the date of grant of pension.

(19.) That a penalty should be imposed for supplying an old-age pensioner with intoxicating drink."

Mr. Asquith's undertaking to lay the foundations of an old-age pensions system for the United Kingdom during the current year lends an additional interest to these recommendations.

### A Geological Report on Tobago.

The following extracts are taken from a Preliminary Report on the Island of Tobago, prepared by Mr. E. H. Cunningham Craig, Geologist to the Government of Trinidad. A sketch map accompanies the Report.

"The greater part of the island is formed of metamorphic rocks, which are naturally sub-divided into (a) those of sedimentary and (b) those of igneous origin.

These rocks consist chiefly of schistose grits, often very felspathic, with talcose and talc-mica schists, closely resembling some of the strata in the northern range of Trinidad.

Quartz veins are rare, and chiefly small stringers or segregations; no reefs worth testing for gold, with one doubtful exception, were observed, though minute quantities of the metal probably exist in some of the veinlets. It is possible, however, that a more detailed examination might be rewarded by the discovery of small auriferous reefs.

(b.) More than half of the island is formed of a mass of basic igneous rock, which has shared in the metamorphism of the schists and grits. The relations of this mass to the metamorphosed sediments have not been observed in any section, but there seems no doubt that the rock was originally intrusive.

Speaking generally, the characters of the igneous mass are fairly constant throughout the area, and taking the mass as a whole it will be more convenient to speak of it as "epidiorite," using the term in a general sense for metamorphosed basic igneous rocks. Until microscopic examination of a number of specimens has been made, no more precise classification of the rock can be attempted.

The importance of this mass of "epidiorite" can hardly be exaggerated. The rock decomposes often to a great depth and has earned the name of "rotten rock." Being of igneous origin its mineral constituents have not lost any of their soluble bases by

lixiviation and consequently their disintegration affords a soil of great richness. Rocks of this class are composed chiefly of ferromagnesian minerals and lime-soda felspars with the secondary products of their decomposition, so the soil is naturally rich in iron, alumina, lime, magnesia and soda. Possibly in potash and phosphates it may be slightly deficient.

In mechanical condition the soil is also excellent, never becoming too stiff or impervious a clay, and allowing free growth of roots and percolation of surface water. There is no other soil in Trinidad or Tobago which exhibits such a combination of favourable characteristics, and the growth of cacao and castilleja upon the "epidiorite" or the alluvium derived from its disintegration bears eloquent testimony to the value of the soil from an agricultural point of view.

No quartz reefs of any size or importance have been observed in or near the margins of the "epidiorite," but any reefs or veins in such environment that may be discovered should be tested for gold. It is from such altered basic rocks that much of the gold supply of the world is, directly or indirectly, obtained.

When undecomposed the epidiorite forms an excellent road-metal, tougher and more capable of sustaining the effects of heavy traffic than any other rock in Trinidad or Tobago, while even when crushed by traffic it will not wash away in a sludge so readily as do the limestones so largely used in Trinidad for road-metal.

Apart from the Metamorphic Rocks the only strata exposed are Tertiary and Post Tertiary.

The evidence of the presence of petroleum, the occurrence of which in Tobago has been known since the latter part of the seventeenth century, has proved somewhat disappointing. An oil-rock certainly crops out below sea level near the south-western coast, and fragments of very pure pitch are washed up on the beach from Crown Point to Lowlands, but the locality of "the manjack rocks" from which according to Captain John Poyntz "the green tar" exudes, has not yet been rediscovered, nor has any outcrop of an oil-bearing stratum been observed on the island.

Possibly, however, a more thorough and detailed examination may furnish more reliable evidence.

The pitch is found sticking to the rough irregular surface of the coral limestone in patches in such a manner as to suggest that it has been quite soft or even semi-liquid when washed up. Much of it is still soft. This indicates that the pitch had not been exposed to the air for long before being washed ashore, and cannot be far from the place whence it originally exuded. I am informed that at the end of the dry season large quantities of this pitch can be collected and that it is used by the fishermen for caulking their boats. Judging from the almost horizontal dip of such Tertiary strata as are exposed, it is probable that the oil-rock which crops out in the sea extends

inland though covered and concealed by newer strata. It is possible, however, that the oil-rock belongs to a much older group in the Tertiary Series, and may not be in conformable succession with the younger strata exposed. To obtain certain information on these points a few shallow borings should be undertaken. Such borings could be made with a light portable plant or even a hand-drill, and need not be carried deeper than 200 feet. A variable thickness of coral limestone will first have to be pierced, and below that the Tertiary strata should be found. It must be remembered that the Tertiaries lie upon a very irregular surface of the metamorphic rocks, so it cannot be expected that any great thickness of Tertiaries will be found in any boring or that an oil-rock will be struck in every locality, but it is by no means improbable that an oil-field of some four square miles and of shallow depth, may be proved by such a series of borings.

Though there is no certainty of striking oil, if such borings were successful the conditions would be distinctly favourable for production, so much so that I consider that experimental work is justified."

**"The Surveys and Explorations of British Africa."** — Annual Report presented to Parliament. 1906.

The Colonial Survey Committee is an advisory committee formed in 1905 to advise the Secretary of State for the Colonies. It is their duty to make such recommendations as will ensure the rapid and economical prosecution of accurate surveys when these are required. The present report tabulates the progress made in the delimitation of British frontiers in Africa and explains the proceedings in each case.

### **Institute of Commercial Research in the Tropics.**

The annual meeting was held in April in Liverpool. It was stated in the report that expeditions had been sent to Germany, Holland, Belgium and the United States, to study the methods of similar institutions. The West African colonies had been visited and much research was conducted, especially on cocoa and rubber. A new method of coagulating the rubber had been devised, which produced a commodity which sold at 4s. 10d. a pound, as against 10d. to 2s. previously. Twelve publications on tropical products have been issued. We congratulate the Institute on this record of sound and valuable work.

An interesting address has been delivered by Mr. Herbert Wright on Scientific Rubber-growing. At the conclusion of the address Mr. Wright was invited by Sir A. Jones to visit West Africa

on behalf of the Liverpool Chamber of Commerce. We append an extract from his speech, for which we are indebted to the *Liverpool Journal of Commerce*.

“The plantation rubber industry in the East is one of the most remarkable developments which has been chronicled in recent times. Ten years ago, though the Botanic and Forest Departments in Singapore, Ceylon, and India then possessed twenty-year-old trees of *Hevea Brasiliensis*, or Para rubber, the planting community and the investing public would not seriously consider the question of cultivating rubber trees. But to-day, in the Indo-Malaya region alone, we have nearly one-quarter million acres of land planted with, or prepared for, rubber trees. In a few years Ceylon alone may be expected to send from 5,000 to 7,000 tons of rubber annually, and the Indo-Malayan region can promise to ultimately supply more than the whole of Africa exported in the year 1906. In the East there has been more land planted with, or bought for, rubber trees during the last two years than in the previous 20 years, and the diverse conditions under which the various rubber-yielding species can be profitably grown will allow of extensive cultivation in the near future. Already there are over one hundred rubber planting companies, and British capital alone has been thus invested to the amount of several million sterling. (Applause.) Many mistakes have undoubtedly been made in the past owing to our ignorance of the real caoutchouc-yielding capacity of certain species of trees and vines in the tropical forests of Africa and America; errors in planting have been frequent owing to the absence of reliable information regarding the essential soil and climatic conditions for each species, and successive methods of later extraction and rubber-curing have been evolved, adopted, and, fortunately, forgotten. The cultivation of rubber-producing plants in all parts of the world, the exploitation of areas possessing indigenous rubber species, the collecting of the latex, the manufacture of rubber, and seed selection and plant sanitation operations on rubber estates are now rapidly developing along scientific lines. (Applause.) You may rest assured that as far as the plantation industry in the East is concerned, it has gone there to stay, and promises to be much more remunerative than other well-known tropical cultivations. Many people do not view the plantation rubber industry in a very serious light at the present time, but it is as well to repeat that the rise in export of plantation rubber in a few years will be as sharp and conspicuous as has been that of the planting of rubber trees, and for this we should be prepared. It will be remarkable for its constancy and purity, the minimum yearly output will be guaranteed, and with good management the quality should improve year by year. (Applause.)

## AFRICAN RUBBER.

'The only other tropical territory in the British Empire which can be regarded as a reliable source of rubber is Africa. (Hear, hear.) The rubber plants in the African regions are widely distributed, and have been recorded from so far south as Natal, 28 degrees from the Equator. The rubber species abounding there differ from those in the tropical American region, and also from those on the planted areas in the Indo-Malayan region, in so far that they are largely of the climbing type. There are, however, signs that the rubber from Africa will soon show an intermingling of characters, and it may be expected, sooner or later, to partake of certain tropical American features. The exploitation of tree forms indigenous to various parts of Africa, and the planting of similar kinds introduced from America and the East, will soon have an effect on the character of the exported material from African ports. (Applause.)

## EASTERN RUBBER

'In the cultivation of caoutchouc-yielding plants our Eastern possessions have led the way, and it is to the credit of the Indian Government and Kew that such good results have been rendered possible with species from regions so distant as West Africa, the Amazon Valley, the State of Ceara, and Mexico. On the chemical side much might be said, though it is perhaps dangerous to make many deductions from the empirical records of chemical analysis at present available. It is not sufficient to state the percentages of resinous, albuminous, mineral, and caoutchouc contents; it appears to me to be necessary to distinguish the components in each of these groups, to explain what differences exist between the proteid matter which is normally included in the coagulated rubber and that remaining in solution in the serum; to distinguish between the resins and even caoutchouc globules in trees of different ages, and in the latex from different species.' The speaker went on to say that the future for commercial enterprise in rubber was beyond realisation. But they required money, men, and time, and especially scientific research."

**"Lectures on the Plants yielding Commercial Indiarubber."**  
By Sir D. MORRIS. (*W. Trousce, 2s.*) A reprint.

"Where the milk is obtainable in quantity, as in the case of the Para and Central American rubber trees, and can be collected in vessels holding a gallon or two, there is available a mechanical method for extracting the rubber which is likely to be of considerable value. Briefly stated the principle is almost identical with that of the cream separator. It

is the invention of Messrs. Howard and Biffen, who have carefully tested the plan in the rubber-producing countries of the New World.

In this method the latex, after being mixed with 50 per cent. of water, is placed in the machine and spun for the space of a few minutes. The machine is then allowed to come to rest gradually, when the rubber is found floating on the top of the liquid in a thick white mass. The albuminoids, proteids, and all dirt and chips are found at the bottom. The rubber is skimmed off and placed to drain on a porous surface. According to experiments carried on by Mr. Hart in Trinidad, it can be removed in about two hours, and in six hours afterwards it is comparatively dry.

The advantages of this method of extracting caoutchouc are as follows :—

- (1.) It produces absolutely pure rubber.
- (2.) The whole process is under scientific control.
- (3.) It is capable of dealing efficiently and immediately with any quantity of milk."

"The result of experience so far gained in the experimental cultivation of the Ceara rubber plant is summarised in the *Bulletin* as follows :

'1. The plant is readily propagated both from seeds and cuttings. Seeds are abundantly produced in almost every part of the world where the plant has been introduced. They may be gathered from plants when only three to five years old. There is therefore the great advantage that a large area could be planted within a comparatively short period. Sowing the seeds in the position where they are to grow permanently is universally adopted in Brazil. It is possible, if adopted elsewhere, this plan would greatly reduce the cost of establishing plantations.

'2. The Ceara rubber plant is very hardy, a fast grower, free from insect and fungoid attacks, requires little or no attention when once established, and thrives in poor, dry, and rocky soils unsuited to almost any other crop. It is evident, however, that the yield of a few trees cannot be remunerative, and only large areas can hope to make the industry a paying one.

'3. It produces a good class of rubber, second only, when well prepared, to the best Para rubber. For this there is a steady and continuous demand. The yield per tree is apparently small, but a return is obtained earlier than from any other rubber plant. With thick planting and judicious thinning as the trees grow up, it may be possible to increase the yield hitherto accorded; while with skilful treatment the permanent trees may be tapped twice yearly, and last in a productive state for 15 to 20 years.

'4. In spite, therefore, of the apparent want of success which so far has attended experiments with Ceara rubber plants in Ceylon and

other countries, the increasing importance of rubber as an article in large demand in all civilised countries at good prices, suggests a reconsideration of the merits of this interesting plant. In many of our colonies possessing a dry climate and a poor stony soil, it is possible that large areas could be profitably occupied with Ceara rubber trees so grown as to provide annual crops for tapping.'

Commenting on the above the *Ceylon Observer*, a high authority on tropical subjects, states: 'We feel very strongly that more might be done in Ceylon with Ceara rubber and that cultivation was not persevered with ten years ago, because of the "boom" in tea. But now in dry districts not suitable for Para the Ceara kind might well be planted.'

**Some Imperial Aspects of Applied Chemistry.**—An Address by  
PROFESSOR W. DUNSTAN.

"Not less important than the service which science can render to existing industries and their extension, is that which it can contribute to the Imperial problem of ascertaining and rendering available for the manufacturer the vast undeveloped resources of our own Possessions. Our own experience and the example of other countries have shown that such work cannot be systematically carried on by private enterprise. Upon its successful accomplishment depends, not only the unrestricted supply of the necessary raw materials for which the manufacturer looks in increasing quantity, but also the prosperity of the country which produces these materials. This success can only be brought about by a combined effort on the part of the manufacturer and of the Government. The manufacturer can provide information as to the materials he needs. The preliminary work of discovering suitable material by scientific means, as several foreign Governments have already recognised, must be endowed, directed, and carried on with Imperial funds. It cannot be expected that private enterprise will take steps to explore the resources of little-known countries on the chance of a particular material being discovered, nor can the work, as a rule, be successfully done by this means. Experience shows that the most effective manner of promoting the commercial development of a new country is for the Government to carry out systematically with its own officers the preliminary work of exploration and examination of the natural resources, with the aid of such technical advice as may be necessary from manufacturers and users, and then, having established the fact that particular products of value can be found or cultivated in a given country, to leave commercial enterprise to do the rest. By action on these lines immense progress is being made in French, German, and Dutch Possessions, whilst the United States Government has taken similar action with the Philippines. In our own case, where this work exists it is in most cases in a more or less

embryonic condition, and lacks the organisation which is necessary for success.

In many of our Crown Colonies and Protectorates there already exist, or are in the process of organisation, agricultural and other scientific departments, many of which include officers who are engaged in the work of exploring and developing the vegetable resources of these countries especially by experimental planting. Chemists are attached to some, but not to all of these departments. In the West Indies the valuable work accomplished by Professor Harrison, Mr. Francis Watts, Professor Albuquerque, Professor Carmody, and Mr. Cousins is well known, and illustrates the great services which the science of chemistry may render, not only to tropical agriculture, but to every branch of economic development. It is clearly desirable that at least one scientific department should be attached to the Government of each of the principal Crown Colonies and Protectorates. As a rule, it is convenient that this should be an agricultural department with the services of a scientific chemist at its disposal. In a tropical climate, and with limited appliances at his command, it must be admitted that a chemist is severely handicapped, and, as a rule, he cannot be expected at first to be able to do much beyond the comparatively simple and preliminary work, chiefly analytical, which, however, in a little-known country is of the greatest importance to an agricultural department. In addition, he would have to deal with the composition of natural products of all kinds, both vegetable and mineral, as well as with the improvement of native industries. If the chemist is able to refer complicated or special investigations to a central department at home, and is provided with assistance in the routine work, he would be in a position to undertake the scientific investigation of a selection from the numerous problems with which a chemist will be confronted.

A chemist working in the spirit of an investigator will be able to render special services to the cause of tropical agriculture, and it is therefore of importance that in future the men appointed to these posts should be chosen as far as possible on account of the promise they have shown as investigators. The determination of the constituents of little-known indigenous plants as the first step towards ascertaining their economic value is another department of work which cannot be carried out without a chemist, and the same applies to the examination of poisonous plants, and also of minerals, in addition to the determination of the composition of food and feeding stuffs.

Tropical agriculture is a subject which is now of the first importance, especially in those countries in which our policy is to depend on a native population for the actual cultivation of the soil. We have two functions to perform in our position as supervisors; the one is to ascertain the nature and capabilities of the soil by actual

experiment, for which well-organised experimental stations are a necessary part of every agricultural department; the other duty is to convey to the natives, chiefly by means of demonstration, the results of this experimental work, so that they may be persuaded to make it a part of their agricultural practice.

Work on these lines is being done under Government auspices in the French and German Colonies, and I may allude to the French successes in Algeria, in Senegal, and in the Sudan, and to the advances made by Germany in East Africa. These achievements are mainly due to a policy of continuous scientific work on agricultural lines. We shall have the privilege of hearing from Dr. Greshoff, the eminent director of the Colonial Museum at Haarlem, an account of the chemical investigations which are being carried out in connection with Java and the Dutch East Indies.

In many of our own Colonies and Protectorates active agricultural departments, equipped with the means of experimental working, are only now in process of organisation. One of the most recently organised of these is that of the Transvaal, which, at Lord Milner's initiation, has been completely equipped on the lines of that model for all such effort, the agricultural department of the United States. This department has, as its chief chemist, Mr. Herbert Ingles, of the Yorkshire College, now the University of Leeds."

"So little has hitherto been done in this direction that the number of problems requiring attention is exceedingly large; and even with a specially trained staff of workers and extensive laboratories, such as now exist at the Imperial Institute, it becomes necessary to select as the principal subjects for investigation those which are regarded by the Governments of the countries concerned as of the most practical importance, and in which the British manufacturer is at the moment most concerned. There must, therefore, remain a large number of materials of unknown composition and of problems of purely scientific interest which offer an attractive field for the chemical investigator. Already steps have been taken to provide for the investigation of these subjects by scientific men who are willing to undertake them in communication with the Institute. For example, Mr. A. G. Perkin, F.R.S., has been furnished with material which has led to the identification and determination of the constitution of the colouring matters of a number of plants which are employed as dyes in India and the Colonies. Professor A. H. Church, F.R.S., has determined the composition of many new or little-known food grains. Dr. Crossley, Dr. Le Sueur, and Dr. Lewkowitzsch have examined the constituents of a large number of fats and oils furnished by seeds of Indian and African origin. Dr. W. J. Russell, F.R.S., has been furnished with selected materials for examination in connection with his interesting investigations of those substances which affect the

photographic plate in the dark, whilst the Hon. R. J. Strutt, F.R.S., has investigated the radioactivity of a number of new or little-known minerals containing rare earths. Last year over 500 different materials and problems were submitted from the Colonies and India for investigation to the Scientific Department of the Imperial Institute, and each year there must remain an increasing number of interesting subjects which cannot be included in the Department's annual programme of work. Many of these would furnish excellent subjects for chemical research by advanced students in connection with the universities and technical colleges throughout the country. It is nearly always possible to arrange to furnish the necessary material for any competent worker to deal with. Next year a list of such subjects awaiting investigation will be available at the Imperial Institute for those in search of subjects for chemical research."

"The services which chemistry can render to the elucidation of the problems of rubber production and utilisation are very numerous. Methods of treatment depending on a knowledge of the other constituents of the latex have led to the production of rubber in a purer condition. Much still remains to be elucidated by chemical means as to the nature of the remarkable coagulation of the latex. As is well known, the latex is a watery fluid resembling milk in appearance which contains the rubber, or, as I think more probable, the immediate precursor of rubber, together with proteids and other minor constituents. The constituent furnishing rubber is in suspension, and rises like cream when the latex is at rest. On the addition of an acid, or sometimes of alkali, or even on mere exposure, coagulation takes place and the rubber separates as a solid, the other constituents for the most part remaining dissolved in the aqueous liquid or 'serum.' The first view taken of the nature of the coagulation process was that, like the coagulation of milk by acids, it is dependent upon a process of proteid coagulation, the separated proteids carrying down the rubber during precipitation.

This explanation cannot, however, be considered complete by the chemist, and there are peculiarities connected with the coagulation of the latex which are opposed to the view that it is wholly explained by the coagulation of the associated proteids. The experimental investigation of the question on the chemical side is beset with many difficulties which are increased if access cannot be had to fresh latex. A number of experiments were made at the Imperial Institute with latex forwarded from India. The difficulties contended with in preventing coagulation during transit were great, but in the case of the latex derived from certain plants these were to some extent surmounted, and the results obtained, especially with reference to the behaviour of certain solvents towards the latex, led to the conclusion that 'coagulation' can take place after removal of the proteids, and

that in all probability it is the result of the polymerisation of a liquid which is held in suspension in the latex and on polymerisation changes into the solid colloid which we know as caoutchouc. Weber, by experiments conducted in South America with fresh latex, arrived at a similar conclusion, which later workers have confirmed. Although the nature of the process is not yet completely elucidated, there is little room for doubt that the coagulation is due to the 'condensation' or polymerisation of a liquid contained in the latex. For the chemist the important question remains as to the nature of this liquid from which caoutchouc is formed."

"Moreover, it cannot be doubted that chemical science will sooner or later be able to take a definite step towards the production of rubber by artificial means.

The production of caoutchouc by chemical means has, indeed, virtually been accomplished in its formation from isoprene. The exact nature of this change has still to be determined. When this has been done it will only remain to cheapen the cost of production to make the manufacture of synthetic rubber a purely practical problem. I should be the last to discourage the great extension of rubber planting which is now taking place. It is warranted by the present demand for material. It has also to be remembered that the actual cost of producing cultivated raw rubber, which is at present about one shilling per pound, will probably be reduced, and the market price of rubber may eventually be so considerably lowered that, as with quinine, the synthetic production could not be profitably carried on. That is a question which involves many factors at present unknown, and only time can decide. Chemists may, however, confidently predict that before the British Association again meets at York the synthetic production of rubber will be a fully accomplished fact."

Three technical papers follow on the "chemical aspects of cyanogenesis in plants," and the chemistry of rubber and gum.

## BUSINESS NOTES.

It is proposed to discuss, *inter alia*, in these notes the stores requirements of the colonies, to mention difficulties which have occurred, and to invite discussions on the merits of different articles.

---

Tropical conditions of course affect materials considerably, and manufacturers make attempts to suit their goods to them, but it is often difficult to conclude whether the results are satisfactory. A comparison of results from various places could not fail to be useful, and we should be glad to receive any experiences.

---

Paint is an example of the numerous articles requiring special care when intended for use in a hot country.

A base of zinc oxide is the best, as lead is liable to discolouration, due to chemical influences. Anti-fouling compositions and anti-corrosive paints usually contain volatile constituents, and therefore dry by evaporation very quickly. For girders, Torbay paint is highly recommended, and (in Scotland) "Forth Bridge" paint. For rough woodwork, stone and plaster, a washable distemper is suitable; it can be obtained in the form of a dry powder, to be mixed with water. "Calcarium" and "Frescoria" are used a good deal, or the powder may be mixed with oil, as Carson's anti-corrosive paint, which has a high reputation. "Siderosthen" is a material which has been recommended from Northern Nigeria as good against white ants. "Stop-rot" on timber has yielded good results in Southern Nigeria; it is a combination of creosote, wood spirit, pitch and carbolic acid, and is very suitable for timber in mines. "Jodelite" is a preparation for similar purposes. But these special preparations command good prices, and for extensive work, it may be better to draw up a stringent specification, and to analyse the supply to see that the specification has been carried out.

Information as to the use to which it is intended to put the various items of an indent for paints should be given, whenever practicable.

The desire for sanitary improvement has led to a considerable demand for disinfecting apparatus. There are two types—the steam and the chemical—on the market. A well-known example of the first is the “Manton Alliot;” that, 7 feet long by 4 feet 2 inches high, by 2 feet 7 inches wide, with boiler, costs about £280. The “Equipose Disinfecting Stove” is rather cheaper, and does not require such high pressure steam. There is a small portable apparatus, manufactured by “Thresh,” costing about £27 or £37, according to size; this has been found very useful in recent cases of small-pox: a gaseous disinfectant (formaldehyde) is used with it. Formaldehyde is only made in Germany; it is apt to deteriorate in carboys which may be imperfectly stoppered, and should be imported in 16 oz. tin bottles (about 1s. per tin, which suffices for two operations). This chemical is also used for the disinfection of rooms, applied on a solid spray by means of a force-pump.

---

For disinfecting rooms and holds of ships, liquid sulphur dioxide is greatly approved. It can be obtained in sealed tins at about 1s. each, and one is sufficient to disinfect a large room with its contents. All doors and windows should be sealed up with gummed paper, which is sold for the purpose in long strips.

The portable “Clayton” apparatus is believed to destroy not only all vermin, but also the bacilli of plague and other infectious diseases. The premises are not disturbed. The gas is forced into the building by pumping machinery and enters all crevices. A supply of roll sulphur is required. This apparatus has been supplied to the Metropolitan Asylums Board.

---

The following Report has been supplied by the Medical Officer of Health of the Port of London:—

“If the apparatus is required to disinfect vessels with cargo in the holds, the only practical one is that manufactured by the Clayton Fire Extinguishing and Ventilating Company, Limited. Other methods can, however, be employed in empty vessels, such as burning sulphur in the hold, or the use of liquid sulphur dioxide.

At the International Sanitary Convention held at Paris in 1903 the question of disinfection of ships and the use of the Clayton apparatus was discussed, and a series of articles or regulations were drawn up for adoption by the countries represented, with a view to uniform action being taken in all cases of plague, &c., on ships. Owing to political questions these articles have not yet been ratified, but Sir Herbert Williams considers that they are already in very general use, and should be fully considered by the Colonial Government in the first instance.

If disinfection is made compulsory, serious claims for damage to cargo, especially corn, will arise, and Sir Herbert, therefore, recommends that the treatment should only be offered as an alternative to quarantine.

The effect of gas upon various materials, grain and food stuffs is dealt with in the Local Government Board Report by Drs. Haldane and Wade (pages 19 to 24).

An apparatus has been devised by Dr. Nocht, of Hamburg, for the destruction of rats by the use of carbon dioxide, but the system is considered dangerous, owing to the persistent nature of the gas used, and the fact that its presence, unlike that of the Clayton gas, which is at once apparent, is only detected by special means."

The cost of the Clayton apparatus varies with the size of the plant, from about £250 f.o.b. to £1,000 f.o.b. Their largest type of machine, which, they state, is generally employed for port fumigating and disinfecting purposes, is usually erected on a tug or barge, and the gas conveyed to the holds or compartments to be treated by means of suitable metallic tubing, costs about £1,000 f.o.b., or together with boiler and circulating pump, flexible tubing, &c., £1,200 f.o.b. This machine has a saturating capacity of upwards of 150,000 cubic feet of 5 per cent. Clayton gas. The percentage 5 they state is sufficient for all ordinary disinfections.

Their smallest type has a capacity of about 10,000 cubic feet, and costs complete, mounted on an iron trolley with oil engine and tubing, £250 f.o.b.

Another use for the Clayton apparatus is indicated in the following extract from the *British Medical Journal* :—

"One large source of mosquitoes is found in the rain-water drains, . . . all outlets being covered by mosquito netting, the system is then divided into sections and the gas blown through, rats, as well as mosquitoes and other life, being exterminated."

The following memorandum concerning experiments made in the Congo Free State in connection with the use of motor cars on earth roads in Africa has been communicated by the Belgian Government :—

"For the last seven years the Congo Free State has been considering the question of using motor wagons for the transport of stores on main roads of communication.

Their first efforts concerned the use of electric cars. The cars were to be driven by batteries with accumulators recharged at stopping places situated about 60 kilometres apart. Each stopping place was to consist of a 6 h.p. electric charging station driven by steam with boiler heated by wood fuel.

"This form of traction had to be abandoned owing to the inherent difficulties connected with the erection of these charging stations.

"The State then contemplated using cars with refined spirit as the basis of motor power, and attempts were made to manufacture the spirit on the spot from local products, such as maize, sorghum, millet, sweet potatoes, honey and rice. As, however, these efforts did not lead to any good results, the State experimented with steam cars heated by wood fuel. Three cars of the Thorneycroft system—the lightest manufactured by these works—were sent to the Congo. These cars weighed  $5\frac{1}{2}$  tons when working, and were able to take a load of 3 tons and to draw a trailer with a load of 2 tons. Practice proved that they could only do good work on the strongest portion of the road and in the dry season, and some means of reducing the dead weight of the vehicles had to be devised.

"In addition to the above experiments, and concurrently with them, a type of light steam car was tried, and the solution so long sought seemed at last to have been found.

"Since September, 1905, the Free State has sent to the Congo five cars of light pattern (constructed at the Cockerill Works at Seraing) of 1.500 kilos., capable of carrying one ton in addition to the wood and water required for covering a distance of 25 kilometres. The boiler, heated with wood fuel, is of 'the flash type.'

"The water consumption per kilometre is from 5 to 6 litres, and the wood required for travelling the same distance weighs 5 or 6 kilograms.

"The cars of the type described have up to the present given excellent results, although the surface at different times has been greatly softened by rains.

"The Free State has also an order at the Cockerill Works, a car of 2 tons which will be able to carry a load of 2 tons.

"In the course of these extended experiments the Congo Free State has become convinced that on earth roads the use of light cars is indispensable. All attempts to use heavy cars on similar roads are sure to end in absolute failure.

"The trial car which led up to the one actually adopted has travelled thousands of kilometres on certain Belgian roads. The mechanism has therefore proved its value.

"A network of roads for motor traffic is in course of construction.

"In an ordinary cross section the motor roads are 5 metres wide and are bordered with ditches to drain off water. The profile of the road is dug out in the ground in such a manner as to profit by the resistance offered by the virgin soil. Avoidance of the use of rubble is strongly recommended except in case of absolute necessity.

“ Generally speaking the roads are not covered with stone in the first instance. Later, if it should prove necessary two strips of broken stone, rolled in, are laid down for the wheels of the motor wagons.

“ Unless absolutely necessary the gradients do not exceed one in ten.

“ Road turnings are effected by curves of a minimum radius of 25 metres.

“ Bridges of 5 metres span and less consist of a floor of planks of OM. 10 by OM. 20 section resting on two or three beams OM. 30 square.

“ Bridges of 5 to 10 metres opening consist of a floor resting on two double beams.

“ For a greater span than 10 metres piles placed from 4 to 6 metres apart are used.

“ During the initial stages, to obviate delay in construction of the roads, transhipment has to be effected across rivers whose breadth exceeds 40 metres.

---

The following report (relating to the Bende Onitsha Hinterland Expedition) should interest the boot trade. It should be possible to produce in this country the article required, and there would no doubt be a considerable demand for the right thing:—

“ The feature that strikes one as being the most remarkable in the sick returns of the native soldiers, is the number of men who reported ill and were incapacitated for marching for a longer or less period of time, through injuries of the feet and legs. Thus, in November, from the 27th to the 30th, eight soldiers led the way. In December the list swelled to 85; while the return for January, February, March and April, up to the 15th, was 59, 82, 40 and 19 respectively, making a total altogether of 293 men.

Only one conclusion can be drawn from these figures, and that is that the soldier in the Southern Nigeria Regiment is inefficiently shod. Indeed, no one is more aware of this fact than the soldier himself; and he loses no opportunity of making the most of any injuries he is liable to, in going through the bush or over rocky ground in bare feet.

The military authorities themselves appreciate this weak point in the force; and the matter was deemed of such pressing importance a few years ago that the leather socks and Chuppli were introduced into the kit—but did not find favour with the native. It is said that they chafed, blistered, caught in the bush, impeded progress and were not comfortable.

But a boot or shoe of some sort is, I think, strongly indicated, to prevent so inordinately large a proportion of each fighting unit being

thrown out of action as is usual on service at present. And in the absence of other suitable foot-gear I should suggest the introduction of a moccasin such as is worn by the bush Indians of Mexico and Central America.

This consists simply of two halves of soft leather uppers sewn on to a stout leather sole, and laced for a short distance above over the instep. Such a shoe worn with the puttie or, better still a knitted legging, would serve all purposes amply.

I am strongly against putting native soldiers or police into boots. Giving them boots destroys their efficiency, and has only one advantage that I know of, and that is it enables them to be drilled, to march in step more easily. But while strongly objecting to boots, I do think that when they are called upon to fight in thick brush-wood and undergrowth, the natural dangers of which to bare feet are increased by the placing of the artificial spikes on the road by the enemy, they should be given some protection for their feet, and that it would be to the advantage of the Government to give this, but it should not be an ordinary European boot, and except when called out on active service they should not be allowed to use any foot-wear."

---

The following letter has been received from Trinity House, on the subject of Lights on a Breakwater:—

*"15th April, 1907.*

In reply to your letter of the 14th ultimo, requesting to be furnished with the observations of the Elder Brethren as to the most satisfactory method of marking the extension of the South-West Breakwater at Colombo, while the works are in progress, I am directed to acquaint you, for the information of the Colonial Authorities, that, in the opinion of the Elder Brethren, this might best be done by the placing of a gas-lighted buoy showing a white light, giving one occultation every ten seconds, to guard the submerged rubble base of the new arm, and the exhibition of two fixed white lights, placed vertically six feet apart, from a mast or stage erected on the seaward end of the permanent work. These lights should be of the ordinary type of fifth order Port Light, burning paraffin, and should be moved seawards as the construction of the pier proceeds, the cost of the two lights being estimated at £160 f.o.b. England.

As the obtaining of the gas supply for the proposed buoy from England would not only involve considerable expenditure but be unreliable, as difficulty would probably be experienced in obtaining freight for the charged gas-holders, and the change of temperature during transit would have a detrimental effect on the gas, the Elder Brethren consider that the most satisfactory arrangement

for ensuring the efficient maintenance of the gas buoy would be the construction of a small oil gas-producing plant at Colombo. This plant could be utilized later for supplying the illuminant for the permanent light which will be required at the end of the Breakwater on its completion, and which the Elder Brethren would recommend should be a fourth-order white double occulting oil gas light, automatic in action, thus saving the cost of continual attendance.

It is estimated that the cost of providing the necessary gas-making plant, two gas buoys and lanterns and one transport receiver, will amount to £1,250 f.o.b. in England, but to this amount must be added freight and the cost of foundations, as well as the provision and erection of a corrugated iron building at Colombo.

It will also be necessary to fit one of the tugs used in connection with the breakwater works with a small Westinghouse pump, for transferring the gas from the receiver, which would be conveyed by the tug to the buoy. The cost of this pump is included in the estimate of £1,250 already mentioned.

The time required for the preparation and shipment of the gas buoys and plant would be about three months, and the Elder Brethren would suggest that a preliminary Notice to Mariners relative to the proposed lights should be issued three months prior to their installation."

---

The following has been received from the Lilleshall Company, Limited :—

"It occurs to the undersigned that it may be of interest to you and to your various Colonial correspondents to record the following experience in regard to the World's demand in wrought iron bars.

Practically 99 per cent. of wrought iron flat bars ordered stops at six inches wide. There is a small percentage ordered seven inches and eight inches wide, but any width over eight inches in wrought iron is so rarely asked for as to make it exceedingly difficult to obtain such wide sizes. They can only be obtained sometimes after long delay, and at a heavy cost for mounting rolls.

Flat bars over six inches wide are used, and much more readily obtained in Mild Steel.

Similar remarks may also be made in regard to round and square bars that are larger than three inches."

---

A question was put in the House of Commons on the 11th of April, whether the Crown Agents issued any information as to the results of manufacturers' tenders, and the name of the successful

tenderers. The answer was to the effect that the Crown Agents like other departments, treat such matters as confidential.

None of the home departments publish such information. In 1888, the War Office and Admiralty, the largest spending departments, obtained opinions on the point from the majority (48) of the Chambers of Commerce, and from a large number (112) of leading manufacturers. The report (C. 5,348) commented on these replies as follows :—

“The Chambers, being more or less in touch with all the different classes connected with Commerce, reflect rather the feeling of the mercantile public as a whole, but it is noted that the preponderance of manufacturers or of merchants in a Chamber appears to turn the balance in favour of the views of that class. Of the forty-eight replies received, twenty-four are on the side of publicity, twenty are against it, and four are unable to come to any decision ; but the twenty Chambers which decide against publication include Birmingham, Glasgow, Leeds, Manchester, Nottingham, Sheffield and Walsall—that is to say, the chief manufacturing districts in the kingdom, whereas the bulk of those which incline the other way are of a more general commercial character, having little direct interest in, or experience of, Government contracts.

The negative reply is still more emphasised by the replies from individual manufacturers. Of the 112 answers received, no less than 101 are in favour of secrecy.

An analysis of the replies received is appended, from which it will be seen that at least twenty different reasons have been adduced in favour of secrecy. Some of the objections, it is true, affect, at any rate in the first instance, the individual contractor rather than the State at large, but it is clear that in most cases the department would either directly or indirectly be a sufferer. Indeed, even those who wish for publicity see little to be gained by such a course so far as the departments are concerned ; the only reason which has been put forward in favour of publication is the security thereby obtained against dishonesty. It is only right and proper, so it is argued, that those who compete for an order should, for their own protection, know the price at which it is taken ; and it is also only right and proper that the tax-paying community at large should see how their money is spent. Such a feeling is prompted partly by mere idle curiosity, and partly by a general love of open dealing, but it leaves out of all consideration both the wisdom and the economy of the proposal.”

The Admiralty summed up the nature of the replies received by them as follows :—

“Particulars of Replies received at the Admiralty.

“Letters were sent to sixty-one manufacturers, and replies have been received from all.”

All except six object to the publication of prices, for one or more of the following reasons, but mainly on account of the second :—

1. It is not in accordance with trade usages.
2. Manufacturers, for various reasons, such, for example, as a desire to keep their workmen employed, the magnitude of orders, security against bad debts, and prestige of holding Government contracts, constantly quote to the Government departments much lower rates than those quoted to private customers, who would learn the Government rates and demand them. To such an extent is this felt that many firms would cease to do business with the Government if the publication of prices were permitted, or be compelled to raise their prices.
3. The publication of prices would enable cutting firms to put in a price just below what was last accepted, and one probably which is unremunerative for reasons given before. They would recoup themselves, or try to do it, by inferiority of quality.
4. Contractors would find great difficulty in buying the raw material, and in dealing with their workpeople.
5. Occasionally the department might be compelled to accept a tender which was not the lowest. It would have to justify its action to disappointed competitors, to say what it thought about their character, and endless correspondence would arise. The effect would be that those persons who have to adjudicate upon tenders would be tempted to neglect every consideration, excepting price.
6. The practice of publishing prices in foreign countries throws the business into the hands of third or fourth rate houses and agents.

Of the six firms who do not object to the publication of prices, not one gives any reason for the opinion expressed."

### **Contract Work.**

The following extract gives the views of the Governor of the Gold Coast on the much-debated question of the best mode of carrying out such public works as railways :—

" Extract from the Minutes of a Meeting of the Legislative Council held on the 1st May, 1905, in connection with the Loans Ordinance No. 5 of 1905.

The Governor expresses full sympathy with the unofficial members in their desire that Government money should only be expended in the most economical and effective manner; but, when considering the expenditure incurred on the railway from Sekondi to Kumasi, which has been so severely criticised, they must always bear in mind the special conditions under which this line was con-

structed. At the time it was commenced, there was no Local Railway Department; the mine owners at Tarkwa and Obuassi were clamouring for the immediate establishment of railway communications; the original approximate estimate of cost was subsequently invalidated by the Ashanti disturbances, and the mining 'boom,' which entirely disorganised the local labour market: while the sickness and mortality among the Europeans, the want of landing facilities at Sekondi, and the difficulties of railway construction through a trackless forest proved even greater than were anticipated. Had the Government awaited the preparation of detailed surveys, estimates, plans and specifications—necessary for its own protection, if this line had been constructed by contract—before commencing construction, there can be little doubt that the delay would have been vehemently opposed by all mine-owners and others interested in the immediate improvement of transport; and to assist the vital interests concerned, it was decided to construct, without delay, what has certainly proved to be an expensive line, but also a most valuable and important one. The respective advantages and disadvantages of the contract system, and of what may be termed the 'English' departmental system, of constructing railways in the Colonies were discussed in a recent Report by the Consulting Engineers to the Secretary of State, which was distributed to Honourable Members and also gazetted.

The Governor has no personal experience of the departmental system in question, but believes that it has been frequently and successfully employed in the construction of railways, in Ceylon and elsewhere. He has, however, seen a good deal of railway contract construction in the East, and has seldom found it satisfactory. In the first place, much time must necessarily elapse before the detailed surveys can be made, and the detailed estimates, plans and specifications prepared, without which it would be obviously imprudent to invite tenders for a contract; since the slightest ambiguity or deviation might, and probably would, involve claims for damages by the contractor; and the most carefully drafted contract seldom avoids litigation. Then it is not unusual, within the Governor's experience, for a railway contractor to carry out the slightest earthworks, and the easiest bridges and culverts, shortly afterwards to abandon the work, and refer the contract to arbitration; leaving the Government to engage engineers, organise a labour force, and complete all the heaviest cuttings and embankments, the most difficult bridgework, and most of the buildings. Railway construction by contract was found so unsatisfactory in the Federated Malay States that it was entirely given up, and, for several years past, every new line has been constructed on the 'local' departmental system; all work being under the direct supervision of the Head of the Railway Department, and much of it carried out directly by means of departmental

labour; only subsidiary contracts being let, when considered advisable, for specific earthworks, buildings and bridges . . . . As to the system to be eventually adopted in carrying out the various Public Works specified in the Schedule to this Bill, he cannot bind the Government beforehand. Each of the three systems referred to has its advantages and disadvantages, having regard to surrounding circumstances, and each is susceptible of modification, according to requirements of the particular Colony concerned. Although, however, he cannot bind the Government to definitely adopt beforehand any given system of construction, he can assure Honourable Members that the whole question will be fully and carefully considered in connection with every item entered in the Schedule, before any final decision is arrived at."

These remarks may be supplemented by the experience of the district authorities in this country in road repairing. A Colony asked to be supplied with information as to the contracts made here for this purpose, and it was ascertained that the contract system had been given up everywhere. The last county to retain it has recently abandoned it, and we append some extracts from the report of a specialist, on which it was decided to abandon the system.

"The question of Contract *versus* Departmental agency passed out of the experimental stage many years ago, and is nowhere adopted, so far as I know, outside of this county. I know of few engineering undertakings on which it is so easy to lose money as on the annual maintenance of roads. The work is so varied, scattered, sub-divided, so beyond the limits of precise specification, and in many parts of the processes so unmeasurable and uncountable in its multifarious details, that nothing short of the best business methods, and the closest supervision of quantities and qualities of materials and work during its progress, can secure economy. It is impossible to judge adequately of road work merely by the apparent quality of surface. No mere inspection of completed work will tell even an expert whether the road has the full quantity of metal upon it which has been paid for, or how long the road surface will last."

"I believe there is an impression that Departmental management of work, where the authority itself employs and pays the labour, is difficult and costly, and that Contractors of repute may be expected to get more and better work out of the labour. It is assumed that where work is paid for by the day and not by the piece, the labour will prove careless and perfunctory, and the work will cost much more than it would by Contract. This is greatly true in regard to many engineering works, where the various processes are specialised, where special materials and special appliances are used, and where most of the labour is skilled labour. What has been already written

shows that road work is an exception to the general rule. Departmental road work, as it is termed, is not nearly so costly as work done by the Contract system, and its quality is far superior. There is no getting over these facts. They are facts, and well known to professional men."

"Feeble control is one of the defects of a Road Contract system. There is a tendency running all through the system to depend upon the Contractors, and to rely upon the Contractor's large establishment for the supervision of work. There is, I believe, a current impression that road work done by Contract does not require the same supervision as when done Departmentally, and that Contractors can be relied upon to get good value for the County out of labour on the roads. This is wholly fallacious. Contractors' economies are economies for the Contractor's pocket and not for the County's. Road Contract work requires more constant personal supervision by the Authority than any Contract work I know of, and lax supervision on the part of the Authority is ruinous to that Authority. In saying this I do not in the least degree suggest unfair motives or practices on the part of Contractors. Road Contractors' interests are throughout naturally and inevitably in conflict with the true interests of the Authority, and they cannot be expected to point out defects of system (or of its application) to their own detriment. This applies still more, if possible, to the supply of materials, which is by far the largest item of road expenditure, amounts here to between £50,000 and £60,000 yearly. Contractors are naturally, and necessarily, and honestly, too, ready and anxious to supply as much material as the County will buy, and to supply the material which is most profitable to the Contractor. It is natural and it is business. It is, on the other hand, to the best interests of the County to buy as little as is absolutely necessary, and not to choose a material which is convenient and profitable to the Contractor, but to choose the best and most enduring material in the most open and cheapest market. By every defect of the Contract system or of its application, the Contractor must invariably be a gainer, and the Authority a loser."

"Apparently this latter work is an 'extra.' It is not traceable in either Tender or Specification. No doubt there are many 'extras.' Apart from these and many other defects of specification which make it difficult to understand, I do not think that it is possible to provide a complete and satisfactory Specification for Contract work in maintenance of roads, or to contrive satisfactory methods of measurement or of effective control."

---

The last remark touches the real difficulty. If it is practically impossible to specify everything that has to be done and how it has

to be done, the contractor is not fully bound, and may take advantage of the situation to charge "extras," or to do the work in an unsatisfactory manner.

Even when it is practicable to compile a complete specification and set of conditions, unexpected difficulties are apt to occur and demands for special allowances are made.

---

On the other hand there may be a great advantage in employing a contractor, who, as is often the case, is a man of great personal ability and organising power. And it is sometimes suggested that a manufacturer should in certain cases be allowed to devise his own means of attaining the object desired. In matters of detail it is an every-day occurrence for manufacturers to make suggestions. But it is obviously a less responsible matter for a manufacturer to work to a design furnished by his employers than to make one himself, and generally speaking he is reluctant to do the latter.

---

If it is desired to leave any discretion and responsibility to a contractor, this should of course be made quite clear from the first. Occasionally there is some confusion in this respect. Thus a colonial government recently ordered certain rack locomotives on designs furnished by themselves; the contractor made certain suggestions and the government revised the designs in accordance with them. The engines failed to do the work for which they were designed and intended. The colonial government appear to have inferred from the suggestions made by the firm that they in effect undertook that the engines so constructed would do the work expected. But this was not made a condition of the order. It appears doubtful however whether any first-class firm would give a guarantee that an engine made for such a special purpose would accomplish it.

---

We reproduce the following letter which appeared recently in several newspapers.

#### PREFERENCE FOR ROTTERDAM.

"Sir,—It may interest the British taxpayer to know how far the present Government are prepared to carry their principle of Free Trade within the Empire, when I am able to state that I have learnt from an unimpeachable source that the Crown Agents for the Colonies have placed several orders for steel motor vessels propelled by paraffin engines to be built and shipped from the port of Rotterdam.

Whether the fact of this Department being open to receive tenders was notified in the usual manner by advertisement I am

unable to state positively, but this I do know that the British houses engaged in this particular line of work are quite as able to construct the hull and fit the most approved propelling motor as any Continental house. Mr. David McBrayne has installed a vessel built at Greenock with an excellent type for his West Highland loch passenger trade; and the Thames and Solent, in fact, all the South Coast abounds with most economical working types of paraffin engine, without necessity to bring the foreigner on the scene, I trust that some energetic member of the House of Commons will place this matter prominently before the Government, and that the Department concerned may learn that 'those who pay the piper have a right to call the tune.'

PASSED OVER."

We think that our readers, official and unofficial, will be interested to know the facts which have led to this severe arraignment. Last year the Southern Nigerian Government ordered a motor barge (the "several orders" is an embellishment) to carry 60 tons on 4 ft. draught, to be made by a certain foreign firm which has had considerable experience of work of this kind. The barge was to be similar to one built for Messrs. Pickford, the well-known carriers, and upon which the *Motor Boat* of May 31st, 1906, commented as follows:—

"It is certainly a matter for congratulation that this, one of the earliest genuine attempts on the part of a shipowner to adopt the internal combustion engine for every-day commercial work, should have been made with the best materials procurable. Too often a new invention has suffered through being applied initially under very unfavourable conditions, and, curiously enough, one of the clearest instances of this in modern times is to be found in the history of that first cousin of the marine motor, the motor omnibus engine. Some of the earliest attempts to produce motor-buses were such conspicuous failures, owing chiefly to bad design and a suicidal policy of cutting down the cost of construction, that the vehicles made a very bad impression on the public, which it took the newer and more up-to-date types some time to efface.

But in the present instance there has been no mistake of this kind. No more suitable engine for the work could be found than the Kromhout, from the fact that the motor is so simple and automatic that an engineer is not required, an ordinary hand from the crew being able to run it quite successfully. Many barges of even 100 tons in Holland run with one hand only on the canals there. In a tideway such as the Thames, or for sea work, two hands would be required, not necessarily to work the motor, but because, as is well known, a couple of hands are an absolute necessity on a barge in a tideway."

"The boat crossed from Holland under her own power. The original intention was to cross direct from Flushing to the Thames, but upon leaving there dense fogs were encountered, and the barge had to put into Ostend, from which place she crossed direct, without incident, in just over 12 hours, the engine running without a hitch the whole time.

"We understand Messrs. Pickford intend using the barge in connection with their Portsmouth and Southampton trade."

It will be seen from this that the case was a very special one, and that the colonial government, which would not be justified in trying experiments, or in taking any but a well tried and approved type, had a strong reason for selecting a foreign made vessel. Whether they could have done equally well in this country is, of course, a perfectly fair and proper question for discussion. Whenever, in fact, a colonial government buys abroad, it is desirable to investigate the circumstances. No colonial government desires to do so if it can be helped, and it may safely be assumed that when it does so it is after much enquiry and consideration; the discussion of the case, however, may be instructive both to governments and to manufacturers, and we should always be glad to give whatever help we can in the elucidation of the facts.

We do object, however, to the assumption contained in the above letter that the "British taxpayer" has a sort of vested interest in any orders which a Crown Colony may have to place. Southern Nigeria is self-supporting and does not receive a penny from the Imperial Treasury; on the contrary she makes a large contribution to the support of Northern Nigeria. It is difficult, therefore, to see how the "British taxpayer" is affected. We quite agree that "those who pay the piper have a right to call the tune," and would point out that the first question is, who does pay? It would, we submit, be unfortunate if the Colonies got the impression that manufacturers in this country claim all colonial orders, without any corresponding obligation on their part; and, if we may so far presume on our newly acquired editorial status, we would suggest to our colleagues of the Press that such complaints, coupled with threats to appeal to members of Parliament, are hardly calculated to foster a good feeling in the Colonies.

---

The exhibition held in April at the Board of Trade under the auspices of the British Cotton Growing Association contained some remarkable articles manufactured from colonial cotton. Curtains and handkerchiefs were displayed which only an expert could distinguish from silk. As an instance of the growth of the industry, it may be noted that in 1903 the West Indies sent us £20,000 worth of cotton; this year it is anticipated that they will send us ten times as much.

## APPOINTMENTS.

Important changes have taken place in the staff of the Colonial Office during the current year. SIR MONTAGU OMMANNEY, G.C.M.G., K.C.B., I.S.O., retired from the post of Permanent Under-Secretary on the 15th of January, and was succeeded by SIR FRANCIS HOPWOOD, K.C.B., K.C.M.G. Sir Montagu Ommanney's connection with the Colonial Office dates back to March, 1874, when he became private secretary to the Earl of Carnarvon, then Secretary of State. In January, 1877, he was appointed one of the Crown Agents for the Colonies, and in June, 1900, he succeeded Sir Edward Wingfield as Permanent Under-Secretary. SIR FRANCIS HOPWOOD has been Permanent Secretary to the Board of Trade since 1901. He acted as honorary secretary to the Chairman of the House of Commons' Committee on the Jameson Raid, and it will be remembered that he was one of the Committee which visited South Africa last year to advise the Secretary of State on the subject of the form of constitution to be granted to the Transvaal and Orange River Colony.

---

MR. F. GRAHAM retired from the post of Assistant Under-Secretary on the 10th of January, when His Majesty bestowed on him the honour of a K.C.B. Sir Frederick Graham entered the Colonial Office in 1870, and had held the post of Assistant Under-Secretary for close upon ten years. He was specially responsible for South African affairs. He is succeeded in the post of Assistant Under-Secretary, and in the charge of the affairs of South Africa, by MR. H. W. JUST, C.B., C.M.G., until recently head of the South African Department. Mr. Just entered the Colonial Office in 1878. He accompanied Mr. Chamberlain in his visit to South Africa after the war in 1902-3, and he is one of the joint secretaries to the present Colonial Conference.

---

MR. A. A. PEARSON, C.M.G., Principal Clerk in the West Indian Department, retired on the 31st of December. Mr. Pearson entered the office in 1867, and had been a Principal Clerk since

1895. He represented the Crown Colonies at the International Postal Conference in London in 1898 and he was one of the British delegates at the Brussels Sugar Conference in 1901-2. He was at Kingston, Jamaica, with Sir Alfred Jones's party, at the time of the recent earthquake.

---

MR. SYDNEY OLIVIER, C.M.G., who succeeded Mr. Pearson in the charge of the West Indian Department, has been appointed to succeed Sir Alexander Swettenham as Governor of Jamaica. Mr. Olivier, who entered the Colonial Office in 1882, has an extensive knowledge of the West Indian Colonies. He acted as Auditor-General of British Honduras from October, 1890, to April, 1891, and as Auditor-General of the Leeward Islands from October, 1895, to February, 1896. He was secretary to the West Indian Royal Commission of 1896-7, whose report on the position of those Colonies marks a turning-point in their history, and has been the basis of administrative policy in the West Indies during the past ten years. In 1900 he went to Jamaica as Colonial Secretary, remaining there until 1905, and administering the government on several occasions and for considerable periods.

---

SIR H. E. McCALLUM, G.C.M.G., A.D.C., R.E., who has been Governor of Natal since 1901, has been appointed to succeed Sir H. A. BLAKE, G.C.M.G., as Governor of Ceylon. He served for a number of years as Colonial Engineer of the Straits Settlements, and became Governor of Lagos in 1897. In 1898 he was transferred from Lagos to Newfoundland, and from there in 1901 to Natal.

---

SIR HENRY McCALLUM is succeeded in Natal by SIR MATTHEW NATHAN, K.C.M.G., R.E., who administered Sierra Leone in 1899, and became Governor of the Gold Coast in 1900; he was transferred to Hong Kong in 1903. Before these appointments he fought in Egypt and the North West Frontier, and from 1895 to 1899 he was Secretary of the Colonial Defence Committee in London. One of his brothers, Lieut.-Col. Sir F. L. Nathan, R.A., is Superintendent of the Government Gunpowder Factory at Waltham; another was Private Secretary to Lord Curzon when Viceroy; and a third was Attorney-General of Trinidad.

---

SIR FREDERICK LUGARD, K.C.M.G., C.B., D.S.O., succeeds Sir Matthew Nathan at Hong Kong. Sir F. Lugard has seen active service in many parts of the world, including Afghanistan, the

Soudan and Burma, and administered Uganda, 1889-1892; but he is most closely associated with West Africa, which he first visited in 1895. Going out in March, 1898, as Commandant of the West African Frontier Force, he became in December, 1899, High Commissioner for Northern Nigeria, a post which he resigned last September. Altogether he has had a particularly strenuous career. Miss Flora Shaw, now Lady Lugard, was a distinguished contributor to the *Times* on colonial subjects.

---

MR. H. C. CLIFFORD, C.M.G., has been appointed Lieutenant-Governor and Colonial Secretary of Ceylon, in succession to the late SIR ALEXANDER ASHMORE, K.C.M.G. He has been Colonial Secretary of Trinidad and Tobago since September, 1903, but the whole of his previous service was in the Eastern Colonies. He was Governor of British North Borneo and Labuan from 1899 to 1901. He has produced a number of excellent studies on colonial subjects.

---

SIR H. M. JACKSON, K.C.M.G., Governor of Trinidad and Tobago, is proceeding to England on sick leave. In his absence, SIR GILBERT CARTER, K.C.M.G., Governor of Barbados, will administer the Government of Trinidad, the administration of the Government of Barbados devolving upon the Colonial Secretary, MR. S. W. KNAGGS.

---

LIEUT.-GENERAL J. H. WODEHOUSE, C.B., C.M.G., has been appointed Governor and Commander-in-Chief of Bermuda, in succession to LIEUT.-GENERAL R. M. STEWART, K.C.B.

---

The Transvaal Government have appointed SIR RICHARD SOLOMON, K.C.B., K.C.M.G., to be the first Agent-General for the Colony in London. Sir Richard was Attorney-General in the Schreiner Ministry in Cape Colony from 1898-1900, and subsequently Attorney-General and Acting Lieut.-Governor of the Transvaal. His brother, Mr. E. P. Solomon, is a member of the Transvaal Ministry.

LIST OF  
COLONIAL OFFICIALS ON LEAVE OF  
ABSENCE

IN THIS COUNTRY

Whose Leave Certificates are received at the Office of the  
Crown Agents for the Colonies.

*The dates given are those of the expiration of the leave.*

*The Editors would suggest that whenever an official desires the insertion of an address he should arrange to have a note entered accordingly on his Leave Certificate.*

*As officials from the self-governing Colonies other than the Transvaal seldom reside in this country for any long period, the Editors do not propose to endeavour to include them.*

# THE COLONIAL OFFICE JOURNAL.

---

---

VOL. I.

OCTOBER, 1907.

No. 2.

---

---

## EDITORIAL NOTES.

WE have received many kind criticisms of our first number and many sympathetic suggestions. One reviewer observes that he sees many rocks and pitfalls in front of us, and no doubt the endeavour to discuss public questions, with the help of information which is only accessible officially, is attended with difficulties. There is, however, a fairly clear line between observations which would embarrass and annoy governments and those which are innocuous and possibly helpful in the discussion of a subject, and we shall do our best to keep it in view.

We take all the responsibility for the publication of any matter which is sent to us, but any opinions which are expressed are put forward for what they are worth and with no official authority.

---

A more frequent warning on the other hand has been that a journal largely devoted to digests of blue-books and official reports would be found uninviting, and one critic of great reputation recommends us to put in some "seasoning." The advice is no doubt good. Such documents, full of excellent matter though they are, are a bye-word for dullness and obscurity. The reason is not far to seek. They are usually arranged in the form of correspondence in chronological order, but many separate matters are mixed up together, and it is difficult and tedious to disentangle the different threads and to make out what happened and why.

---

A former Parliamentary Under Secretary in the Colonial Office (occupying a more responsible post in the present Government) was so impressed with the inconvenience of this zigzag and tortuous

method of presenting a case that he took an early opportunity of compiling a blue-book of correspondence on a different method. He picked out the main points with which the papers dealt, and divided the correspondence accordingly under separate headings. But we believe the experiment was never made again. The correspondence is usually too interwoven to admit of such treatment, and any attempt to classify it upsets the historical order. The novelist can hark back, but not, we think, the dramatist; and official correspondence is more in the latter than the former plane.

---

The only way to eliminate the unnecessary and to give the true effect is to make an abstract of the correspondence and relate the matter historically. This, however, will not do when the actual correspondence is called for for controversial purposes. Parliament and the press want to know exactly what someone said on a particular occasion, and a digest which largely eliminates the personal element would be generally unattractive from this point of view and always open to mistrust.

---

Such summaries on suitable occasions not only save a great deal of labour, but may give essential explanations which cannot be gathered from the correspondence. Thus, in the case of the Pacific Cable, an account of which we give in the present number, several parliamentary papers of correspondence and reports were issued by the Colonial Office, but they stop short of the most important point of all—the agreement of the Home Government to find the capital and the understanding as to the proportion in which the contributing governments were to share the liability. This arrangement was made verbally by the Chancellor of the Exchequer.

---

Blue-books, which consist of the evidence taken by committee and of their reports, are afflicted by the difficulty of voicing the opinions and expressions of several men. The secretary or whoever first drafts the report, is usually prudent enough to confine himself as far as possible to concocting answers to the specific questions put to the committee. The conditions of the case do not encourage historical surveys, general views, and strong opinions. The qualities which are most attractive in an individual writer are therefore absent. The spirit of compromise is not an effective stimulant, and most readers enjoy a statement most when it is presented with a good robust bias from one side or the other. Nevertheless, the intellectual voluptuaries who like to see the facts sifted and marshalled fully and impartially will find admirable instances of keen examination and

judicious conclusions. The witnesses and the judges are of the best. Much of the best ability of the country is recorded on the patient pages of parliamentary papers.

---

The action of the Australian Commonwealth in giving a preference to British goods is evidence of the strength of the Empire feeling, and this distinction is not affected by the fact that the new tariff gives further protection to the Australian manufacturer. The same spirit, different as the economical policy is, is certainly prevalent in this country. Preference for the Colonies in a general sense is as widespread as any political doctrine. Large grants are made every year to assist the development of possessions which require them, and the Home Government takes much of the responsibility for great enterprises in the Crown Colonies. Australia and Canada benefit, and will benefit much more, by the progress of our Eastern possessions, and the settlement of South Africa. All classes in this country have contributed heavily in recent years to the maintenance of the Empire, and hardly any expenditure passes through Parliament with more general consent than the grants-in-aid which are made on various occasions to the Colonies.

---

The division of the Colonial Office into two geographical sections, the one, under Mr. C. P. Lucas, concerned with the self-governing Colonies or "dominions" and the possessions geographically connected with them; and the other, under Mr. R. L. Antrobus, with the Crown Colonies, will meet the suggestion made by Mr. Deakin and Sir Joseph Ward at the Imperial Conference, that the self-governing Colonies should be put in a different category from the Crown Colonies. A third section, under Mr. H. B. Cox, will deal with legal and general business, and an important feature of this arrangement is that certain subjects of general application, such as railway construction and management, will be dealt with by committees selected from various geographical departments. Mr. H. W. Just will be Permanent Secretary to the Imperial Conference, and in that capacity will be associated with the Dominion division. Many persons will share Lord Elgin's feeling of regret that the old term Colony, with its classical and historical associations, should be displaced, but some mark of differentiation was called for. The two divisions of the Colonial Office will be called the Dominion Department and the Colonial Department, and the change no doubt implies a definite recognition of the fact that the self-governing communities will be dealt with in negotiations as on a level with the Mother Country. Whether there was any ground for supposing that this position was not fully recognised before is a question which need not

here be discussed; there is a good deal in the appearance and arrangement of things, and, if a new office organisation can help to promote a good understanding, it is clearly right to have it.

The British North America Act, 1907, passed in the last Session of the Imperial Parliament, deserves attention. It amends the scale of payments to the Provinces of the Dominion by the Dominion Government for the support of their Governments and Legislatures. These payments were fixed in the case of Ontario, Quebec, Nova Scotia, and New Brunswick by the Confederation Act of 1867, and in the case of the other Provinces by Dominion legislation, or by the Orders-in-Council under the Act of 1867, regulating the terms of admission of new Provinces into the Dominion. For some years the Provinces have been anxious to obtain increased subsidies, and these are now secured by the Imperial Act. In future each Province will receive a grant varying according to its population. When the population—

is under 150,000 the grant will be	... ..	\$100,000 ;
is 150,000, but under 200,000, the grant will be	150,000 ;	
is 200,000, but under 400,000, the grant will be	180,000 ;	
is 400,000, but under 800,000, the grant will be	190,000 ;	
is 800,000, but under 1,500,000, the grant will be	220,000 ;	
is 1,500,000 or over	... ..	240,000.

Further, each Province will receive a payment at the rate of eighty cents. a head on the population ascertained from time to time by the census until the population exceeds 2,500,000, and at the rate of 60 cents. a head for such part of the population as may exceed 2,500,000. An additional allowance of \$100,000 for ten years is assigned to British Columbia in view of the exceptional circumstances of that Province.

The procedure in such a matter of merely local interest by an Imperial Act is unusual, but arises from the fact that, save in certain matters provided in the British North America Act, 1867, the Parliament of Canada has no power to alter the Constitution of the country as contained in that Act. Every other self-governing Colony has this power, which was conferred even on the Leeward Islands Federation by the Imperial Act of 1871, but it must be remembered that the terms of the Confederation of Canada formed, as it were, a treaty of union between the federating Provinces, which they desired to render unalterable by the Dominion which they created, leaving the power of alteration to the Imperial Parliament alone, which was thus constituted the guardian of Provincial rights. Strictly speaking, an Imperial Act could have been dispensed with,

since in all cases the subsidies payable are increased, and the increases could have been secured by Dominion Legislation, but the Dominion Government preferred to obtain the formal approval of the Imperial Parliament for the alteration in the subsidies.

---

The publication of the Letters Patent conferring responsible Government on the Orange River Colony has been received quietly. It was known that the lines of the Transvaal constitution were to be very closely followed, and as long ago as last December the decision of the Government upon most of the questions to be determined was announced in the House of Commons. But the working of the new system will be watched with very great interest. The Transvaal Legislature has adapted itself with an almost precocious facility to the system of Parliamentary Government on the British model, and it is difficult for anyone who studies its votes and proceedings or reads the reports of its debates to realize that the latest Parliament of the Empire is still in its infancy. In the Orange River Colony there will be a more complete novelty in the form of Government, and the predisposition towards the ordinary forms of party government will hardly be so strong. But the Parliamentary habit seems to be easily acquired, and it is probably safe to prophesy that the new Legislature about to be established in Bloemfontein will very soon acquire the dignity and self-confidence which already characterize its neighbours.

---

The most important recent event in connection with South African affairs has been the publication of Lord Selborne's memorandum on Federation, which has greatly enhanced a reputation which has been steadily and deservedly growing ever since Lord Selborne first held public office. The memorandum has been favourably received throughout the Colonies affected, and the preliminary steps towards the federation of British South Africa will probably be taken next year. The task to be faced is a great and difficult one, and if we may judge from experience elsewhere, will probably take some years to accomplish. One difficulty is to be found in the close relations subsisting between the Transvaal and Portuguese East Africa, and this has been emphasised by the *communiqué* which the Transvaal ministers issued simultaneously with the publication of the memorandum. Another, it may be surmised will arise from the existence in Natal of a system of indentured Asiatic labour under conditions which will certainly not be allowed by the other Colonies to extend to their own areas. But the end in view is so clearly favoured by economic, geographical and political conditions that its accomplishment is only a matter of time.

When consolidation has been effected, there will be an end of inter-port rivalry and the jealousies of coast and interior communities.

---

The Financial Report of the Straits Settlements for 1906 contains an instructive account of the measures taken by the Government to keep steady the exchange value of the dollar. The rate was kept firm by the Government taking power to issue gold in exchange for notes, and to sell telegraphic transfers payable in London against notes, thus contracting the currency. The extreme high water and low water limits of the sterling value of the dollar, as determined by the cost of bringing gold to Singapore or sending it to London, are put at  $2/4\frac{5}{16}$  buying, and  $2/3\frac{1}{16}$  selling. In consequence of the rise in the value of bar silver, the bold step was taken of deciding to reduce the bullion value of the dollar; this is done by reducing the weight to 312 grams but without altering the fineness. The detailed facts are clearly stated by Mr. Anthonisz, and the Colonial Government are to be congratulated on the skill with which they handled this delicate subject.

---

The Royal Commission on Shipping Rings has taken a great deal of interesting evidence, and is sending a committee of its members to make enquiries in South Africa. Shipping rings, like most other rings, are, as a rule, the result of keen competition which has brought down the rate of profit to a figure which makes it necessary for those concerned to consider whether they should abandon the business or take measures to mitigate the competition. The first step usual in such cases is to form a ring, the members of which agree among themselves not to do business below an agreed figure, and when outsiders try to cut into the business, the ring protects itself by the above system, and, if necessary, by cutting down their rates to a figure at which the outsiders can only go on at a loss. The competition then becomes a question of endurance and length of purse, and the result is always that the outsider either forces the ring to admit him to membership or abandons the struggle. In either case rates are put up to their old figure or perhaps higher to recoup the ring for their losses during the struggle.

---

The monopoly acquired by the ring may be used harshly, and in any case it is only human nature that complaints should be made against a body that controls the situation. On the other hand, there is a considerable amount of evidence that merchants are willing to put up with the high rates because they are fixed. This consideration, however, does not appeal to the Government or the

public which eventually has to pay, and it is not surprising that in many parts agitations are going on against the rates charged by conference lines. The favourite suggestion is that deferred rebates, given on condition that the shipper uses no other line, should be made illegal; but it is very doubtful whether this would break up the combination, whose strength rests mostly on their financial resources and complete organization of trade. This is shown by the failure of all schemes for state-owned or merchant-owned steamship services. Such ideas have a great fascination for Colonial publics, but, to say nothing of the special skill and experience which the working of such services requires, it would be extremely difficult for either the state or a combination of merchants to collect business enough to support regular sailings. The Australian proposal for a state-owned line appears to have collapsed.

---

We do not presume to anticipate the finding of the Royal Commission by expressing any opinion as to whether rebates should be prohibited, but in any case there are two practical grievances which seem remediable. It is a great annoyance to merchants, and eventually to both producers and consumers, when, as frequently happens, rates are put up with practically no notice. Legislative provision might be made to require that reasonable notice should be given, and arrangements made for the discussion of such matters by ship-owners and merchants together. Secondly, it is not fair or in the long run beneficial to the consumer that shipowners should themselves send in goods, "on ship's account," at a lower rate than is charged to the merchants, and if this is done, it should at any rate be required that proper notice should be given.

---

We print a forcible rejoinder by Mr. Eyre Hutson to the contention that Canada's consuming power is not sufficient now, and cannot for many years be sufficient to cope with the producing power of the West Indies. The increase in Canada's consumption of tropical products in the last few years is very remarkable. The United States will always be a naturally handy market for fresh fruit and vegetables, but Canada's demands for more durable produce will grow fast, and will be more reliable than those of the United States. The expansion of Canada and the Panama Canal, which will at once put the West Indies in a similar position as regards the entrépot trade to that occupied in the Mediterranean by Gibraltar and Malta, are the two great factors in the future prosperity of the West Indies.

An illustration of the improvement in the West Indies is supplied by the statements of the Revenue and Expenditure for 1906-07, of the five Presidencies included in the Colony of the Leeward Islands, which show that the position of the Colony on the 31st March last, was far more satisfactory than it has been for several years past. Of the five Presidencies, Antigua, which is still staggering under debt charges amounting to nearly £7,000 a year, was the only Presidency that closed its accounts of the last financial year with a deficit, and that deficit, instead of being £5,572, as was anticipated when the Estimates for 1906-07 were framed, was only £1,031. On the financial transactions of last year the Presidency of St. Kitts-Nevis showed a surplus of £3,546, the Presidency of Dominica a surplus of £3,094, the Presidency of Montserrat a surplus of £1,681, and the Presidency of the Virgin Islands a surplus of £393. After deducting Antigua's deficit from the surpluses of the other Presidencies for the year 1906-07, there remained a surplus of £7,683 in favour of Revenue over Expenditure in the last financial year, taking the Colony as a whole. On the 1st April, 1907, the Presidency of St. Kitts-Nevis had a surplus of assets over liabilities of £12,577, Dominica a surplus of £5,353, and the Virgin Islands a surplus of £451, and, if the present satisfactory indications of the prospects of the five Presidencies are fulfilled during the current financial year, the position of the Colony will be still more favourable on the 31st March, 1908. There is reason even for hoping that Antigua may be able, for the first time for many years, to make its local revenue sufficient to meet its local expenditure.

---

A different picture is unfortunately presented by the affairs of St. Helena, where the 3,500 inhabitants are feeling acutely the loss of trade and the withdrawal of the garrison. An attempt will be made to relieve them by re-establishing the flax industry there. The "New Zealand flax" which grows there is a kind of hemp, and hopes are entertained that a good profit will be yielded by the industry. A grant of about £4,000 has been made by Parliament, and with this sum buildings and machinery can be provided and wages paid till some fibre can be placed on the London market. Mr. Fulton, the leading fibre expert in New Zealand, has been to the island to start the undertaking, to which we trust the steamship companies will be kind. A further grant of £470 has been made to send out a lady expert to teach lace-making to the women and girls. It is greatly to be hoped that these industries will be successful and compensate for the withdrawal of the garrison, but some time must elapse before substantial results can be achieved.

---

The Colonial Office has often been charged with ignorance of the Colonies ; but it is satisfactory to find that the *Natal Witness* knows all about the Colonial Office. We take the liberty of reproducing its description :—

“The Colonial Office—except during the term of office of Mr. Chamberlain—was the archetype of Dickens’ Circumlocution Office. It was a warm nest for the younger sons of the aristocracy who could not be feathered in the more comfortable incubation of the Foreign Office. It had men in charge of Colonial departments whose knowledge of the territories assigned to their care was only added to at brief intervals when an eyeglass was requisitioned to survey the map with the view of finding out where the ‘demmed place’ really was. After Mr. Chamberlain’s departure from the Colonial Office, tried men, like Lord Elgin, and untried men, like Mr. Winston Churchill, assumed the reins of guidance. The reins, providentially, fell into good hands, but the working staff of the Colonial Office remained the same, and the interests of the Colonies were retained in the hands of gentlemen who occasionally prepared minutes in the short time allowed them by rides in the Park, an hour or two at the club, and evenings spent in dinners, receptions and fashionable gatherings to which Colonists were only admitted on sufferance.

“The heads of departments in the Colonial Office are tried and good men, but the rank and file are merely butterflies of fashion.”

This description we are sure has nowhere received more cordial appreciation than within the walls of the warm nest of butterflies in Downing Street.

---

## IMPERIAL ORGANIZATION.

So much has been spoken and written on the subject of Mr. Deakin's proposal for the establishment, in connection with the Imperial Conference, of a Permanent Secretariat wholly distinct from and independent of the Colonial Office that it may seem a superfluous task to re-open a discussion already inordinately protracted. But although a rich chorus of lamentation has been aroused by the failure of the Australian Premier to induce the Conference to accept his proposals in anything like their original form, very little effort has been made to appreciate either the principle underlying the scheme, or the reasons which led to its rejection. Was it merely the want of sympathy on the part of the Home Government, and the determination of the Secretary of State for the Colonies to cling to an obsolete prerogative, that frustrated Mr. Deakin's efforts? If this be the correct view, it is a remarkable circumstance that in a policy of mere obstruction the Home Government should have found such ready accomplices in Sir Wilfrid Laurier and General Botha; but a cursory reading of the proceedings of the Conference makes it clear that this view is wholly incorrect. The real objection to the constitution of a Secretariat on the lines proposed by Mr. Deakin is the impossibility, clearly pointed out by Sir Wilfrid Laurier, of reconciling it with the principle of ministerial responsibility which, throughout the British dominions, is the central principle of every self-governing community. There is no Imperial Minister to which such a department could be made subordinate; no Imperial Cabinet to which such a minister could belong; no Imperial Parliament, representative of all the self-governing dominions, to which such a Cabinet could be responsible; no Imperial electorate on whose votes such a Parliament could depend. In a word, the scheme presupposes the existence of a system of Imperial Federation. Mr. Deakin, of course, did not go so far as this; he did not suggest, and probably would not admit, that Imperial Federation was even the ultimate goal at which he aimed. But the Australian Premier is a statesman

with progressive ideals ; he spoke of his scheme as a comparatively humble beginning which was to lead to greater things ; and assuming the essential characteristics of the scheme as he outlined it to have been accepted, it is not easy to see how it could have developed along any other line.

The idea of Imperial Federation is one which has long exercised a powerful attraction over thinkers of very different political schools, and it is possible to marshal an impressive array of arguments in its favour. The political theorist may argue upon abstract grounds that it is impossible for the organization of the British Empire to remain in a state of rest ; that there are both centripetal and centrifugal tendencies constantly at work within it, and that unless the former be encouraged the latter will, sooner or latter, win the day. And in support of this abstract argument a number of striking historical parallels can be adduced. The two principles can be shown in conflict in the history of the German Empire and of the United States of America, as well as in that of our own Dominion of Canada and Commonwealth of Australia, and the moral and material advantages of closer union can be convincingly illustrated in each of these cases. Lord Selborne's recent memorandum on the advantages of federation in South Africa is a notable instance of the force with which this method of argument can be employed, and in Mr. F. S. Oliver's brilliant essay on Alexander Hamilton, it is expressly applied to the question of the general organization of the Empire as a whole. And, on a somewhat lower plane of argument, nothing is easier than to demonstrate the inconveniences of our present system. There is a variety of subjects on which it is desirable that there should be uniform legislation throughout the Empire, and in most cases there is no vital interest standing in the way of such uniformity. The obstacle is the existence of a number of legislatures, each jealous of its independence. It is possible that in many cases the different Prime Ministers of the Empire could come to an agreement as to the lines on which legislation should proceed ; but they are unable to commit their respective legislatures in advance, and measures cannot be introduced into any British Parliament with an intimation that they must be passed unaltered, because they represent the outcome of an agreement between the self-governing dominions. Thus the convenient uniformity of legislation which is possible under the more mechanical Crown Colony system, by which the passage of a "model" Ordinance through a dozen different legislatures can be safely ensured, remains for the more important parts of the Empire an unattainable ideal. But neither abstract theories as to the necessity of either consolidation or disintegration of the British Empire taking place, nor parables preached on the text of foreign experience, nor practical considerations as to the advantages of an orderly and symmetrical machine, are likely to exercise a determining influence upon the

development of our Imperial institutions. The political instinct of Great Britain has always been independent and even impatient of strict logic, and this characteristic attaches, certainly not less strongly, to the Colonies. Statesmen must face the task of imperial organization, not as doctrinaire purveyors of constitutions, but as men able to weigh and appraise the practical sentiment operative throughout the different members of the Empire. At the present time that sentiment is unmistakably one of local independence. One of the forms which it takes is a desire to get rid of all traces of the period which preceded self-government. The old name of "Colony," as Lord Elgin noted with regret in his speech at the Corona Club dinner, is becoming unpopular, and such titles as Dominion, Commonwealth, and State are replacing it. There is a tendency to view with suspicion the functions of the Colonial Office as a medium of imperial communication, because the Colonial Office still "governs" to a considerable extent the Crown Colonies and Dependencies which have not attained to self-government, and is credited, rightly or wrongly, with an occasional disposition to treat the self-governing "dominions" in the same spirit. But the sentiment of local independence goes very much further than a desire to shake off any assertion of control by Great Britain. It is a fact, and a fact which was emphasized by one premier after another at the Conference, that control by a central Imperial Council would be regarded as not less intolerable; and this fact is the obstacle, for the present clearly insuperable, which every scheme of Imperial Federation has to encounter.

Is it reasonable or accurate to describe this sentiment as it exists to-day in Canada, in Australasia and in South Africa by such words as "centrifugal" or "separatist"? Can it fairly be compared with the sentiment animating some of the American States before the adoption of the constitution,—the sentiment against which Hamilton fought and against which Lincoln was to fight years afterwards? Is it the same thing as the sentiment which postponed federation in Canada and Australia, and may perhaps postpone it in South Africa? To such questions the attitude of the leading Colonial statesmen constitutes in itself a sufficient answer. The imperial sentiment is strongest and most vigorous in those in whom the sentiment of local independence is most fully developed. There is no psychological anomaly in this, for local and imperial patriotism spring from the same root of sentiment, and it would be ridiculous to marvel at the existence in the Canadian and the Australian of a habit of mind which is accepted as natural and inevitable in the Welshman and the Scotchman. But it is not a matter of sentiment only: it is founded upon a practical consideration of the utmost importance, which differentiates the question of the federation of the British Empire as a whole from those other cases of federation which have been mentioned. For the

citizen of a Canadian province, the questions which the Dominion Government has the power to decide are of far greater importance than those which are within the competence of the provincial government; and the same statement may be made, though with considerable qualifications, with regard to the governments of the Commonwealth and the Australian states. But if the relation of the British Empire, as a whole, to its constituent parts be considered, the position will be found to be reversed. If an Imperial Council or an Imperial Parliament were to be established, the matters with which it might deal would certainly be of less direct importance to an Englishman than those which would remain within the sphere of the British Parliament, and the position is the same for the Canadian, the Australian and the South African. The fiscal question, the land question, the education question, questions of social and industrial organization, the question of the churches, the question of state ownership versus private enterprise—all these are matters of the utmost importance to the ordinary citizen in his daily life and are, and must remain, wholly within the competence of local Parliaments, as distinct from any possible Imperial Council; and to whatever lengths Imperial organization may be carried, it must be recognised as inevitable that Imperial questions properly so-called are never likely to provoke the keen and passionate interest which will naturally attach to local politics. For this reason a strong and highly centralized federal government for the British dominions is unthinkable, and the best energies and abilities of its constituent populations are always likely to be concentrated upon the settlement of their own problems, rather than in the furtherance of the interests of the Empire at large. So long as men's minds are deflected in the pursuit of an unattainable Utopia, no progress is likely to be made with the solution of the real problem, that of converting a loose affiliation into a closely-knit alliance, in which an interchange of experience, a readiness to compromise conflicting interests and a strong sentiment of union are normal features. This, no doubt, is the problem which Mr. Deakin set himself to solve, but the particular solution which he proposed seemed to lead, if anywhere, towards that Utopia which can never be attained. The scheme which the Conference ultimately accepted—for a Secretariat charged under the direction of the Secretary of State for the Colonies with the duty of obtaining information and conducting correspondence—is modest and unambitious; but it is a first step which will never have to be retraced, and it is better to proceed cautiously only so far as the path is clear, than to enter upon doubtful experiments whose failure would prejudice the cause which they are intended to promote.

An incident of Mr. Deakin's proposals was his criticism of the Colonial Office, which he was anxious to displace from its position

as the medium of communication between the self-governing Dominions and the Home Government. The principle which he sought to establish was that the Governments of those Dominions should discuss matters with the British Government upon a footing of equality. He regarded the "intervention" of the Colonial Office as detracting from this principle, and therefore sought to obtain direct access to the Prime Minister. The competency, or incompetency, of the Colonial Office was not the question at issue. Mr. Deakin disclaimed all hostility towards it, and Sir Wilfrid Laurier and Sir Joseph Ward went out of their way to pay it compliments, possibly more generous than its performances warranted. But it is difficult to see how Mr. Deakin's views in the matter could well have been met. The complicated task of Government can hardly be carried on otherwise than through the machinery of departments. When France and Germany negotiate with Great Britain they negotiate as Government with Government upon a footing of complete equality. But they do not approach His Majesty's Government as a whole, or the Prime Minister as representing it: they approach the Foreign Office. Almost precisely similar are the functions which the Colonial Office performs in its relations with the self-governing dominions. It is a specialized department, devoted to one particular branch of the immensely varied business which the British Government has to conduct. It is merely the mouthpiece of the British Government, and in no sense an independent entity, any more than the Commonwealth Department of External Affairs is independent of the Commonwealth Government. To set it aside would be to leave the British Government without means at its disposal for dealing systematically and thoroughly with Colonial affairs. Nor can the proposal be more favourably regarded if it is held to mean only that the Prime Minister should take personal charge of the department dealing with the relation of his Government to the self-governing dominions. Sir Henry Campbell-Bannerman intimated that he was not prepared to accept such a re-arrangement, and Sir Wilfrid Laurier expressed his entire agreement. The severe criticism which was directed against Lord Salisbury only a few years ago for holding at the same time the posts of Prime Minister and Foreign Secretary sufficiently indicates the unsoundness of the proposal: when, as now, the Prime Minister is in the House of Commons, it would be clearly unworkable. But there are indications that the real grievance is the combination in a single department of work connected with the Crown Colonies and that connected with the self-governing dominions. Mr. Deakin, at the outset, urged that the Colonial Office should in the future be what it was at the commencement, simply the office for the Crown Colonies. His view was that the self-governing Colonies suffered from the demands made by the Crown Colonies on the attention of

the Secretary of State for the Colonies. But it can hardly be thought that this evil, if it exists, would be removed by adding the task of controlling our relations with British North America, Australasia and South Africa to the duties of an already overburdened Premier; and the logical method of removing the grievance would apparently be, not to do without any Colonial Secretary, but to have two Colonial Secretaries. This would be a heroic and expensive measure, hardly likely to commend itself to the British taxpayer, and it has the attendant disadvantage that neither of the two Ministers would have enough important work to occupy his time. Provided that the status of the self-governing dominions is on all occasions frankly recognized by the Home Government, and that this recognition is sufficiently emphatic and ungrudging to allay any possible feeling of suspicion or sensitiveness overseas, Mr. Deakin's objects will be attained more completely and more easily than they could be by any mere change of machinery.

## THE STORY OF THE PACIFIC CABLE.

THE idea of a trans-Pacific cable followed naturally the laying of the Trans-Continental line of telegraph across Canada, which was undertaken in conjunction with the building of the Canadian Pacific Railway. Seven years before the road was opened from Montreal to Vancouver, Mr. Sandford Fleming, the Engineer-in-Chief of the whole line, submitted a scheme for an all-British route to Australia and thence to South Africa, and it is believed that Lord Beaconsfield was much impressed with the idea. The route projected by Mr. Fleming was a northern one, by way of the Aleutian Islands to Japan, where the line would join the Eastern Company's system. At that time there was little definite information about the Pacific Ocean, and the great distances and depths appeared to present insuperable obstacles to a direct route to Australia. The successful construction, in 1902, of the cable by the direct route showed that engineering foresight and skill could triumph over these difficulties. But it took several years of discussion and correspondence before the authorities could come to a decision, and in that time electrical science made advances which greatly facilitated the project. The story of the negotiations shows the gradual simplification of the engineering difficulties. It also shows the growth of the desire of the Mother Country and the Colonies to combine together in an enterprise, the leading feature of which was that it would bind them more closely together.

The scheme sprang into prominence at the first Colonial Conference held in 1887. A definite proposal was made on behalf of a projected "Pacific Telegraph Company." They proposed a cable by a direct route, the through rate from England to Australia to be 4s. a word, and they asked for a subsidy of £75,000 a year for 25 years. The Canadian Government expressed its willingness to pay one-tenth of the subsidy. The Conference, however, had not the material for weighing the merit of the proposal, and contented itself with resolutions that the cable was a project of general importance to the Empire, and that every doubt as to its practicability should, without delay, be set at rest by a thorough and exhaustive survey.

For some years after the Conference a somewhat desultory correspondence dragged itself along without any real progress. This case can be cited as an argument for some special machinery for carrying on inquiries and negotiations between the Companies. It is clearly impossible for a Conference to collect facts from all quarters and to conduct the correspondence which is necessary before the case is ripe for judgment. This must be done in the intervals, and it is a great gain to have it provided that the work shall be somebody's business. The thorough survey recommended by the Conference was never undertaken. The Home Government appeared to assume that the Colonial Governments should find the money. The Canadian Government proposed to send Commissioners to discuss the whole subject with Australia, but various difficulties occurred, one being the prospect of federation, and nothing was done for several years. In 1893 the Canadian Minister of Trade (the Hon. M. Bowell), accompanied by Mr. Sandford Fleming, visited Australia, and the Ottawa Conference of 1894 was the result of this mission.

In the meantime the Eastern Companies had greatly strengthened their position, as against the Pacific project. At the time of the first Conference their ordinary rates per unit were from 9s. 4d. to Victoria to 10s. 6d. to New Zealand. These high rates were a chronic source of dissatisfaction, and although the Pacific scheme was based by its advocates more on general considerations of an imperial character than on its being a competitor with the Eastern lines, it appealed to a large public as likely to effect a substantial reduction of the charges. There were, furthermore, occasional interruptions ascribed to volcanic action on the Eastern lines, which indicated the advantage of having another line by a wholly different route. The Companies took steps to fortify themselves in both respects.

In 1889, after an interruption of twelve days on the single line between Sydney and Nelson, New Zealand, they proposed to duplicate it. They at first asked for an assurance that they would be secured against any competition not necessary, with a due regard to the public interest, provided they dealt efficiently with the traffic, but very soon afterwards they decided to duplicate the cable without waiting for an answer to this application. They also triplicated the communication between Australia and Java by connecting Western Australia with Java. In the following year they proposed that the charges for telegrams should be reduced by about one-half, on condition that a certain revenue should be guaranteed, and the deficit, if any, halved between the parties. It was supposed that this guarantee would mean a payment of £54,000 a year by the guaranteeing governments. The advocates of the Pacific cable at once took up arms against this proposal. It was obvious that its acceptance would be a serious blow to their project. The Imperial Government declined without delay to join in the guarantee, but on the general principle that they would

only subsidize submarine cables for political or strategical reasons. Six of the seven Australasian Colonies agreed, and the rate was reduced to 4s. In the first year of the guarantee the payment made by the Colonies was £55,040, and in the second £43,558; in view of this loss the Colonies then asked the Companies to increase the rate to 4s. 9d., which was done in 1893. It may be added that afterwards there was no deficit and therefore no call upon the Colonies.

In 1892 the Associated Chambers of Commerce of the United Kingdom took up the flagging movement by a resolution, "That, in the opinion of this Association, the extension of direct telegraphic communication between the component parts of the British Empire will facilitate defence, promote trade and investments, emphasize community of interests, and generally stimulate the development and consolidation of the Empire." They received, however, no encouragement from the Colonial Office, which replied that there did not seem to be any indication, having regard to the magnitude and corresponding cost of the enterprise, that the project could be arrived at with any prospect of success. In the following year, however, some solicitude was shown for the project. This was due to the action of Queensland and New South Wales in countenancing and subsidizing a French cable between Australia and New Caledonia. Australia was doing a useful trade in sending supplies to the French colony and a cable was wanted, but there was good reason to believe that this cable was intended to be the first section of a trans-Pacific line. England might hold that she had no particular interest in establishing a Pacific cable, but if there was to be one it was clearly desirable that it should be under her control. Thus there entered into the case a new element of competition, and the action of the two Australian colonies was accordingly viewed with some apprehension. The Secretary of State wrote to them that, while regarding with satisfaction the telegraphic concessions of Australia with New Caledonia, Her Majesty's Government could not but view with regret the action taken, as it implied a "departure from principles with regard to Colonial cohesion and the consideration of Imperial interests to which prominence was given in the discussions of the Colonial Conference of 1887," and diminished the chance of the assistance of the two Colonies in laying any future cable "passing through British possessions or protected territory, and avoiding the possessions of European Powers."

On the other hand the Colonial Office received about the same time a discouraging report on the project from the General Post Office. This department considered that, to secure even the moderate working speed of 12 words a minute, the cable must have a core of 940 lbs. copper and 940 lbs. gutta-percha to the knot over the Vancouver-Fanning section, and they estimated the cost of manufacturing and laying this section at about £600 per knot, or £2,374,200

and that of the whole cable at £2,924,000. They added that it might well be doubted whether, with existing appliances, the Vancouver-Fanning section could be either laid or maintained. They put the possible revenue, at first and for many years, at not more than £70,000 a year, and the expense at £227,164, leaving a deficit of £157,164.

The Colonial Office had also before it a report received from the Admiralty, which indicated that no support would be given by that office. Looked at from an Admiralty point of view, the report stated, the sole advantage of a submarine cable across the Pacific would be the power of communication with ships at Honolulu and the Fijis and surrounding groups. This advantage, it was observed, could not be considered as great in peace time, and would not appear to be important in time of war, as the Fijis were the sole possession affected. The report made no reference to the fact that the cable would give an alternative route to Australia and New Zealand, and that some value might be ascribed to it in case of interruptions in time of war on the Eastern lines. Possibly the Admiralty might have been less discouraging if there had not been another cable project under consideration in which they took a stronger interest. This was a scheme of the Eastern Companies for laying another cable to South Africa, not along the West Coast, where, owing to volcanic and other forces, interruptions were not infrequent, but out at sea via St. Helena and Ascension. For this work a subsidy was at first asked for and favoured by the Admiralty; eventually it was carried out (with some difference in the route) by the Companies without assistance.

From a commercial point of view it was by no means clear that it would be to the interest of the United Kingdom to procure the laying of a cable across the Pacific. England was the telegraph exchange of the world. It was the centre of all the great lines of communication. To the westward the telegraph lines came to a dead stop on the western side of the continent of North and South America, and in the opposite direction they terminated in Australasia, and on the coasts of Annam, China, Japan and Asiatic Russia. This position gave the merchants of England an advantage over their rivals in every other part of the world. Thus, in particular, if there was any business to be done in the far East, the English merchant could hear of it before his American competitor.

No one foresaw that within a few years political events would invest the shores of the Northern Pacific on either side with such importance that the extension of the cable system to this ocean would be a matter of course. The prospect of any line joining America and the East was extremely remote. The cable from San Francisco to the Hawaiian Islands was hardly talked of till 1890. The construction of a cable from Canada to Australia, which would

at once open up communication between the East and America via Australia and invite an extension from the mid Pacific to the East appeared to jeopardize the advantageous position of England.

Not only did it appear to be in opposition to the commercial interests of the Mother Country to give a subsidy for a cable across the Pacific, but the whole procedure was contrary to the practice of the Imperial Government. Nowhere had the Government subsidised a cable to a British possession which was already provided with an efficient means of telegraphic communication. The subsidies paid for the cables to Bermuda, the Seychelles, and Mauritius were for the purpose of establishing telegraphic communication where there was none before. It was a very different matter to subsidise a cable to compete with those of the Eastern Extension Telegraph Company. It was argued with no little force that it would be unfair for the Government to undertake or assist an opposition to a service which had been established by private enterprise and which was efficient.

Practically no progress was made until arrangements were made about the end of 1893 for the holding of a Conference at Ottawa, at which the cable scheme was to be one of the principal subjects of discussion. Possibly in view of this understanding Sir John Pender, on behalf of the companies, approached the Colonial Office with an offer to co-operate with the Home and Colonial Governments in carrying out the work if the necessary subsidies were forthcoming. He estimated the annual sum which would be required (for a cable via Honolulu) at about £200,000.

A Conference held at Wellington, New Zealand, in the spring of 1894, put the matter in a more favourable light, and shortly afterwards the Marquess of Ripon, writing to the India Office, said that he would view with satisfaction the establishment of the cable if it should appear after the meeting in Ottawa that the representatives of the Colonial Governments considered the project feasible. He made the important statement that, while it was natural that Sir J. Pender and others financially interested in the existing cables should view with disfavour a project of a competitive character, that fact alone would not in his opinion justify Her Majesty's Government in withholding such support as might be prudent and possible from a line binding together that large portion of the empire which was interested in the scheme. This pronouncement finally decided the attitude of the Colonial Office on the point of competition with private enterprise.

At the Ottawa Conference in 1894 a resolution in favour of the scheme was passed, and the Canadian Government were requested to make inquiries as to the cost. Tenders were accordingly invited, and the answers were very encouraging. This result led to the appointment of a Committee which sat at the Colonial Office in 1896,

and ascertained that a cable of a type recommended by Lord Kelvin could be laid for £1,517,000—a very much smaller sum than had been contemplated by General Post Office. This type, for the long section between Vancouver and Fanning Island, had a core of 552 lbs. copper and 368 lbs. gutta-percha, and no little diversity of opinion was shown by the experts as to the carrying capacity of such a line, their estimates varying from 63 to 80 letters a minute. The result of the Committee's recommendations was, that the Colonial Office informed the Colonies that Her Majesty's Government was willing to offer an annual subsidy of five-eighteenths of the deficit, the amount so paid not to exceed £20,000, and the line to be constructed and provided for by the Canadian and Australasian Governments. It was observed that Her Majesty's Government considered that the cable was a matter of much greater importance to the Colonies than to the United Kingdom, and that they would not have been disposed to recommend Parliament to aid it but for their desire to afford the support of the Mother Country in a project the success of which could not fail to promote Imperial unity. The Colonies, however, did not like this proposal, which did not place the Home Government on the same footing in the matter as the Colonies. They argued, and with force, that the principle of joint ownership and control was the keynote of all the negotiations. They also pointed out that, if the United Kingdom did not join in raising the capital, the cost of doing so would be greatly increased. These objections proved effective, and in July, 1899, the Home Government agreed to co-operate fully with the Colonies. The arrangement was that the Home Government should provide a capital sum of £2,000,000, for which the sum of £77,544. 18s. 0d. was to be paid yearly by the undertaking for interest and sinking fund; any deficit was to be made up by the contributing parties in the following proportions: England, five-eighteenths; Canada, five-eighteenths; Australia, six-eighteenths; and New Zealand, two-eighteenths.

When this decision became known, the Eastern companies took a strong step—they offered to reduce the rates immediately to 4s. a word on ordinary messages (3s. on Government and to 1s. 6d. on press messages), and to make further reductions to 3s. 6d., 3s., and 2s. 6d., if certain average receipts were obtained. They also offered to lay a cable from Australia to South Africa. The consideration wanted for these terms was, that the companies should be allowed to open offices in Australia for the reception and delivery of telegrams—a power which they did not possess at the time, as the Government held the monopoly of such business. It was clear that, if these reductions were carried out, the Pacific charges would have to follow suit, and that a through rate of 3s. would probably be necessary. Another committee sat (in 1900) to consider the position. They

estimated the deficit at £54,000 a year, on the basis of a 3s. rate, and observed that the commercial object of the project was the reduction of the rate, and that the saving to the public from a reduction of the rate from 4s. 9d. to 3s. would be about £200,000 a year on the then traffic. They estimated that the traffic would amount to 960,000 words, and the revenue to £96,000. The consulting engineers (Messrs. Clark, Forde and Taylor) recommended, as a more economical distribution of material, a core of 600 lbs. copper and 340 gutta-percha for the longest section, with lighter and cheaper cables for the shorter sections. Tenders were again invited on the footing, with the result that the Telegraph Construction and Maintenance Company made the most favourable offer, their figure being £1,795,000. The price of gutta-percha had risen very considerably, and one tenderer rather plaintively stated that since the issue of the form of tender, practically the whole of the gutta-percha suitable for the cable had been taken off the market: no doubt the Construction Company had taken time by the forelock. The previous estimates were therefore substantially exceeded, but under the circumstances the tender was a satisfactory one, and was accepted about the end of 1900. The cable was laid without a hitch, and was opened for traffic in 1902.

The results, from an engineering point of view, have been extremely good. The best hopes as to the reliability and speed of the cable have been borne out to the full. No fault or interruption has occurred in the long section to Fanning Island—or on any other—and there is good reason to conclude that the cable, except where it necessarily traverses shallow waters, lies safely embedded in the primeval ooze, far below the limits of borers and such destructive life. The deeper the water the softer the bottom, and the more of the globigerina ooze the longer the cable will last: great depth, in fact, is almost a guarantee of safety. For the shore ends and all lengths in shallow water the cable has, of course, been specially strengthened to resist as far as practicable the destructive influences it must necessarily encounter. The working has also proved very satisfactory. Without going into technicalities, it will be enough to instance that the result of a test match in Australia reached London over the Pacific Cable in eleven minutes after stumps were drawn, and was automatically telegraphed to every London evening paper within ten seconds. The message was handed in at the office in Sydney at 2.40 a.m., and was delivered in London at 2.43½: it traversed a route of 14,566 miles, at an average rate of 4,162 miles per minute. This beat all records. The message in this transit was received and retransmitted five times at intermediate stations, and it goes without saying that it is dealt with on these occasions with breathless zeal. The operators are the pick of their profession, and it is their marvellous quickness and accuracy, saving every fraction of

a second, that makes such performances possible. To them an important occasion has the exhilaration of a sport, and great is the joy of knocking something off the record.

The receipts have increased from £80,118 in 1903-4 to £113,516 in 1906-7. This seems to show a satisfactory rate of development, but some disappointment has been felt that the cable has so far failed to obtain, in competition with the Eastern lines, one-half of the Australasian traffic. The Pacific Cable Committee of 1899 did not anticipate that it would, but put the share of the cable at between one-half and one-third of the whole traffic. The share actually obtained has been less than one-third. The statistics indicate the explanation clearly. New Zealand has diverted to the Pacific some 78 per cent. of its traffic, but Australia only about 21 per cent. ; Queensland gives a whole-hearted support, but in Victoria and New South Wales the results have been disappointing. This was due to the right which the Eastern Companies acquired by the agreement of 1901 and subsequent arrangements to open their own offices in those two colonies, and to the energetic use which they made of that right. The concession, in fact, altered the position by giving the Eastern Companies a valuable privilege and the Pacific cable suffered accordingly. So much criticism was excited by the matter that the Secretary of State held a conference in 1905 to consider the position. If the enterprise had been a private one, it might have been argued with great force that it was wrong for any one of the partners, after being committed to the scheme, to lessen the chances of its success by giving a new privilege to its competitor ; but in a public matter the convenience of the public is the strongest factor, and the inducement from this point of view to New South Wales to accept the offer of the Eastern Companies was very great. In any case, the thing being done, there was nothing for it but for the Pacific Cable Board to come to terms with the Eastern Companies or to fight them by opening competing offices at Melbourne and Sydney, or to obtain the closing of the Companies' offices. Some informal negotiations took place, but led to nothing, and the Board eventually decided to open an office in Sydney. In Melbourne, the Federal Government had the power to close the Companies' office, and did so, leaving the Post Office to act equally for both the Pacific and the Eastern routes. It may reasonably be anticipated that these steps, taken in 1906, will result in a larger share of the traffic being secured.

The expenditure, which has been very steady, was in 1906-1907 £168,439 ; this includes not only interest and sinking fund on the capital, but a renewal account of £33,000, so that really a double provision is being made for the replacement of the cable when necessary. The deficit on this footing was £54,923, of which £15,256—a substantially lower figure than, as shown above, was originally contemplated—fell to England. Taking the £33,000 as

a profit set aside, it would be very satisfactory if the difference between this sum and the above deficit could be swept away by an increase of traffic. When it is considered that the line passes practically from end to end with very little intermediate traffic, such a result would be no small achievement.

Looking back upon the story, it is clear that it was the high rates originally charged by the Eastern Companies that led to the Pacific cable. No great support was even given to the scheme by the military experts. Substantially, it was a commercial enterprise. It is easy to criticise after the event, and want of enterprise or decision is the last thing that any one would attribute to the managers of the Eastern lines; but it is certainly more than possible that, if the reduction which they ultimately made had been made a year or two earlier, the Pacific line would never have been made. As it was they were made at the eleventh hour, too late to stop the project. It is a difficult matter to launch a Government scheme, but it is by no means easy to stop it when launched.

The public—mostly financial and commercial—which uses the cables, has gained greatly by the result. There has been a permanent increase of communication and a permanent reduction of rates at a comparatively small expense. On the other hand, it may be argued that the cable is a direct interference with prior private enterprise, that it does not pay, and is only run at a loss both to the proprietors and the competitive lines. The subject of such interference is an interesting one academically, but when it comes to a specific scheme there is little chance of discussion on academic lines; the matter is settled one way or the other on its own merits, according to the magnitude of the public interests involved. In this case there was not only the cheapening of the rates to be considered, but also the completion of a "round-the-world" chain of cables, giving the security of an additional route which lies remote from any risks which might affect the Eastern. That these risks are not imaginary is shown by the recent breakdown of all three cables between Banjowangie and Australia. What the effect strategically would be of the cutting of the Eastern lines in case of a great European war, if there were no alternative route, is beyond our calculations; it is enough to say that if, as is fairly certain, the lines were cut somewhere, the result commercially would be disastrous.

We cannot close this short review without a reference to the labours of the late Chairman of the Board, Sir Spencer Walpole, who died in July. He showed throughout a clear grasp of all the facts and figures which had to be considered. He spared no pains and overlooked no detail. He endeared himself to his colleagues and the staff by his fine personal qualities. He had seen politics from the inside, officially and socially, and had decided views of his own, and whatever he had to say was said with a tact and earnestness which went far to convince. His loss is deeply regretted.

## EMIGRATION AND THE EMIGRANTS' INFORMATION OFFICE.

IN the years 1884-6, there was a good deal of distress among the working classes, and much pressure was put upon the Government to encourage emigration. The Government ultimately declined to give a subsidy for this purpose, but decided to open an office at which intending emigrants could get information and guidance. Thus the Emigrants' Information Office was opened in October, 1886.

This office, unlike the generality of emigration agencies, has no special interest in any particular place. It is there to spread information and to answer questions, and this it does on a big scale—thus 335,000 free circulars were distributed last year. But it has no propaganda. It does not directly either encourage or discourage emigration, but aims only at giving facts in an impartial manner. Practically, however, its function of spreading information which can be and is relied on, has a great effect, and has operated in the direction of diverting to the Colonies much emigration that would otherwise have gone elsewhere. From time to time it has issued warnings against emigration to certain places (*e.g.*, recently, Brazil), which are quite unsuitable for the ordinary emigrant, or where the demand is temporary and exceptional, as when caused by a strike.

The general advantages of our Colonies, such as the community of race and language and the similarity of institutions, are kept steadily in view, and any special attractions, such as grants of land to settlers, are put prominently forward. The enquirer knows that the facts given are free from colouring and misrepresentation; he goes out with a knowledge of what he has to meet, and if he is disappointed, he cannot at any rate excuse himself on the ground that he has been misled. The feeling of confidence in the accuracy of the information given is of great service to the Colonies.

It is always difficult to estimate the effect of any one influence when there are others at work, and of course the efforts and growth of the Colonies themselves are the principal consideration. Also the circumstances which promote or retard emigration as a whole, are beyond any government agency. But selection is no doubt very

appreciably affected by the office's pamphlets and circulars. At the present time there is good reason to be satisfied, from the point of view of the Colonies, with the general trend of emigration. In 1880, out of a total emigration from the United Kingdom of 180,535 there went to the United States 140,052; in 1906, out of a total of 194,671, only 85,941. In 1880, only 16,214 persons went to British North America; in 1905 and 1906, we need hardly say for the first time, the number exceeded that to the United States. Great strides are now being made by Australia, the number having risen from 3,693 in 1903 to 9,920 in 1906; but we are still a long way from the figures of the eighties, where they rose to 64,420 (1883), and there is good reason to anticipate that the present development will go on. The only cloud is that which at present hangs over South Africa, where the figures, which stood at about 28,000 in 1902 and 1903, came down in 1906 to 3,160. The war left the country with a large floating population which could not be immediately absorbed.

Some correspondence on emigration was laid before the Imperial Conference, and shows that the Australian States generally are encouraging emigration by opening government land for selection. The practical difficulty is to secure that immigration will be followed by colonisation. In Australia it is considered that labourers can only be absorbed in a proportion of about four to each farmer provided with capital enough for his purposes, and farmers with capital are not easily obtained. This is one of the difficulties of state-aided emigration. It encourages many persons to go out who are, in the actual circumstances, undesirable. Sir Joseph Ward put this very plainly at the Conference. New Zealand will not go with anything like a wholesale scheme of immigration with state aid. But they give a grant of £10 towards the passage of a selected emigrant, and under this system 6,632 persons came to the colony in two years and brought with them the sum of £275,000. They are satisfied with this healthy and steady progress, and with good reason, for they "have not known the meaning of unemployed in the ordinary sense for many years."

In sub-tropical countries the question arises how far agricultural and other labour can be carried on by Europeans. Australia wishes to substitute white for Kanaka labour on the Queensland sugar plantations, and it is of course much to be hoped that white men will find it possible to do the work. New arrivals will find the work of harvesting very trying, but Mr. Deakin pointed out that the cane-cutting would be varied by work of a much less trying character during the rest of the year further south. Much of the rural labour in Australia is nomadic, the shearers travelling from the north right down to Victoria. On the other hand, Dr. Jameson said that in South Africa the experiment of trying to get white men to do the

work now done by black labour had been tried and failed. He gave as an instance the case of navvies imported from this country. Several hundreds were sent out at one time to work on the Central South African Railways, and they were found unsatisfactory and were sent back. The incident however does not appear to us to prove much. These men are habitually employed here from day to day and under close supervision; in South Africa they were engaged for a year, and, as might have been expected, they took advantage of this circumstance. The position of a labourer under a private employer is very different. General Botha made it clear that he was entirely in harmony with Mr. Deakin in the desire to encourage white immigration. "We think," he said, "we can have a population of millions of people." Irrigation is the prime necessity for a movement in this direction.

One thing stands out clearly from the mass of official literature on the subject, and that is that successful emigration must be in connection with the going concerns of the Colony; the emigrant must mix in its life and be absorbed naturally into his proper place. There is a long list of colonisation schemes in the sense of special settlements in selected districts, but, in spite of the pains that have been lavished on these projects and the suitability of the settlers for agricultural work, they have lamentably failed. Apparently these cut and dried schemes do not fit in with the spirit of independence of many British emigrants, and pioneering work is not to every one's taste; in any case men drift away and the scheme fails. Furthermore, the majority of emigrants are unfit to take up land for themselves immediately on arrival. Some experience of local conditions should be acquired on existing farms. When a large number of families are taken away from this country and dumped down in a strange region to make their way as best they can, it is probable that they will soon find their way to more settled parts. It is not surprising therefore that such settlements as that of the Highland crofters at Saltcoats in Canada practically disappear after a time, and if this happens in the case of men from the country it is of course sure to happen with town-bred men. This is in short the objection to such large schemes of organised emigration as that advocated by Mr. Rider Haggard.

But organization is required, and on a large scale, to advise, assist and take charge of individual emigrants. The emigration societies have been greatly extended and improved of recent years. They select carefully, assist generally, make arrangements carefully, and keep up a sympathetic correspondence which has a most beneficial moral effect. The work is largely a labour of love, and because it is so is effective for good. If any financial help is forthcoming, whether from the state or the philanthropist, it should be on the basis of encouraging and relying on these bodies. The Canadian and

Australian governments have also organized agencies which have shown remarkable energy and judgment.

It is, however, very doubtful whether any state aid is desirable or justifiable, unless under very exceptional circumstances. The chronic distress which exists in our large towns is due to deep-seated causes, which would not be removed by emigration. It is not the weak-minded and the feeble-bodied who would go. Any artificial influence would simply take away some of the healthy and enterprising men and women, and no one supposes that their removal would cause the rest to level up. Emigration is rather for the benefit of the individual than of the state, and is best left, as a rule, to the wishes of the individual and the assistance of the colonial and philanthropic agencies. Severe distress in a particular trade or locality may call for special action, but the evil is usually temporary, and would rarely justify the expenditure of national funds.

To the large number of men who are willing to emigrate and suitable for the career our colonies are an immense benefit. Not only do they find there great possibilities and a more wholesome life, but, as Mr. Deakin said at the Conference, "they will find government, business relations and social conditions much nearer to those they have left than they can hope to find anywhere else." And apart from the main sources of emigration, there is a considerable amount of employment in the Crown Colonies of artisans who are engaged for more or less short periods. In any large engineering shop at home there is usually someone who has crossed the seas to the east or the west to erect or run machinery. All these experiences help to widen the range and enrich the ideas of the working classes.

## BRITISH MANUFACTURES IN COLONIAL MARKETS.

WHENEVER there is any appearance of British trade losing ground in the Colonies, the Board of Trade is on the alert, ready to give the statistics, point out the articles which the enterprising foreigner is selling with increasing success, and indicate to the manufacturer at home the supplies which he is neglecting. A recent instance of this activity is the report (Cd. 3,639) on the conditions and prospects of British trade in Australia, based upon information collected by the Board's commissioner, Mr. R. J. Jeffray.

The report points out in a very lucid way that much of the falling off in British exports, as compared with foreign, is due to the fact that many foreign goods, which were formerly sent to London to be shipped to Australia and thus swelled the totals of so-called British exports, are now, in consequence of improved shipping facilities, sent direct from continental ports. In 1905 an attempt was made to distinguish between the totals shipped and the articles of which the United Kingdom was the country of origin, and it was shown that our actual share was about 15 per cent. less than our apparent share. Probably the direct shipment of goods from the country of origin will increase, and this is a factor to be reckoned with in considering whether British-made goods are holding their ground.

Nevertheless it is clear that, while the progress of foreign trade in Australia in comparison with ours has been exaggerated, there has been a greater growth than ours has enjoyed. The result of the enquiry, however, is that on the whole the British manufacturer has maintained his position against the foreigner in the chief staple lines; it is in the miscellaneous requirements, mostly cheap qualities, that he fails, and this chiefly because he does not study the local conditions so carefully as the American and the German. What is wanted is greater adaptability and attention to small details.

The home manufacturer might reply to this criticism that he cannot do everything, and that it pays him better to devote his attention to a big output of an article which is in great demand and commands a good price than to compete for requirements of a special

character. So long as the mills are fully occupied, as at present, this is sound enough. But it is bad policy in the long run to lose any market, and it is to be hoped that our manufacturers will not neglect the openings for goods designed with a view to local customs and convenience.

It is here that reports on colonial requirements may be very useful. The reporter should not be satisfied with stating general considerations and compiling statistics—more than half of the Report under review consists of arid tables of figures which no manufacturer will look at—but should indicate specifically what alterations are wanted in British goods to suit local conditions. This was done to a valuable extent in Mr. Jenkin's Report on the trades of South Africa, and in Mr. Whitham's on the textile trades. In these works, for instance, the types of popular axes and hammers, and of the printed cottons in general use, are explained and illustrated. We find nothing of this kind in the present Report, and the manufacturers therefore will obtain no definite instruction from it. Also we do not think that sufficient consideration has been given to the special advantages which in some cases the foreign manufacturer has, just as ours has in others. Thus mention is made that in fancy woollens a German cloth is successful, but it is well known that Saxony wool is a very high-class product and accounts for the goodness of some German blankets and rugs. In another place it is pointed out that the sales of some foreign papers are increasing, because the makers "will eagerly make what is required;" the explanation is perhaps rather that our manufacturers have no local material for certain special styles; thus, esparto grass has to be imported for some choice writing papers.

To make the requirements quite clear to the manufacturer the ideal course would be to have an exhibition room of patterns of the articles required. Exhibitions are almost invariably of things which the locality can produce, not of what is wanted elsewhere, and unfortunately the people abroad do not to any great extent see them. A pattern-room would be more useful to the manufacturer. The Government acts on this principle; it keeps here patterns of the articles which the Colonial and Indian Governments require, and the manufacturer goes to inspect them.

Speaking generally, what is required in textiles for Colonial use is brighter colour, more attractive design, and really fast dyes. The warm rains which occur in most of the Colonies are very trying to the dye, and though indigo is largely used there seems to be great difficulty in this country in making it really fast on cotton. The Germans are said to have an absolutely fast dye. This matter is of the first importance, as when the colour has begun to run the article looks bad, however good the material may be. Such tests as washing in water and soda or boiling are not severe enough to show that the

dye will resist long exposure to tropical weather. Our manufacturers might very well attempt to obtain the trade in "denims," now the usual material for the farming classes in Australia. In this line the Report states that the Americans have turned out "some magnificent cloth"; but we believe that the real secret of their success was they used suitable machinery for giving the material a surface dye, instead of dyeing the yarns.

In hardware the question is largely that of patterns. Much more trade could be done if this consideration were studied. Our manufacturers, however, should beware of selecting articles in which much wood is required, for in this respect the Americans have an advantage. But probably the detail which most requires improvement is packing. Manufacturers, who pay rail carriage here by weight, should remember that on ships freight is mostly charged by measurement. Packages should therefore be carefully designed, and should not be too large or too heavy for easy handling. The outside should be properly marked with an indication of the contents.

Much also depends on the tone of letters replying to complaints or inquiries. Offence is often given quite unintentionally by curt and unsympathetic answers. Some firms which put a great amount of energy and thought into their productions seem to relegate their correspondence to an inferior plane. It need surely hardly be remarked that this is a grave mistake, the more regrettable as for honesty and conscientiousness the British manufacturer maintains his high reputation everywhere.

## THE DEVELOPMENT OF NORTHERN NIGERIA.

It is seven years since H.M.'s Government took over the administration of the territories of the Royal Niger Company, and during that period their responsibilities have greatly increased. It is impossible in practice to limit policy in such countries to the requirements of the moment, and to take thought merely of the gradual extension of trade. Crime and disorder on the margin of the effective occupation are continually necessitating a step further. Thus we have now the burden of maintaining peace and order in a territory some 400 miles from north to south, and 600 from east to west. On the other hand one important object of taking over the administration from the Royal Niger Company—the effective opening of the river to general trade—has not been accomplished. It was hardly realized at the time of the transfer that the strength of the Company lay not so much in its administrative rights as in its commercial organization, its launches and its landing places. The monopoly which it had then it has continued to enjoy.

In the meantime a consideration has come prominently forward which makes the speedy utilization of these enormous territories a matter of the greatest importance. The cotton industry in this country, upon which it is estimated that ten million persons are more or less dependent, draws 85 per cent. of its raw material from America, and is frequently agitated by violent fluctuations of price which are caused partly by variations in the crop and partly by enormous gambling. In 1899 the American corn crop fell short of that of the previous year by  $1\frac{3}{4}$  million bales, and prices went up to a great height. All the mills went on short time and general distress followed. The moral was obvious. The risk of a shortcoming in America must be met by reducing the dependence on the supplies from that quarter; the predatory habits of New York and Liverpool gamblers must be countered by developing new areas of production within the British Empire. The Royal British Cotton Growing

Association was formed with this object, and considering the comparatively small fund at its disposal has done remarkably good work. The West Indies, West and South Africa, have all felt the impulse. In 1903 Lagos sent 500 bales; in the present year it will send 12,000; altogether West Africa will send about £200,000 worth. But the output required is so immense that the present performances can only be regarded as proof of ability to produce rather than as substantial achievements. Some new field must be found, and in the vast plains of Northern Nigeria the essential requisites are at hand for an enormous supply. The soil and climate are suitable, yielding a long and white staple; land is cheap and labour abundant. Sir A. L. Jones has recently stated that he owns about 100 square miles which had been given to him, and on which he had already commenced to grow cotton, and that the other day he refused an offer of 600,000 acres at one shilling an acre. These figures suggest the trading possibilities of the future.

To enable the administration of the territory to be carried on—to open up the country to the trader—to utilize the possibilities of the land as a source of cotton supply, it is necessary to construct a railway 400 miles long through the heart of Northern Nigeria. At present the inland provinces are cut off from the world. The trade of these Hausa states, such as it is, is with the distant Mediterranean shores. They are not accessible from the Niger. The highest point of this river to which there is throughout the year enough water for navigation must be the starting point of the railway. This point may be taken to be at Baro, where the river bends away to the west and away from the inland provinces. The river is fairly navigable so far: at Baro the depth at present is from 4 to 12 feet according to season, but dredging will be required not only at Baro but in many places below, to make the river passable for the trade that will come. Baro is seventy miles above Lokoja, which is some 300 miles from the coast. From Baro the line will run through Bida and near Zungeru to Zaria and Kano. It is contemplated that Zungeru will be reached by the end of 1909, Zaria in 1910, and Kano in 1911. It is believed that the line, on a 3 ft. 6 in. gauge, can be constructed at a cost not exceeding £3,000 a mile, on the footing that stations, quarters, plant and rolling-stock are to be added as may be possible, and that light bridges shall be laid in the first instance. The policy will be to construct the line as cheaply and quickly as possible and to improve it as resources admit when the traffic has begun. It was only possible to win consent to the undertaking on the understanding that construction was practicable at the above figure, and the Protectorate authorities can be relied upon to give the work that careful supervision on which expenditure so much depends. It is specially fortunate that Sir Percy Girouard, who constructed the Desert railway from Wady Halfa to Atbara at, we

believe, little over £2,000 per mile, excluding military labour, is at the head of affairs.

Thus the total cost of the line, including a dredger at £30,000, will be £1,230,000, and it may be anticipated that the requirements will be :—

					£
To the end of 1909	...	...	...	...	500,000
In 1910	...	...	...	...	430,000
In 1911	...	...	...	...	300,000

Side by side with this project is the extension of the Lagos railway, to the Niger at Jebba. The two schemes have to a certain extent been regarded as rival alternatives, but this was mainly on financial grounds; each stands on its own merit topographically. The idea now is to connect the Lagos line with the Northern Nigerian by an extension from Jebba to Zungeru. The bulk of North Nigerian trade would however no doubt continue to go to Baro and down the Niger. In the meantime the section Ibadan to Iwo, (30 miles) was opened in October last; the extension to Oshogbo, the 185 miles point, has made satisfactory progress; and a reconnaissance survey has been made to Zungeru. Up to Zungeru, the two routes—the Lagos and the Niger—will be in competition with one another, and, perhaps, if everything that has happened could have been foreseen a few years ago, a different scheme would have been adopted, but there is room for both. The Niger may be made navigable up to Baro for vessels drawing 12 feet, and which could make the voyage from England; but this would only be for a limited part of the year. The solution of the difficulty may eventually be found in the extension of the line from Baro to the Cross River.

The railways in other parts of West Africa are too young yet to be fairly judged, but the results are so far satisfactory and encouraging. In the Gold Coast, a net profit is anticipated this year of £87,000, equivalent to  $4\frac{1}{2}$  per cent. on the outlay. To this, of course, should be added the increased customs revenue and the mining royalties due to the facilities afforded by the railway; the royalties alone amount to about £50,000 a year, and the revenue has increased by 150 per cent. in ten years. The Lagos railway already yields 2 per cent. on the cost, and taking into account the additional customs duties, may reasonably be considered to be a paying concern. In Sierra Leone it is estimated that there will be this year a net profit of £14,000, and £20,000 additional customs receipts due to the line, which then yields  $3\frac{1}{2}$  per cent. By way of comparison we may observe that the French Government have recently provided no less than £6,400,000 for the development of their West African Colonies.

The reconnaissance survey from Jebba to Zungeru was carried out early this year by Mr. S. G. Brounger, who found the country so favourable as to admit of the construction of a direct line with a maximum gradient of 1 in 80 and moderate works. The distance is about 120 miles. Mr. Brounger in a very readable report states that the line would run through a well-watered and fertile country capable of growing practically anything. Cultivation has been, in times gone by, carried on to a vast extent, but the population is sparse, and the inhabitants, who are Nupés, are proverbially an indolent race. They are, however, tillers of the soil, and it is probable that under British rule the population will again increase in the course of many years and that agriculture may again flourish.

The crops grown at present consist chiefly of yams, Guinea corn, cassava, Indian corn (mealies), sweet potatoes and cotton; while patches of peppers (chillies), indigo and rice, are occasionally met with. A considerable quantity of palm wine, and native beer made from Guinea corn, is produced for home consumption, and many of the chiefs and monied men are said to indulge somewhat freely in these intoxicating liquors.

As a general rule, however, drunkenness is absent, and the people are quiet, friendly, and well disposed, as far as a white man can judge of the intricacies of the native mind.

As regards natural products, Shea butter trees abound from Jebba to Zungeru, and only require labour in sufficient quantities to deal with them. At present probably 95 per cent. of the shea nuts are allowed to go to waste. Palms and bananas occur in considerable quantities, and tamarind trees were occasionally seen.

The country abounds in game, the tracks of a very great variety having been met with daily in large numbers. Bush cow (buffalo), roan antelope, kob, harness antelope, duikers, and many others occur in great numbers, while bush fowl and at least two other varieties of partridge, as well as sand grouse, and numberless guinea fowl were constantly seen (and shot). Leopard, pig and hyenas also occur in considerable numbers, and here and there lions exist, but they are few and far between.

A curious case of natural history may be cited from the report. At one place Mr. Brounger found a stream "which must extend underground for a considerable distance, and open out into pools of some size and depth; for many crocodiles, held sacred by the natives, make their home in these unexplored depths, and constantly come out and sun themselves in the adjacent pool from which the natives draw their water. These reptiles are perfectly tame, harmless, and familiar, and upon any sunny afternoon, men, women, children and crocodiles may be seen freely disporting themselves in the pools, and though I never saw one of the latter more than about five feet in

length, I was told that much larger ones are often met with, and that they are upon as friendly terms with the people as their smaller brethren."

Mr. Bronger also made a reconnaissance survey of the river Niger between Jebba and Baro, and seems to prove conclusively the impracticability of crossing the Niger by a bridge at any point other than Jebba. He describes the valley of the river between Lokoja and Jebba as one vast swamp extending for miles on either side of the normal channel. Jebba is the only point where there is fairly high ground on both sides. This conclusion would of course apply also to a ferry.

## BRITISH AND FRENCH METHODS IN WEST AFRICA.

"*La Situation Economique de Afrique Occidentale Anglaise et Française*," par EMILE BAILLAUD. (A. CHALLAMEL, Paris, 1907.)

"*La Politique Indigene de l'Angleterre en Afrique Occidentale*," par EMILE BAILLAUD.

("*Annales des Sciences Politiques*." November 15th, 1906).

ADMINISTRATIVE methods in the British Colonies of West Africa have recently formed the subject of several reviews in the Journals devoted by the French to their colonial interests. It is interesting, if not always agreeable, to see ourselves as others see us. There is, however, nothing disagreeable in the two works just published by Monsieur Emile Baillaud, Special Commissioner of the French Government, who has given, as the result of his observations during several years spent in tropical Africa, some unique comparisons between British and French systems of Government there.

The following quotation from "*La Situation Economique de l'Afrique Occidentale*" affords an index to the unprejudiced tone of the author's criticisms: "Nothing distinguishes more completely the English method of administration and that of the French colonies than the extensive employment by the British of their 'educated natives,' while among ourselves practically all the administrative work of the Colonies is done by whites, and natives are not employed in any office higher than those of interpreters and copyists. This results from the fact that, although we have natives who are as well educated as those employed as civil servants in the British Colonies, our system is much more complicated than that adopted by the English . . . Their financial organization is as simple as ours is complicated."

In British West Africa, natives are employed in comparatively highly paid clerical posts in the Secretariat and Treasury, and in some cases as inspectors of schools, district commissioners, medical officers, and in appointments of importance and responsibility in the

Customs and Post Office. This results in a substantial difference in the expenditure of the Colonies under the head of European Staff, but Monsieur Baillaud finds that although the English Colonies employ fewer white officials, the average rate of salary is considerably higher than that obtaining on the French Civil Staff. In 1905, French officials to the number of 1,660 accounted for £392,693, whereas the estimates of the British Colonies provided for 895, at a cost of £435,334. Moreover, British white officials are given four months' leave clear in England, on full salary, after each year of residential service, while French officials receive six months' leave after twenty months' service, on half pay.

On the other hand it will be remembered that a large part of the early development of French West Africa was carried out under a military régime, and many public works were executed under the superintendence of non-commissioned officers of Engineer Corps, whose rates of pay and conditions of service would not compare in actual cost with those of the foremen and artizans engaged in England and sent out for similar works in the British Colonies.

Under the head of "Health and Sanitation," Monsieur Baillaud admits that ". . . the service is much more complete than in our Colonies." He notices that there were 149 doctors provided for in the estimates of the British West African Colonies in 1905, as against 49 in the French, and the British expenditure under this head was stated at £135,572, as against only £50,857 in the French budget.

In "*La Politique Indigene de l'Angleterre en Afrique Occidentale*" (which is the summary of an extensive report not yet published), Monsieur Baillaud discourses upon the general results of Great Britain's occupation of West Africa. He begins by considering the paradoxical fact that ". . . a large part of West Africa has been occupied by England almost—so to speak—in spite of herself." He says that our West African possessions were secured to us mainly by the treaties of British trading companies, by the efforts of some determined officials, and perhaps also by our fear from time to time of incursions by other European powers. At the same time he recognises the debt that France owes to the British explorers and traders who first explored and partly opened up trade routes into the countries along the Senegal and Niger rivers, now under French dominion.

In this second pamphlet, Monsieur Baillaud gives a further series of comparisons, and has much to say on the subject of our policy towards the native. He is warm in his praises of the work of Governors like Sir William McGregor and Sir Frederick Lugard, and their policy of governing through the hereditary chiefs. At the same time he anticipates that difficulties may be experienced in the future, when there may be some dissatisfaction with the present form

of Legislative Council among the educated natives, who are likely to demand with each succeeding year a greater interest in the government of their country. This eventuality, he thinks, can never occur in this shape under the semi-military rule of France. This reliance on military rule, we may remark, seems far removed from an administrative ideal; and it may be doubted whether even the French system can keep permanently under repression the desire, which is bound in the long run to result from education and civilisation, to have a voice in the management of affairs. When that desire manifests itself the French system will lack the safety valve afforded by our Legislative and Native Councils.

In conclusion the author points to the necessity of greater unity of policy between European powers, especially in their attitude towards the native, and to the importance of modifying that policy as change of circumstances require. We may observe that a beginning has been made in this direction. The British and French Governments have arranged to communicate with one another as to any native questions which possess a common interest. He has a note of warning on the subject of the "Mohammedan peril." Islam, he argues, has over-ruled ancient tribal beliefs in a great part of the Western Soudan, and is an influence to be reckoned with even at the Coast, and it may some day form an instrument of revolt in the hands of discontented agitators. It might be replied that when Mohammedanism is associated with British systems of administration and civilisation it becomes a force making for tranquillity and industry.

There are many other points in Monsieur Baillaud's work which are worthy of notice. As a comparative study of French and English methods (in—as he remarks—the only country in the world where such a comparison is possible) it is unique, and we hope that the full report, of which the article under review is only a summary, may before long be published *in extenso*.

## A VIRGIN TROPICAL FOREST IN EAST AFRICA.

THE Colonial Office has issued a Report (Colonial Reports—Miscellaneous, No. 41) by Mr. D. E. Hutchins on the Kenia Forest in the East African Protectorate, which is of exceptional interest. Mr. Hutchins estimates the total value of this forest at no less than £23,000,000, and considers that the difficulties of transport are not sufficiently serious to hinder its profitable exploitation.

The cedar tree which abounds in this forest is of the largest and finest type in the world, and no doubt will before long be a valuable asset: it is the kind which is used for pencils. But the most valuable tree is the camphor, a tree of extraordinary durability. Mr. Hutchins recommends that one anna per cubic foot shall be charged by the Government for the more valuable trees, and half an anna for the others.

At a time when the end of the United States' timber supply is said to be in sight, and prices are ever going upwards, it may fairly be expected that the forest will soon begin to make its mark as a valuable asset. The following extracts will show its character:—

### *“ General Description.*

“The Kenia Forest is situated under the equator; the equator passes somewhere about mid-way through its northern half. The Kenia Forest extends in a belt some 287 miles long and eight miles broad entirely round the slopes of Mount Kenia. I compute the area of timber forest approximately at about one million acres, of which I have seen the southern half, or 500,000 acres. This forest is entirely extra-tropical in climate and character. It belongs to the dense evergreen class of forest commonly seen at high altitudes in the tropics. It is, in fact, the yellow-wood forest of South Africa with a larger number of trees to the acre and a large average size of tree. It is further enhanced in value, compared to the South African forest, by the addition of cedar (*Juniperus procera*) in the drier forest

## A Virgin Tropical Forest in East Africa. 151

and of Ibean camphor in the wetter forest. Everywhere, however, it preserves its general likeness to the indigenous forest of South Africa. The same forest which occurs at sea level (or near it) on the southern coast of Cape Colony; at 3,000 feet in Natal; and between 4,000 and 6,000 feet in the Transvaal, is seen between 6,000 and 9,000 feet on the slopes of Kenia and in British East Africa generally. Going towards the equator the number of species increases. This is not an advantage, but it is not a great disadvantage, as there is a general resemblance to one another among the Kenia hardwoods, and they are not excessively hard, as is the case in tropical forests. The indigenous yellow-wood forest of South Africa has been worked profitably for 200 years. Its total area in Cape Colony is under 500,000 acres.

"The best forest I saw was in the Embu country, on the southeastern slopes of Kenia. I understand that this fine forest is continued northward along the eastern slopes, where occurs the heaviest rainfall. It was through the Embu forest that a linear sample area was taken, right through the belt of forest. This Embu forest is the finest I have seen of its class; so close and dense is it that on entering the forest at noon it takes some minutes for the eye to become accustomed to the gloom, and one can walk about in this forest hatless at mid-day without inconvenience. The covert is generally good, and the trees lofty, while the soil is entirely clear of undergrowth, and covered with a carpet of dead leaves and humus. This clean forest soil I have seen nowhere else in the Protectorate. As soon as the best forest is past, undergrowth again becomes apparent.

"In the lower forest the number and variety of the trees is greater, but their stature less.

"In the upper forest, the trees suffer from the excessive wet, and are at first smaller with a larger proportion of diseased trees and a lesser number of species. Higher up, the number of species declines further, and most of the trees look unhealthy, being covered with moss and lichen. In places the moss and lichen are phenomenal. If there were a railway to Kenia the moss might be exported to South Africa. Considerable quantities of moss are now imported to South Africa from Europe. The moss is used for packing fruit trees and other purposes. Above the timber forest is the bamboo zone. Here at first there is timber interspersed with the bamboo (*Arundinaria alpina*). Then the timber becomes less and the growth of bamboo denser, until at about 8,500 feet the timber practically ceases. From here, up to the base of the cliffs and rocks of the snowy peak of Kenia, stretches a zone of dense, generally unbroken, bamboo.

"In Cape Colony forest similar to that in Kenia has been worked profitably for 200 years. It has been worked consecutively

for the last quarter of a century. It will be useful, therefore, to note that the stocking in the eastern forests of Cape Colony is estimated to amount now to an average of 1,200 cubic feet. In the Knysna forests, where the stock of exploitable timber is approaching exhaustion, the quantity of timber marked for felling has averaged 400 cubic feet per acre. The highest maximum recorded for small areas of virgin forest at the Cape and in Natal has been 10,000 cubic feet. Small areas, equal or surpassing these figures, could no doubt be found in the Kenia forest.

"The price of timber as it stands in the Cape forests has been valued at an average of 2·4d. per cubic foot; the best of it, stinkwood and snezewood, sells at 1s., "wagonwood" (certain hardwoods) at 4d., yellow-wood at 3d., and ironwood at 1d. per cubic foot. The rates vary in different forests, but these may be taken as average figures. Inferior timber in diseased trees is sold at half price, and timber in inaccessible localities at reduced rates. 2·4d. per cubic foot is probably the correct average figure. On the basis of an average value of 2·4d. per cubic foot, the timber in the Kenia forests is worth 2,300 cubic feet by 2·4d. = £23 per acre; and on the half million acres of forest in Southern Kenia, £11,500,000.

*"Total Value of the Kenia Timber.*

"The northern half of Kenia was not visited by me. Viewed from a distance one can see that the forest belt is continuous. The timber in it may be worth more or less than that in the southern part of the belt. In support of the view that it is worth more is the probability that it is drier and carries more cedar. It is in the portion of the Embu country not reached by me that native reports place the very best of the forest. On the other hand the width of the belt may be less if the climate is somewhat drier, as seems possible; or again, it may be broader on account of the absence of the forest-destroying Kikuyu.

"If we assume that the northern forest is, on the whole, equal to the southern forest, that would give a total of £23,000,000 as the total value of the timber in the Kenia forest.

"It is, of course, easy to reduce this figure if, with the distance from the coast, 2·4d. per cubic foot be considered too high.

"A railway from Mount Kenia viâ Fort Hall to the Uganda Railway at Nairobi would involve the construction of about 90 miles of railway. This would have easy gradients, but it would pass over comparatively dry and thinly-inhabited country. If a feasible track for a railway could be found from Kikuyu, on the Uganda Railway, along the foot of the Aberdare Range, it would traverse the remains of the once fine Aberdare Forest and the whole of the country occupied by the industrious Kikuyu, a people whose numbers are

estimated now roughly at  $1\frac{1}{2}$  millions, and who are rapidly increasing in numbers. The extraordinary development of native traffic that has occurred on some of the Indian railways will be remembered. As the crow flies, the distance by this route would be only 68 miles (Military Map 94—A). A railway along this route would act as a direct feeder in labour and provisions to the Kenia Forest, until local supplies were forthcoming in the equally fertile Kenia country. Before long there would probably be developed sufficient native traffic to pay interest on this line apart from the timber traffic. No part of the Uganda Railway, after it leaves the coast, traverses country so thickly populated as this. Lastly, this railway would be of the utmost importance to the scheme (discussed in my report on the forests of the Protectorate) for establishing a zone of white settlers along the base of the forest country between the forest and the natives. The timber in the Kenia Forest has been valued, assuming that a cubic foot be worth 2·4*l.* on an average, at £23,000,000. In view of these figures the cost of making a railway to Kenia becomes insignificant, and the forest affords a ready guarantee for the interest on the cost of making a railway.

“An alternative scheme to the railway would be to float the Kenia timber down the Tana River. This would involve some 200 miles of railway, of tramway, or operations required to render the Tana River floatable.

“For a distance of 340 miles from the coast there appears no difficulty in floating timber down the Tana River. I have the opinion of a competent engineer, who has seen this portion of the Tana River, that a floating scheme is quite practicable. I find, by experiment with the Kenia timbers, that all the common timber will, with the exception of black iron-wood, float in water when thoroughly air-dried; most of them float easily.

“At elevations varying from 6,000 to 8,000 feet the climate, though equatorial, is naturally temperate and healthy at all times of the year. During the ten days that I was encamped in the centre of the best forest on the southern side, temperatures were remarkably equable and pleasant—never rising above 70° nor sinking below 45°—a typically pleasant and invigorating extra-tropical climate. Outside the forest the temperatures are naturally less equable. There are bouts of sunshine wherein the shade temperature will go up to 80° Fahrenheit, while above 8,000 feet radiation frosts are observable on grass.

“It has been my fate to witness the success or failure of a host of industrial enterprises in South Africa and India, particularly mines. At the back of these enterprises lay the climatic factor, generally neglected at the outset, and often scantily recognised at the conclusion. It is safe to say that had the gold of the Rand occurred in the low veld there would have been no Johannesburg. In an

enterprise such as the working of the Kenia Forest, where not only European enterprise but European labour has to be employed, it is important to note exactly how far the climate is not only healthy, but suitable for European labour. On the next range of mountains, the Aberdare, separated only by 60 miles of plain from Kenia, is quite a successful small saw-mill run by the Italian Mission. Here there are five European mechanics from Northern Italy. All skilled labour at the mill is done by these men. They turn out excellent work, they all looked in robust health, and at my visit assured me they enjoyed the best of health.

“The pleasantest and most gorgeous climates are sometimes unhealthy. This is not the case in the Kenia Forest country. Fevers are unknown; I did not see or feel a mosquito during the whole of my stay, and never felt better in my life. Fever is unknown amongst either Europeans or natives. A roaring camp fire is an enjoyable luxury throughout the year. During the wet season camp life would be less pleasant and perhaps not healthy. In so fertile and rich a country, but withal damp, I should recommend the erection of substantial buildings of rough stone from the outset. With very cheap unskilled labour at hand, and stone in nearly every gully, such rough stone buildings are not costly. Iron buildings should be avoided as costly and unsuited to the climate. They are unwholesome in their heat by day and cold by night. During spells of damp, misty weather there is no reserve of warmth in an iron building, which is consequently damp and unhealthy. For the same reason an iron building is not even well suited for simply storage purposes, and should be entirely discarded. Iron should not be employed even for roofing. Excellent shingles can be made out of cedar, either split or sawn. Yellow-wood shingles have been used, but cedar is preferable. A shingle roof is cool by day and warm by night; and, though it looks infinitely better than corrugated iron, costs less.

“The general climatic effect of forest on water supply has been much discussed, and has, in recent years, been denied by a certain class of observers. It has been held that, although the water-holding power of humus and the forest soil was incontrovertible, the action of forest in increasing the rainfall was inappreciable. The only experimental proof sufficiently long continued to be of much value comes from Europe. These results will be found summarised in the recently published new edition of Dr. Schlich's classical *Manual of Forestry*, Vol. I. Reference should also be made to the review of the whole subject given in Dr. Hann's *Meteorology*. In Marsh's “*Man and Nature*” there is a critical review of a number of cases where, in warm climates the cutting down of forest has been followed by the loss of the water flowing from the forest, and in certain cases the water has been recovered by re-establishing the forest. On the

## A Virgin Tropical Forest in East Africa. 155

other hand, there is a class of forest, in certain extreme climates, which exhausts more water than it conserves. This is the case with the Eucalypt Forest of Australia, which has in consequence been destroyed over enormous areas by ringbarking.

“Without going into too much detail, it may be stated, that in every forest there is a water-conserving and a water-exhausting action; and it depends on circumstances—mainly climatic—which of these actions shall predominate. In the case of Eucalypt Forests in South Africa or in Australia we have rapid-growing trees making enormous demands on sub-soil moisture for their vegetative process. At the same time they are usually of a sparse open character giving free access to the bright sun and drying air of that climate. The forest has little or no action in checking evaporation at the surface of the soil, and all available sub-soil moisture is sucked up and dispersed into the arid atmosphere. This class of forest can stand long periods of drought in which the soil is practically quite dry. This forest makes little or no humus.

“The converse of this is the dense evergreen forest with a rich layer of humus, growing in a damp climate where there is little drain on sub-soil moisture. When, from any cause, the forest is slow-growing, and the vegetative process thus slow, the water conserving action is at a maximum. This is the case with the dense evergreen forest of South Africa; and, as I have already pointed out, the upland forest of the Protectorate is simply the northern extension of the South African forest. The water-conserving power of the indigenous forest of South Africa has long been recognised. Streams of water dry up when it is removed, and when roads are opened through this forest a broad belt has to be cut, or the road will remain wet and impossible to keep in good repair.

“The Kenia Forest represents all the conditions required for a good water-conserving area. It stands on the track of the endless procession of cloud borne from the Indian Ocean by the easterly winds which blow throughout the year; and it is of the class of forest which conserves sub-soil moisture the most, and exhausts it the least. The forest is rich in humus and decaying vegetation. It is the result of many experiments that humus is able to conserve and hold two-thirds its bulk and between two and three times its weight of water. What this means over so large an area as Kenia will readily be appreciated.”

## CANADA'S PURCHASING POWERS IN RELATION TO BRITISH WEST INDIAN PRODUCE.

IN an article published in *The Fortnightly Review*, for the month of July last, entitled "The Problem of the West Indies," the statement is made that the purchasing and consuming power of Canada is not sufficient now, and cannot for many years be sufficient to cope with the producing power of the West Indies. The term West Indies as used in the article refers to the British West Indies.

The following is a quotation from the article referred to :—

"The suggestion that Canada and the West Indies should conclude some such arrangement (a treaty of commercial reciprocity) is by no means a novel one, but there are serious objections to be urged against it. The purchasing and consuming power of Canada is not sufficient now, and cannot for many years be sufficient to cope with the producing power of the West Indies; and until the Dominion is in a position to take the whole of the Colonies' agricultural exports, the dread of precipitating a tariff war with the United States—a war which would spell complete ruin to the West Indies—causes many of the most thoughtful men who have been called upon to consider the proposal to deprecate the policy of Canadian reciprocity."

There is a good deal of misapprehension as to the quantities and value of Southern or tropical products imported into Canada annually and at the present date.

The following table prepared from the Board of Trade's Statistical Abstract for the year 1905, gives the value of Imports into Canada of products that can be grown or manufactured in the British West Indies. The years taken are 1898 and 1905, the latter being the latest year for which statistics are available. The year 1898 is selected, because it was shortly before that date that the

Canadian Government instituted the preferential tariff in favour of certain products originating from British possessions :—

Article.	1898. £	1905. £
Coffee ... ..	97,798	131,928
Cotton (raw and waste) ... ..	839,296	1,241,402
Fruit (green) ... ..	337,775	611,629
Rice ... ..	73,843	114,381
Hides and Skins (other than fur) Horns and Pelts ... ..	740,010	1,077,258
Salts ... ..	67,314	82,034
Sugar (except Maple) ... ..	1,080,455	2,034,502
Molasses ... ..	121,319	226,286
Tobacco (unmanufactured) ... ..	218,759	523,347
Tobacco (manufactured) including cigars, cigarettes and snuff ... ..	45,200	122,156
<b>TOTALS</b> ... ..	<b>£3,621,769</b>	<b>£6,134,923</b>

Increase in seven years £2,513,154.

The actual value of the Imports into Canada from the British West Indies for the same years was ... ..	1898.	1905.
	£148,823	£1,545,367
Increase in seven years	£1,396,544.	

The value of Imports into Canada from the West Indies <i>other than British</i> was	1898.	1905.
	£84,174	£137,291

If the value of the total Imports into Canada from the British West Indies for 1905, viz. : £1,545,367 be deducted from the total value of Southern products imported into Canada during that year, viz. : £6,134,923, there will be a balance of £4,589,556, which may be taken to be, roughly speaking, the value of such products imported into Canada during 1905, from sources other than the British West Indies.

As already stated, in the year 1905, the total value of Canadian imports of produce which could be exported from the British West Indies was £6,134,923, and with the exception of the value of a certain quantity of green fruit, other than tropical, this estimate may be taken to be fairly correct.

The total value of all Exports from the British West Indies to all countries, including bullion and specie, for the year 1905 was £9,969,722. In this amount is included the value of exports from British Guiana, British Honduras and Bermuda. The value of the total exports during that year to the United Kingdom was £2,905,573, that to other countries was £7,064,149, and comparing this latter figure with £6,134,923, the total importations into Canada

of what may be described as West Indian products, there is a balance of £929,226, which may be taken as representing the value of West Indian exports which in 1905 could not be purchased by Canada. On the other hand, however, it has been impossible with the statistics at my disposal to ascertain how much of the total amount of West Indian exports was bullion and specie. During the year 1905 the value of raw gold and diamonds exported from British Guiana was £352,031. This amount should be deducted from the £929,226 mentioned above. Nor has it been possible for me to estimate how much of the total value of exports from the West Indies was a re-exportation of imported goods, and therefore no part of the domestic and other produce of the various Colonies. Again, it has not been possible for me to state the value of rum imported into Canada from the West Indies. This article is not named in the Statistical Abstract Tables.

It is interesting to note that in 1905 the total quantity of sugar exported by the British West Indies was cwts. 5,000,715. Of this cwts. 1,209,029 was exported to the United Kingdom, leaving a balance of cwts. 3,791,686 exported to other countries.

The Canadian exportation of sugar (other than maple) during 1905 was cwts. 3,712,595. These statistics would appear to indicate that in 1905 the Canadian market was capable of purchasing practically the whole of the sugar exported by the British West Indies to countries other than to the United Kingdom.

The above figures may be accepted as a rough estimate of the capabilities of Canada in 1905 to purchase and consume the bulk of products that could be exported from the British West Indies. Canada's capabilities in that respect have increased since 1905 and are growing daily, while the powers of the British West Indies to increase the output of domestic produce is by no means in the same ratio. To take advantage of the Canadian demands, the Colonies in the West Indies would have to extend considerably the output of cotton, rice and tobacco.

EYRE HUTSON.

## RUBBER CULTIVATION IN CEYLON.

THE Ceylon Government has prepared for the use of the Emigrants' Information Office an account of the position and prospects of the rubber industry in the Colony. It is primarily intended for the benefit of persons in the United Kingdom who may think of settling in Ceylon, but will interest others who are concerned with this industry.

The account states that the cultivation of rubber-yielding plants (chiefly of the Para variety, or *Hevea Brasiliensis*) has attracted much attention in Ceylon during the past few years, and it is now estimated that there are from 115,000 to 120,000 acres planted with Para (mainly), Castilloa, Ceara or the Landolphia vine—against about 390,000 acres under tea; 34,000 planted with cacao, and about 680,000 acres under the cocoanut palm, the last mentioned chiefly in plantations and gardens owned by natives. Although rubber trees were shown to grow well and yield profitable returns in the local Botanic Gardens well-nigh twenty years ago, and a rubber planting manual was locally published, tea occupied attention so greatly that very few planters touched rubber before 1901, up to which year 2,500 acres in all were planted; by 1904 this was increased to 11,000; early in 1905 to 25,000 acres, and then came the "rush," which has led to about 120,000 acres being planted by the middle of 1907. There has been a similar development in the Federated Malay States; while in India, Burmah, Java and Borneo (apart from East and West Africa, Mexico, &c.) a considerable start has been made in rubber planting. Some authorities hold there is now some risk of "over-production," considering the supplies of wild rubber still remaining in South and Central America and in Africa. On the other hand, the uses to which rubber can be applied have so multiplied, the demand for motor and cycle tyres so increased, and the prospect is so good of the application of rubber to paving in residential squares, and even public streets if only the price was less, that other good authorities think a profitable demand is sure to equal the supply for many years to come.

In the case of the Ceylon planter it has been demonstrated that he can begin to harvest "latex" safely, when his trees are six years old, the yield increasing annually as a rule—each tree, judiciously planted, giving from 1 to 2 lbs.; prepared rubber worth 4s. to 5s. a lb.; 150 trees, say, to an acre yielding a crop worth £30 to £60 per annum, according to age, at a cost of £7. 10s. to £10; while the capital outlay on a plantation under favourable circumstances, for the first six years, including cost of land, should not exceed £30 per acre in all. In this way there is the possibility of all expenditure being got back by the close of the eighth year. Such is the result of actual experience in a small way up to date; for the total Ceylon annual exports have hitherto only been rising slowly from 2,792 lbs. in 1898 to 77,212 lbs. in 1904; but rising to 168,547 lbs. in 1905, 327,000 lbs. in 1906, and probably over 650,000 lbs., or say 300 tons, for 1907. When it is realised that the world's consumption of rubber is about 65,000 tons per annum, it will be seen that even if we add 600 tons for the Malay States' export this year, the total of both is only a drop in the bucket, now and probably for some years to come. The risks before the Ceylon planter have reference to disease in his trees (especially where large areas are rapidly planted), to a possible insufficiency of labour and occasional unfavourable climatic conditions. It must be remembered, too, that in tropical cultivation it is so often the "unexpected" that happens. Ceylon has had its great warnings in the past in the complete failure of its coffee-growing industry through a deadly fungus; and of cinchona, through too rapid planting, over production and lowering of price to an unprofitable limit. But cinchona barks only yielded a "medicine," the demand for which was necessarily very limited. The case of "rubber" in the markets of the world is very different; and canker and other troubles incidental to all planting have already been successfully dealt with, the scientific staff of the Peradeniya Botanical Gardens being ready to aid the Ceylon planter, as they have already done most successfully.

To young men with some capital, and still more to larger capitalists who can safely take some risk, there is undoubtedly still scope for investment in Ceylon, although suitable and easily accessible land for rubber planting is every year getting scarcer, and, from competition, dearer. Still, if experiments now being made in certain new districts prove a success, there may be considerable additions to the available land. Crown land is usually put up at 15 rupees an acre, and often rises at auction to 50, and even 60 or more rupees per acre, *i.e.*, to £4. Economically laid out, £20 to £30 more per acre should suffice to bring a plantation into bearing in six or seven years; and then if each 1 lb. of rubber only costs one shilling to produce, the investor can reckon for

himself the margin, even if the present price of rubber falls very considerably. To young men who wish to become rubber planters in Ceylon, the best advice is that they should, through a London or Colombo mercantile house or an ex-Ceylon resident (retired Civil Servant or Colonist), get an introduction to reliable, hardworking Ceylon estate managers, who would take them as pupils to be trained in return each for a fee (50 or more guineas, perhaps) and cost of board. During the period of training—1 to 1½ years—the young planter-capitalist can be on the look out for a block of land to purchase at the first convenient opportunity, and on which he can go to work on his own account when he feels himself qualified to do so. Or he may be able to enter into an advantageous partnership; or possibly he may prefer to take shares in a promising planting concern, he himself getting employment as a paid assistant or young manager after his training has been completed. No one can speculate with absolute safety on what the “rubber” developments may be in Ceylon during the next half-a-dozen years; but that there should be room for further profitable investment of capital, and scope for more young men of the right stamp—not afraid of work, well-educated, temperate, athletic—is very reasonable to anticipate.

### STAMPS (*continued.*)

SOME particulars as to the manufacture of the paper on which stamps are printed may be of interest to our readers. It is machine made, and watermarked by means of a private dandyroll, the cost of which in the case of the Crown Colonies has been defrayed by them in proportion to the amount of paper used by each.

The dandyroll is of the shape of a drum, about 6 inches in diameter and equal in length to the width of the paper. It is made of brass gauze and the emblems (which in the case of the Crown Colonies are C. A. and the Crown) are punched with steel dies out of sheet of brass, sewn on at intervals with fine brass wire. The paper is made from cuttings of Irish longcloth which is first reduced to its original condition before it was woven. The dandyroll passes over the pulp as soon as it has settled into the form of paper, and before the drying begins, and the local pressure of the above mentioned emblems marks the paper.

The dandyroll is kept locked up by an Inspector appointed by the Inland Revenue Department, except when it is actually in use. The paper made each day is counted by him and any made in excess of the order is retained in his custody until another order reaches the mills.

The paper is then sent to the Inspector at the Stamp Manufacturers' Works, and duly counted out to them as required in exchange for a receipt.

It is at this point that some of the paper is treated with the solution which produces the so-called chalky appearance. This is done to paper required for stamps printed in doubly fugitive ink, but not to that on which singly fugitive ink is used. The reason is that in the latter case this additional precaution is not required, as stamps printed in this ink are only intended to be proof against attempts to clean off cancellations applied by means of proper obliterating ink. It will thus be seen that stamps which are supposed by some people to differ only in respect of the presence or absence of a chalky surface differ also in the character of the ink employed for printing them. A chalky surface will never be found on a stamp which is not at

least partly printed in green, lilac or black, these being the double fugitive colours, and not always in these cases, and a practised eye is required to detect which ink has been employed. An example of this is to be found in the recent change to singly fugitive ink of the stamps of the Federated Malay States. The 4 and 10 cents. stamps are now printed in singly fugitive ink, and one printing of the 20 and 50 cents. stamps was made in similar ink, which has however again been abandoned in favour of doubly fugitive ink, and consequently chalk-surfaced paper for these two values.

The printing plates are "proved" on ordinary coloured paper without watermark, for no white paper is allowed on the works. The making ready occupies a considerable amount of time as the slightest inequality in the plate has to be compensated by "underlaying" and "overlaying." Underlaying is the insertion of paper between the printing plate and iron back and overlaying is the insertion of paper on the "drum" which carries the sheets of paper on to the printing plate.

The next difficulty to be overcome is the mixing of the colour or ink, so as to match the pattern stamp exactly. The trials have to be made on paper of the same kind as that which will be used for the stamps, as the slightest variation of the character of the paper affects the colour of the stamp. The printed sheets of stamps are eventually counted out to the firm for perforation. This is done by machines with a large number of accurately placed needles, each of which fits exactly into a bed, and it may easily be imagined that breakage of the needles is far from a rare occurrence. Indeed, a staff of workmen is perpetually attending to this one branch of the business.

The last process is the examination for flaws and for final counting. The quickness of the trained eye in detecting the slightest defects is most astonishing. An untrained eye may search long for the defect for which a sheet has been condemned. Of course one defect in a sheet of 240 or 120 stamps does not condemn the whole sheet. If it is one of 240 stamps only the quarter in which the offending stamp occurs is sacrificed, the remainder of the sheet being then divided into sheets of 60 stamps. Thus original sheets of stamps may be found to contain sometimes 240 and sometimes 60 stamps. The condemned sheets are destroyed by fire in the presence of the Inspector, who has to show that the sheets so destroyed, together with those passed by him, make up the total given out for the order.

A question that is often asked by philatelists is why many of the Colonies use  $\frac{1}{2}$ d., 1d. and  $2\frac{1}{2}$ d. stamps printed in colours other than those prescribed by the Postal Union Convention of Washington. It has been raised as recently as April of this year in *Gibbons' Stamp Weekly*. The answer may have been gathered from the last number of this Journal, but it may be worth while to give it more explicitly.

Until recently it was thought wiser to print stamps of all values in doubly fugitive ink, and unless coloured paper is used (the artistic effect of which is not quite satisfactory, the resulting colour not being very clear), part of each stamp must then be printed either in purple, black or green. The last-named colour suited the  $\frac{1}{2}$ d. duty, but the only way in which the red and blue colours could be introduced in the other two values was on the labels at the top and bottom of each stamp, the body of which was printed in doubly fugitive purple. This is still done in a few cases, but the Rome Postal Union Convention has made it obligatory for the prescribed colours to be followed as from 1st October, and the change will, we believe, be made as early as possible.

Another point which is of considerable interest to stamp collectors will be found in the provision of the Rome Convention that stamps of all values which are valid for the prepayment of postage on correspondence sent from one country of the Postal Union to another must, as from 1st October, bear their values in Arabic numerals. This, if strictly carried out, will involve a new issue of stamps in all cases in which the values are expressed in words. The first Colony to take definite action in this matter is Ceylon, where, however, the change will not take effect until March of next year, when five and six cents. stamps of the new pattern may be expected. The expense of complying strictly with this regulation will be considerable and will fall heavily upon the smaller Colonies, and the new plates will therefore only be made as opportunities occur.

A record of the principal changes in Colonial stamps will, we believe, be found useful, and we intend to give details of the changes which are made by the Colonies so far as they come to our knowledge.

---

1d. and  $2\frac{1}{2}$ d. stamps in the Postal Union colours have lately been supplied to ST. KITTS and the  $\frac{1}{2}$ d. value will follow suit when more of that value are required.

ST. LUCIA has ordered  $\frac{1}{2}$ d., 1d. and  $2\frac{1}{2}$ d. stamps in the Postal Union colours.

$2\frac{1}{2}$ d. stamps printed in two colours are being supplied to the TRANSVAAL for the last time. In future they will be printed in all blue. The number of 1d. stamps required annually by the Transvaal is so large that a fresh 240 set plate is being prepared for use with the existing plate, thus enabling the stamps to be supplied in sheets of 480.

Several corrections have been made in the Arms of MAURITIUS, necessitating a change in the existing issue of stamps in the early future.

Owing to alterations in connection with the local currency of the STRAITS SETTLEMENTS and the FEDERATED MALAY STATES the 3 cents. stamp will in both cases take the place of the 4 cents. stamp as the international equivalent of 10 centimes. It will therefore be printed in all red, and the 4 cents. Straits Settlements stamp will be in lilac, and that of the Federated Malay States will remain black and red as at present.

HONGKONG has ordered a stamp of a new value, *i.e.*, 6 cents. and CYPRUS one of 5 paras. The latter is, we think, the lowest value used by any of the Colonies, as 40 paras make up 1 piastre, the international equivalent of 1d.

$\frac{1}{2}$ d. TRINIDAD stamps may shortly be expected in singly fugitive ink.

The 8 cents. FEDERATED MALAY STATES stamps will in future be printed in all blue.

MONTSERAT has recently been supplied with 1d. and 5s. stamps on chalk surfaced paper with all-over watermark.

MAURITIUS 3 and 50 cents. stamps of the existing design, but on chalk surfaced all-over watermark paper are on order.

Two new Revenue stamps have been supplied to SEYCHELLES. They are of the existing revenue type, and the values are 50 cents. in lilac and sage green and Rs. 2·50 in green and black. Both are on chalk surfaced paper with all-over watermark.

The last supply of  $\frac{1}{2}$ d. and 1d. N. NIGERIA stamps in two colours has just been despatched. In future these values, and also the 2 $\frac{1}{2}$ d. value will be printed in the Postal Union colours.

It has been decided that the GRENADA postage and revenue stamps for 3d., 6d., 1s., 2s., 5s. and 10s. shall in future bear the Colony's badge, instead of, as hitherto, the King's head, and they will be surface printed with doubly fugitive inks, instead of copper plated.

## BUSINESS NOTES.

### Floating Docks.

A floating dock, ordered by the Trinidad Dock and Engineering Company, was sent on its way to Trinidad in July, and arrived safely, and as there is a growing demand for these contrivances, which in many places are more convenient than slipways, some particulars may be useful. The Trinidad dock has a lifting capacity of 4,000 tons, and an overall length of 365 feet. It consists of three independent units, each with its own pumping machinery. At the trial the two end sections were lowered, both having their points inwards, until deep enough to draw the ends, which had been previously fitted with timber blockings, under the floating centre section. The two sets of pumps fitted to the outer sections were then started, and the pontoons lifted until the decks of these sections were above the water and the underside of the centre section had been raised about 7 ft. 6 ins. above the decks of the end sections. The whole of the lifting operation was successfully carried out in fifty-five minutes. The dock was left in this position twenty hours without any change being observable in the flotation line. The valves were then opened and the dock lowered until the centre section was again afloat, when the end sections were raised and turned; the sections were then riveted together for the voyage to Trinidad. At a further trial the S.S. "Nembe," drawing 11 ft. 3 ins. of water, and having a dead weight of 3,100 tons, was satisfactorily docked. The dock was lowered until there was a depth of 13 ft. over the keel blocks when the vessel was warped over the centre of the dock, and the latter raised until the keel of the vessel rested on the keel blocks; the whole of the pumps were then started, and after 70 minutes' continuous pumping the vessel and dock were lifted until the deck of the latter was 3 ins. above water; the time thus occupied in lifting the vessel being less than the time contemplated by the contract for a vessel of this weight.

The contract price for this dock was £55,000.

---

The Company are to be congratulated on the perseverance which they have shown in the matter. They have obtained a certain

guarantee of interest from the Government—never an easy thing to do under any circumstances—but we trust that they will reap the fruits of their energy to an extent which will make the agreement a matter of form. From the graphic description given by the *Port of Spain Gazette* of the formal opening we gather that both the Company and the Government are resolved that the dock shall be a success, and that there shall be no chance of Trinidad being a “*statio malefida carinis*.”

---

The large floating dock at Forcados has been very successful, and it has been decided to provide a small one, lifting 400 tons, at Lagos, instead of completing the slipway. The cost will, it is anticipated, be about £12,500.

---

The Trinidad Coaling Company, in view of the facilities which will be afforded for repairs by the floating dock, have provided hulks and tugs to supply coal, water and other supplies promptly. They possess wireless telegraphic stations at Port of Spain and Tobago, and vessels equipped with the apparatus can have supplies got ready against their arrival.

---

#### Tanjong Pagar Tug.

The Tanjong Pagar Dock Board have given a striking instance of vigour and enterprise by building for themselves a tug and salvage steamer, which is the most powerful of her class in the East. The length over all is 128 feet, breadth moulded 25 feet, depth moulded 13 feet. The hull is built of steel throughout. There are two sets of triple expansion surface condensing engines developing about 1,100 I.H.P.

---

#### Mosquito Netting.

In a circular letter recently addressed to all Colonial Governments on the subject of wire gauze for excluding mosquitoes, the opinions of the principal medical officers were invited as to the size of mesh most suitable for use in tropical climates. The replies received show different views on the point, the mesh recommended varying as much as from 14 to 24 to the inch; but mostly they favour the use of a mesh of either 16 or 20 to the inch. While it is held that the former mesh is sufficiently fine to exclude the dangerous mosquito—the anopheles—the latter mesh appears to be necessary if the exclusion of all mosquitoes, sandflies, &c., is desired. The larger mesh, however, finds much favour owing to the better ventilation it affords.

Recent quotations for gauze of either 16 or 20 mesh are as follows:—

Brass wire gauze, 36 inches wide ... 3d. per sq. ft.

Tin wire gauze " " ... 1½d. "

Tin wire (tinned steel) is apt to rust quickly, and the brass is much more durable.

If these gauzes are not available, a cheap and effective substitute when the wind is not too strong, is to use varnished mosquito net, which lasts well if the varnishing is done when the net is quite dry. A mixture of petroleum and a strong lather of soap has been found efficacious in keeping off insects when no means of exclusion are procurable.

### Ammonia Refrigerating Machines.

Information about these machines is so often desired that we have obtained the following recommendations as to the type to be adopted:—

1. The machine should preferably work with a two stage compression in order that the difficulties of the tropical climate may be best overcome. The motive power should preferably be a steam engine driving on to the same crank shaft as the compressor, side by side (the tandem position compressor being driven by tailrod of steam cylinders is to be avoided except in the case of duplex machines). Any other drive, belt driven, direct or geared may, however, be employed, as best suiting the requirements of the Colony.

2. The ammonia condenser should be of the surface evaporative type, with circulating pump to keep the coils well covered with water. Refrigerating machines require a large quantity of water for their condensers, and this type is exceedingly economical of water. The coil surface should be large—certainly not less than 70 to 80 square feet per ton ice making capacity per 24 hours.

3. The area of the ammonia refrigerator coils should be the same as that of the ammonia condenser.

4. *Price* (approx.). Price is governed by ice making capacity. It may be taken roughly that for tropical work, the price would be about £300 to £350 per ton ice making per 24 hours (exclusive of steam engine and boiler or other motive power).

For work in temperate climates it would be about £200.

A liberal estimate of power required for working such plants would be 7 to 8 HP. per ton I.M. per 24 hours (tropical).

For large plants about 5 to 6 HP. (tropical) (say above 10 ton I.M. size).

For *Cold Storage Work*. It may be taken that one ton I.M. capacity per 24 hours will look after 10,000 cubic feet of *well insulated* chambers, when working day and night continuously.

5. *Cost of Working.*—Plants are worked in tropical climates at 5/- to 6/- per ton I.M. capacity per 24 hours including all full labour and water. These figures of course vary with the cost of these commodities, but ought not to be greatly exceeded.

---

### Lime-Burning.

A convenient kiln for this purpose will often save a government much expense, and in the West Indies and other places where sugar is grown it may be used for the making of "temper" lime, which is used very largely in the manufacture of sugar. The kilns used are of two sorts, one in which the calcium carbonate is in contact with the fuel, and one in which the products of combustion alone come into contact with the limestone, the resulting lime being of much better quality in the latter case. The fuel to be used may be of poor quality. The most economical kiln is continuous, but this is only suitable when a large output is wanted, say 20-25 tons per day. For a small output a discontinuous kiln, yielding about 50 tons per day, known as the "bottle" type, is suitable. It is built of ordinary stock brick and is lined at the lower zone with firebrick, and any ordinary builder can erect it, often without any imported materials, if provided with a plan.

---

### Patent Fuels.

The new fuel "coalite" is attracting a good deal of attention, and if it comes up to expectation as a steam-raiser will be very useful to the Colonies. The existing patent fuels, of which "Crown Preserved" is the favourite, are used by some governments. The caloric of these fuels is a little less than that of the best Welsh steam coal—say 7,300/7,400 as against 7,500/7,700; but, on the other hand, coal deteriorates quickly in hot climates and being friable often makes in use about 40 per cent. of small. The patent fuels lose nothing in weight, being solids, practically unaffected by atmospheric influences. There is no particular difference between the prices of coal and the patent fuels. For "coalite" a higher caloric value is claimed than is possessed by coal, but this is on the ground, not that it possesses more heat units, but because more of its calorific value is on combustion converted into sensible heat. This result, however, appears to have been obtained from an ordinary domestic grate, and much further experience is required for industrial purposes.

---

### Testing Petroleum.

An enquiry has been received whether apparatus can be obtained for testing the flashing point of petroleum. A suitable apparatus is Pensky-Martin's Flash Point Apparatus, list price £5. 5s. 0d. A book of directions is obtainable.

**Sprinkling Disinfectant.**

In Egypt and some of the Colonies there is a demand for an apparatus for sprinkling disinfectant, consisting of a cistern to be carried on the back, a pump to be worked by the right hand, and a nozzle and spray to be held in the left. It is used to destroy vermin in public buildings. It is made in France, and costs about 30s., and makers in this country might think about producing an article of the same sort.

---

**Root-clearing.**

Enquiries are occasionally made as to machines for removing the roots of trees, an operation which of course greatly improves the ground for agricultural purposes. In this country it is usually done by manual labour, gunpowder being sometimes used, but in a new country a more effective plan is desirable. Small scrub may be rolled down with a heavy roller and burnt. Trees are removed in Australia by a machine known as the "Forest Devil," a sort of capstan with block and tackle. There are two varieties, one hand, the other horse-power. There is also a hydraulic stump extractor, the cylinder of which, on the top of a tripod, is raised by the action of the pump and brings up the root: and an extractor worked mechanically with ratchet and hand. An American hand extractor is well spoken of, which is said to have a pulling strain of 20 tons, and costs about £10. In Canada a machine is made which raises the stump by means of a 3-in. double screw running through a metal cap supported by the legs; prices (without the wood-work) about \$57 to \$62 according to length.

---

**Preserving Steel Sleepers.**

We have seen an expert opinion that a pickling process would not help sleepers which have begun to rust, but the reverse, as it would be impossible to get rid of the acid. If compressed air is available, a wire brush fixed in an air drill or a sand blast can be used; the latter would be the more effective. A sand blast outfit would cost about £125, exclusive of the cost of a wooden hut in which the operation must be conducted, and the compressor, which would be about £160 (if belt driven). Both tanks should be used for coating sleepers and it would be better to warm them before letting in the liquor. One tank should be put higher than the other, so that pumping is only required in one direction.

Salt soil is the one thing that steel (or any iron) sleepers will not stand, and wood is probably preferable on such lengths.

---

**Roofing Materials for Hot Climates.**

This is a very important requisite, and there are many articles on the market, but it is doubtful whether any one possesses all the desiderata. The material should be waterproof, a non-conductor of

heat, light in weight, unbreakable, non-inflammable; it should not harbour insects or foul the rain-water, and should be cheap, easily fixed and durable.

Galvanized corrugated iron sheeting possesses all these qualifications except that of keeping out heat; where it is used a large air space should therefore be provided by a ceiling allowing a free circulation of air. It oxidises quickly near the sea and is hardly suitable in such a position; but generally speaking it is the best material in point of simplicity, cheapness and durability.

Tiles, of which there are some special varieties, such as "Broomhall" and "Kohler," are satisfactory generally, but are expensive and liable to be broken.

Tilestone is a kind of calcareous cement, made in the form of a powder and applied by mixing with water in the usual way. It is applied as a coating to ordinary roofing materials such as boarding, corrugated galvanized iron sheeting, or thatch. It forms a smooth and clean surface that offers no harbour for insects, is non-combustible, requires no skilled labour for its application, and a roof of either boarding or corrugated iron sheeting covered with Tilestonite is moderate as to weight and cost. It is claimed by the makers to be thoroughly waterproof and a non-conductor of heat. Of its durability we are unable to speak. Some buildings on the West African Government Railways were experimentally covered with Tilestonite and favourable reports were received of its capability for keeping out the heat.

Willesden canvas is light, unbreakable, easily fixed, and when painted offers a clean waterproof surface. It has, however, very little power in resisting heat, is inflammable and unless frequently painted soon deteriorates. On this account, although of moderate cost in the first instance, it cannot be considered a very cheap material. Its durability depends entirely upon the composition of the bedding and paint, and upon the care with which it is laid. It should be well bedded in a coat of thick white lead, and afterwards painted with three coats of good white lead paint without driers or adulterants. If this is done and it is kept periodically painted it may be made to last some considerable time.

McIlwraith's Broomloan Roofing Canvas is a strong unprepared canvas, and what has been said above with reference to the Willesden Canvas applies to this material. It is somewhat cheaper than Willesden Canvas in its first cost, but as it takes more paint to bed and cover the ultimate cost may be taken to be about the same.

McIlwraith's Prepared Flexible Roofing Canvas, No. 53, is a canvas of moderate substance, completely imbedded in a composition of oxidized oil and some pigment—apparently ochre—and is largely used for the roofing of railway carriages; it is very flexible, so does not readily crack. All that is necessary to preserve it is one bedding

coat of thick white lead to stop all joints and cracks in the boarding and two coats of white lead after laying. The remarks as to Willeeden Canvas apply to this. It is somewhat more expensive than the last two materials and requires more skill in laying, but it can be laid in less time. It is made in widths up to 10 ft. 6 ins.

Compressed Cork consists of small fragments of cork compressed together to form a slab—made in various thicknesses from  $\frac{3}{4}$  in. to  $2\frac{1}{2}$  ins.—and is applied by bedding it in cement on thin boarding and rendering the surface with a thin coat of Keene's or other suitable cement. This forms a covering impervious to water and with considerable power of excluding heat. It has a smooth clean surface, the cork slabs are not easily broken, and although in themselves combustible, used as above described, they could not be set on fire from the outside. It is rather expensive.

Asbestile is entirely of a mineral nature, being composed of Asbestos fibre and Silicate of Lime compressed into sheets—usually  $\frac{3}{16}$  in. thick, and for roofing purposes secured to battens or boarding with copper clips and nails. This is a new material which appears to be waterproof, it is a non-conductor of heat—so far as so thin a material can be—is light, not easily broken, non-combustible, will not harbour insects, presents a clean surface for the collection of rain-water, and is moderate as to cost. With regard to its durability we have no data upon which to form an opinion—except that a material which will resist the action of water and heat may be presumed to be durable. It is said to have stood well in positions exposed to very heavy rains. It is also made in sheets  $\frac{3}{16}$  in. thick. This thickness will still better keep out heat and is stronger, but it is somewhat expensive.

Uralite is a Russian invention. It is composed of the same mineral matter as Asbestile and is made of the same thickness,  $\frac{3}{16}$  in. It is a new manufacture in this country. To render it perfectly waterproof it requires to be dressed with boiled linseed oil and a little red and white lead after fixing. It is about the same price as Asbestile.

Calmon's Asbestos Slate is also similar to Asbestile. It is made in sheets 40 ins. square and from  $\frac{1}{8}$  in. to  $\frac{1}{2}$  in. in thickness. For roofing purposes  $\frac{1}{8}$  in. and  $\frac{1}{4}$  in. are mainly used. It possesses much the same properties as Asbestile. It is somewhat cheaper than Asbestile or Uralite.

John's Asbestos Roofing is another application of Asbestos to roofing purposes and is an American invention and manufacture. It consists of a canvas foundation saturated with a waterproofing material and covered on both sides with a very thin sheet of Asbestos felt. It is laid on boarding, to which it is secured by nails and the laps cemented. It is perfectly waterproof, light and clean. It is claimed to be proof against "burning sparks and cinders," but if large fragments of burning matter fell upon it there would be great

risk of the Asbestos blistering and the waterproof composition—which is of a bituminous nature—taking fire.

Wire-wove Waterproof Roofing consists of waterproofed paper boards made upon a foundation of fine steel wire gauze, and for roofing purposes painted and sanded. It is used by nailing it to the rafters, and cross battens fixed to take the horizontal joints, the vertical joints being covered with wood fillets and the horizontal joints simply lapped. This roofing is very light and inexpensive, it has a clean neat appearance, and has been largely used for bungalows, cricket pavilions, &c. It is claimed to be “non-inflammable,” but this is hardly correct, it burns readily, it has no heat-resisting properties, and considering the high winds of the tropics there would be great risk of its being stripped off unless laid on boarding. Its durability would no doubt depend upon its being repainted at frequent intervals.

Asphalted Felt has long been in use as a covering for buildings of a rough and temporary nature. Laid on boarding it forms one of the cheapest roofing materials that can be found, and if tarred and sanded occasionally, it is fairly durable. An objection to it is that it fouls the rain-water, but if the pipes are plugged or removed till the roof has been well washed the water is drinkable.

It is perfectly waterproof, light, unbreakable, and easily fixed, but is, of course, inflammable, and has very little heat-resisting power. It is more fit for out-buildings than for dwellings.

Slag Wool and Silicate Cotton are two names for one material made from iron slag by converting it while in a molten condition into a mass of fibres by means of a blast of air or steam. It is the best non-conductor of heat known and is very largely used in buildings for cold storage. For this purpose it is usually applied loose packed between the boarding of the partitions. It is also made into slabs between galvanized iron wire netting 1 in., 1½ ins. or 2 ins. thick. In this form it might be used for roofing by laying slabs, say 1½ ins. thick on ½ in. match boarding and covering all with galvanized corrugated iron sheeting. This form of roof would be very cool and possess all the qualities required, except that it would be rather expensive.

Expanded Metal is very largely used instead of fir lathing for ceilings and partitions on account of its fireproof qualities. It is also used as a bond for concrete in floors and other fire-proof constructions. It might be used for roofing purposes as lathing secured to 3 ins. by 1½ ins. battens spaced 12 ins. apart nailed on ½ in. match boarding, thus securing a 3 ins. air space for ventilation. The lathing would have to be plastered with ordinary lime and hair plaster, two coats, and floated with Keene's cement.

This would make a cool roofing, be perfectly fire and water-proof, clean and moderate in cost, but somewhat heavy.

“Colonial Roofing,” consists of one, two, or three thicknesses (1, 2 and 3 ply) of paper saturated with a bituminous substance and sanded on both sides. It requires to be laid on boarding to which it can be nailed, the joints being cemented. It is perfectly waterproof, and it is claimed that it does not taint water collected on it. It appears to be of a durable nature, but a time test alone can determine this. It is inexpensive, is very light and unbreakable, and can readily be fixed by unskilled labourers. It softens slightly under heat, and is highly inflammable.

For the guidance of persons who desire to compare the cost of these materials, a table is annexed giving an estimate of the weight and cost F.O.B. of a sufficient quantity to cover 100 square feet; but the prices are continually varying and must not be accepted as correct for the present date.

DESCRIPTION.	Weight in lbs.	Price of Materials, F.O.B. at Liverpool.		
		£	s.	d.
Galvanised Corrugated Iron Sheeting, with double side lap and 6 ins. end lap, 10 ins. by 3 ins., No. 24 S.W.G. ....	165	0	17	6

Colonial Roofing on ½ in. boarding (3 ply) ... ..	284	1	11	0

These particulars do not include nails or screws for fixing except when otherwise stated.

**Preserving Papers.**

The Secretary of State recently obtained the advice of Dr. T. E. Thorpe, C.B., F.R.S., Principal Chemist of the Government Laboratories, as to the best methods of preserving books and documents from the injury caused by insect and animal pests in tropical climates. We reproduce Dr. Thorpe's letter, which has been communicated to the tropical Colonies in a circular despatch :—

“ GOVERNMENT LABORATORY,  
 “ CLEMENT'S INN PASSAGE,  
 “ STRAND, LONDON, W.C.,  
 “ 25th March, 1907.

“ Sir,

“ With reference to your letter of the 19th ultimo, I have the honour to inform you that records as to the results of anything like systematic study of the efficacy of insecticides other than those applied in connection with field, garden and vineyard operations, are most meagre.

“ In 1888 the British Consul at Swatow called attention to the frequent injury to books which occurred in China, and quoted a remedy which he stated was quite effectual in preventing such ravages. The recipe which he gave for this preparation is as follows, viz. :—Corrosive Sublimate 5 drachms, Creosote 60 drops, and Rectified Spirit 2 lbs.

“ This is an alcoholic solution—methylated spirit or rectified spirit would equally serve—containing approximately 2 per cent. of mercuric chloride and one-half per cent. of creosote. The directions for use were :—Apply with a brush in the joint of the book between every six or seven pages, and in binding add a little of the solution to the glue used, whilst to protect the cover from cockroaches, apply to the cover a thin, clear spirit varnish.

“ Such a preparation I should expect to prove satisfactory ; and it is noteworthy that among the replies received to the enquiry of the Governor of the Bahamas, decided approval is expressed of a preparation of ‘ Corrosive Sublimate, Carbolic Acid and Methylated Spirit,’ which is very similar to that given by the Consul at Swatow.

“ For the preparation and use of such a solution the following instructions may be given :—Dissolve 5 grams. of corrosive sublimate (mercuric chloride) and 60 drops of wood creosote in two pints of rectified spirit (or methylated spirit).

“ In binding books, a little of the solution should be added to the paste and glue used, and the liquid should be applied with a brush to the back of the sewn book before it is fixed in the covers, to the inside of the leather or cloth, and to both sides of the millboard used in preparation of the covers.

“ For the preservation of books that are already bound, the liquid should be applied with a fine brush to the joint of the book between each ‘ sheet ’ of which the volume is composed, and as far as possible to the sewn back of the book inside the cover. In both cases there can be no objection to the application of a thin spirit varnish to the finished covers in accordance with the recommendation already quoted.

“ With regard to the treatment of books and papers for the destruction of insect pests with which they may be already infested, the evidence available is in favour of carbon disulphide. This appears to be effective and it has the merit of spontaneously volatilising even at ordinary temperatures with of course increasing readiness at tropical heat. If an entire room is to be treated, the articles should be lightly disposed so that the carbon disulphide vapour may reach everything and all parts, *i.e.*, books should be taken from shelves, stood on edge and half opened ; bundles of papers should be untied, and opened out as much as possible ; book-cases should, if possible, be moved from the walls, &c., &c. Finally, all fire-places, doors, windows, keyholes, cracks and crevices in connection with doors and windows should be closed by being pasted over and then, before finally closing it up, liquid carbon disulphide should be placed in open vessels in various parts of the room, which should then remain closed for at least twelve hours. When the room is again opened it must be remembered that carbon disulphide vapour forms, like coal-gas, an explosive mixture with air, and no light must be brought near until doors and windows have been opened for some time and all smell of carbon disulphide has disappeared.

“ For operations on a smaller scale, no better arrangement can be suggested than an equivalent of the zinc-lined box mentioned as being used in Bermuda. Probably the following would be found more convenient than an actual box :—Prepare a base of the dimensions required, say 5 ft. by 3 ft., of metal, *e.g.*, galvanised iron plate or of wood covered with lead, having just within the border a gutter say one inch deep which, when filled, with water is designed to act as a water seal. A cover should be provided of a convenient height, say 3 ft., and of such length and breadth that when placed upon the base it shall fit into the water-seal gutter. This cover might be of light metal, like galvanized iron plate, or be made in the form of a light iron-work frame fitted with air-tight glass panels, and where it was desired to fully utilize the space within the small chamber thus formed, shelves could be provided by a light metal stand.

“ Placing now, for a chamber 5 by 3 by 3 feet, a breakfast saucer half filled with liquid carbon disulphide on the base of the chamber, the articles to be treated would be lightly disposed around and above it, and the cover then lifted into position and so kept for at least

twenty-four hours, care being taken that the channel is kept full of water so as to preserve the water seal.

“In all cases the inflammable character of carbon disulphide vapour should be borne in mind and no light be brought near where this substance is in use.

“As a general protective of books, papers, &c., no better substance than naphthalene can be recommended. This substance can be placed in bookcases, presses, cupboards, boxes, &c., without injury to the books or papers and has the advantage of being a solid which volatilises but slowly, and so needs to be replenished only at comparatively long intervals.

“I have, &c.,

“T. E. THORPE.

“The Under Secretary of State,  
“Colonial Office,  
“Whitehall, S.W.”

## MEDICAL NOTES.

### The Sleeping Sickness Conference.

At the invitation of the British Government, an International Conference was recently held in London to consider the question of Sleeping Sickness. The sittings lasted from June 17th to June 24th, and the Governments represented were those of Great Britain, France, Germany, Italy, Portugal, the Congo Free State and the Soudan. The British representatives were Lord Fitzmaurice, Sir Walter Foster, M.P., Sir Patrick Manson, K.C.M.G., Professor Rose Bradford, Mr. E. A. W. Clarke, of the Foreign Office, and Mr. H. J. Read, of the Colonial Office. The delegates were not empowered to prepare an actual International Convention, and the results of their labours accordingly took the form of a report, which will, it is hoped, form the basis of a definite agreement to be drawn up at a future conference. Resolutions were passed in favour of the establishment of a Central Bureau in London, to work in close touch with local Bureaux to be established by the countries participating; and of the preparation by the Central Bureau of pamphlets recording the present stage of our knowledge on the subject of the disease, and of an official chart indicating its geographical distribution, as well as the distribution of the flies which transmit or are suspected of transmitting the disease. A general report was drawn up, the main points in which are summarised below:—

Sleeping sickness is produced by the *Trypanosoma Gambiense*, and its transmission is due to the *Glossina palpalis* or Tsetse fly. It is probably also transmitted by other species of *Glossina*, but there is no evidence that it can be transmitted in any region free from the *Glossina*.

Steps should be taken to disseminate among medical officers and missionaries in the districts affected or threatened a knowledge of the symptoms of sleeping sickness in its early stages.

The removal of infected persons to districts at present immune should be prevented as far as possible.

The authorities of neighbouring territories should keep one another fully informed of all facts of importance in connection with the disease.

Each administration should communicate to the Central Bureau an account of the results of the measures which it adopts, in order that all the administrations may profit by the experience gained.

Treatment by atoxyl produces great amelioration of the disease, if not an absolute cure, and it should be extended as far as possible. In some cases patients can be removed to districts which are free from *Glossina*, and where consequently there is no risk of other persons being infected from them.

European settlements should as far as possible be established in districts free from *Glossina*.

Trees and undergrowth on the banks of rivers in infested districts should be cleared so as to remove the ordinary breeding places of the *Glossina*. Dwelling places should be protected by means of wire gauze, which will also be valuable as a protection against the malarial mosquito.

A systematic programme of research work into the life-history of the *Trypanosoma* and the *Glossina*, the possibility of the former being transmitted by other insects, and of animals, domestic or wild, serving as intermediate hosts, should be undertaken; and the study of the effect of treatment by atoxyl, and other suggested remedies should be continued.

The Conference will re-assemble on the 1st of November next, when it is hoped that the conclusion of a definite agreement may be possible.

The above particulars are taken from an interesting article by Professor R. Blanchard, one of the French delegates, which appeared in the *Semaine Médicale* of July 3rd, and has been reprinted in pamphlet form. The magnitude of the problem to be solved is graphically stated by M. Blanchard in the following passage:—

“At the moment when the partition of Africa has been accomplished, when its pacification has been achieved, when its geographical data have been adequately established, and when consequently colonization might proceed unfettered, a mere fly and a wretched microbe threaten to render useless the efforts accomplished by the colonising nations. The unforeseen intervention of these two creatures, and the terrible epidemic which results from it, are imperilling the definitive establishment of the white race in the new territories which it has conquered at the cost of so much blood and money.”

It is a legitimate source of satisfaction that the British Government should have taken the lead in this arduous and honourable campaign.

**Beri-beri.**

An important addition to the series of reports that have been published from time to time in connection with the outbreaks of beri-beri in the public institutions in the Malay Peninsula is the preliminary report by Dr. W. Fletcher. So far the results obtained in such experiments have varied, and on close investigation fallacies can usually be detected.

Careful inquiries into all the factors concerned in these outbreaks are essential to the study of the ætiology of the disease.

The three main hypotheses are (1) that the place is infected ; (2) that infection spreads from man to man directly or indirectly ; and (3) that the cause of the disease is contained in the diet.

Dr. Fletcher's results are in favour of the view that the cause of the disease is contained in rice which has been husked without preliminary boiling, so-called "uncured" rice.

The report states that :—

"During the year 1905 an epidemic of beri-beri broke out in the Kuala Lumpur Lunatic Asylum. Commencing in February it reached its height in July and August, declining somewhat towards the end of December.

"Out of 219 lunatics treated in the asylum during the year, 94 persons were affected, of whom 27 succumbed to the disease.

"The chief constituent of the rations supplied to the inmates of the asylum was uncured (Siamese) rice, and in view of the fact pointed out by Dr. Braddon that beri-beri occurs chiefly amongst communities with whom such rice is the staple article of diet, it was decided, with the sanction of Government, to place half the lunatics on cured (Indian) rice.

"The Government readily gave their consent, and the experiment was commenced on the 5th December, 1905.

"Amongst 120 patients on uncured rice there were 43 cases of beri-beri (two admitted with the disease) and 18 deaths.

"Amongst 123 patients on cured rice there were two cases of beri-beri, and these both had the disease on admission.

"Ten lunatics actually suffering from beri-beri were put on a diet of cured rice, and all recovered.

"Of 26 patients suffering from beri-beri who were not put on a cured rice diet 18 died.

"None of the 10 lunatics suffering from beri-beri who were placed on a diet of cured rice had a relapse.

"Of the 26 patients suffering from beri-beri who were not transferred to a cured rice diet 16 died during the first attack, and the remaining 10 all developed beri-beri again with the exception of two, who were discharged, being no longer insane. The latter have been lost sight of, and whether either of them subsequently relapsed is unknown.

“Four lunatics who had been on a diet of cured rice for more than five months, and were apparently healthy, were transferred to a diet of uncured rice. Two of these patients developed beri-beri within three months.

“Dr. Fletcher observes that at the commencement of the experiment the opinion was held by himself that rice was neither directly nor indirectly the cause of beri-beri. It was fully expected that the patients on Bengal rice would suffer from beri-beri to the same extent as those who remained on the Siamese variety, and that the result of the experiment would be a refutation of the rice theory. With this in view precautions were taken to provide separate cooking utensils, plates, &c., for each set of patients, in order that the upholders of the rice theory might not be able to point to any possibility of contamination of the Bengal rice with the poison which is supposed to be present in uncured rice.

“Contrary to expectation the result of the experiment, as far as it goes, is to prove the truth of Dr. Braddon’s contention that uncured rice is the cause of beri-beri. It remains to be proved whether the cause of the disease amongst the eaters of uncured rice is a poison contained in the rice, or whether there is something essential to the human economy which is supplied by the cured rice whilst it is absent in the uncured.

“Takaki and the Japanese School still hold that a deficiency of proteids in the diet is the cause of beri-beri. As yet it has, unfortunately, not been possible to obtain analysis of the two kinds of rice; but when this is done it will probably be found that the cured rice contains a larger quantity of proteid matter than the uncured. If this be the case the deficiency of proteid matter in the diet may be the actual cause of the disease, or what is more likely the lack of nutritive matter in the rice may induce a condition in the patient which renders him an easy prey to some external agency, bacterial or protozoal, which is the actual cause of beri-beri.”

---

The Government of the Straits Settlements has issued a comprehensive report on the Sanitary Condition of Singapore by Professor W. J. Simpson, M.D., F.R.C.P. The report, which is illustrated by a number of plans and photographs, embodies proposals for the improvement of housing conditions, of the water supply, and of the sewerage system, with a view to the reduction of the death rate, which has continued to be abnormally high.

---

A somewhat similar report on the sanitation of Colombo, by Dr. A. J. Chambers, M.D., F.R.C.S., Registrar of the Ceylon Medical College, has been issued by the Ceylon Government.

A report on the sanitation of Nairobi and other townships in British East Africa, by Mr. G. B. Williams, A.M.I.C.E., has been issued. He points out that a refuse destructor is not so easily worked in such places as in England, where over 60 per cent. of the refuse is half-burnt cinders, breeze and ashes, containing considerable caloric value. The climate is suitable for Europeans, and malaria is not common, but may become so unless some of the marshes are drained. The defects of Nairobi, which has sprung from nothing to a population of 14,000 in seven years, are largely due to the rapid growth and the haphazard arrangements. Mr. Williams recommends the removal of the Indian bazaar to another place, and the placing of the new Government offices in a park of about 130 acres.

---

A correspondent writes that "Yerba Maté" or Paraguayan Tea deserves to be more widely known and used among European residents in the tropics and elsewhere. It affords a pleasant and stimulating beverage, without the astringent and acid qualities of the Eastern herb. Medicinally it is known for its mild laxative properties, and is infinitely better than China or Indian tea for persons whose internal machinery is not of the strongest, especially where, as in West Africa, for example, food is often indifferent, cooking worse, and fresh vegetables scarce.

The tea is the dried leaf of *Ilex Paraguayensis*, a plant extensively cultivated in Brazil and Paraguay. It is to the gaucho of the Argentine pampas what the Kola nut is to the West African negro, and is universally used in South America. The gaucho sucks his *maté* with a tube from a gourd, but cultivated folk brew it just as ordinary tea, and drink it with milk and sugar, and although perhaps it is an acquired taste, it very soon becomes a habit.

Whether Paraguayan tea has properties which serve as a prophylactic against malaria is not certain, but among the lower class peoples living along the creeks and swamps of the Parana and Uruguay rivers, all *maté* drinkers, malaria is not anything like as prevalent as it might be expected to be.

Paraguayan tea can be obtained in London at about the same price as good China tea.

**RAILWAY NOTES.**

THE Report of the Central South African Railways for 1906 shows a revenue of £4,782,049, a decrease of £582,570 from the previous year. The open mileage was 2,158, and 406 miles were under construction during the year. Provision for depreciation was made for the first time. The working expenditure was £2,878,713. The workshops are being improved with a view to building rolling stock more largely, and sleeper plantations—mostly red ironbark—are being extended. The percentages of tonnage from the ports were: Cape, 20·91; Natal, 29·79; Lourenço Marques, 49·30.

The General Manager (Mr. T. R. Price) observes that:—

“The serious loss of revenue to each of the Administrations, as the result of the diminution in through goods traffic and the reductions in rates, in the case of the—

C.S.A.R.	...	...	...	...	£532,903
C.G.R.	...	...	...	...	81,522
N.G.R.	...	...	...	...	202,090
C.F.L.M.	...	...	...	...	27,910

Or a total of ... .. £844,425

serves to emphasise not only the extent to which the welfare of the coast Colonies is bound up in the prosperity of the interior Colonies, but still more the urgent necessity for reviewing the whole position in the light of altered conditions, with the object of taking measures calculated to lead to the filling in of the interior Colonies with a white population, so as to place the position of the maritime as well as the inland Colonies on a permanently stable foundation.”

The pace has perhaps been too fast. Since the war the railway mileage has increased by nearly 95 per cent., and when the lines now under construction are open the increase will be brought up to 131 per cent.

---

The Federated Malay States Railways report for 1906, printed at the Government Printing Office at Kuala Lumpur, is excellently

got up and contains many interesting illustrations, the last being a set showing "train derailed by collision with a wild elephant," and "the elephant that caused the trouble." Both parties appear to have suffered badly, and while the elephant sacrificed its life it had good reason to be satisfied with the effect on the train. This incident, however, happened so far back as 1894, and we presume has not been repeated. The mileage now open is 428 miles 67 chains, besides sidings. The capital account for open lines is \$41,275,005; the revenue for the year, \$4,774,124, and the working expenses, \$2,991,762; but of this \$516,744 were spent in relaying certain sections with heavier rails. On the Johore State Railway 110 miles of jungle had been cleared. Mr. C. E. Spooner, the General Manager, observes that: "At the present moment the Federated Malay States Railways have the heaviest engines and rails and the longest passenger carriages to be found on any metre gauge railways in the world, and I can confidently state that this departure has in every way proved successful."

---

In the Federated Malay States the cost of wood fuel per engine mile in 1906 was 13·99 cents, or 3·9d. The corresponding figure for coal in West Africa was 5½d. to 7d. On the Uganda Railway the cost is 2·44d. per mile for wood fuel.

---

Tubular iron telegraph poles were replaced by old 46½ lb. rails for a distance of 89 miles.

---

The passenger traffic between Hong Kong and Canton by steamer is about 2,250 each way per day, and the fare varies from 35 to 60 cents. The railway could not charge less than 60 cents, and this rate would not pay if adopted generally. The principle of varying the rates per mile according to outside competition is much questioned, but it is a common one, and convenient unless pushed to unreasonable limits. Railways have the inducement of speed and superior convenience, but third and fourth class passengers, upon whom the success of the line depends, will pay little extra for these advantages.

In Lagos the whole of the traffic on the railway is penalised by water competition up to the 60 mile point.

---

The Ceylon railways made in 1905 a profit of 5·86 per cent. on the expenditure, and as about half of that expenditure appears to have been paid off, the pleasing figure of 11·35 represents the profit on the outstanding capital. In every year from 1862 to 1905, with the exception of the first eight years and 1894, there was, even in

years of depression, after payment of working expenses and interest and allowing for the sinking fund, a balance from the receipts, and the aggregate of these balances is no less than Rs. 39,560,509—more than half the whole capital expenditure. The position was practically maintained in 1906. These figures speak for themselves, and bring out not only the very successful financial results of the Ceylon Government Railway as a whole, but also the great support it has given to the general revenue of the Colony, and may perhaps be taken as additional evidence of the importance of developing and fostering in every reasonable way an undertaking so important to the Colony.

---

Two sessional papers have been published in Ceylon on landslips and washaways on the railways. It is considered that any line necessitating cuttings through such a fissured and treacherous formation as exists in the hill districts of Ceylon must be liable to interruptions by "rock-slips," and that nothing can be done to prevent such occurrences entirely, but that the condition of the adjoining hills should be carefully watched with a view to minimising the possibilities of accidents. As to washaways, it is pointed out that it is extremely difficult to gauge the extent of bridge and culvert accommodation required, and it is only after experience of floods that the proper waterworks can be decided on. During the last north-east monsoon no less than twenty-nine slips, washaways and floods occurred on the Northern Line between Kurunegala and Pallai. Fifty-one additional openings for waterways were recommended.

General experience shows that any tropical line which is built with due regard to economy is liable to such mishaps. It is practically impossible to foresee at what points the weight of water in flood time will soak the embankment to a dangerous extent, and if an opening were made at every place where this event seems possible, the cost of construction would be greatly increased. But careful watching is of course essential to prevent accidents.

---

We see from the following extract that a railway report may contain valuable sociological material: "Under soap there has been a noteworthy increase of 69 tons, which may perhaps indicate a growing feeling after a higher level of existence." (Lagos Railway Report).

## REVIEWS AND NOTICES.

Canada (painted by T. MOWER MARTIN described by W. CAMPBELL.  
*A. and C. Black, 20s. net.*)

THIS is one of the publishers' "Beautiful Books" series and is charmingly illustrated by 77 pictures in colour of well-known Canadian places and typical scenes. There is a delicate suggestiveness in these illustrations which recalls old impressions to those who have travelled in Canada, and with those who have not will stimulate the desire to do so. Mr. Campbell's description of the beauties of Canada is written with unflagging spirit and will compare favourably, we think, with any of the many glowing accounts which have been penned since the construction of the Canadian Pacific Railway. He does not, however, by any means confine himself to the point of view of the passer through pleasant places, but comments on the character and promise of the Dominion with the special knowledge of a Canadian. Before all the potential wealth of the country he puts, as the most hopeful factor, the promise of a type of personality of uncommon force of character. There is undoubtedly an earnestness in the utterances of press, platform and pulpit in Canada which bespeaks high ideals and a keen feeling of responsibility. Mr. Campbell believes that the welfare of Canada depends mostly on the growth of the rural population. "Commerce," he contends, "is all right in its place; but it must be kept in its place. Mining as an industry may be a great asset in the wealth of a country, but it does not make for the best citizenship in either workmen or owner." Canada will certainly shine with the sterling virtues of an agricultural population, which will go on increasing till the west is studded with great towns. Of the advance of Manitoba, Mr. Campbell quotes the following vigorous lines from the pen of a Canadian poetess:

"Softly the shadows of prairie-land wheat  
Ripple and riot adown to her feet,  
Onward and onward, her fertile expanse  
Shakes as the tide of her children advance;  
Onward, and soon on her welcoming soil,  
Cities shall palpitate, myriads toil."

**Twentieth Century Impressions of Ceylon.** (Edited by ARNOLD WRIGHT. *Lloyd's Greater Britain Publishing Co. Ltd.*).

This splendid volume is both a scholarly account of the history and character of Ceylon and an up-to-date directory of its public and commercial men. It is extraordinarily complete from every point of view, and many able and willing hands have been engaged on its 916 pages. For general interest we would pick out the description by Mr. Arunaachalam of the races, religion, languages, castes and customs of the island.

---

### **Ceylon.**

A very full review of the progress of the Colony from 1904 to 1907 has been issued by Sir Henry Blake. He explains that, owing to a practice of treating large sums in the accounts as recoverable advances, when in fact they were not recoverable but had been spent, a surplus had been shown which was far from being a real one. At the end of 1904 it was ascertained that the true surplus was about Rs. 1,000,000, while the supposed surplus at the end of 1903 was put at Rs. 4,500,000. The case illustrates in a striking manner the confusion which results from a loose method of dealing with expenditure, and Sir H. Blake is to be congratulated on the vigour with which he took the matter in hand. The result of the disclosures was that the works schemes had to be reconsidered. A clear account is given of the present projects. There is an interesting chapter on the use and abuse of opium, the import duty on which of Rs. 2 per pound has been doubled this year. A feature which might well be envied in some other Colonies is that the salaries of the public service have been raised from 10 to 15 per cent. In conclusion, Sir H. Blake expresses his obligations to the Legislative Council in terms which it is a pleasure to read: "In all my experience of Legislative Assemblies I have never known one more free from acerbity, more courteous in debate, more careful in the consideration of the business before it, or more instinct with that capacity for compromise within reasonable bounds without which no deliberative assembly can satisfactorily discharge its duties."

---

**Colonial Laws and Courts** (reprinted from "Burge's Commentaries on Colonial and Foreign Laws," edited by A. WOOD RENTON and G. G. PHILLIMORE. *Sweet and Maxwell*).

This valuable account of the legal systems in the different parts of the Empire has been brought up to date by the editors with the assistance of a large number of Colonial lawyers. The care taken to include recent changes is evidenced in the introductory statement

by the references to the substitution, which has only just been agreed to, of Roman-Dutch law as an alternative subject to English real property law in the Bar examinations, to the amalgamation of Lagos and Southern Nigeria, and to the Anglo-French New Hebrides convention as an example of extra territorial jurisdiction.

Cession of a place by one Power to another does not affect its laws and customs, and many parts of the Empire have accordingly retained the imprints of previous possession. Thus Roman-Dutch, French, Spanish, Italian and Ottoman systems are all to be found in force in our possessions, and have held their ground on the whole with remarkable success. The origin and present position of these jurisdictions are stated fully and carefully. The task is easier where the places dealt with possess British systems, but great pains have everywhere been taken to analyse the statutes and instruments relating to the systems of law and the constitution of courts. It is almost hypercritical to remark that Ashanti is not, as stated on page 263, part of the Gold Coast Colony. It is a separate territory, although administered under the government of the Gold Coast Colony.

---

**The Ancient Ruins of Rhodesia.** (By R. N. HALL and W. G. NEAL. *Methuen & Co.*, 10/6 net).

**Great Zimbabwe.** (R. N. HALL. *Methuen & Co.*, 21s. net).

These volumes have reached second editions. The interest which Mr. Bent's researches aroused in the Mashonaland ruins has been kept fully alive, and no doubt much discussion on the origin and meaning of these prehistoric works has yet to come. There is perhaps no place where the mystery of monuments creates a deeper curiosity. Here as in some other countries the ruins are the sole record of a speechless past, but here is added the secret of an immense population, the name and origin of which are unknown, as their exodus is inexplicable. The riddle can only be solved by comparison with the results of investigations elsewhere, and it would be idle to dogmatise at present, but Messrs. Hall and Neal's works will have an abiding value for their careful and attractive statement of the character and condition of the works.

---

**The Pocket Guide to the West Indies.** By ALGERNON E. ASPINALL. *Stanford*, 6/-.)

This handbook, the author of which is the Secretary of the West India Committee, will be of the greatest value to the increasing number of English and American tourists who visit the West Indian Colonies. Besides the practical information as to the steamship routes, fares, hotel accommodation and prices, etc., indispensable to

a work of this character, it contains in a compact and readable form notes on the complicated and romantic history of the various Colonies, and information with regard to their present financial and commercial position and natural resources. There are a number of well-selected illustrations, mainly from photographs taken by the author, and a complete set of excellently printed maps, including a reproduction of a quaint "Topographical Description and Admeasurement of the Yland of Barbados," originally published in 1673. Visitors to the West Indies will find Mr. Aspinall's book invaluable, and even those who are denied the opportunity of visiting them will find that it well repays perusal.

---

### Victoria.

A parliamentary paper has been compiled by Mr. T. G. Watson, Clerk of the Legislative Assembly, entitled "The first fifty years of responsible government in Victoria," and contains a succinct retrospect and a well condensed summary of the present position. The total private wealth in the Colony is put at £313,851,000, at which figure the Colony ranks third in the world in accumulated wealth per caput. The statistics indicate a wide and increasing diffusion of this wealth. It is mentioned that in recent years lines on the standard gauge of 5 ft. 3 ins. have been opened at an outlay of less than £1,450 per mile, and the Parliament of Victoria is no doubt entitled to great credit for the investigations and exertions which have made this result possible.

---

### Trinidad Oilfields.

The Government of Trinidad has published an interesting report by Mr. Cunningham Craig on the Central and Northern Anticline in the Western District, in continuation of his previous report on the Southern Anticline. Mr. Cunningham Craig examines in detail the question of the origin of the famous "Pitch Lake," and gives an elaborate description, illustrated by a map, of the geological structure of the whole district, with an account of the numerous indications of oil occurring in it. He considers that the prospects of oil production throughout a large part of the area appear distinctly good.

---

**The Surveys of British Africa.** (Second Annual Report of the Colonial Survey Committee). *Colonial Reports, Annual Series.* No. 532. Price 3s. 1d.

This Report contains an account, illustrated by maps and photographs of the work done under the direction of the Colonial Survey

Committee during the year 1906-7. This Committee is only concerned with the surveys so far as Imperial interests are concerned, the Colonies having their own survey departments. The geodetic triangulation of the Cape Colony and Natal was completed in 1892, and that of the Transvaal and the Orange River Colony, commenced in 1903, is now practically finished. Topographical maps of these Colonies and of the Orange River Colony are being produced by the Committee. No proper topographical maps exist of the Transvaal, and we do not find that any are being produced. At the beginning of the Report the work of the past year is summarised as follows :—

*Topographical Surveys.*—A total area of about 49,000 square miles has been topographically surveyed in the field, as under :—

Orange River Colony	...	...	8,000 sq. miles.
Cape Colony	...	...	17,000 „ „
East Africa...	...	...	2,400 „ „
Uganda	...	...	250 „ „
Gold Coast (includes work previously in hand)	...	...	16,000 „ „
S. Nigeria (partial)...	...	...	5,000 „ „

*Longitude Expedition.*—The results of the Nigeria Longitude Expedition have been computed ; their accuracy is very satisfactory.

*Geodetic Triangulation.*—The British South Africa Company has completed the measurement of the meridian 30° E. of Greenwich as far north as a point within 70 miles of Lake Tanganyika.

*Geographical Explorations* have been proceeding in the Anglo-Egyptian Sudan.

*Cadastral Surveys* have been in progress in the Anglo-Egyptian Sudan, Gold Coast, Uganda, and East Africa. In the last Protectorate an area of 870,267 acres was surveyed during the year. In the Sudan 578,000 acres have been surveyed during the year.

*Boundary Commissions.*—Two Commissions have been, and are still, at work along the W. frontier of Uganda, and the N. frontier of Northern Nigeria, respectively.

*Maps Published.*—General Maps have been published of British Central Africa, the Gold Coast and Northern Territories, and the Gambia.

Boundary maps have been published of the Anglo-Portuguese (Zambesi) frontier, and the Anglo-German (Niger-Cameroon) frontier south of the Cross River ; provisional sheets have been printed of the Anglo-German frontier east of Lake Victoria.

The following topographical sheets have been published :—

Orange River Colony (military edition) ... ..	5
The Cape Colony ... ..	6
East Africa... ..	1
Gold Coast ... ..	2
Africa $\frac{1}{1000000}$ series ... ..	10
„ $\frac{1}{250000}$ compilations ... ..	21

*Inspection.*—An independent inspection of the Survey Departments of East Africa and Uganda was made during the year.

Arrangements have been made for a class of civil and military officers in colonial employment to assemble each year at Southampton about the end of May, to enable them to make traverse and reconnaissance sketches of the routes in their districts.

## OFFICIALS ON LEAVE OF ABSENCE IN THIS COUNTRY WITH DATE OF EXPIRATION OF LEAVE.

This List is compiled from the Leave Certificates sent to the Crown Agents for the Colonies. The Editors will be glad to receive notice of any other cases of Colonial Officials on Long Leave.

# THE COLONIAL OFFICE JOURNAL.

---

---

VOL. I.

JANUARY, 1908.

No. 3.

---

---

[*This Journal, though published with the approval of the Secretary of State for the Colonies, is not official, and the Secretary of State is in no way responsible for the opinions expressed in it.*]

---

---

## EDITORIAL NOTES.

THE *Morning Post*, in a recent article, invested this JOURNAL with an official character, and remarked that "every subject is discussed from the old official standpoint." Two instances are given to bear out this statement. One is that we have observed that "many persons will share Lord Elgin's feeling of regret that the old term Colony, with its classical and historical associations, should be displaced, but some mark of differentiation was called for." We are unable ourselves to detect in this observation the hall-mark of confirmed officialdom. The other instance is that "Newfoundland, somehow, has been forgotten altogether in the first two numbers." We deplore the omission, but it seems curious that it should be cited as an instance of discussion from the "official standpoint."

---

The plain fact is that we have no intention of venturing upon the field of diplomatic controversy, and this for the very reason that it is not our object to undertake the task of voicing official views. We leave to such papers as the *Morning Post*—which is distinguished by the consistent attention which it pays to colonial questions and the abundant information which it collects—the arena of polemical politics. But there is a great field of enquiry where there is, in strictness, no official opinion. In such matters it is useful to

EDITORIAL NOTES.

THE *Morning Post*, in a recent article, invested this JOURNAL with an official character, and remarked that "every subject is discussed from the old official standpoint." Two instances are given to bear out this statement. One is that we have observed that "many persons will share Lord Elgin's feeling of regret that the old term Colony, with its classical and historical associations, should be displaced, but some mark of differentiation was called for." We are unable ourselves to detect in this observation the hall-mark of confirmed officialdom. The other instance is that "Newfoundland, somehow, has been forgotten altogether in the first two numbers." We deplore the omission, but it seems curious that it should be cited as an instance of discussion from the "official standpoint."

---

The plain fact is that we have no intention of venturing upon the field of diplomatic controversy, and this for the very reason that it is not our object to undertake the task of voicing official views. We leave to such papers as the *Morning Post*—which is distinguished by the consistent attention which it pays to colonial questions and the abundant information which it collects—the arena of polemical politics. But there is a great field of enquiry where there is, in strictness, no official opinion. In such matters it is useful to

collect data and compare views. There is no fixed form of thought which can be identified with an official way of looking at things.

---

We remarked in our last number on the increasing emigration to Australia, and we see that Mr. Deakin states that the Commonwealth Government are anxious to encourage it. The first requirement is land which can be offered to settlers. If the States will find the land, the Federal Government offers to bear the expense of bringing people to it. The difficulty is that the States, in order to do this, are confronted with the necessity of buying back at £3 or £4 an acre land which at no very distant date was sold at £1. We understand, however, that a considerable emigration to Australia from these shores is now going on, though the movement is not received with unqualified favour in all quarters in the Commonwealth.

---

The anti-Asiatic riots which have occurred in Vancouver have caused serious embarrassment to the Canadian Government, but do not seem likely to bring about a change in its general policy. It is in connection with Japan that the chief difficulty arises. When Great Britain in 1894 and 1895 concluded conventions with Japan, whereby the subjects of each power were to have full liberty to enter the territories of the other power, and the most favoured nation arrangement as regards customs duties was adopted, Canada and the other self-governing dominions were, as usual, left to decide for themselves whether they would adhere to the conventions or not. Canada in the first instance decided not to do so; but in 1906 she changed her policy, from motives which are easily intelligible. Her trade with Japan is at present small, but it is sure to grow, and it can be conducted in a convenient way. In the autumn the railways on the eastward side are congested with the carriage of grain to Europe. On the westward side the lines are comparatively idle, and it is obviously the right policy to encourage a traffic in that direction.

---

At bottom these racial questions depend largely on economic considerations, and views as to the expediency or in expediency of introducing Asiatic labour will vary according to the material interests at stake at a given moment. So long as the Asiatic will do work which no one else can or will do, he will be welcomed and encouraged. Thus Trinidad, Jamaica, and British Guiana take from British India nearly 10,000 coolies a year, about half of whom settle permanently in those Colonies; and though their introduction has been made the subject of some criticism, on the ground that it displaces West Indian labour, it is accepted on the whole as a

necessary measure. But as soon as the Asiatic enters the field against white labour of any kind, the agitation against him begins, and develops in accordance with the growth of the competition. Ultimately it becomes a question whether the economic advantage to the employer is great enough to be set against the social and political consequences of the displacement of white labour. Frequently it would be difficult to prove that white labour is to any great extent really displaced; but, even if there is no actual displacement, the abundance of cheap labour may result in a lowering of the general standard of remuneration; and in any case public opinion is governed very largely by appearances, and the presence of fairly large numbers of Asiatics is taken to prove that they are ousting Europeans.

---

There is, of course, another ground of objection to the Asiatic, based upon the conviction that a European race should preserve its individual character, its own ideas of civilisation, and its standard of living, and the fear that all these things are imperilled by the influx of a race alien in sentiment and traditions, which a white population can never hope to assimilate. Considerations such as these would justify the sacrifice of many material advantages. But there seems to be a tendency to exaggerate both the proximity and the extent of the danger, just as the alien question in England, which, for all its importance, is nothing more than a local question affecting certain districts of London, Manchester, and Leeds, has been magnified by lively imagination into a national peril.

---

There is obviously a considerable awakening going on in the Asiatic countries, and the new vigour makes itself felt in many ways in our Eastern possessions. But there are no signs that the movement will take the form, within any reasonable time, of such wholesale emigration to other countries as was foreboded by Dr. Pearson. The Englishman, however, who preaches patience and moderation to the Colonial must recognise that the value of his advice is discounted by the fact that he is himself as yet exempt from this particular danger. We publish a letter in which this and other aspects of the question are discussed in direct terms and with considerable animation.

---

The circumstances under which the Cape Parliament has been dissolved are of exceptional interest from the point of view of constitutional practice. The defection of one member of the Upper House from the side of the Government to that of the Opposition

resulted in the two parties in the Legislative Council being equal in number. But as the Chairman of Committees was a supporter of the Government, the Opposition, when the Council went into Committee, were in a majority of one. Advantage was taken of this circumstance to prevent any progress being made in Committee with the Appropriation Bill, which had passed through all its stages in the Lower House, and had been read a second time in the Council. In the full Council, after three abortive attempts to secure progress with the Bill in Committee, the following resolution was adopted by the President's casting vote:—

“That this Council, while not abandoning its abstract claim to reject a Money Bill when it feels itself warranted by the public necessities in resorting to so extreme a measure, is of opinion that under the present circumstances of the Colony the further progress of the Appropriation Bill should no longer be delayed.”

This resolution, however, brought about no alteration in the tactics pursued in Committee, and the President ruled that the resolution of the Council could not in any way bind the Committee. An attempt was then made to suspend the Standing Orders so as to dispense with the necessity of any Committee stage before the third reading, but this was defeated by the Opposition, with the exception of one member, withdrawing from the Council and leaving it without the necessary quorum. Finally the Prime Minister announced that he would advise dissolution as soon as the indispensable supplies had been granted.

---

We do not propose to comment upon these proceedings in so far as they involve questions of party politics. But this practical assertion of the power of an Upper House to block the Appropriation Bill while the Government continues to command the support of a majority in the Lower House is an incident of the highest constitutional importance. It is a somewhat remarkable circumstance that the Lower House took no steps to question the propriety of the proceedings in the Legislative Council, or to assert its special privilege in financial matters. The Upper House in the Cape is, of course, elective; but its powers in money matters have hitherto been regarded as subject to the same restrictions as those of the House of Lords.

---

In Queensland also a constitutional situation of great interest has arisen. Mr. Kidston, the Premier, introduced legislation of a character too advanced to meet the views of the Upper House, the members of which are nominated for life by the Governor. The

Premier, therefore, asked the Governor to nominate sufficient additional members to give him a majority in the Legislative Council. The Governor did not feel able to accept the advice of his Prime Minister, and the Ministry accordingly resigned. A fresh Ministry was formed under the leadership of Mr. Philp, but immediately met with defeat in the Lower House. The Prime Minister asked for a dissolution, which the Governor decided to grant, although the Opposition had refused to grant supply, even to tide over the period before the results of the general election would be known; but his decision has proved highly distasteful to the majority of the representative chamber, Mr. Kidston going so far as to compare it to the action of the Czar in dissolving the Duma. There can, however, be no doubt that it is not merely the right, but the duty, of the Governor to use his own judgment with regard to the two questions at issue in this case, viz., the nomination of members of the Upper House and the granting of a dissolution. The wisdom of a particular decision may be called in question, but the Governor's personal responsibility is clear, and he cannot avoid it.

---

The elections in the Orange River Colony have resulted, as was anticipated, in an overwhelming majority for the Orangia Unie party. The Constitutionals gained their only successes in Bloemfontein, where they won four out of the five seats, and very narrowly missed winning the fifth. The new Cabinet, under the leadership of Mr. Abraham Fischer, includes two of the generals who fought against the British forces in the late war, and the position of Generals De Wet and Herzog as Ministers of the Crown in the Orange River Colony affords a close parallel to that of Generals Botha and Smuts in the Transvaal. The Cabinet is completed by the inclusion of Mr. Wessels, a former member of the Orange Free State executive, and Mr. Ramsbottom, who was defeated in one of the Bloemfontein constituencies, and for whom, it is understood, a seat will be found when the election of a Speaker causes a vacancy.

---

All who have experience of the administration of tropical dependencies must view with an interest not unmixed with astonishment the most recent political developments in the Philippines. After nine years of American rule, the inhabitants are now to enjoy the benefits of a popularly elected legislature, the elections for which took place in August. This appears to be the natural corollary of the policy which has already provided the Philippines with some six hundred elected municipalities; but it indicates an astonishing faith in the suitability of American institutions to all sorts and conditions of

men. Mr. Alleyne Ireland published some time ago some very adverse criticisms on American methods of administration in the Philippines, as compared with British methods in the Eastern Colonies; and Mr. Sydney Brooks, writing in the *Westminster Gazette*, affirms that the American government of the islands has proved a disastrous failure, and that at the present time the prevailing desire in the United States is to find some means of escape from the irksome responsibilities which were undertaken after the Spanish-American war. It is perhaps in this desire that the true motive for the establishment of "Home Rule for the Philippines" is to be found.

---

The subject of extraterritorial rights is, as remarked in the article which we publish, of considerable interest to the colonies, and we may note here that the Hague Conference decided, by a majority of 36 votes to 2, to include in the Convention questions of this interpretation and application. The two dissentients were Great Britain and France. No doubt diplomatic and consular privileges are often delicate matters, but if it is permissible to take a disinterested view of the matter, it would seem that the subject requires a tribunal, and that the Hague Conference may find an important field of work in dealing with it. Where treaties exist, the Convention will not prejudice them.

---

Remarkable evidence of the progress of the cotton industry in the West Indies is afforded by a report made to the Colonial Office by the Imperial Commissioner of Agriculture for the West Indies. The value of the lint and seed exported from the West Indies for the five and a half years which ended on June 30th, 1907, was £374,486, and of this sum £167,664 represents the value of the exports during the last six months of the period. Efforts have been concentrated on the production of a long staple Sea Island cotton which commands a high price and a ready market, and as special climatic conditions are required for the production of cotton of this type, the West Indies stand in less danger from competition than countries where ordinary American cotton is grown. The excellence of the West Indian seed is sufficiently shown by the fact that the growers in Florida have this year made use of it for planting purposes. The success of the new industry is mainly due to the effort of the Imperial Department of Agriculture and the hearty co-operation of the British Cotton Growing Association, whilst the West Indian planters and small proprietors have shown a commendable readiness to adapt themselves to new circumstances by undertaking the cultivation of a product comparatively unfamiliar to them.

In West Africa the object of the experimental work which is being carried on is to improve the standard of cotton by establishing a hybrid which will flourish in the climate and at the same time suit the Lancashire trade. The native varieties are hardy, but give a small yield; the American give a good yield, but do not satisfactorily resist the changes of weather, the torrential rains, and the attacks of insects. Egyptian cottons have invariably failed. Native varieties are being used as the female parent, as they are acclimatised, and promising results have been obtained. The Lagos cotton this year has been found very satisfactory in working, and the demand exceeded the supply.

---

A recent handbook (price 6d.), issued by the Emigrants' Information Office, on the Nyasaland Protectorate contains some useful notes by Mr. S. Simpson, the cotton expert, on the cultivation of cotton, coffee, fibres, and other tropical products. Mr. Simpson's previous "Report on the Cotton Growing Industry" is obtainable from the Colonial Office, and will be found by growers to contain much valuable advice.

---

The 1907 report of the Botanical Department of Trinidad, by Mr. J. H. Hart, F.L.S., is a remarkable record of valuable work and real progress. We notice especially that a strain of tobacco has been obtained by experiment which unites the vitality of the Virginian with the leaf character and flavour of the best Sumatra and Cuban kinds, and which grows well in Trinidad soil. Four shillings a pound was offered for the best quality produced, and a profit per acre of £15. 12s. 6d. was obtained. This very encouraging result may well be recommended to planters who are discouraged by sugar prospects. The seedless orange is now established on some orange stock in the nurseries. All other standard tropical produce has been cultivated and investigated. We recommend the report to the attention of tropical planters in all parts.

---

The article which we publish by Mr. Parkinson on the mineral resources of Southern Nigeria deals with a subject which is particularly interesting at present in view of the formation of the British Colonial Petroleum Corporation and the report that the Admiralty intend to introduce oil as a fuel on men-of-war. We notice that the *Daily Express* observes that "Government experts who have visited the territory are convinced that before long Nigeria will be one of the greatest oil-producing regions in the world," and statements have appeared that the Admiralty have been influenced by this belief. We do not know that the facts quite

warrant these conclusions, but there is no doubt a promising field for prospectors. A bituminous deposit near the Tano river on the Gold Coast has recently been explored with promising results.

---

A Return has been presented to the House of Commons giving particulars of all Steamship Subsidies for Foreign and Colonial Services chargeable to the Exchequer of the United Kingdom (House of Commons Sessional Paper No. 359). The largest item which appears is the subsidy of £340,000 per annum (to be reduced from February 1st to £305,000) paid to the Peninsular and Oriental Steam Navigation Co. for the India, China, and Australia mail services. The Cunard Company receives £68,000 per annum for the New York service, and the Canadian Pacific Railway Company £60,000 for the Hong Kong service via Canada. All these are postal services, and the amounts payable are in part made up by Indian and Colonial contributions. The special subsidy to the Cunard Company in respect of the *Lusitania* and *Mauretania* is charged to Navy Funds, and will ultimately amount to £150,000 per annum. Only three subsidies are chargeable to the Vote for Colonial Services, and all these are connected with the West Indies. Messrs. Elder, Dempster and Co. receive £39,500 for the Jamaica service, of which Jamaica pays £19,500. The Royal Mail Co. were paid at the rate of £17,500 for the Intercolonial Service, one-half of this being made up by contributions from the Colonies. But a new contract has now been signed under which the company will receive £25,000 per annum, of which the Colonies contribute £12,500. Lastly, Messrs. Pickford and Black receive £27,000 per annum for the service between Canada and the West Indies, one-half of this being paid by Canada and one-half by the Imperial Government.

---

The question of marine insurance is an important one for the colonial governments which import goods from this country. The practice is very varied, some colonies following the Imperial rule of not insuring anything, while others either insure everything or insure in particular cases. If the transactions are on a large scale, there is much to be said in favour of the policy of taking the risk; in the long run the presumption is that the colony will gain, by saving premiums, more than it will lose by marine losses; of course, if this were not the case, the insurance companies could not carry on their business at a profit. But this policy is very seldom accepted. The inconvenience of one serious loss would be so great that colonial governments are reluctant to face it. The charges for insurance are individually small, and in many cases practically negligible; that in the aggregate they may amount to considerable

sums is a consideration which does not come prominently forward. Further, the practice of allotting a specified sum to the requirements of each department has much to do with the matter; the indenting officer, by directing insurance, secures that he will get compensation if marine damage occurs; without this another vote might be necessary. The suggestion readily arises that a colonial government might insure itself by establishing a fund and keeping an account; and if some governments could agree to combine together, the risk of any great liability would be lessened, and perhaps some economy in administration effected if a common fund were instituted.

---

In some cases the colonial government solves the question by taking upon itself the smaller risks, while protecting itself by insurance against heavy losses. One plan is to direct insurance of all indents over £1,000 or some such sum, but it is better to take the cargo rather than the indent on the basis of the system; there might be in the same ship several consignments of comparatively small value individually, but of a considerable aggregate. This plan is also simpler, as the value of goods is, of course, better known at the time of shipment than at the time of indenting.

---

The despatch from Lord Northcote, enclosing the Commonwealth Navigation Bill, which has recently been presented to Parliament (Cd. 3,826, price 7d.), affords pleasant testimony to the useful results of the Conference which was held in London in the spring. "My Prime Minister," writes the Governor-General, "advises me that it affords much pleasure to the Government to express concurrence in the view that the result of the Conference proves the value of such meetings for the free and full discussion of complicated and important subjects."

---

A "concession" has lately been given to the "British Somaliland Fibre and Development Company," and as this means of developing new territories is being used with some frequency, it may be of interest to give the leading particulars. The concession is in the form of an agreement between the Crown Agents, acting for the Somaliland Government and the concessionaires, and gives the right of cultivating and manufacturing fibre over a specified district in Somaliland of about 10,000 square miles for 25 years. The Company is to pay £250 a year rent for the first eight years, and afterwards £500, and is to spend at least £5,000 a year on the property. A sum of £24,000 is to be paid into a special account in such a way that it will be secured for the cultivation of fibre and the necessary operations. Any grazing

warrant these conclusions, but there is no doubt a promising field for prospectors. A bituminous deposit near the Tano river on the Gold Coast has recently been explored with promising results.

A sum of £24,000 is to be paid into a special account in such a way that it will be secured for the cultivation of fibre and the necessary operations. Any grazing

rights of natives are to be respected. No similar right is to be granted in the district in question for 15 years. The capital of the company is £150,000.

---

The number of periodicals issued for the benefit of stamp collectors is astonishing to those who have not taken up this hobby, and the points which they notice are often extraordinarily minute. We notice, for instance, a statement that a stamp which is perforated at the sides with a number of perforations slightly different from what is usual may be worth £40 or more. On the other hand, these papers contain many historical and geographical notices, and in that way have some educational value. We notice in one of these an account of the Falkland Islands, in which it is remarked that the group is "honest and well executed." It is not clear whether the islands or the stamps are referred to.

---

The scheme of Colonial Office reorganisation, to which we referred in our last number, has been fully set out by the Secretary of State in a despatch addressed to the Governors of the self-governing colonies, published as a White Paper. The change is a great one, and necessitates an entire re-casting of the personal arrangements. The line of division between the Dominions and the Crown Colonies will be complete. The General Department will deal with various matters common to the Crown Colonies, such as currency, banking, postal and telegraph matters, education, medical and sanitary questions, pensions, patronage, railways and concessions—a sufficiently weighty list, which opens up a large field to the principle of consolidation of subjects. The idea of bringing together all railway and concession questions is new. It is obviously convenient that this department should be blended with the legal department.

---

The French Minister of the Colonies recently visited London, and investigated personally the methods of carrying on the business arrangements of the Crown Colonies and Protectorates. The result of his visit has been a decision to adopt, to a considerable extent, the same methods, and it may be taken to be highly complimentary. The following passages relating to the new French scheme will be of interest :—

“ M. Millières-Lacroix va créer, tout d'abord, une agence générale des colonies.

“ Celle-ci, érigée en service annexe de l'administration centrale, traitera, pour le compte des colonies, et sans l'intermédiaire des directions politiques, toutes les questions d'intérêt purement local.

“Elle assurera directement l'administration des personnels locaux en congé, et l'exécution de toutes les commandes courantes de fournitures, d'approvisionnements et de travaux publics prévues aux budgets locaux, le contrôle des fournitures, le contrôle des ports.

“L'agence sera divisée en quatre sections, administration du personnel, approvisionnements généraux, travaux publics, fonds et comptabilité.

“L'agence, on le voit, est basée sur la spécialisation par affaires, et non par colonies ; c'est que certains marchés de fournitures sont souvent passés à la fois pour plusieurs colonies, et que la création d'agences distinctes, pour chaque colonie, au lieu de simplifier l'expédition des affaires la compliquerait.”

---

The Royal Horticultural Society (Vincent Square, Westminster) will hold exhibitions of colonial fruit and vegetables, fresh and preserved, on 5th-6th March, 11th-12th June, and 26th-27th November, 1908. No fee or charge for space is made, and produce can be consigned direct to the society. These are good opportunities for informing the home market of what is produced.

---

In the article on Canada's purchasing powers of West Indian produce, which appeared in our last number, it should have been stated that the Canadian importation of sugar in 1905 was 3,712,595 cwts. The word “exportation” was substituted by an error in printing.

## WIRELESS TELEGRAPHY IN THE EMPIRE.

IN various parts of the Empire schemes are at present being actively discussed for the installation of wireless telegraphy. The commercial practicability of the method, under certain conditions, is now fully established. It remains to be seen whether the Marconi Company can compete successfully with the cable companies for the trans-Atlantic traffic. But no feat of this kind is required to demonstrate the feasibility of connecting islands with a neighbouring mainland, linking up the members of an archipelago, and communicating with ships and lighthouses. Sufficient has been done to show, not only that these things are practicable, but also that they can be done at a cost which compares favourably with that of transmission by cable.

A brief description of the means employed may be of interest to the untechnical reader. A transmitting and a receiving station are required, and at each of these there must be a mast or some other structure supporting wires. This structure is called the aerial or antenna. A transmitter, of which there are various types, sets up powerful electrical oscillations in the wires, and these oscillations create a disturbance in the universal ether called an electric wave. This electric wave radiates in all directions, and a contrivance is used in the receiving aerial to detect them on arrival. The ordinary cable or telegraph wire is a continuous conductor, which guides the electric waves to a particular spot along a fairly definite line. Except for leakage, the waves in this case are confined more or less to this conductor, although they induce a current in any other conductor lying close by, as is often observed on a telephone, when the user hears a conversation between two other persons. Wires are also used in the new system, and to some extent may be contrived to direct the waves, and in strictness, therefore, the term "wireless telegraphy" is incorrect, and the more recently used, "radio-telegraphy," is scientifically preferable. The wires are, however, only used at the

termini or stations, and the distance between is traversed by means of an energy which must be enormously greater than that required for a continuous conductor. Broadly speaking, the energy required in the latter case is the 200th part of a horse-power; for such enterprises as are contemplated for local transmission by wireless telegraphy the energy would vary from about 1 to 50 horse power.

The energy is produced by a battery or generator worked by a steam, gas, or oil engine. Two kinds of waves can be produced. In one case, that known as "spark telegraphy," they are produced by an isolated electrical discharge, which has been compared to the crack of a whip—it sets up a powerful wave, which gradually dies down as it traverses space, and arrives at its destination in a comparatively feeble condition. In the other, a later method, known as "arc telegraphy," a continuous current is kept up, the initial wave not being so strong as in the former method, but kept up throughout, as in the oscillation of a rope caused by shaking it continuously at one end. The first is the present Marconi system, the second the Poulsen, and the waves are known as "damped" and "undamped" respectively. It is claimed for the latter that the waves so produced reach their destination in a state of greater energy than in the former system, and are, therefore, more easily recorded there, and there is a considerable body of expert opinion that the system is sound in theory, and will eventually be the most efficient in practice.

The aerial at the receiving end is the counterpart of that at the sending end. It requires a sensitive relay—called a "coherer" or "responder"—capable of being influenced by the delicate currents transformed from the impact of the electrical waves in the ether on the exposed wires. Usually this relay acts on a telephone. The waves for the purposes of communication must be of a certain length and strength. If a receiver is arranged for one kind of wave, it is not suitable for the reception of another; the two stations must be tuned together. Perfect tuning is a difficult matter to accomplish, but the difficulty may be considered to have been overcome to such an extent that the messages will not be disturbed unless the disturbing station is very near, say, within ten miles. This, however, depends on the degree of power used.

A question which has been much discussed, and which comes into the polemics of rival undertakings, is whether an instrument can be readily adjusted for the purpose of receiving a message sent by a different system; the experts differ on the point, and, as is frequently observed in the law courts, set out conclusions either way which accord with the commercial interests with which they are connected.

An impartial view is perhaps that a skilled wireless telegraphist can adjust his receiving apparatus until he reaches the right wave length for picking up the message. This may take some time, and therefore may be ineffective. But it is reasonably practicable, and the recommendation of the Select Committee in favour of adherence to the Berlin Convention may be taken to indicate the opinion that such intercommunication would often be convenient, and should be encouraged. The convenience, for instance, of making all signal stations available for communication with the ships of all countries is very great, and any country which does not secure it would drive traffic away. On the other hand, "tapping" is likely to be resorted to on critical occasions, and in this respect the wireless systems do not offer the secrecy of the submarine cables; in any case, however, this is not a matter which greatly affects the colonial schemes, and it is open to use codes or cyphers when desirable.

The theory now most in favour is that the waves do not pass through intervening heights, but skim along the ground as they would along a conductor, the earth, in fact, acting to some extent as one. On this theory it would seem possible that such an obstacle as a thick forest would impede the course of the waves, and experience in Trinidad has shown that this interference actually occurs, and is a serious matter. There is an installation at Calcutta which sends messages for a hundred miles across thick jungle, and probably the impediment is not very great over comparatively short distances.

But there is a marked difference between the effects of land and sea on transmission. Land is more difficult to cross than water. Changes are constantly going on in the atmosphere due to sunlight, radio-active matter in the soil, and cosmical action; these changes affect the electrical waves, and over considerable distances the variations are considerable. This is the reason why transmitters of large power will sometimes fail to cover distances which, under different atmospheric conditions, are within the range of low power instruments. The atmospheric changes are called "ionisations," and the process which interferes with transmission "absorption." These influences are greater on land than on sea, and the practical conclusion is that transmission is more sure and cheap on sea than on land. This is as it should be, as, of course, submarine cables are very much more expensive and more difficult to protect and repair than land wires. It may be added that "ionisation" is greater in sunlight than in darkness, and therefore signals sent at night are stronger than those sent by day.

On the vital question of expense it is difficult to attempt any exact statement. The expense varies with the power applied and the contrivances used. Roughly speaking, a 3-h.-p. installation of two stations can be put up for £1,000; the range with this power would be from 200 to 300 miles. For such a distance as 1,000 miles it

would hardly be safe to have less than 50 h.-p., and the expense of this would be £10,000 at least. There are at least five companies which could provide installations for the latter distance—the Marconi, the Amalgamated Radio-Telegraph Company (continuing the Poulsen and De Forest systems), the Lodge-Muirhead Syndicate, the Gesellschaft für drahtlose Telegraphie (Telefunken), and the National Signalling Company of America (Fessenden system).

The Lodge-Muirhead Syndicate supplied the materials for an installation between Trinidad and Tobago for about £700, the oil engines were 3 h.-p., and attempts to signal between Tobago and Port of Spain (across a range of wooded hills rising to 3,000 feet) were unsuccessful; but since the removal of the Trinidad station to North Post communication with Tobago has been maintained with ease and complete regularity, and messages have on some occasions been received from and transmitted to vessels at much greater distances. The syndicate, in addition to the charge made for materials, asks for a royalty of £250 a year for each station. For such comparatively short distances the charges made by the different companies do not, as we understand, greatly differ; but, as the distances increase, the charges rapidly mount up, and the differences in the estimates or offers show an extraordinary range. The scheme for establishing wireless telegraphy throughout the West Indies differs so widely in the matter of cost that it was hardly possible to avoid the conclusion that the system, on a large scale, was still largely in the experimental stage, and that the prudent course was to defer any such large undertakings until experience had brought out further improvements and given more precise results. A substantial step, however, seems likely to be taken in the desired direction without involving direct government intervention, as the West India and Panama Telegraph Company have offered to establish wireless telegraphy between Trinidad and British Guiana, without any increase in the subsidies which they receive for their cable service. Possibly, in anticipation of a general system in the West Indies, communication may be established in special cases, such as between St. Kitts and Nevis and between Antigua and Montserrat. We hear also of projects for wireless telegraphy between Fiji and islands of the South Pacific, and it is probable that stations will eventually be established which will act as feeders to the Pacific cable.

To turn to the example of other departments. The War Office have experimented with various systems, and have lately favoured the Lodge-Muirhead. The apparatus sent out to South Africa and Somaliland were lamentable failures. This was owing to the dryness of the earth, and to the fact that in the system adopted the earth forms an important element. Dry land is a bad and variable conductor, and therefore moisture is essential to a good earth. The sea

is much better as a conductor, and this is one of the reasons why it is a more suitable place for wireless telegraphy. Direct connection with earth tends to increase the effective range, and is therefore suitable for long distance transmission across wide spaces over sea, but it detracts from close tuning owing to variations in the prevailing conditions.

The Admiralty have fitted up almost every commissioned ship. They have paid, we believe, £20,000 to the Marconi Company for their patent rights, and £5,000 a year, but have modified the system. They seem to have been very successful, as for quite a long time back their ships have kept up communication from Gibraltar to England.

The German company, which is an amalgamation of the systems of Professor Slaby and Professor Brauer and of all the German firms engaged in the industry, have done a great amount of work, many hundreds of installations having been put up by them. Their price for a complete station up to 100 km. (62 miles) over-sea is low (£300, without any royalty); but it is doubtful whether for enterprises of greater magnitude their terms would be as favourable as those obtainable in England.

In America, the De Forest Company earned much reputation by their installation of the steamship chartered by the *Times* during the Russo-Japanese war. On one day 2,000 words were sent across 180 miles of sea at a mean speed of 30 words a minute; the feat was so remarkable and disturbing that both belligerents took steps to stop the practice.

We can now make some attempt to compare the cost of a wireless installation with that of a submarine cable. The cost of a cable may be roughly put for general purposes at £200 a mile, or £4,000 for a distance of twenty miles. The cost of protected shore ends, a tank for conveyance, shipment from England, and laying the cable (this assuming that a ship is available) may be estimated at £1,000. If the government have no suitable ship for laying, a considerable sum must be added for this service; the cost may be estimated at £4 per mile. On the other hand, the first cost of wireless installation for such a distance may fairly be put at about £1,000. Coming to the question of maintenance, the cost of keeping up a submarine cable varies, of course, very much according to the kind of bed on which it is laid; round the British coast it comes to £5 per mile per annum, and a reasonable allowance for the above case could not be less than £100. The upkeep of the wireless apparatus would be a small matter, but the royalty payable could not be put at less than £200, and might be considerably more. The wages of the operators should be much the same eventually under both systems; in either case a trained expert is required to supervise, but at present a higher salary would have to be given for a wireless expert. It has been stated that a skilled telegraph expert could be trained for

wireless telegraphy in a fortnight, but one or two months would usually be required.

The result from this point of view is very substantially in favour of the wireless system. But it must be remembered that this system is, at present, very much slower than cable communication, and much more liable, ordinarily speaking, to delays. Furthermore, a cable can transmit and receive simultaneously, and this the wireless cannot do. If, therefore, there is traffic enough to occupy a considerable part of the day, the larger revenue which a cable can earn will more than counterbalance the heavier initial expenditure. This, however, unfortunately, is not the case with which a colonial government has usually to deal. The problem is practically in all cases one of communication in places where the business is neither large nor urgent. A considerable growth in these undertakings may therefore be anticipated as soon as colonial governments can ascertain, with some approach to precision, their cost and efficiency.

Favourable evidence of actual working, under conditions of the kind contemplated in this article, is afforded by the Trinidad annual report for 1906-7, recently published. Mr. W. M. Gordon, the Acting Colonial Secretary, writes as follows:—

“The wireless telegraph system between Trinidad and Tobago, opened to the public in the beginning of the year 1906, continued to afford satisfaction. The total cost of the installation, which is duplicated, was £1,865, and the total estimated cost of the working during the year 1907-8 was £943, of which salaries of operators, messengers, and clerks absorb £681, and maintenance, repairs, oil, spares, &c., £262. The substance of the public news telegrams is transmitted daily to Tobago, and increasing use is being made of the system for private and official telegrams.

“The total number of wireless telegrams transmitted to and from between Trinidad and Tobago during this its first year's working was 407, besides daily news telegrams. Communications with ships of war lying in harbour at Barbados and Grenada were also held, and several telegrams exchanged with other vessels within a radius of 250 miles from Trinidad.”

The Trinidad installation is on the same principle as that established between Burmah and the Andaman Islands, which, we understand, has now been working for two years without a breakdown; but in the latter case the horse-power used is only one-half—a striking proof of efficiency.

The consideration of the comparatively modest undertakings which we are referring to should not be affected, either one way or the other, by the example of great and ambitious enterprises. Not only the daily press but also some technical papers have given publication lately to sensational and exaggerated statements, which can only

result in disappointment and the public disrepute of the idea. Thus it was stated that on the 18th October last 14,000 words were transmitted across the Atlantic. This was absurd, and certainly did not proceed from the Marconi Company, which is avowedly content at present with 500 words a day. The speed of transmission appears to be very low as compared with that of submarine cables, and there is reason to believe that the repetitions on account of inaccuracies are numerous. These are vital matters, and it can be hardly gainsaid that transmission over great distances is still in the experimental stage, and that much more will have to be done before serious competition begins with the cables. But for short distances we conclude that the system has reached the commercial stage. What is now wanted is that the various companies should settle more or less definitely what their terms are to be. They should, in fact, establish themselves on an ordinary business footing. They must be prepared to give some sort of a guarantee; governments will not, as a rule, embark on a new thing of this sort without some substantial assurance that they will get their money's worth, and a reasonable form of guarantee could, no doubt, be arrived at, probably on the principle of the royalty being conditional on results. It is generally wasting time to ask for a monopoly or exclusive rights. When these points are recognised, we may look for considerable developments.

## JURISDICTION BEYOND THE REALM.

**Nationality, including Naturalisation and English Law on the High Seas and beyond the Realm.** By Sir FRANCIS PIGGOTT, Chief Justice of Hong Kong. (2 vols., *Clowes & Sons*, £3 net.)

**Exterritoriality, the Law relating to Consular Jurisdiction and to Residence in Oriental Countries.** By THE SAME. New edition. (*Butterworth & Co.*)

THE ancient law of England knew but of one territory—that which was within the body of a county. All beyond that was the high sea. The common law did not step beyond the low-water mark. Every offence had to be tried within the county in which it was committed, and if no county was concerned, there could be no jury and no trial in the usual way. But from time immemorial the ships of the nation had dealt in more or less summary fashion with crimes committed at sea near the coasts or at the mouths of rivers. This was the foundation of the modern Admiralty jurisdiction, now based on specific legislation and involving many difficult questions. The subject of this jurisdiction is of particular interest to the colonies, because the extraterritorial cases with which they are concerned are, relatively speaking, more numerous and important than those which arise in the neighbourhood of Great Britain. But the colonial jurisdictions are limited to their respective territories, as those of the English counties were, and, therefore, all these matters, whenever legislation is required, must, generally speaking, be dealt with by the home Parliament.

The limitation of this proposition is due to a decision of the Judicial Committee of the Privy Council given in 1906 (*Attorney-General of Canada v. Cain and Gilhula*). A Canadian statute empowered the Dominion Government in certain circumstances to return an alien immigrant to the country whence he came, an operation clearly involving the exercise of a restraint outside the territorial limits of Canada. The Judicial Committee held that the

Crown itself undoubtedly held, by virtue of the rights inherent in sovereignty, the power to deport an alien immigrant to his country of origin; that this power might be delegated by the Imperial Government to the Government of the Dominion, and that such delegation did in fact take place when the Royal assent was given to the Canadian statutes above-mentioned. It would appear from this decision that it is possible for a Colonial Act which is *ultra vires* to be made *intra vires* by the Royal assent; but any such case would be very exceptional, as a Colonial Act which is clearly *ultra vires* would almost certainly be disallowed on that ground.

In the reign of Henry VIII. the jurisdiction of the Admiral was transferred by statute to a territorial court. This statute has been succeeded by a number enacting that offences committed on the high sea or abroad are to be tried in the same way as if they had been committed on land. The memory of the old county jurisdiction is kept alive by the variation contained in some of these Acts, that the offence shall be deemed to have been committed in the county of Middlesex—a curious instance of the legal fiction when applied, as under the Slave Trade Act of 1873, to an offence which might have been committed in the Indian Ocean; but, as usual, there was a practical reason for the fiction, viz. that troublesome questions might otherwise arise of jurisdiction when the act is begun in one place and completed in another.

From the beginning there has been an obvious distinction between the waters near the coast and the high seas. Every great nation has exercised the right of protecting its territory and revenue by patrolling the coasts. But there is some difficulty in reconciling this right, involving as it does the seizure of foreign vessels, with the principle that the seas are the highways of all nations. We can safely start with the principle that a State can protect itself by operations within a reasonable distance from its shores. But there is no general agreement as to what this distance should be, and, in fact, the reasonableness varies according to situation and purposes. In the Hovering Acts, which have been passed for the protection of the Customs Revenue, the distance is declared to be three leagues in the case of ships belonging to British subjects, or on which half the persons on board are British subjects, and one in the case of foreign ships. But in this and similar cases there is a specific purpose in view, and the machinery of the Acts is limited to it; it is a different matter when the question is that of the general application of jurisdiction to waters. Of old international jurists had propounded a theory of territorial waters, and the favourite range was three miles, and this academical principle had materialised to some extent by the three-mile limit being adopted in some treaties: e.g. England and France in 1786 agreed not to carry on hostilities, when at war with any third party, within cannon-shot or three miles of the coast of

the other. But the *Franconia* case showed that these cases did not amount to applying the whole body of our general law to a foreign ship passing within that limit, and that legislation was necessary for that purpose. The result was the Territorial Waters Act, 1878, which created the territorial waters throughout the Empire. But these waters are not thereby included in the King's dominions, and acts which are not offences when committed by foreigners outside these dominions, as in the case of the Explosive Substances Act, 1883, are not offences when committed within the zone.

It is old law that "an arm or branch of the sea which lies within the *fauces terræ*, where a man may reasonably discern between sea and shore, is, or at least may be, within the body of a county" (Hale, *De Jure Maris*). The limitation was that you should be able to see from side to side, but the conception has grown greatly in recent times. Now we have the "headland doctrine," under which a line can be drawn between two distant headlands. Thus in the United States Delaware Bay was held to be American territory, though sixty miles from cape to cape. Such waters are more than "territorial" in the above sense—they are part of the realm. Here the foreigner has no right to come in, and he may be forbidden or subjected to regulations just as if he were on the land. The ordinary law of the country applies. Obviously it is a difficult matter to say how far the doctrine can be stretched. It is primarily and principally a question of topographical configuration—a wide angle is inadmissible; the arms of the land should to a substantial extent embrace the waters. Thus the excellent maxim, "*res ipsa loquitur*," is mostly to be relied on; but the geographical considerations may be strengthened by evidence of long actual exercise of dominion.

A matter which concerns several colonies is that of the ownership of part of the bed of the sea, as in the case of oyster, pearl, and coral fisheries. The right is acquired by occupation. When the fisheries are close to land, there is no difficulty in extending the sovereignty of the place to the fisheries, but delicate questions might arise if a foreigner took possession of a fishery which is near to land, but not continuous from it.

Beyond any territorial limits the King may acquire jurisdiction by treaty, and such acquisition has taken two shapes. In the one case the King has had surrendered to him the exercise of jurisdiction over his own subjects in a foreign country; in the other a special relation is set up by the two Sovereigns by which one is placed under the protection of the other, and in this case the jurisdiction acquired may extend to natives and to foreigners. The colonial service is little concerned with cases of the first kind, but questions over those of the second occur wherever protectorates are established. Broadly speaking, the doctrine now prevails that the somewhat

general terms in which the right to protect is given by treaties with the chief of uncivilised races include or imply the power to levy taxes, administer justice, and to do all things which are necessary for the good government of the country. But this position was only gradually arrived at, as the responsibility of the protecting power became greater and more inevitable.

We make these brief remarks on a subject which has many aspects, and admits of great detail, in view of the recent appearance of Sir Francis Piggott's works on "Nationality" and "Exterritoriality" (new edition). Sir Francis Piggott, then Procureur and Advocate-General in Mauritius, did valuable work by his laborious and careful collection of all the Imperial legislation applicable to the colonies (1902). This work brings together, in a way never attempted before, all the statutes both of general and special application, in two not over bulky volumes, in which the colonial lawyer will readily find the text which he requires. In the volumes under review the Chief Justice of Hong-Kong has dealt with a subject which is practically outside the range of ordinary law text-books, but of great interest to administrators and colonial lawyers. In the two volumes of "Nationality" he deals with the extra-territorial law affecting British ships and subjects, discussing fully such points as jurisdiction in territorial waters, sea fishery legislation, offences committed abroad, naturalisation, &c. In the work on "Exterritoriality" he treats of the delegated exercise of foreign jurisdiction, the Foreign Jurisdiction Act and Acts applied under it, consular courts, and domicile. The style is everywhere clear, and the reasoning fully set out. A reader who takes an interest in the scientific handling of these important questions will certainly be pleasurably impressed with these volumes.

## NATIVE AFFAIRS IN NATAL.

THE Report of the Natal Native Affairs Commission was certain, in view of the native rebellion which took place in that colony in 1906, to be a document of great interest. But its value is enhanced by the fact that the Commissioners have not hesitated to discuss the fundamental problems underlying the administration of native affairs by a white community, and have drawn conclusions which, if sound, are applicable to a much wider area than that of Natal, or even of South Africa. The report is a lengthy document, and we shall only attempt here to summarise and illustrate those parts of it which are of most general interest.

In their general survey of the results of native administration the Commissioners are more frankly pessimistic than any outside critic would probably have presumed to be.

“As nothing is to be gained by reticence, the opinion is here expressed that the chasm between the races has been broadening for years, and that the attitude of the natives is now one of distance and distrust. In their inexact and unreflective way they attribute all their troubles to the Government, which they believe either originates or permits or sanctions all that has changed their life from the simplicity of the past to the uncertain conditions of the present. Reasoning as they do, they see the hand of Government in the high rents and labour demanded by landlords; the various taxes they have to pay; the numerous passes or permits they have to be provided with; the restrictive, unfamiliar, and unknown laws they have to submit to; the compulsory service they have to render upon public works; and the disintegration of their tribal and family systems. These are amongst their most prominent complaints, and will be more specifically dealt with later.

“Notwithstanding that their obligations, both public and private, have, to some extent, been increased during the recent past, their present ability to meet them has been considerably lessened by the loss of their cattle by disease, their crops by locusts, by a growing

neglect of cultivation, especially by the women, and by a general reduction in wages and openings for employment."

They find the condition and temper of the natives in Zululand to be in marked contrast to that which exists generally throughout Natal; and they attribute this circumstance "solely to the fact that they have been left more to themselves, and have not been suffering from the exactions of landlords." But even in certain districts of Zululand the natives are "apprehensive about the alienation of their lands for European occupation, a policy which undoubtedly contains the germs of unrest." The Commissioners accordingly recommend the reservation of a larger area of Zululand for the expanding native population and "the closer settlement and more beneficial use of the native reserves, both in Natal and Zululand."

"To sum up, we have not satisfied any of the various classes which go to form the native section of the community. The exempted native believes that, while asking for bread, he has been given a stone, by being denied the full privileges of the European; the Christian, or educated, native wants more education, fixity of land tenure on Mission Reserves, and suitable avenues for the employment of his children; the half-caste frets because his cry to be freed from native law and be legally classified with his European ancestor has been persistently ignored, and, as a contrast to these strivings for improvement, there is the kraal native, representing the great mass of the population, who simply desires to be left alone, preferably under the sway of his chief, to live his own life of sensual stagnation."

The effects of intertribal rivalry can no longer be relied upon, now that the old system of native society has been largely disintegrated, to prevent concerted action against government, and a positive, instead of a negative, policy is urgently required. "What is to be the destiny of this Colony, with its overwhelming native population? Noted for their fecundity and virility, they will not die out or succumb to ordinary adversity, and, as we can neither assimilate nor destroy them, political forethought and common sense alike call for a settlement of the question on a broad, enlightened, and permanent basis." It must be made clear that the predominance of the white race will be secured at all hazards, and that no attempt, overt or covert, to destroy it will be tolerated. But the prestige of the white man has been impaired by the adoption of a system which leaves him the minimum of opportunity for the exercise of his personal qualities. "With a people accustomed to, and comprehending no other than, personal rule it is essential that the magnetic and powerful influence of human condescension and sympathy should not be ignored as indispensable to their successful control. Putting law in the place of sympathy has had the natural effect of inhibiting and neutralising their con-

fidence." "The administration of Native Affairs must, if it is to be successful, have a self-contained constitution of its own, based on the autocratic principle of control." Under the system of Responsible Government this principle has been less regarded than it was under the Crown Colony régime. In particular, the "movability of ruling officers" passes the comprehension and excites the apprehension of the natives. "They understand why the Governor, as representative of the Sovereign, should be changed, but it fills them with astonishment that ministers should come and go without apparent reason." Nor is a minister thus subject to displacement likely to become the author of a bold constructive policy. "Faced by the many problems of this interminable question, the ordinary minister, with his uncertain tenure of office, is satisfied if he tides over difficulties and maintains the *status quo*, and he is thus under difficulties from the commencement." "Is it to be wondered at then," the Commissioners ask, "that the more intelligent and reflective among the natives so frequently drew comparisons between the consideration and treatment shown them in the pre-Responsible Government days, when the personal factor had sway, and what it is to-day, when this element has practically been eliminated altogether?" Stress is also laid upon the evil of over-legislation. Since 1893 no fewer than 48 enactments specially applicable to natives have been passed, while another 13 failed to become law; and this state of affairs justifies the complaints of natives that they are ignorant of the laws which they are expected to obey.

The Commissioners make some interesting reflections on the causes of the native rising of 1906:—

"Although the discovery of the causes of the late Rebellion is not within the scope of this inquiry, it may be permitted to say that they were both material and psychological. It was primarily a revolt against restrictive conditions, assisted by a natural desire, common enough, as history shows, amongst subject races, to return to their own mode of tribal and family life. All their views of government, its acts and omissions, benefits and defects, are largely coloured and shaped by the feudalistic traditions of their lives, which, by preventing the development of self-reliance and individual character, have taught them to regard their rulers as the only and natural sources of power, punishment, reward, and welfare. This explains why their attitude towards the government has been one of alternating expectation and despair. The belief that the conditions they were finding intolerable were attributable in one way or another to government action or inaction explains why so little injury was done to private property during the late disturbances. Looking upon government as the maker and enforcer of laws, the imposer

and collector of taxes, the fountain of all authority, with its officers everywhere, they wonder why their family system is permitted to crumble to pieces, and their daughters go astray; why they are compelled, through the courts, to pay heavy rents and usurious interest; to submit to the overbearing conduct of the police, and to laws they were ignorant of, and in the making of which they had no voice. Yet all the time we were flattering ourselves that, by giving them peace, a stable government, and a pure judiciary, we were doing our whole duty to and by them. We never stopped to think that our system had become too impersonal for the masses, or to see the pathos in a simple people looking for fatherly advice and assistance from a purely judicial officer, or longing to consult an exalted and virtually inaccessible minister. The head of the Native Department has never been approachable by the multitude, while to the chiefs he was accessible only to a limited extent, and in accordance with certain formalities. We live and move and think on different planes, and to make them contented and satisfied with our rule, our methods must be less artificial and complicated, and nearer the compass of their understanding."

In its constructive recommendations the report is not less interesting than in the criticism of existing conditions. The establishment of a Native Council or Advisory Board on Native Affairs, consisting of four official and three unofficial members, nominated by the Governor-in-Council, is recommended; and it is proposed that legislation specially affecting the natives should be prepared by this council and subsequently presented to Parliament for ratification. The Commission further recommend the appointment of at least four executive officers of high rank, to be styled Native Commissioners, who are to be charged with the administration of native affairs throughout the colony. They should have no judicial functions, but should exercise a supervisory power of the magistrate in their administrative work. The number of magistrates requires to be increased. Native chiefs should be treated more as peace officers; their jurisdiction should be made territorial rather than personal; and they should receive formal letters of appointment, and should be formally installed by the Native Commissioner. The Governor's powers as Supreme Chief should be enlarged and more clearly defined; and the office of Minister for Native Affairs should be invariably held by the Prime Minister. It will be seen that all these recommendations are based upon the principle of emphasising the dignity and responsibility attaching to official position, and strengthening the system of personal rule.

We cannot give more than the briefest summary of the other recommendations of the Commission. They would make the attainment of exemption from native law somewhat easier and more

certain for civilised and educated natives; and the majority favour the election, by exempted natives, of from one to three members of Parliament, "such members to be selected by ballot from European candidates, nominated by the Governor-in-Council." They observe that "not one of the many educated and exempted natives, who expressed themselves very strongly upon the question of direct parliamentary representation, suggested that one of their own race should be their member."

The Commission find the extent to which natives are indebted to Europeans and Asiatics to be a serious and growing evil; and they recommend that interest at a higher rate than 15 per cent. per annum should not be recoverable, and that the courts should have power to enquire into all the circumstances of a loan. Where a loan is made to secure labour, the contract should be enforceable by civil process only, and not under the Masters and Servants Act.

They consider that the imposition of the Poll Tax was a mistake, and that taxation on natives should be revised or consolidated in the form of a single Hut Tax, a method of taxation which is well understood, and involves no difficulty in collection. Simultaneously with this change they would abolish the system of compulsory labour, and as the nature of that system in Natal is often misunderstood and misrepresented, their observations on the subject may be quoted at some length:—

"It is in force only in the Locations in Natal and the Reserves in Zululand. Chiefs are requisitioned to supply men according to the size of their tribes, and the number in service averages about 3,000, on an engagement of six months' duration. This apparently large number is employed in the maintenance of nearly 6,000 miles of roads in Natal and Zululand, and constitutes about 15 per cent. of the total number of young men in Natal Locations alone. They receive an ample ration of maize meal, are provided with tents and huts, and receive a wage of 20s. a month. There is no proper system of rotation or limitation of calls, much being left in the way of selection to the whim, caprice, and partiality of the chief and his indunas, who are known to call out the same men over and over again, while favourites and those who bribe them (often substantially) escape altogether. A shorter period than six months would, in itself, have gone far to diminish the dislike to the service. The Native and Public Works Departments and the magistrates might long ago have concerted some simple rules by which the system could have been stripped of some of its most objectionable features. For instance, no one should have been liable to be called out for more than two or three periods of service, and the wages for each subsequent enrolment should have been raised; young raw lads should be paid at a lower rate than men; and those who could prove a reasonable amount

of private service should have been exempted from one or more periods of public employment, or, possibly, altogether.

“ Although the work on the roads is intensely unpopular, mainly because of its compulsory nature, the personal aspect of the question is, perhaps, not the most important, the labourers being well treated, and receiving a fair wage, much higher than is ordinarily paid by farmers to their tenant-servants, about which, by the way, there is no outcry, except on the part of the natives concerned. In its public aspect it furnishes a contributing factor against the proper occupation of the Locations, it being asserted that, so strong is the dislike to the service, many refrain from living there, in order to escape, even when Hut Rent has to be paid elsewhere. The closer settlement of the Locations being one of the prominent features of the policy proposed herein, anything that militates against giving this its full effect should be removed.

“ In addition to all that has been specially advanced against it, there remains the full force of modern public opinion, which is strongly opposed to the constraint of labour in any form, and it is accordingly urged that Government should without loss of time devise some satisfactory substitute for procuring labour for public works. This can, it is suggested, be done in two ways : (1) Through the proposed public labour bureau, with or without private recruiters or contractors ; or (2) arranging through or with the Location Chiefs to recruit men for public works, remunerating them by a capitation bounty. Market rate of wages would have to be paid, and the contract should be on the monthly basis. Contracts for sectional maintenance and repairs would necessarily enter into the consideration of any change of system.

“ Its abolition should not be merely effected on paper, but be publicly promulgated and explained throughout the Locations as part of the proposed scheme, if adopted, of re-adjusting Location taxation, by consolidating the dues within those districts, raising the Hut Tax to the higher scale, and abrogating the Poll and modifying the Dog Tax. It is important that its withdrawal should be effected concurrently with the change in taxation. The cancellation or even abridgment of the powers now vested in the Supreme Chief to call out natives in times of emergency or for service in the public weal forms no part of this proposal. That question has been well considered, and those powers should remain unaltered.”

The whole of the Report supplies much food for thought. The Natal Government have taken time to consider it, and declined to make any statement of their policy during the last Parliamentary session.

## THE MINERAL RESOURCES OF SOUTHERN NIGERIA.

By JOHN PARKINSON, *late Principal, Mineral Survey.*

BEFORE attempting to form an estimate of the mineral resources of Southern Nigeria, or, indeed, of any comparatively unknown country, some idea of the geological structure, and, therefore, of the geological history, should be obtained, because such knowledge may, on the one hand, limit any area of probable economic importance to a certain definite district or, on the other, may extend it with fair likelihood of success to an adjacent area, which so far had shown no indications of value.

In this connection the importance of negative evidence is apt to be overlooked. No one should regard a reconnaissance as fruitless because such exploratory work fails to discover valuable occurrences of minerals, for it may be the means of preventing a greater expenditure upon futile search, and at any rate will collect information of much geological value.

In Southern Nigeria we find as the most important geological factor a platform of various crystalline rocks, gneisses, schists, granites, and the like, on the surface of which all later sediments have been deposited, and on the subterranean contours of which their thicknesses at any given point depend.

This basement platform appears at the surface on either side of the Protectorate. On the east it extends from Kamerun territory over the international frontier, and forms the rounded masses and outlying spurs of the Oban Hills, reaching the Cross River, in British territory, as far as is known only at Ikorana.

The available information suggests that the border of the crystalline rocks passes through or near Abokam, on the Upper Cross River, and, stretching northwards, follows roughly and at some distance the eastern bank of the Aweyong River. Thence it passes out of Southern Nigerian territory, and joins the crystalline rocks on the southern bank of the Benue.

Proceeding westwards, our knowledge fails for lack of exploration, but, as far as is known, gneisses are next found on the Niger in lat.  $7^{\circ} 19' N.$ , and, although the boundary to the west requires much additional work before it is adequately defined, it may be considered without great error as passing a short distance to the north of the Afuge Hills and of Ifon, a few miles to the south of Ondo and Abeokuta, and thence as turning westward paralld to the sea to enter Dahomey territory.

Speaking broadly, there is a great gap in age between these gneisses and granites and the succeeding sediments of Cretaceous time (roughly corresponding in age to the British chalk).

This second chapter, probably volume would be a better word, in the geological history can be read amongst the thin-bedded limestones, shales, and sandstones deposited against the southern, western and northern edges of the Oban Hills, thence extending up the Aweyong, and stretching through Abakalliki and the Edda Hills near Afikpo, probably far towards the Niger.

Much additional mapping and exploration must be accomplished before we can piece together the geography of this long past time, but I think there can be no doubt that the Cretaceous sediments were deposited in a deep gulf, which lay between the headland of the Oban Hills on the east and the rocky, possibly island-studded coast of the Central Province and Lagos on the west.

Approaching the latter shore, the depth of the Cretaceous sea gradually decreased, and the sediments thinned out against the higher contours. The Cretaceous period closed, and again we find an interruption in the history, for the next deposits (doubtless of Tertiary age) appear to be those containing the lignite of the Asaba and Ibusa district, with which certain lignite-bearing beds near Moroko, south of Abeokuta, should probably be included.

This series was followed by the sands and shales of the Lagos Province, now impregnated with bitumen, and these again by the red sands and clays which form the surface soil of Lagos, Benin, Asaba, and Calabar.

The lignite and bitumen-bearing beds were doubtless fresh-water or estuarine deposits, for in them are found traces of leaves and plants, and also shells which inhabit brackish or shallow sea-water.

The deposits of economic importance to Southern Nigeria at the present time centre in the lignite of Asaba and Moroko and the bitumen deposits of Lagos, and it is, in my opinion, of considerable importance further to investigate this area by means of deep boreholes in order to arrive at some definite conclusions in regard to the solid as distinct from the surface geology.

In 1905-6 these bituminous sands were examined with a shallow drill, and enough information was obtained to show that these

## The Mineral Resources of Southern Nigeria. 235

deposits are of such a character as to justify the further exploration suggested.

Near Moroko and Mafuoko the border of crystalline rocks is not far removed from beds producing lignite and bitumen respectively; and correlating, as one is sorely tempted to do, the lignite of Moroko with that of Ibusa, one is fain to think of a sheet of carbonaceous material extending below the bituminous beds, and to look to the former for the origin of the latter.\* On the other hand, judging by analogy with other bituminous and petroliferous districts on the western side of Africa, it is perhaps more probable that the source is in beds of Cretaceous age.

Doubtless the basement platform on which any and all of these various sediments were deposited was not a flat but a hummocky surface, so that the total thickness of the covering mantle and probably the value of the same may vary from point to point.

Samples of lignite forwarded to the Imperial Institute, as a result of the survey investigations at Ibusa and Okpanam in 1905, have been examined; while during the present year the survey under Mr. Kitson has been engaged in continuing the work in this district. The seams previously studied ranged from  $9\frac{1}{2}$  ft. in thickness downwards. The average calorific value is † 5,747 cal.; the evaporative power from and at  $212^{\circ}$  Fahr. per lb. is 10.73, as compared with 12.55, the average value obtained from four lignites from the States.

The average amount of moisture is probably between 11 and 12 per cent.

Trials carried out on launch and stationary engines gave on the whole promising results, due consideration being given to the fact that the lignite was burned in furnaces that were not specially designed for this class of fuel.

The importance of a cheap fuel to such a dependency as Southern Nigeria in the process of being actively developed is obvious enough, especially if it be remembered that the Protectorate coal bill for 1905 was £15,990. The lignite outcrops are some nine miles only from the Niger, which is navigable for vessels of light draught throughout the year, so that the expenses of transport cannot seriously hamper the economical distribution of fuel to the stations of the Marine and the Department of Public Works.

The manner of occurrence of the bitumen of the Lagos Province is of interest and importance. It does not appear to be original to

\* See "Petroleum and its Products," by Sir Boverton Redwood, vol. i., pp. 105 and 189.

† Taken from Col. Rep. Miscell. No. 33, Southern Nigeria, p. 18. No. 4 of the table there given should be omitted; the specimen was apparently obtained from the surface, and its exact locality is unknown.

the sands and shales in which it is now found, but to have been derived from an external source, and to have impregnated the beds in degrees varying with their capacity, *i.e.*, a coarse sand contains more bitumen than a fine sand, and the latter than a shale. Overlying these bitumen-bearing beds comes a group of red sands and sandy clays, constituting an overburden, and concealing the underlying series except where dissected by streams. In such instances part of the bituminous series has been cut through, and the viscous bitumen has travelled along the dip of the beds, and oozed out to form tarry masses along the banks of the stream. These are the so-called "outcrops," and consist of material naturally far purer than the bituminous sands from which they were derived.

It may be noted in passing that the Lekki and adjacent lagoons of the Lagos Province form a most valuable series of waterways adjacent to the bitumen field, so that the cost of transport is in favour of the successful working of these propositions.

The bituminous beds have been traced by the Survey from the western side of Epe to the north of Aiye (south of Ondo) a distance of nearly 60 miles, and there seems no reason to suppose that they do not extend further both to east and west of that area.

The location of fresh "outcrops" of bitumen in this thickly forested and swampy country may be looked upon as practically fortuitous, and it is upon the drill that reliance should be placed to extend the areas within which it is already known that the beds are near the surface.

When the bitumen-bearing strata are overlain to great depth by other beds, better conditions for the accumulation of bituminous products may exist, with less oxidation.

With the exception of some beds of sandstone, suitable for building purposes, and some galena, which is found to the south of Abakalliki, the Cretaceous beds have so far yielded nothing of importance.

To this the salt said to occur a day and a half's march to the westward of Afikpo, and also on the eastern bank of the Aweyong River, a little to the north of the latitude of the Moya Creek, may prove a possible exception. The occurrence of galena and salt in the basin of the Benue indicates a considerable extension for these beds.

It is to be regretted that up to the present no limestones have been found sufficiently pure and extensive to be suitable for burning on a large scale; the Cretaceous beds having been apparently deposited in shallow waters unsuitable for the extensive formation of this rock.

The lead occurring in the Enyiba country, a few miles to the south of Abakalliki, occupies a fissure trending approximately south and north, or directly across the strike of the shales.

The vein was traced at intervals for a distance of some miles, and in places the galena was found to be associated with blende (sulphide of zinc) and iron oxides, mostly chalybite. The old workings of the Ezhis at Enyiba show the vein to be some 6 ft. wide, the sulphide being altered to the carbonate and sulphate of lead near the surface.

The value of this galena depends largely on the content of silver, details of which have not been published, although many samples were forwarded home. I think 5 or 6 ozs. per ton of ore is an approximate figure.

The minerals of economic importance found in connection with crystalline rocks are monazite and cassiterite, both from alluvial deposits near the Oban Hills. The former is a phosphate of cerium, lanthanum, didymum, and thorium—of value for its content of thorium.

The monazite is associated principally with the finer grained acid gneisses, *i.e.*, those containing a fairly high silica percentage, the cassiterite with the geologically younger granites and pegmatites. As in other localities where cassiterite is found, tourmaline is an accessory mineral, particularly here, of the pegmatites. The detailed work of the Survey showed that the gravels in the neighbourhood of Ibum, which so far have proved the best for this mineral, afford concentrates up to  $10\frac{1}{2}$  lbs. per cub. yd. (taken as equal to 3,000 lbs.), and averaging about 4 lbs. per cub. yd.

Analyses carried out by the chemical department at the Imperial Institute gave about 4 per cent. of thoria in the concentrates, the monazite itself containing from 5 to 6 per cent.\* Small quantities of ilmenite, zircon, and garnet are included in the concentrates. So far monazite has not been found in the parent rock.

The Akwa Ibami district on the south-western side of the Oban Hills has yielded, from the sands and gravels of small streams, tin concentrates averaging some 3 lbs. per ton. Mineralogically it is interesting to note the association of columbite, a niobate and tantalite of Fe and Mn, with the cassiterite.

Putting aside the Iyangita, which seemingly does not contain sufficient tin for profitable exploitation, dredging is impossible in the district. The best concentrates so far obtained were derived from the gravels of a group of small streams, almost waterless in the dry season and together forming the headwaters of one of the tributaries of the Iyangita.

In this locality the impounding of sufficient water to wash a large quantity of "dirt" would probably be an undertaking of considerable difficulty, and consequent expense.

---

\* *Vide* Colonial Reports above referred to.

The monazite district near Ibum is well watered, the grade of the stream beds being such as to make many of the tributaries torrential in character; though on either the upper or lower reaches we find meandering streams with occasionally considerable deposits of alluvium on each bank.

The gravels of the Ukpon River appear to contain sufficient monazite to warrant further investigation in detail.

During the last four or five years the rainfall of Southern Nigeria near the coast has been approximately 130 inches, by far the greater part of which was concentrated into the months between May and October. During this wet season the impounding of water would proceed, and should, if the site of the dam were carefully selected, present no insuperable difficulties.

In regard to transport the lower and middle reaches of the Ukpong are navigable during the wet season, though in the swollen state of the river the journey is not easy, while the overland route consists of a three days' march along a rough and hilly bush path to 'Nsan, from which town an excellent road has been made to Calabar.

It should be remembered that in such a country as Southern Nigeria, geographical and mineralogical work is rendered exceptionally difficult by the denseness of the bush, and the work of the Mineral Survey has to be conducted in practically unmapped country. For the investigation and location of economic minerals in this type of country the value of a sketch survey can hardly be over-estimated.

No open eminence can be gained from which the course of a river may be traced and the tributaries connected by eye to the main stream; information must be laboriously acquired, a process far longer and more tedious than might be imagined.

It should be remarked, in conclusion, that excellent granite has been found, and was worked by the Department of Public Works, a short distance above Uwet, on the Calabar River. No works requiring so substantial a stone are at present under construction, and the opening up of the quarry has been discontinued. The site selected was on the Calabar River with sufficient depth of water for barges to draw up to the quarry floor, and an uninterrupted river passage to Calabar.

My friend and late colleague in Nigeria, Mr. L. H. L. Huddart, M.A., A.R.S.M., Assoc. Mem. Inst.C.E., has kindly twice read through the MS. of this paper. I am greatly indebted to him for his readily given help, and many suggestions incorporated in the preceding pages.

## CANADA AND OLD AGE PENSIONS.

THERE are many questions of domestic politics in which the home Government can learn much from the experience of the self-governing dominions. The Imperial Parliament recently ordered the report of the Commonwealth Commission on Old Age Pensions to be reprinted for the benefit of English politicians.\* In this matter, as in many others, Canada has shown herself more conservative and less adventurous than Australia. Valuable light is thrown upon the Canadian attitude by a pamphlet, printed by order of the Canadian Senate, containing the text of a draft bill providing for the establishment of a system of old age annuities, together with speeches delivered on the subject in the Senate by Sir Richard Cartwright, Messrs. McMullen, Ross, Ferguson, and Sullivan. The draft Bill merely provides for the establishment of Government annuities upon lines similar to those of our English Post Office system, and the only clause of an exceptional character in it is one which provides that the property and interest in a Government annuity "shall be exempt from the operation of any law relating to bankruptcy or insolvency, and shall not be seized or levied upon by or under the process of any court whatever." Sir Richard Cartwright explained that in his opinion the main essentials of any Government scheme must be absolute security as an investment, and absolute freedom from forfeiture. To realise the latter it would be necessary to provide that an intermission of payments should not involve forfeiture of benefits, an opportunity being allowed for resumption under easy conditions. But Sir Richard Cartwright was emphatic in dissociating himself from any advocacy of old age pensions, except in the form of an insurance scheme. And he considered that such a scheme ought to be self-supporting, though the draft Bill contained a clause which would enable any deficiency in the "annuities fund" to be made good out of the public revenue. His condemnation of any old age pension scheme conferring benefits

---

\* See COLONIAL OFFICE JOURNAL, No. 1, p. 70.

which are not merely the actuarial equivalents of contributions was based upon familiar arguments. "My own impression is," he said, "that, in a great many cases, such a scheme would be found to encourage extravagance, and the result would be that the thrifty, industrious working man would find himself compelled ultimately to bear the burden of his less industrious, and possibly dissolute, companion." This argument, which is so rapidly losing ground in England, appears to appeal with greater force to Canadians because it is felt that the opportunities for advancement in the Dominion are so abundant that destitution or poverty must necessarily be the results of misconduct. This optimistic view is reflected in nearly all the speeches. "Fortunately for us in Canada," says Sir Richard "I think I am justified in saying, and I think the experience of my colleagues here and elsewhere will bear me out, there is very little risk of any hardworking, industrious, able-bodied man not being able to make an adequate provision for his old age, if only an opportunity be given to him." Mr. McMullen speaks in the same strain. "We have here every opportunity for every industrious man to make headway in life, and lay by a percentage of his earnings. Under such conditions, old age pensions are not necessary. No man in Canada has to live from hand to mouth, as is the case in other countries where the labourer is often unable to make provision twenty-four hours ahead for his family. It will be many years before anything of that kind is likely to be witnessed in Canada." These quotations illustrate the manner in which opinions and arguments are tempered by local conditions. No one says these things any longer in England. Not even the most stalwart of conservatives, or the most orthodox of poor-law theorists, would venture to put the case against old age pensions so strongly. England is one of the "other countries" whose position Mr. McMullen contrasts unfavourably with that of Canada. But the debate produced one speaker who was less confident of the complete well-being of the Dominion. Mr. Donald Ferguson, in an eloquent speech, gave a clear and interesting review of the old age pensions schemes in actual operation in Germany, in Denmark, in Australia (New South Wales and Victoria), and in New Zealand; and of those which had been put forward from time to time at home; he urged that the time was ripe for Canada to follow the examples set elsewhere.

"In Canada to-day," he said, "we are making millionaires and multi-millionaires. Our wealth is accumulating as fast, perhaps, as that of any country under the sun. The strides we are making are known to all within the range of my voice; but I say, and say without fear of successful contradiction, that at this time, when the progress of the country is so great and undoubted, the wage-earner, notwithstanding a reasonable increase in wages, is not in

a better position than he was ten years ago, when wages were at least twenty per cent. less than they are now. The expense of living has been going up, and the consequence is that to-day the wage-earners of Canada find it as hard or harder to make ends meet than years ago when the times were less favourable and wages lower than they are just now.

“Hence I conclude that conditions in England, our own observations in Canada, and indeed universal experience, show that in these days when money breeds money, and capital has such a great inherent advantage, no state can begin too early to safeguard the interests of those who are working for wages in the service of wealth.”

Mr Ferguson proposed the initiation of a scheme under which pensions should be payable twenty or thirty years hence, and he held firmly to the principle that the wage-earners should be required to contribute, regarding the contrary opinion of the English labour-party as a heresy. Mr. Ferguson's policy would probably be regarded as reactionary in Australia; in England it would be characterised by many as timid; but in Canada it is evidently in advance of public opinion, and the grounds of that opinion are to be found in the conviction expressed by Sir Richard Cartwright in closing the debate. “It is our happy position that in Canada there is as yet no submerged tenth, and I may add it will be our own fault as a nation if for many a day and many a generation a submerged tenth should come into existence in Canada.”

This position may be compared with the trend of thought in Australia. Here also there is no submerged tenth. The question is not one of abject poverty, but of the decent workman. It is he who thinks most of the future, and agitates for a provision for it. The demand for old age pensions is in fact influential where the average standard of living is high, and where the worker learns to appreciate the comforts of life. But a state of rapid commercial expansion, which familiarises public opinion with examples of brilliant successes and obscures the failures, is not favourable to the idea. Evidently the movement will have no place for the present on the American continent.

## THE LAND QUESTION IN BRITISH EAST AFRICA.

THERE has been some correspondence in the press lately on the subject of emigration to British East Africa, and the complaint has been made that settlement on the land is greatly impeded by the long delay which attends the grant of titles. It cannot be denied that the delay is a fact, and that improvement in this respect is a matter of the first consequence. The difficulty is the slow progress of the survey. The lands in question are to a large extent, unlike those in the West African Colonies, without private owners, and the Crown exercises the right of making grants and concessions. On the West Coast the Crown in places will give a purchaser a certificate of ownership, but the title really proceeds in the first instance from a native owner, and all that the Crown does is to ratify the transaction on certain conditions. The purchaser can therefore obtain a preliminary title at once in the usual way by bargain with the owner, and generally he can satisfy himself that the acquisition will meet the requirements of the law. The precise boundaries of the property may be left over for subsequent settlement when the Government certificate is to be granted. The fact which underlies this procedure is that practically all the land has an owner. In British East Africa this is not the case. Great territories are practically unoccupied and unclaimed, and the only sort of title must be got from the Government. But in disposing of this estate the Government is confronted with the necessity of marking it out on the ground, and is without the substantial assistance afforded by existing boundaries and well-established rights.

A survey is therefore of paramount importance, and this fact has been recognised ever since the administration of the Protectorate was taken over. The object is to encourage the occupation of land by *bonâ fide* white settlers. The highlands of the Protectorate are undoubtedly suitable for a European. They begin 267 miles from the coast and extend along the Uganda Railway for some 300 miles.

They contain enormous runs of excellent grazing and agricultural land, but the most convenient land has been taken up, and the intending settler must now go some distance from the railway. The climate is good, and the children of European parents thrive in it. Settlers must have enough money to provide themselves with the substantial houses required to stand equatorial sun and rain, and to take up at least 300 or 400 acres. For these purposes and ordinary comforts a settler should, it is considered, have at least a capital of £500. The price of agricultural land in the highlands varies from 2s. 8d. to 5s. 6d. per acre freehold, and 20s. per 100 acres leasehold; grazing land costs half the above figures freehold, and half an anna per acre leasehold. A settler can obtain a homestead of 160 acres, on certain conditions as to cultivation, without payment till the end of three years, and then payment may be spread over 16 years. These terms offer great attractions in such a situation, and the next requirement is the preparation of the land for occupation by a survey. It is not unreasonable to anticipate that the cost of doing this will be trifling when compared with the sums spent on public works and administration.

The case has been put strongly and clearly by Major E. H. Hills, who has drawn up a scheme for the work required. He recommends an increase of staff for the topographical and cadastral work, and also a simplification of procedure which seems eminently practical and which we set out in his own words:—

“ Apart from the understaffing, several other causes of delay may be noted. First and perhaps foremost among these must be put the fact that the unsound practice has been followed of selling blocks of land as containing a certain specified number of acres instead of as marked out upon the ground. Suppose a farmer wishes to acquire a farm of 640 acres. It is of no vital importance to him whether the area is 650 or 630 or even 610 acres; what is important is that he should have his ground plainly marked out by boundary posts and that the definite deed, conveying the land to him, should be delivered with the minimum of delay. When this is done he is in a position to fence his land, should he so desire, or if he wishes to dispose of it he can cut it up or transfer it as a whole. Should the purchaser be of such an exacting nature that he wants precisely the 640 acres, neither more nor less, then it is clearly his business to get it surveyed on his own behalf and at his own expense. To demand that a small establishment should undertake the survey of isolated patches of land, situated all over the country, executed with such a degree of precision that the plans show the exact acreage is setting it an almost impossible task, and, in any case, one that could not be accomplished without a staff entirely out of the present question. Yet this is precisely the demand that has been made upon the Survey and Land

Office in the past. To remedy this state of affairs is not difficult. The actual wording of the deeds contains no explicit or implied guarantee of the acreage, and to prevent any misunderstanding it is only necessary that steps should be taken to bring home clearly to the intending purchaser that it is land included between certain boundary marks that he is buying, and that the acreage is only mentioned as a guide and not as a guarantee of the quantity of land lying inside the marks. It would further be well that a note should be either added to the deed or attached on a separate slip to the effect that the acreage is only provisional, and that the rent or assessment will be revised when the final survey is carried over the ground."

We believe that the matter is being taken in hand, and that the result will be that titles will be expeditiously dealt with. It would not take long to overtake the arrears. The process will not only provide good titles to buyers, but will prevent the irregular acquisition of land by mere occupation and lapse of time.

Another requirement pointed out recently by Col. Owen Thomas, is an organisation for the handling of produce. A new country must find out what its possible markets are, and arrange the machinery for supplying them. We may mention, by way of illustration, that Somaliland buys maize from London.

Considerations of health and sport will tempt men to the highlands, the wonderful plateaux which at a height of from 5,000 to 9,000 feet extend without break. It is likely enough, however, that the tropical coast belt would give the most remunerative results. Rubber, fibre, and cotton can be cultivated in this region, and it has the great advantage over the West Coast that stock flourish. This combination of climatic resources is an element of great strength and justifies the belief in the coming prosperity of British East Africa.

**STAMPS** (*continued*).

On page 65 of this JOURNAL we referred to the fraudulent manipulation of the values of stamps, the main portions of which are printed in the same colours, *i.e.* green or purple (the doubly fugitive colours). It is only fair to acknowledge the valuable services which have been rendered to the colonies by Stanley Gibbons Ltd., Mr. H. L. Ewen, and other stamp dealers, who have brought many cases of manipulation to the notice of the authorities. It is a considerable safeguard to the colonial revenues that so close a scrutiny is being constantly applied by philatelists to stamps, and it may be confidently asserted that without their aid it would be possible for frauds to escape detection for a considerable time.

As long as extensive series of stamps are printed in one colour and differ only in the name of the colony and the value, it is impossible absolutely to prevent this form of fraud, but it might be limited by the same colours being used for the same duties in all colonies using such stamps. If one colony uses a tablet printed in red for a £1 stamp and another a similar tablet for a 1s. stamp, it is easy to see that one can be substituted for the other to the great detriment of the revenues of the colony using the £1 stamp.

The adoption of the same colours for the same values will not, however, by itself, prevent manipulation within each colony's series, and this is indeed the form of fraud which has been frequently perpetrated of late.

A heroic remedy has been proposed, *i.e.* that all colonial stamps should be of different designs, but the author of this suggestion can hardly have calculated the cost, which might—but at the same time might not—be defrayed by the increased sale to collectors. There are simpler ways of dealing with the matter, and we may be in a position to discuss definite schemes in a future number.

---

GOLD COAST 2d. stamps will shortly be supplied in the existing colours, but on unsurfaced paper. The 1d. stamps are about to be printed from a new single colour printing plate.

ST. LUCIA  $\frac{1}{2}$ d., 1d., and  $2\frac{1}{2}$ d. stamps, printed in single Postal Union colours on unsurfaced paper, were despatched early in October.

CAYMAN ISLANDS stamps will in future bear the words "Postage and Revenue," instead of only "Postage."  $\frac{1}{2}$ d. and 1d. stamps of this kind have recently been supplied, but there has been no change of colour or paper. Two new values, *i.e.* 3d. and 10s., will be issued shortly, and a change of the colours of the other stamps of the series is under consideration. No change, of course, will be made in the  $2\frac{1}{2}$ d. value.

The Government of NATAL has decided to adopt doubly fugitive ink for all its larger-sized stamps, *i.e.* from 5s. upwards, as soon as a further supply is required. The colours will in future be as follows:—

Value.		Border.		Centre.
5s.	...	D.F. purple	...	Carmine.
10s.	...	"	...	Chocolate.
£1	...	"	...	Blue.
£1 10s.	...	"	...	Brown.
£5	...	D.F. green	...	Black.
£10	...	"	...	Brown.
£20	...	"	...	Violet.

It follows that all the above stamps will be printed on the specially surfaced paper.

6d. DOMINICA stamps have been despatched, printed on surfaced and multiple watermarked paper.

NORTHERN NIGERIA has received a supply of 2d. and 5d. stamps printed on similar paper.

The Government of MAURITIUS keeps a supply of stamps with blank duty tablets, the value being inserted locally. The colours of these stamps are doubly fugitive black, green on blue paper, or purple on red paper. The green stamp has now been supplied on the surfaced multiple watermarked paper.

In spite of all we have said we notice that the philatelic press is continually reporting wrongly the paper on which stamps are printed, *e.g.* a new printing of British Honduras stamps on ordinary paper has been reported, whereas since all the stamps have been printed hitherto in doubly fugitive ink the paper had of course been surfaced. The 1d. Gibraltar has also been reported on surfaced paper as recently as last month, in spite of the clear statement contained in our October number.

We have received Messrs. Stanley Gibbons' 1908 Catalogue of Foreign Stamps (2/6 net). The illustrations might be found suggestive to officials who are contemplating special designs.

## REVIEWS AND NOTICES.

**Over-Sea Britain.** A Descriptive Record of the Geography, the Historical, Ethnological, and Political Development and the Economic Resources of the Empire. The Nearer Empire (the Mediterranean, British Africa, and British America). By E. F. KNIGHT. (*John Murray, 6s.*)

THIS is a handsome volume, the production of which at so low a price as six shillings reflects credit upon the publisher. It is Mr. Knight's intention to deal in a second volume with the British Possessions in Asia and Oceania. It is perhaps unfortunate that the author did not decide to confine his treatment of the subject within somewhat narrower limits. It will readily be realised that it is a physical impossibility to deal adequately, within the compass of little more than three hundred pages, with the formidable list of subjects which Mr. Knight enumerates in his title, especially when the phrase "British Africa" is interpreted as including Egypt and the Soudan. As a piece of descriptive geography, Mr. Knight's book possesses the merits which readers of "Where Three Empires meet" will expect from him, and there is probably no other volume which deals with this aspect of the subject at once so concisely and so readably. The historical side of the work is, however, necessarily sketchy, and it would have been well if Mr. Knight had devoted more space to the "political development" of the territories with which he deals. A book of this character, as Mr. Knight acknowledges in his preface, inevitably loses some of its value from the rapid changes which are taking place throughout the Empire. We notice a good many passages which must already be regarded as out of date, but upon the whole a high standard of accuracy is maintained. In these matters a general survey in literary form cannot compete with a year-book, and if, as we hope will be the case, Mr. Knight's volume commands a circulation which justifies a second edition, he will no doubt be able to make further improvements in what is already a readable and convenient text-book.

**A Woman's Trek from the Cape to Cairo.** By MARY HALL.  
(Methuen & Co., 16s. net.)

Miss Mary Hall, by her journey from the Cape to Cairo, has accomplished a feat which would have been remarkable in a man a few years ago, and the possibility of which testifies to the great advance which has taken place in the dark territories. No little discomfort and even danger must have been met, but it is not the least merit of the book that no parade is made of these things, the lady's experiences being set out with a lightness and simplicity which give the impression that she thoroughly enjoyed the tour. The narrative begins with the landing at Chinde, and gives the detail of travel from there through the great lakes, the Nyasa, the Tanganyika, the Victoria, and the Albert, and down the Nile to Khartoum. Most readers will, we think, be surprised to find how widely the influence of civilisation has spread in British Central Africa and Nyasaland. Miss Hall on one occasion admits that her heart failed a little, this being when she saw on Lake Albert "the small craft which was to be my home by day for more than a week, for it was merely a large rowing boat carrying a sail." Any lady who repeats Miss Hall's feat may look for more comfortable conditions at this point, as a steamer for the lake is to be ordered.

---

**Indiarubber and its Manufacture, with Chapters on Gutta-percha and Balata.** By H. L. TERRY, F.I.C. (Archibald Constable & Co., 6s. net.)

The largest rubber plantations in the world are those of Ceylon and the Straits Settlements. But the largest supplies are still from the natural forests of tropical America, and planters and investors are much concerned with the question whether there are great natural stores which are easily movable and not yet drawn upon. The quinine plantations, especially those of the Dutch colonies, practically killed the old South American business, but it would be by no means safe to draw the inference that plantation rubber will triumph in the same way. The plantation quinine was the same article as the South American, and could be produced at a lower cost. The plantation rubber, on the other hand, is on the whole inferior to the natural rubber. It is probable that improved methods of collection and coagulation will alter this, and a great amount of investigation is going on with this object. Rubber varies greatly in kind and quality, and expert study on the spot is desirable; we notice that British Guiana contemplates an appointment for this purpose, and it is to be hoped that the industry will grow in the West Indies. Meantime it can only be said that at present plantation rubber is only a very small

part of the supply, and that, speaking generally, it can be sold at a profitable price. The great natural forests are under the disadvantage of being difficult of access and remote from skilled labour and convenient means of transport.

There seems to be little ground for apprehension that any artificial substitute can be put into competition with the real article. But a vast amount of compounding goes on, not merely for cheapness, but for special purposes; so much so that the rubber itself becomes a comparatively small matter, and has been ironically defined to be "an elastic material for binding together chalk and other minerals in the manufacture of certain goods." The facility with which rubber can be mixed with other things leads to its employment in an astonishing range of modern articles; a large number of mechanical goods, for instance, such as valves, buffers, washers, and belting are made of rubber hardened by vulcanisation to the point desired between pliability and rigidity.

A striking case of the increase in the use of rubber-compounded articles is that of the Wood-Milne heel pads, which, it is said, have reached a yearly output of 20 million pairs. Sometimes, of course, the compounding is carried too far, and in particular waterproofings have got a bad name in consequence of excessive cheapening. Some of the vulcanised proofings which are "guaranteed to stand all climates" are poor stuff when exposed to severe climatic conditions. Proofed tarpaulins used on tropical railways have been known to be short-lived and unsatisfactory, and the heavy oil which is frequently added to the rubber is sufficient to account for the failures, oil being a notorious enemy to rubber.

All these developments are a good augury for plantation prospects, and stimulate the interest of the general reader in the subject. Mr. Terry's book appeals to both classes. It is written with admirable clearness and with the unmistakable touch of the practical man. It reviews the modes of production and treatment, the chemical and physical properties, and manufacturing uses and applications.

---

A paper entitled "Fifty Years of Responsible Government in Tasmania," by Mr. E. C. Nowell, I.S.O., has been presented to both Houses of the Tasmanian Parliament. The material progress of Tasmania in this period is shown by remarkable figures, and the belief is expressed that her resources, "if strenuously developed, should, in the next fifty years or less, make Tasmania, for its size, one of the greatest wealth producers in the world." The writer states that federation has not yet proved satisfactory to the State. It is a common feature in the history of political combinations that local interests complain of neglect or ill-treatment, and dissatisfaction

on this ground with federation will find expression until a stronger sentiment of union is fostered by a longer common history and a more developed feeling of national pride.

---

We welcome the appearance of a "Handbook to St. Vincent," edited by Mr. R. M. Anderson, and suggested by the success of the cotton industry, which "gives such promise of a return of prosperity" to the island. In addition to the great beauties of the place, the large number of neolithic instruments supply an attraction to the intelligent tourist; they are often beautifully finished and always genuine, as the labourers of to-day could not make them. Agriculturally, St. Vincent is most celebrated for its arrowroot, which is the best in the world. Unfortunately, this pure and digestible article has a rather high retail price, and cornflour and other starches extracted from cereals by the caustic soda and fermentation processes are sold cheaper and used largely by an indiscriminating public.

## BUSINESS NOTES.

### Gas Producers.

Gas producers for power purposes are rapidly displacing small steam engines, and their convenience and economy recommend them for use in the colonies. Producer gas is obtained from a mass of incandescent carbon, in the form of coal or the like combustible matter, through which a supply of air, or steam and air, is forced. Solid carbon, when burnt, has an affinity for oxygen, and combined with it forms carbon dioxide, which is the product of complete combustion, and of no value in a gas engine; but if the gas is forced through a further mass of incandescent carbon, it is converted into carbonic monoxide, which, when fed with oxygen, will burn. In the "suction" gas producer the vapour from heated water is drawn into the generator with a quantity of air at each suction stroke of the engine. The essential parts of this producer are a water heater, a generator, a cooler, and an expansion box. No gasholder is required, as no gas can get away from the generator and connections. The management is easy, and there is the great advantage over a steam engine that there are no pipes and boilers to clean.

Suction producer plants are quite commonly made up to 200 B.H.P., but the smaller sizes such as 8 or 20 B.H.P. are most frequently met with. A plant of the smaller size, consisting of producer and engine, can be obtained for about £11 per B.H.P., whether the plant is intended to work with anthracite or coke. For larger plants such as 100 B.H.P. to 200 B.H.P. the price would be somewhat less, say about £10 per B.H.P.

Suction producers are usually constructed to work either with anthracite or coke, but in the latter case they require slightly larger grates and the consumption of fuel is a little more. With a plant of almost any size, large or small, it is possible to obtain 1 B.H.P. with a consumption of anthracite of 1.1 lb. per hour, or 1.3 lb. of coke per hour; these figures in each case include the fuel used for keeping the fires banked up in the producer all night in accordance with the usual practice. These figures for fuel consumption are only about a

third or a quarter of the corresponding figures for steam engine plant, since not only are internal combustion engines as a class of higher efficiency than steam engines, but the standby losses of a producer are trifling when compared with those of a steam boiler.

The consumption of water for cleansing the gas and supplying the necessary small quantity of steam should not be more than 2 gallons per B.H.P. at full load when using anthracite or 3 gallons when using coke.

It has been stated that, if a 20 B.H.P. plant were arranged to start at the beginning of the week with its producer empty and to run on full load for 10 hours each day, banking the fires at night, as usual, the consumption of anthracite peas in one week would be about half a ton. The consumption of water under the same conditions would be from 2,000 to 3,000 gallons per week.

A useful little handbook (at 1/- net) on the subject of gas producers has been published by Percival Marshall & Co.

Sometimes a nuisance is created in the locality where a gas plant has been created by the discharge from the blow-off or exhaust pipes before and after starting the engines. To prevent this, a gas purifier should be used. This in shape resembles an ordinary box with a lid, containing grids fitted with a purifying medium through which the gas is forced. Soft grey lime, slaked, may be used as the medium, but does not last long; oxide of iron will last from one to two months, and is approximately of the same cost. The oxide should be packed in as lightly as possible, as otherwise it takes a long time to blow the gas through. The price of such a purifier, f.o.b., is £14.

---

### Telephones.

The following notes have reference to questions which are asked from time to time by colonial superintendents. The "Sinclair" pattern of insulator is believed to be decidedly the best; the Indian form of field insulator is cheaper, but not so satisfactory. For the lines, phosphor bronze (40 lbs.) is considerably cheaper than copper wire (100 lbs.), and may be used over moderate distances, except along the coast, where its life is decidedly shorter. The 100-lb. copper wire is superior from every point of view to the 40-lb. phosphor except in the matter of cost; it has greater tensile strength and less resistance.

Where telephone wires have to cross overhead tramway trolley lines or high tension lines, it is desirable that the wires should be brought down and placed underground where the crossing is made, with proper protection from lightning. In some cases this is not practicable, and then it is advisable to have fuses on either side of the crossing. These should fuse at 3 or 5 amperes.

As an alternative to the use of fuses, which are a cause of trouble after thunderstorms, a wire net cradle can be slung across the telephone wires and well earthed.

The type of cable used should be the air space paper insulated, lead covered and armoured cable, laid direct in the ground at sufficient depth to prevent risk of damage during road repairs. Every 200 or 300 yards, or at more frequent intervals where necessary, there should be a brick chamber, entered by a manhole with iron cover, large enough for a man to work in, when making a joint or connection, or when applying the dry air pump. The chamber should be drained to the nearest rainfall outlet, or, where this is not possible, made watertight. The cable joints should be made with lead sleeves, and should be impervious to wet. Connection to subscribers en route should be made from these chambers by means of similar cable containing the number of parts required in the house.

Recent prices of armoured telephone cable are as follows :—

102 prs. ... ..	£588 per mile.
52 ,, ... ..	355 ,,

The prices, however, fluctuate very much owing to the state of the copper market ; in 1905 these cables cost £419 and £262 respectively.

Manhole covers cost for footways £1. 10s. to £2. 10s. each according to size, and for roadway, where there is heavy traffic, £8. 10s.

A dry air pump, with desiccator, mounted on a truck, costs £5.

### Rope.

As large quantities of rope are exported to the colonies, it may be useful to mention that in the trade rope is sold by weight in coils of 120 fathoms, and it is usual in giving an order to state the number of coils required. The weight varies according to the size circum, and this depends on the number of yarns. Tables are obtainable showing the particulars ; thus, of white manilla rope :—

Size circum.	Yarns in rope.	Weight per coil of 120 fathoms.	Minimum breaking strain.
3 ins.	75 (25 thread)	1 cwt. 3 qrs. 20 lbs.	4 tons.

The size of rope is always indicated by its circumference and not by its diameter ; ignorance of this practice often leads to confusion.

A yarn or strand can be dyed as a means of identification. The present price of white manilla rope of a reliable type is about 50s. per cwt.

---

#### Motor Cars.

The distance between the wheels from side to side is usually greater than with ordinary vehicles. In many colonial roads these latter form grooves with ridges just beyond ; the ridges are generally hard and stony, and the tyres get cut badly. It would be an improvement for such places if makers were to adjust the gauge to that of ordinary traffic.

Makers should bear in mind that celluloid cases for accumulators are not durable in the tropics.

Induction coils should be specially manufactured for the tropics, as otherwise there is a danger of the insulating material melting when the current passes.

---

#### Muntz Metal.

A complaint has been received from a colony of the failure of Muntz metal as a sheathing for ships' bottoms. In one case it appears to have perished after eighteen months' immersion. The name originated with the first manufacturers of an alloy of copper and zinc, which, when subjected to the action of sea-water, exfoliates, so that barnacles come off with each exfoliation. The patent of Messrs. Muntz has expired, and the name is now in general use for sheets intended for the above purpose. The composition is usually copper, 62 per cent. ; zinc, 38 per cent. The sheets should be bedded on felt and Stockholm tar. If this is done, and the nails are of the same composition, voltaic action will proceed uniformly in the presence of sea-water ; otherwise, there is danger of the zinc being prematurely removed by electrolysis, and of the remaining metal becoming brittle. Brown paper and varnish are sometimes substituted for felt and tar for the sake of cheapness, but are not effective.

---

Coal tar and pitch. A report has been received that blast-furnace tar compares favourably with the gas-house quality generally supplied ; it costs about 1s. 6d. per barrel less.

---

A patent bed called the " Handy-Cosy " has been brought out which can be folded into dimensions of 3 ft. 4 ins. by 8 ins. by 6 ins., and weighs 28 lbs. The frame is of light steel tubing, and the mattress is made of rot-proof canvas. It is strong and quickly fixed, and can be obtained from Messrs. Way & Co., Billiter Street, for 45s.

It is worth while occasionally to notice what sort of cargo is carried by a representative steamer between England and a colony. A recent arrival from Jamaica (the *Port Henderson*) shows that the exports from that place are very varied in character. There were about 8,000 cases of oranges; then come various timbers, satinwood, lignum vitæ, ebony, mahogany; barrels of extract of logwood; bags of pimento, coffee, cocoa, tea, cocoanuts; cases of honey and tortoise-shell; barrels of wax, copper, sarsaparilla; puncheons of rum; and of course bananas—23,250 bunches.

---

The Gold Coast Government recently sent to England 8½ tons of selected cocoa, on behalf of native planters, to see whether a better price could be obtained than by local sale. The prices realised averaged 67s. 8d. per cwt., being 2s. 8d. per cwt. above the current market price, and the experiment was therefore, as the Governor has observed in his address to the Legislative Council, thoroughly successful. The cocoa was sent to the Produce Brokers' Company, Liverpool, and sold at public auction.

---

There are a quarter of a million goats in Cyprus. These could be shipped probably at 5s. f.o.b. If any colony could take a shipload, this is the place to go to. Sheep skins could be supplied at a low rate, and manufacturers requiring them would do well to obtain them from Cyprus. No doubt the island government would lend its assistance.

### RAILWAY NOTES.

A RETURN has been presented to the House of Commons containing full particulars as to the ownership and length of railways "in British Protectorates, leased territories, and colonies (other than the Transvaal and Orange River Colony) not possessing responsible government," together with details of their original cost, the revenue received, and the working expenses incurred since their first construction. The average cost of construction has been about £7,500 per mile. A study of the figures given shows that it is the Eastern colonies and protectorates which are conspicuous for the successful and profitable working of their railways. During forty-one years the Ceylon Government Railways have yielded a profit on working of Rs.84,416,000, interest charges during the same period reaching a total of Rs.32,244,000. The Federated Malay States Railways have since 1885 yielded a net profit of \$13,491,687, while, as the whole cost of their construction has been met from the current revenue of the States, they are burdened with no debt charges. The fifteen miles of railway owned by the Straits Settlements Government have also been constructed out of revenue, and the enterprise yields a good profit. Of the West African railways, the Gold Coast shows the most satisfactory financial results, while on the opposite side of the Continent the rapid increase in the traffic and revenue of the Uganda Railway is remarkable. (In 1903-4 there was a loss on working of £60,100; in 1904-5 a profit of £2,600; in 1905-6 a profit of £56,600; and in 1906-7 a profit of £76,000.) In the West Indies the Trinidad Government Railway alone shows particularly successful results. The Jamaica Railway yields a substantial profit over working expenses, but is hampered by a very heavy debt charge. This undertaking has had a particularly chequered history, having twice been taken over by the Colonial Government from private companies, upon terms which have proved very burdensome to the Colonial Treasury. The general impression produced by the return is distinctly favourable to the ownership and management of railways by Government.

In all the cases where a railway has been constructed in these colonies by a private company, the Government has had to come to its assistance with a subsidy or to take over the line. It is noteworthy that the Malta railway did not pay expenses so long as it was run by a company, but has shown a substantial surplus ever since the Government took it over.

---

We notice that the colonies were not asked, and that the returns only state in a few cases the gauges of the railways. The figures in such a compilation would be much more instructive if the gauges and weight of rails were given.

---

A considerable quantity of permanent way material was sent out promptly for the Northern Nigerian Railway, and was conveyed expeditiously by the ocean steamers. Unfortunately the river, instead of reaching its maximum flood by the middle of September, for some reason or other elected to remain at its minimum. It is hoped that such an irregularity will not occur when the railway is busy; but the contingency has to be reckoned with, and the dredger will no doubt find plenty of work to do. This time the difficulties were successfully surmounted, and rails for about thirteen miles were got up; but the flood next year will have to carry some 40,000 tons of permanent way material, and it is to be hoped that the river will be on its best behaviour. Some complaints, we believe, have been made by merchants that the Government demands on the steamers seriously interfered with their business, but the railways will eventually more than make up for any inconvenience of this kind.

---

It has been decided to establish a ferry at the Niger Railway crossing at Jebba, at an estimated cost of £25,000.

---

The clearing of the Niger and the construction of railways at a navigable point will help enormously to open up the immense Nigerian territories to the ordinary trader, who has hitherto found that the river is practically barred to the outsiders. Physical difficulties keep out the small man, and encourage the formation of strong bodies which monopolise the facilities. The best help which the Government under such circumstances can give to the public is to remove the difficulty and multiply the facilities.

---

It is announced that the French Government have decided to construct the last section of the railway from Konakry to the Niger. The cost is estimated at 30,000,000 frs., and the work is to be completed in 1910.

The Lagos Railway report for 1906 shows that the total capital expenditure had been £1,230,939, equal to £10,000 per mile to Ibadan. The average cost per mile will, however, be materially reduced by the extensions now in progress. The wharf, at which a terminal charge is made of 2s. 6d. per ton, appears to be remunerative. The revenue of the railway increased from £72,649 in 1905 to £84,663. A considerably larger revenue is anticipated for 1908, but, taking into account the sinking fund, which hardly is a proper charge against railway revenue, the loss on the undertaking will, it is estimated, be almost £19,000. The railhead crossed the Northern Nigerian boundary on 13th December.

The Uganda Railway report for 1906-7 states that the sportsmen and tourists who were reported to be coming in large numbers did not appear. But there was a large increase of second-class passengers, and this is very encouraging, as it represents farmers and traders who have mostly come to stay. Altogether 609,461 passengers were carried in the year, as against 542,461 in the previous year—very good progress, but some of it is due to reduced fares. The total traffic is steadily increasing. There was a net profit on the year's working of Rs.1,151,458.

A paper published by the Ceylon Government contains some interesting correspondence on the subject of the proposed establishment of through railway communication between Ceylon and Southern India. The lines of the South Indian Railway Company are to be extended across the Paumben Channel to the extreme end of the island of Rameswaram, while the Ceylon Government has decided to undertake a survey with a view to the extension of the Government railway for some sixty miles to the island of Mannar. This will leave a gap between the two systems of only twenty-one miles, which is almost entirely occupied by the reef known as Adam's Bridge. The construction of a viaduct over this reef has been contemplated; but the cost (which Mr. Priestley, the agent of the South Indian Railway Company, estimates at 300 lakhs of rupees) must be regarded as prohibitive, for the present at any rate. As an alternative, Mr. Priestley suggested a "wagon ferry," the cost of which, including the provision of three car ferries, and the necessary terminal piers and protective works, he estimated at 28 lakhs. The gauge of the Ceylon Northern Railway is 5 ft. 6 ins., while that of the South Indian Railway is 3 ft. 3 $\frac{3}{8}$  ins., so that, if this scheme were carried out, it would be necessary to tranship the bodies of the cars from the bogie trucks which carry them, which Mr. Priestley proposed to do by means of the Ramsay system. Messrs. Gregory, Eyles, and Waring, in reporting upon these proposals, considered the estimates of cost to be unduly low. They were

of opinion that a larger and stronger type of steamer than that proposed would be necessary if cars, with their heavy underframes and bogies, were to be carried across a stretch of sea where rough weather was to be expected; and that the cost of the harbour works which it would be necessary to provide on the Ceylon side had been greatly under-estimated. They were also opposed on principle to the suggested transshipment arrangements. "Special mechanical arrangements dealing with a break of gauge," they state in their report, "are always undesirable, and have been abandoned in the great majority of cases where they have been tried." Lastly, they pointed out that the receipts to be anticipated from the coolie traffic were insufficient to justify the proposed outlay, while the amount of goods traffic which could be attracted was quite uncertain, no attempt having been made even to frame an estimate of it. In these circumstances it is not surprising that it should have been decided to postpone for the present the consideration of this part of the scheme, and to rest content with the extensions of the two railway systems, and the provision of regular communication over the intervening strait; but this will not preclude the adoption of one or other of the more ambitious alternatives suggested—a wagon ferry or a viaduct—should the traffic appear likely to justify it.

---

The railway which is being constructed by the Shiré Highlands Railway Company in Nyasaland will, when completed to Blantyre, be a useful link in the route between the producing area and markets in Europe; but it will be only a link, and so short that it is difficult to anticipate any great economic effect from it at first. There will be a certain saving in transit between Blantyre and Port Herald, where the bridge over the Shiré River is completed, but any great extension of planting operations can hardly be looked for until the line is carried southwards from Port Herald to at least the head of navigation, which may for practicable purposes be taken as Villa Bocage.

---

The construction of the Cyprus Railway is now practically completed. The expenditure has been about £119,000, and the cost of construction per mile, including sufficient rolling stock and stations, £1,940. This cost is little more than that of the Egyptian Delta Light Railways, which are principally laid on the roads in a dead flat country, and have a much greater mileage. The traffic returns, however, are poor, and the conservative methods of the peasantry are clearly a great impediment. We understand that a pier at Larnaca is contemplated, and it would certainly be very useful; but this will not help the railway, in fact will operate

the other way. It does not seem likely that the railway will succeed in converting Famagusta into the leading port of the island, and the case is an instance of the importance of fully recognising established commercial habits when fixing the base of a railway.

---

The difficulties which are being met with in the construction of the Beacon Hill tunnel on the Kowloon-Canton Railway are a good illustration of the uncertainties of engineering. It was anticipated that some clay and shale would be found, but no sign of them has appeared yet; the material is so unyielding that it appears to defy hammer, pick, and ammunition alike, and it is reported that in a granite tunnel three times more material could be dislodged for the same amount of ammunition. A hard dry stone may be much more easily cleared than a wet tough substance. The tunnel is making as much water as will fill a six-inch pipe continually at each end; that represents a very heavy downpour for men to work under, and fast progress cannot be expected.

---

It appears to be sometimes considered that a bridge can be relied upon until it shows increased deflection under rolling loads; but this is not the case. Bridgework fails by the wasting by corrosion resulting in the overstrain of some detail, and such a wasting may be far advanced without giving any warning by increase of deflection under test. It is necessary that every structure should be periodically examined for any of the usual evidences of failure or overstrain in its details.

---

The Prussian State Railways some time ago were anxious to equip certain stations on the Rhine with efficient coal-tips, and invited competition for the designs. The result has been the adoption of tips constructed to deal with trucks of up to 40 tons capacity with end or bottom doors, adaptable to the state of the tide, and with shoots attached for sliding the coal into the hold gently. The approach of each tip is provided with an electrical turntable, fitted with weighing machine, to enable the gross and tare weight of each truck to be taken, and the distribution of the empty trucks to be effected over the shunting sidings without the use of locomotives for the empties. The arrangements, we understand, have been found very satisfactory.

---

Steps are being taken to advertise the attractions of the Uganda Railway more freely. A French and a German edition of the guide are contemplated, and 40,000 copies of a booklet similar to that on

Rhodesia. Posters for railway stations may be brought out. In these matters artistic style is one of the first considerations, and no doubt an effort will be made to make the productions attractive to the eye.

---

The Renard train manufactured by the Daimler Motor Company has come in for a good deal of attention as an effort to provide something like railway accommodation without rails. The engine used is a four-cylinder, 75 h.-p. The weight of the motor is 3 tons 2 cwt.; front wheels with solid rubber tyres, back wheels with steel tyres. The carriages have six wheels; the driving wheels have steel tyres, the trailing wheels rubber tyres; weight of trailers for goods—tare 2 tons, load 4 tons; tare of passenger carriages holding 26, 2 tons 14 cwt. Four trailers is the number recommended. The train is stated to be able to go up a 1 in  $5\frac{1}{2}$  gradient, and to go round a radius of 14 feet. Petrol consumption is about  $4\frac{1}{2}$  miles to the gallon. The flexibility of the train is remarkable; each car follows precisely the car in front of it, except at a high speed when there is considerable oscillation. A first class road is probably necessary for it. The cost of the train with three trailers is £3,200. It is a complicated machine to look after, the number of parts requiring attention being considerable; but it might be remunerative where there are good roads in various directions which it could take successively.

---

A colonial government has raised specifically the question how it can satisfy itself that railway construction work which is being carried out under the direct instructions of consulting engineers is being efficiently, expeditiously, and economically carried out. It is clear that the officer under whose charge the works will eventually be placed should have every opportunity of becoming thoroughly acquainted with what is being done. He should, therefore, have the opportunity of expressing his opinion on the works during their construction, and he should report his views freely to the Governor. It would seem particularly important that this officer, who is usually called the General Manager, should satisfy himself about all matters directly affecting the subsequent working of the line, such as station and goods accommodation, the housing of the working staff, the quantity and design of rolling stock, &c.; and, therefore, he should be consulted about these matters. Much, of course, depends on the personality of the officers employed in the two positions of General Manager and Resident Engineer, and friction is likely to arise if there is any aggressiveness or undue susceptibility on either side; but if they work well together, the arrangement secures the union of technical knowledge of construction work with experience of local

conditions and requirements. We understand that any representations or criticisms made by the General Manager in regard to construction should be made to the Colonial Government and not to the Resident Engineer.

---

It should be understood that, while the Resident Engineer works under the Consulting Engineer in purely technical matters, he is under the direction and as fully the servant of the Colonial Government as the General Manager, or any of his staff. He is responsible in all matters, except technical ones, to the Government. His letters to the Consulting Engineer should pass under flying seal through the General Manager and the Colonial Secretary's office, and he should also report periodically to the Government direct on the cost and progress of the work, and whenever unforeseen circumstances renders a material increase of cost inevitable.

## MEDICAL NOTES.

**Malta Fever.**

THE discovery of the true cause of Malta Fever is one of the most valuable recent results of medical research. We extract the following paragraphs from the recently published Report on Malta for 1906-7 (Colonial Reports, Annual Series, No. 535, price 2½d.) :—

“The number of cases of Mediterranean fever reported was 883, with 80 deaths, as against 1,606 cases, with 138 deaths in 1905-6. The decrease in the number of cases reported was, therefore, 723, or 45 per cent.

“While the total decrease in the number of cases reported is 723, the decrease in the number of cases reported among the civil population was only 108, or about 15 per cent. of the total decrease, the remainder of the decrease (85 per cent.) occurring in the naval and military population. These figures furnish the clearest proof—if proof were needed—that goats' milk is the principal agent in spreading Mediterranean fever. The use of goats' milk has been absolutely prohibited by the Naval and Military Authorities, with the result indicated above. The civil population, in spite of the warnings of the Government, conveyed to them by means of leaflets printed in the vernacular, continue to use goats' milk, without even taking the precaution of boiling it. This is, in the main, due to ignorance and a tenacious adherence to old ideas and beliefs; but it is surprising to find educated people wilfully shutting their eyes to a fact that has been so clearly demonstrated.

“The Mediterranean Fever Commission have now concluded their investigations and have issued the Fifth, Sixth, and Seventh Parts of their Reports.

“The results of the researches of the Commission have been summed up by Colonel D. Bruce, C.B., F.R.S., Royal Army Medical Corps, in a short pamphlet published this year; and after briefly referring to the experiments conducted with a view to ascertaining how the micro-organism enters the human body, he states that the

results of the experiments pointed to the conclusion that the most probable way in which the micrococcus entered the body was 'by the alimentary canal, and, therefore, by some infected food or drink.'

"Then came the discovery that 10 per cent. of the goats in Malta were actually excreting the micrococcus in their milk, and a flood of light was at once thrown on the subject. To quote Colonel Bruce's own words:—

"Here, then, at last has been discovered a mode of infection which explains many of the curious features in the epidemiology of Malta fever—the irregular seasonal prevalence, the number of cases which occur during the winter months, when there are no mosquitoes and little dust. It is true there are more cases in summer, and this may be explained by the temperature being more favourable for the multiplication of the micrococcus in milk that has been set aside, and to the fact that more milk and cream are used for fruit, in ice-creams, &c. It explains the liability of the officer to attack being three times as great as in the case of the private soldier, since the former consumes much more milk in various ways than the latter. It also explains the isolated epidemics which sometimes occur at any season of the year in institutions or in messes, such as that published by Dr. Johnstone in Vol. ii. of the Reports of the Commission, where a sergeants' mess was severely struck, while the men living in the vicinity escaped.'

"The consequences of prohibiting the use of goats' milk in naval and military hospitals and barracks have been mentioned above, and the Royal Society are fully justified in claiming that the results achieved by the Commission are highly satisfactory."

---

The full text of the proceedings of the first International Conference on Sleeping Sickness, held in London last June, has now been published and presented to Parliament (Cd. 3,778, price 6d.). An account of the Conference was given in the October number of the COLONIAL OFFICE JOURNAL (p. 178).

---

The annual report on Jamaica, for 1906-7, contains an interesting account of the manner in which the emergency arising from the earthquake of last January was dealt with at the Kingston Hospital. The following extract will show that great credit is due to the medical staff for the manner in which they met the occasion.

"The most noteworthy events which occurred at the Kingston Hospital last year were concentrated in the few weeks following the

14th January. The Superintending Medical Officer reports that when he entered the hospital shortly after the earthquake the whole quadrangle and the spaces between the female wards were crowded to overflowing with wounded people. 'The patients,' he states, 'were lying with clothes partially torn off by falling masonry and many of them soaked in blood. The wounds were not ordinary wounds, clean made, like those to be dealt with after an action, but wounds made by the grinding and falling of masonry.' The male wards had been shaken and the wounded refused to enter them. The plaster at the top of many of the female wards was loosened and fell in many places. The partly finished new operating theatre was wrecked when it was most needed, and the X-ray apparatus ordered previously had not yet arrived. The number of patients for whom provision is made on the Estimates is 214. The number on the night of January 14th was 624. In the first instance patients were to a great extent laid out in the open air, tents not being obtainable for several days, but fortunately the weather remained remarkably fine. The female wards were occupied, and the piazzas surrounding them afforded excellent accommodation, as did also the covered ways between the wards. Many, however, had to lie out in the open, and many had to be operated on where they lay. It is a matter for congratulation, therefore, that the efforts of the medical staff, reinforced by medical officers from outside, and of the nurses, assisted by volunteers, were rewarded with results as successful as those shown by the returns of the institution. The total number of patients injured by the earthquake dealt with between the 14th of January and the 31st of March was 499, exclusive of a large number of cases treated for minor injuries of which no record was kept. Between the 14th and the 15th of January there were thirty-eight deaths, and between the 16th and 17th sixteen, but many of these cases had been brought to the hospital in a moribund condition. Of the 445 cases operated on 28 died. Seven of these deaths were caused by tetanus—a small proportion, considering the nature of the injuries and the conditions under which they were treated."

"The failure of the ordinary sources of supply demanded extraordinary organization for the provision of food, drugs, and medical appliances, but the difficulty was successfully overcome with the aid of volunteers drawn not only from the neighbourhood, but also from across the sea."

---

A conference was recently held at the Colonial Office to discuss the prevalence of ankylostomiasis in the West Indies. This disease is caused by the presence in the intestine of a small worm, the "ankylostoma duodenale." This worm produces vast numbers of ova, which do not however develop in the intestine, but only after being passed out

with the excreta into suitable conditions of temperature and moisture. The worm finds its way into the intestine either through the skin, or by contamination of the food or water. Persons exposed to continual re-infection suffer from increasing debility, which may have fatal results.

In British Guiana, under the able direction of Dr. Godfrey, active measures have been taken for the eradication of the disease. The steps taken comprise the prevention of the contamination of the soil by the erection on estates of suitable latrines, and the treatment of sufferers with one of the well-known specifics, such as thymol or beta-naphthol.

It is understood that the United States Government have adopted similar measures in Puerto Rico, with gratifying results, and steps are being taken to obtain a report on the subject. The question is one of considerable importance, in view of the great loss of labour which the disease entails. It is especially prevalent among the Indian coolie labourers, of whom, it is said, 75 per cent. are infected before their embarkation for the Colonies. The treatment of coolies during the voyage from Calcutta to the West Indies has recently been undertaken, but the results are not yet fully known.

It is worth noting that ankylostomiasis is prevalent in Germany, and also in the Cornish mines, where it was introduced, it is believed, from South Africa.

## ASIATIC IMMIGRATION.

*A LETTER TO THE EDITORS.*

THE colour question, and particularly that form of it which is concerned with the immigration on a large scale of the coloured races into countries other than the home of their birth, is an embarrassment from which Great Britain, considered simply as a member of the European community of nations, enjoys a happy exemption. But as an imperial power, with possessions extending over every quarter of the globe, Great Britain finds that the question is one which interests her very closely and directly. At the present moment it is, in one form or another, a burning question in Australia, in Canada, in South Africa, and to a lesser extent in the West Indies. Here in England, if anywhere, it should be possible for sane views and reasoned judgment to be formed upon a question the consideration of which is too often vitiated by passion, prejudice, and jealousy. We have adequate sources of information; we are sufficiently concerned to take a lively interest in the problem; we are sufficiently distant to be impartial. But in practice English opinion on the subject rarely rises above the level of a vague or rather Pharisaic sentiment; and anticipations of the future are generally confined to a faith, not based on reason, that with the spread in distant latitudes of the spirit of humanity and toleration at present characteristic of the British Isles, the difficulties of the colour question will be happily and permanently solved. Recently, by a combination of curious accidents, one isolated and by no means characteristic form of the problem became the subject of acute political controversy at home. I have no desire to raise the ghost of the Chinese labour controversy, now fortunately moribund. But I may be allowed to illustrate, from certain incidents in that controversy, the general want of system and logic which characterises English thought, or perhaps I should say English utterance, upon this type of question. The opponents of Chinese labour maintained that the Chinaman was a man and a brother, and ought to be treated

as such. They also maintained that he was addicted to all manner of crimes and vices, infected with all manner of diseases, a peril to life and health, and—worst of all—to property, a loathsome and almost inhuman creature, unfitted for introduction into any decent and highly civilised population, such as that of the Witwatersrand. The advocates of Chinese labour retorted that the Chinaman was peaceful, law-abiding, thrifty and industrious, possessed in fact of all the virtues that go to make a good citizen and a useful member of society; and they added that ample precautions were being taken to ensure that he should not become a citizen or a member of society at all. It is only at special seasons, usually coincident with a general election, that opinion can continue to subsist at this high altitude and in so rarefied an atmosphere. But English opinion on the colour question, as it presents itself, for example, in Australia and in Canada, if less picturesque, is not much more profound. It is characterised as a rule by an inability to understand why the white Colonial should exhibit such an antipathy towards the coloured races, an antipathy which it commonly ascribes to a blind race-prejudice due to want of education, or to climate, or perhaps to the absence of a leisured class. It is, indeed, neither unnatural nor discreditable that English sympathy should incline towards the coloured races. England was after all the protagonist in the matter of negro emancipation; she has come nearer, in her West Indian Colonies, to solving the colour question once for all than any other white race ever has, and her method of doing it has been to sweep away all restrictions and establish full and complete race equality; she is to-day engaged in a sincere if ineffective protest against the iniquities under which the black population in the Congo Free State is suffering; and she was the first European power to signify, by the conclusion of the alliance with Japan, that she was prepared to admit a coloured Asiatic power into close association upon a complete footing of equality. But we are apt to forget that since we paid £20,000,000—a ridiculously inadequate sum—to complete the work of negro emancipation, our humane and advanced sentiments on the colour question have cost us little. We have done our magnanimity on the cheap. It is easy to maintain with impassioned argument the equality of white and black or yellow, so long as the black man and the yellow man have not become your neighbours and competitors. It is easy, and it is by no means disagreeable; for the advocacy of lofty sentiments is warming to the inner man. The Aborigines Protection Society and the League of Universal Brotherhood can extend the hand of fellowship to the coloured man, undeterred by fear lest he should propose to their daughters, or offer to perform their work for a lower salary. But to the white Colonist these two contingencies are very real possibilities, and it is ultimately upon them that the whole colour question turns. I do not mean to suggest that these are the

only obstacles to a complete understanding and sympathy between the races. To begin with, there is a vague semi-instinctive dislike, springing from an acute sense of difference. I think that any candid person will admit that, on first contact with persons of colour, he has been conscious of this feeling and has had to make a deliberate effort to overcome it. I imagine that a white cat, which had never seen a cat that was not white, would have a similar feeling when it met a black cat, or a tortoise-shell cat, for the first time. In fact I believe myself to have detected clear traces of this sentiment on the part of an English tabby, of conventional temperament, when first introduced to a Manx cat. But familiarity breeds tolerance, and this sentiment can easily be eliminated. There remain the two tangible grounds of objection to the coloured immigrant which I have indicated—the objection to him as a son-in-law, and as an industrial competitor—and they suggest the two divisions into which any discussion of the question naturally falls. The one aspect of it is social; the other economic.

With the former, though it is, of course, by far the more far-reaching, I shall deal here shortly. It is not the immediate subject of my letter, and I propose to say only so much as seems necessary to indicate my general attitude towards the race question. In my opinion, a community cannot be satisfactorily constituted, if there exist side by side in it two races which do not intermarry. In many parts of the world, and especially in its tropical areas, this state of affairs is already in existence, and, for the present at any rate, cannot well be remedied. But when it does not exist, it appears to me to be the rashest of social experiments to bring it about. If therefore the influx of a coloured population into a community predominantly white is to be encouraged, if my starting principle is right, the inter-marriage of the two races must also be encouraged. It cannot be questioned that such inter-marriage is generally regarded by white, and especially by Anglo-Saxon, populations with strong repugnance. I believe that the grounds of that repugnance are largely exaggerated, and that by degrees it will tend to diminish. In particular, I believe that the common statement, that the half-caste inherits the faults of both parents and the virtues of neither, is wholly fallacious. What does happen is that a race is produced which finds its social position ambiguous, and which has no environment to which it can easily and naturally adapt itself; and the reason why this happens is that the moral, intellectual, and social standards of the two races, as a whole, are still far apart, if not actually divergent in direction. If, by a gradual educational process, those standards can be assimilated to one another, then the objection to mixed marriages will disappear, and it is possible that a composite race, endowed with fresh vitality and strength of character, will arise. But even if this optimistic view be accepted, until that assimilation

of standards takes place, a mixed marriage is an almost unmixed evil, and a white community is fully justified in taking what measures it can to protect itself. But although a good deal is heard of the cry of "the purity of the race" in connection with the White Australia question, and with the recent anti-Asiatic riots in British Columbia, I do not believe it to be the root of the objection entertained by the Canadian or the Australian to the coloured immigrant. To him it is primarily in its economic aspect that the Asiatic immigration question presents itself, and it is with this aspect that I am primarily concerned. Briefly and boldly expressed, the objection of the white man to the Asiatic immigrant is his objection to a man who is prepared to work for a lower wage than he is himself. And, in passing, I may observe that the objection entertained in South Africa to the British Indian is closely analogous; it is the objection of the white trader to a competitor who cuts prices. In each case, a hundred other reasons are alleged, but the real motive is the economic one. The real objection to the Asiatic is not that he is insanitary in his habits, insincere in his devotion to the empire, addicted to opium smoking and violent crime, unchivalrous towards the female sex, but simply that he is industrious and thrifty. Is this objection reasonable? The question cannot be answered without a consideration of the different views which it is possible to take of the moral and social value of work. The normal English view appears to be that work is a thing desirable in itself and for its own sake, a thing which it is at once unreasonable and unrighteous not to search for, and welcome when found. The Tariff Reformer pictures to himself as his ideal a society in which there shall be work for all, not a society in which there shall be an adequate income for all, and work for none; and so strong is the force of theory that in a world straining beneath the burden of over-work, the promise of more work still exercises a mysterious attraction. It is commonly for others rather than ourselves that we desire this boon. But it would be a mistake to suppose that there is anything insincere or hypocritical in the theory. The Industrial Freedom League—if it still exists—burns with a quite genuine moral indignation against the man who only lays 600 bricks a day, when he might, by straining every nerve from sunrise to sunset, lay 750. And, on the same principle, the attitude of the manual worker towards the idle rich is less one of envy, or of enmity inspired by a sense of injustice, than one of moral disapproval. Summed up in a sentence, the European creed is that work is a thing which it is wrong for other people not to appreciate. Possibly we owe a debt of gratitude to the African race for having revealed to us that this is not the only possible creed. The negro does not consider that work is a good thing either for himself or for other people. He believes it to be an evil, and often an unnecessary one. He avoids work

himself; he expects others to avoid it. And, being by nature charitable and sympathetic, he feels no indignation against those who avoid it with success. At most, he envies their talent or good fortune. He frankly regrets the garden of Eden, and could view the prospect of a return to it without fear of boredom. He has never interpreted the primal curse, "In the sweat of thy brow shalt thou eat bread," as a blessing in disguise. This habit of mind is a very amiable trait in the African race, and, if only it proves as enduring as it is at present widespread, it justifies us in entertaining the belief that that race has something to contribute towards the ideas of the future.

But it is not, I think, to be regarded as a fundamental racial characteristic. It is partly the result of climatic conditions and economic environment, in the West Indies it is largely an inheritance from the days of slavery, an institution which accords indifferently with the doctrine of the "dignity of labour." Nor is it an attitude which is unchangeable; when, as for example in Barbados, the negro is subjected to conditions involving a severe industrial competition, he takes to work more naturally and pursues it with greater assiduity. But, generally speaking, it is a point of view characteristically African; and if it were only African immigration which Canada and Australia had to fear, the economic objection to it would never have arisen. The white population of South Africa entertain no objection to coloured labour. It cries aloud for more of it, and racks its brains for means to induce or compel the black man to do more work than he chooses. But the attitude of the Asiatic towards work is not that of the African. So different is it, in fact, that in the West Indies it has been found convenient to call in the old world in order to redress the balance of the new. The employer of labour is not content with a workman who works only when the spirit moves him; who responds to intimidation by taking a holiday; and to whom even the offer of high wages is but a slender inducement to the performance of an uncongenial task. What he desires is a person from whom he can exact an unreasoning and unreasonable continuity of industry; a human being who approximates as nearly as possible to a machine; who never ceases to work except when some part of him is out of order; whose activities are never interrupted by moods or sentiments or caprices; who is obsessed by an inveterate and automatic habit of labour. He finds the nearest approach to what he desires in the Asiatic, and this is why the Asiatic is brought to labour under indentures in our West Indian Colonies, where there is already a negro population amply sufficient for all requirements, if its particular temperament did not stand in the way. It is sometimes said that this indentured immigration is unjustifiable, and has the effect of taking the bread out of the

mouths of the negro population. The charge is untrue, for the Asiatic immigrant is imported to do work which the negro cannot be persuaded to do, and which, if he were not imported, would be left undone. If the attitude of the Asiatic towards work is not that of the African, neither is it that of the European. I do not know what his theory may be; his mind is a sealed book; but in practice he would almost appear to approach work, not as a thing undesirable, or as a thing desirable only for others, but as a thing desirable for himself. It is here that he comes into conflict with the white man. He will work extravagantly long hours for extravagantly small pay, and the bulk of that pay he will save instead of spending. Bearing this in mind, it is easy to understand why the real objection to the Asiatic should be that he is industrious and thrifty. In estimating the force of that objection, as it is felt in Australia, it is important to remember that Australia has framed for herself a far more definite ideal of national well-being than England has. The conception of prosperity which finds most expression in England is that of a condition of affairs in which the Board of Trade returns expand in geometrical progression. Nothing else really matters. Wealth may be accumulated in few and for the most part in worthy hands. Energies which might be devoted to the work of production may be wasted in the humiliating task of circumventing trade rivals. The discomforts and uglinesses of life may be multiplied. Social differences may be widened, with their inevitable consequences of promoting ill-feeling between classes and impairing our national solidarity. Industries which have their root in oppression and suffering may spring up and flourish. It is no matter. So long as our imports and exports increase, all must be for the best in the best of all possible Englands. This is not the Australian point of view. In Australia a systematic policy has been pursued, which aims at establishing a community in which inordinate wealth and extreme poverty shall be alike unknown, the one being eliminated by a system of taxation deliberately designed to break up great properties, the other by a system of legislation which prevents the exploitation of the worker. The central principle of the whole system is the maintenance of wages in every industry at a level, which will enable the worker to enjoy reasonable comfort without excessive toil. It is the principle of trades unionism raised to the level of a national policy. Australia does not desire the introduction of industries which depend for their prosperity on the existence of a class driven by competition to accept wages which render the maintenance of a decent standard of life impossible. She does not accept the sweating system as something which is inevitable, because it would cost so much to put it down, or because state regulation is so hampering to private enterprise. She does not tremble before

the threat that capital will forsake the country if labour is accorded its due. Whatever party may be in power she adheres steadily to her principle that the well-being of the many is more important than the wealth of the few, and that it can be secured only by insistence on the maintenance of conditions of labour which are not prejudicial to the health, the comfort, the intelligence or the independence of the worker. How far Australia is prepared to carry that principle is shown by the provision in the new Tariff Bill for an excise duty penalizing local industries, which fail to reach the approved standard as regards wages, hours and conditions of labour. To this principle the Asiatic, with his capacity for labour over-developed, his desire for comfort, for amusement, and for luxury hopelessly atrophied, is a deadly enemy. He must be excluded, even though the Government of India may protest against injustice to our fellow subjects, and the Government of Japan against insult to an allied nation, until such time as he shall have learned to do less work and to demand more wages. The aboriginal population of Australia offers no obstacle to the realisation of this ideal; for the Australian aborigines belong to a little group of peoples (in which the Indians of North and South America, and the Malays may be included), which work with such reluctance and such incompetence, that it is not worth anyone's while to make them work at all. But there are many who, while sympathising to some extent with the ideal, consider that Australia has pushed it to unreasonable lengths at any rate in so far as the sugar plantations of Queensland are concerned. They defend Kanaka labour on the ground which I indicated as being the proper defence for indentured Indian labour in the West Indies--viz., that if the Kanaka is not admitted, the work will not be done at all, because the white man cannot perform in the tropics the manual labour required on a sugar plantation. But the Australian is not prepared to believe that things cannot be done, until he has at any rate tried to do them. He is at present testing the possibility of white labour on the Queensland plantations, and he is greasing the wheels of the experiment with a bounty of £3 a ton on sugar which is the product of white labour. The experiment may fail; but it is an experiment worth making; and in estimating its chances of success or failure it may be useful to look beyond the limits of Australia. In the Transvaal it is said to be impossible for white men to perform unskilled labour in the gold mines. Yet in Western Australia and in the United States precisely similar work is regularly performed by white men under climatic conditions certainly not more favourable. The impossibility in the Transvaal is not an impossibility inherent in the nature of the work: it is the impossibility of the white man and the black man working side by side at the same work on an equal footing. Were there no coloured labour available in South

Africa, the work would long since have been undertaken by white men. If coloured labour be eliminated from Queensland, a similar result may follow. In any case, I repeat, the experiment is worth making.

Canada has not as yet found nearly so definite an idea of a "national minimum" as Australia. The country is developing so rapidly that it is still easy for a man to pass from the ranks of the wage earners to those of the employers and landowners, and hence the necessity of protecting the wage earner has not presented itself as the first consideration in national policy. Had it done so, the Canadian Government would inevitably have been more cautious in concluding its agreement with Japan. And there are other circumstances which differentiate Canada from Australia. There is not the same concentration of the bulk of the population in a few large cities, and principally for that reason, trades unionism is less developed, and the influence of labour on politics is far weaker. For this reason in Canada, as compared with Australia, the race argument against Asiatic immigration is proportionately stronger, and the economic argument proportionately weaker. But the instinct of self-preservation is strong in the working classes of Canada, and the Asiatic immigration danger is sure to result in a rapid crystallization of opinion. Even our English theory that labour, like everything else, should be bought in the cheapest market, would not survive the menace of an influx of cheap Asiatic labour for six months. Our various political parties would abandon their cherished theories and vie with one another in their anxiety to propose a policy of exclusion not less vigorous than that adopted by Australia. In the interests of our political intelligence, it is perhaps unfortunate that we are protected from this danger. But, whether by climate or other causes, for the time being protected we are; and so long as the protection lasts, the colonial attitude is likely to remain distasteful to many Englishmen—so much so, that they think the Canadians at any rate must be Americans in disguise. There are some whose distress is based upon abstract principles. They hold that all men are free and equal, and have an inalienable right to work too long for inadequate wages. There are others who are more severely practical. Australia, they point out, is an ill-developed country, with vast unoccupied areas, and a population increasing, but slowly. British Columbia has mighty undeveloped resources, and the land cries aloud for labour. Let in the industrious Asiatic, and the wilderness will blossom like the rose, and import or export returns "swell wisely." They forget that these advantages can be bought too dearly. "The place where a great city stands is not the place of stretch'd wharves, docks, manufactures, deposits of produce merely. . . . Nor the place of the tallest and costliest buildings, or shops selling goods from the rest of the earth. . . . Nor the place of the most numerous

population." It is far better that the so-called economic development of a country should be extended than that it should proceed upon a wrong system, and no system is ultimately so disastrous to a nation as that which depends on cheap labour.

It is possible that the characteristics of the Asiatic which make him so undesirable as an immigrant—his thrift and industry—may in time undergo modification or disappear. I have already suggested that the social objections to Asiatic immigration are not necessarily so permanent as they are generally considered to be. And I suggested also, when referring to the negro, that the different attitude adopted towards work by different races was a result rather of environment than of immutable racial characteristics. For this reason I do not despair of the reformation of the Asiatic. He may yet learn to become a good trades unionist, and when he is, there will no longer be any economic reason for excluding him. But I am dealing with the immediate present, and in so doing I have no hesitation in affirming that in the interest of all parties concerned, the exclusion of Asiatics from communities which are predominantly white should so far as possible be vigorously maintained.

ISHMAEL.

## EDITORIAL NOTES.

---

THE question of Asiatic immigration attracts more and more attention, as it is bound to do, in the home press. The *Times* has urged that a Committee of the Imperial Conference should at once set about the "preliminary investigation necessary for any useful decisions." The committee, it is argued, would "at any rate make plain mutual difficulties"—a result which, we are afraid, is probable enough. To assist the committee under these embarrassing circumstances, it is suggested that "the evidence before such a commission might convince some of our most exclusive Colonies that, with a growing tide of population in the East, it will be impossible entirely to bang the door against it; it might also convince us that the unrestrained immigration of Asiatics would be fatal to our civilization and even to our race. Certain parts of our territories most suited to Orientals and least suited to our own habits might be specially reserved for Oriental immigration."

---

It seems very doubtful, however, whether the question is one that the Conference could settle to any material extent. It is a matter which affects the Dominions, not—for the present or for the immediate future—the United Kingdom, except in the sphere of its

foreign relations and its task of governing India. An attempt to bring pressure to bear would certainly be resented as an interference with the right of self-government, and would confirm the fears of those who see in any form of Imperial Council the danger of infringing constitutional rights. It is not one of those cases of bargaining or co-operation in which each party has a direct interest and can make terms on a business footing with the rest. This country has nothing to offer to the Dominions as an inducement to them to alter their policy, whatever it is.

---

Mr. Winston Churchill, fresh from his tour in East Africa, has pointed out the suitability of the tropical areas of the Protectorate for Indian immigrants, and the suggestion came at a very opportune time. The general character of the country and its geographical position are clearly convenient. It remains to be seen whether Indians will be attracted. Some efforts to obtain them for East Africa have, we believe, been unsuccessful. Many parts of India itself are sparsely populated, and there is no crying necessity for an outlet for any surplus population; if, however, there are any available emigrants East Africa could utilise them. Of course it does not follow that the Uplands of the Protectorate will be thrown open in the same way. We have no doubt that these will be effectively preserved to white men.

---

Mr. Winston Churchill's tour in East Africa and Uganda will be a memorable one. Such visits, as Mr. Chamberlain expressed it of his South African tour, export Downing Street to the Colonies. The value of these visual studies lies not merely in the collection of figures, but in the stimulus which they give to idea and action. The general tendency of an office at home is to deal only with the questions which come formally before it; the ability to look to the possibilities of the future comes mostly from the vividness of local experience. Mr. Churchill's admiration for the Protectorates, his tributes to the Uganda Railway, and the energy with which he has pursued since his return the subjects which came before him, all testify to the fascinations of the Empire and to the value of such visits as contributing to a wide and sympathetic outlook.

---

Defence comes in the first line of Imperial questions, and the discussion which is now going on in Australia with regard to the naval defence scheme is as interesting as it is important. There are two considerations which have to some extent conflicting claims. On the one hand it is desirable from the point of view of strategy that

there should be as many powerful battleships and cruisers as possible, and that the Admiralty should have the power of concentrating any of them on any point. The ultimate result of war must admittedly depend on fleet actions. Offensive action would be the keynote of our policy, and any raiders would be followed and, if possible, brought to action. These issues are not a matter of local defence. The sea commerce between Great Britain and Australia might be cut at any point, and far from the coasts, and the first essential for its preservation is a fleet which can be ordered to any point, and which would be effective in action. On the other hand, the Australians naturally look largely at the means of local protection. It is not that the landing of a large armed force is apprehended, but a raid or dash at a port is certainly possible, and would be sufficiently mortifying, to say the least. There is a sense of insecurity when the defence is remote and invisible. Therefore there is a natural desire on the part of Australians to have some scheme of naval defence which will at once show something for their money, reassure them as to their safety, and satisfy the laudable feeling of national sentiment.

---

It is, of course, possible to provide for both considerations. The matter of purely local defence is one for the Australians. But at the Conference of 1887 they accepted the principle that they should also share in the defence of the seas. The contribution which they then agreed to pay has not been popular, principally because the money has gone on objects which are to them not of the visible and tangible order; but no one denies that the work has to be undertaken, and we have yet to find any argument that a contribution from Australia to this object is unreasonable. The Admiralty, however, has left the question to Australia in the most open manner. "We gladly take all that you can give us," said Lord Tweedmouth at the Conference of last year, "but at the same time if you are not inclined to give us the help that we hope to have from you, we acknowledge our absolute obligation to defend the King's dominions across the seas to the best of our ability."

---

The controversy in Australia at the present time is as to whether it is sufficient as a beginning to provide submarines and destroyers, as has been proposed by Mr. Deakin, or whether sea-going vessels should be procured which would not only protect the ports but patrol the coasts. Obviously the more Australia does in this direction the better for Great Britain and the Empire. It is, therefore, rather bewildering to us to find that the Melbourne *Age* is attacking both Mr. Deakin and the Home Government, because Lord Tweedmouth at the recent Conference fully recognised the value of submarines and

destroyers. Surely it need not be inferred from this that the Admiralty would not be pleased to see Australia providing larger vessels. If Australia takes steps to make her coasts and commerce safe, as the *Age* appears to urge, the Sea Lords should be among the first to rejoice.

---

The *Morning Post*, endeavouring, as it always does, to do justice to the Colonial point of view, has, we think, done less than justice to the Admiralty in this matter in suggesting that that department has "not altogether played the game as the trusted naval advisers of the whole Empire." An illustration given is that "the Committee of Imperial Defence, deprecating the proposal to create an Australian Navy, actually suggested that the coastwise trade of Australia—said to be worth £170,000 a year—should in time of war come to a standstill in the shelter of fortified harbours of refuge." We cannot think that this is a fair rendering of the Committee's statement that "from the point of view of the protection of sea-borne commerce, it is necessary to provide a certain number of fortified harbours of refuge, where merchant shipping can, *in case of need*, seek protection from capture or molestation and remain in safety until commerce raiders reported in neighbouring waters have been dealt with by His Majesty's ships or compelled to withdraw from shortage of coal."

It is obvious that this country is at least equally interested with Australia in the security of the over-seas commerce, and it is quite certain that on any outbreak of war every effort will be made to protect it.

---

There never has been any difference of opinion in naval circles as to what is the best policy in this matter. It was propounded as emphatically at the Colonial Conference of 1887 as at that of 1907, that it is a mistake to provide armed vessels for purely defensive purposes—that the Imperial forces will best ensure not only the safety of floating trade, but also the immunity of coast towns from attack, by attacking the enemy wherever he is, and that absolute co-operation and unity of command are requisite for that purpose. In the face of this opinion there is no room for recrimination. We recognise, however, apart from the technical treatment of the case, the strength of national sentiment and the importance of encouraging it. If this sentiment is not satisfied unless naval weapons are provided for coast defence, which are distinctively Australia's own, this country, we imagine, will cheerfully accept her decision.

---

The admirable paper which Mr. A. Berrisdale Keith, of the Colonial Office, read to the Royal Society of Arts (printed in the *Society's Journal* of 21st February) traced the steps in the development

of the autonomy of the self-governing Colonies, and explained clearly the functions of a governor, both as Colonial and Imperial officer. In the course of the discussion, the Agent-General for South Australia suggested that the officials of the Colonial Office require instruction on the principles of constitutional government. But no attempt, as Mr. Keith observed, has been made to impede constitutional development, and we do not find that any allegation is made of interference in recent times with the local affairs of the self-governing Colonies. Any proposal for such interference comes from outside.

The grant of self-government is followed by urgent appeals to meddle with it. There is always some person or some class which complains of oppression, and the Home Government are appealed to to put matters right. The answer of course is—and it has frequently been given officially—that the Home Government cannot now interfere in local matters. It would clearly destroy all confidence in the Colonies if the Home Parliament took upon itself the task of revising the decisions of Colonies to which responsible government has been granted on local questions. It might properly do so, according to a celebrated despatch from the Secretary of State in 1898, where “Imperial interests are involved,” or where the measure is “so radically vicious as to reflect discredit on the Empire.”

---

The last cases of interference with local matters were the disallowance of the Deceased Wives' Sisters Marriage Bill of New South Wales and other Colonies, and these decisions went partly on the ground that such an alteration of the Marriage Law in Australia might affect British subjects living elsewhere; in other words, that the matter was not purely local. It is practically certain that this attitude will never be adopted again. Sir Charles Dilke expressed the opinion, we think a correct one, that in what might be called constitutional issues we have arrived at calm water. The problems of the future lie in the conduct of foreign relations and in the modes of co-operation.

---

In commenting on Mr. Keith's paper, Sir Charles Dilke showed the wide knowledge and deep interest which are characteristic of him with regard to Colonial questions. He referred to two recent matters in which he thought the Colonial Governments had not been fully consulted. One of these was the New Hebrides Convention, in which “the Colonies were not consulted in advance in regard to the arrangement which was made.” We have no pretensions to put forward any opinion on the merits of the negotiations, but we are merely correcting what seems to us to be a misapprehension of fact,

if we point out that the arrangement in question was not a concluded convention, but merely a draft expressing the recommendations of certain comparatively subordinate officials. It began, as Mr. Deakin observed at the Conference, with a "chat between two officials about evidence (as to land claims)." The "chat" enlarged itself into a draft signed by a Commission, and this document was duly sent out to Australia for consideration. It was not therefore an arrangement or convention in the formal sense, and it was sent out with the express statement that it would not be confirmed until the Home Government had had the opportunity of considering the views of the Australian Government. Mr. Deakin's point at the Conference was that the Australian Government should have been consulted during the discussion on the draft; but this is a very different thing from an allegation that the arrangement was made before the Colonies were consulted. Every effort will, we are sure, be made in future to avoid giving Australians any reason to believe that their opinions are not fully appreciated.

---

We may note in this connection that Sir Wilfrid Laurier has recently acknowledged in generous terms the recognition accorded to Colonial interests in the sphere of diplomacy, and has emphasized the fact that Canada, at any rate, has no quarrel with Downing Street. The assistance rendered to the Lemieux mission by Sir Claude MacDonald, and Mr. Bryce's happy remark that he regards himself as the Ambassador of Canada no less than the Ambassador of Great Britain, have done much to remove the bitterness left by old controversies.

---

The other case referred to by Sir Charles Dilke was the Newfoundland *modus vivendi*. It certainly seems incongruous that the Imperial Government should be paying the fines inflicted, no doubt quite correctly, on certain Newfoundland fishermen for breaches of the Colonial law. But the Imperial Government is responsible for foreign relations, and it was absolutely necessary to construct some temporary arrangement pending the formal settlement of the difficult treaty questions involved. Happily all parties have now agreed in principle that the question should be referred to the arbitration of the Hague Conference, and in the meantime the *modus vivendi* appears to have been cheerfully accepted by the fishermen of the Colony.

---

An interesting review of industrial and labour conditions in Canada during 1907 is given in the Dominion Labour Gazette for January. During the first nine months of the year the very favourable conditions of 1906, which had surpassed any previous year in the history of the Dominion, were continued without abatement,

although the opening of the season of activity was delayed by a late spring following upon a winter of exceptional severity. There was a continued expansion in almost every branch of trade and industry ; settlement in the north-west provinces proceeded with unexampled rapidity. There was great activity in the work of railway construction, and prices and wages, the most obvious indices of industrial activity rose substantially above the high level of 1906. With the close of the summer season, however, a certain decline became noticeable, which was primarily attributable to the growing stringency in the money markets of the world, and Canada was to some extent adversely affected by the severe financial crisis in the United States. These conditions were aggravated by a decline in the yield of grain in the north-west, and a sensible slackening in the timber industry. There was in consequence more than the normal amount of unemployment, especially in the larger centres, including Toronto, Hamilton, London, Winnipeg and Vancouver, when the season of outdoor activity came to an end. During the closing weeks of the year, however, there was a noticeable improvement in the general tone of the labour market and in industrial and commercial circles, and the outlook for 1908 was regarded as very favourable. On the whole, Canada seems to have passed through a trying period with an absence of anything like panic or serious distress, which affords satisfactory evidence of the stable foundations upon which her prosperity rests.

---

Perhaps the most remarkable feature of the year in Canada has been the continued increase in the tide of immigration. The total number of immigrants arriving was expected to fall but little short of 300,000, this figure representing an increase of about 31 per cent. on that for 1906. A feature of the year was the pronounced activity of immigration during the autumn months, and in view of the decline of industrial activity, to which reference has been made above, and of the great reduction of employment which the winter season always brings in Canada, the Dominion Government found it expedient to take special steps to discourage the influx of new-comers before the spring of 1908. Notices were accordingly issued extensively in Great Britain warning intending emigrants that the winter months are not suitable for emigration to Canada, and a new regulation was issued requiring immigrants arriving before February 15th to have \$50, and those arriving between that date and April 1st to have \$25 in their possession, in addition to the means requisite to convey them to their ultimate destinations in Canada, unless they can show that they are going to definite employment or to friends who will care for them. The Emigrants' Information Office has co-operated with the Canadian authorities in giving a wide publicity to these precautionary measures.

if we point out that the arrangement in question was not a concluded convention, but merely a draft expressing the recommendations of certain comparatively subordinate officials. It began, as Mr. Deakin observed at the Conference, with a "chat between two officials about evidence (as to land claims)." The "chat" enlarged itself into a draft signed by a Commission, and this document was duly sent out to Australia for consideration. It was not therefore an arrangement or convention in the formal sense, and it was sent out with the express statement that it would not be confirmed until the Home Government had had the opportunity of considering the views of the Australian Government. Mr. Deakin's point at the Conference was that the Australian Government should have been consulted during the discussion on the draft; but this is a very different thing from an allegation that the arrangement was made before the Colonies were consulted. Every effort will, we are sure, be made in future to avoid giving Australians any reason to believe that their opinions are not fully appreciated.

---

We may note in this connection that Sir Wilfrid Laurier has recently acknowledged in generous terms the recognition accorded to Colonial interests in the sphere of diplomacy, and has emphasized the fact that Canada, at any rate, has no quarrel with Downing Street. The assistance rendered to the Lemieux mission by Sir Claude MacDonald, and Mr. Bryce's happy remark that he regards himself as the Ambassador of Canada no less than the Ambassador of Great Britain, have done much to remove the bitterness left by old controversies.

---

The other case referred to by Sir Charles Dilke was the Newfoundland *modus vivendi*. It certainly seems incongruous that the Imperial Government should be paying the fines inflicted, no doubt quite correctly, on certain Newfoundland fishermen for breaches of the Colonial law. But the Imperial Government is responsible for foreign relations, and it was absolutely necessary to construct some temporary arrangement pending the formal settlement of the difficult treaty questions involved. Happily all parties have now agreed in principle that the question should be referred to the arbitration of the Hague Conference, and in the meantime the *modus vivendi* appears to have been cheerfully accepted by the fishermen of the Colony.

---

An interesting review of industrial and labour conditions in Canada during 1907 is given in the Dominion Labour Gazette for January. During the first nine months of the year the very favourable conditions of 1906, which had surpassed any previous year in the history of the Dominion, were continued without abatement,

although the opening of the season of activity was delayed by a late spring following upon a winter of exceptional severity. There was a continued expansion in almost every branch of trade and industry; settlement in the north-west provinces proceeded with unexampled rapidity. There was great activity in the work of railway construction, and prices and wages, the most obvious indices of industrial activity rose substantially above the high level of 1906. With the close of the summer season, however, a certain decline became noticeable, which was primarily attributable to the growing stringency in the money markets of the world, and Canada was to some extent adversely affected by the severe financial crisis in the United States. These conditions were aggravated by a decline in the yield of grain in the north-west, and a sensible slackening in the timber industry. There was in consequence more than the normal amount of unemployment, especially in the larger centres, including Toronto, Hamilton, London, Winnipeg and Vancouver, when the season of outdoor activity came to an end. During the closing weeks of the year, however, there was a noticeable improvement in the general tone of the labour market and in industrial and commercial circles, and the outlook for 1908 was regarded as very favourable. On the whole, Canada seems to have passed through a trying period with an absence of anything like panic or serious distress, which affords satisfactory evidence of the stable foundations upon which her prosperity rests.

---

Perhaps the most remarkable feature of the year in Canada has been the continued increase in the tide of immigration. The total number of immigrants arriving was expected to fall but little short of 300,000, this figure representing an increase of about 31 per cent. on that for 1906. A feature of the year was the pronounced activity of immigration during the autumn months, and in view of the decline of industrial activity, to which reference has been made above, and of the great reduction of employment which the winter season always brings in Canada, the Dominion Government found it expedient to take special steps to discourage the influx of new-comers before the spring of 1908. Notices were accordingly issued extensively in Great Britain warning intending emigrants that the winter months are not suitable for emigration to Canada, and a new regulation was issued requiring immigrants arriving before February 15th to have \$50, and those arriving between that date and April 1st to have \$25 in their possession, in addition to the means requisite to convey them to their ultimate destinations in Canada, unless they can show that they are going to definite employment or to friends who will care for them. The Emigrants' Information Office has co-operated with the Canadian authorities in giving a wide publicity to these precautionary measures.

In proportion to population Canada appears now to be receiving a larger number of emigrants than any other country ; but the gross total of emigration to the United States is naturally greatly in excess of that to the Dominion. From the report of the United States Commissioner-General of Immigration it appears that, during the year ended June 30th, 1907, no less than 1,285,349 alien immigrants arrived in the country. A striking feature of the returns is the extent to which the Latin and Slavonic races now outnumber the Celtic and Teutonic among the new-comers, 76 per cent. of the total number now coming from the first-mentioned sources. Austria-Hungary sent 338,000, Italy 285,000, and Russia 258,000, while only 113,000 came from the United Kingdom ; of the huge Austrian total only 40,000 were of Germanic race. If this process continues, and present indications point rather to an increase than to an abatement of it, it will produce in course of time a sensible alteration of the American national stock. The same process is at work in Canada, but as yet the influx of alien elements has not outgrown the power of the Dominion to assimilate them. The number of emigrants to Canada from the British Isles is now larger than that to the United States, and when the much smaller total of emigration is taken into consideration, it will be realised that the proportion which the British element bears to the total is very much higher in the case of Canada than in that of the United States.

---

The subject of emigration recalls a Canadian case which came in December last before the Judicial Committee of the Privy Council, and which illustrated in a picturesque way how the dissensions of the Old World can be transferred to the New. The judgment sets out that—

“ In Galicia, the province from which the settlers came, the great bulk of the population is divided pretty equally between Poles, or Polaks, as they are sometimes called, and Ruthenians, or Little Russians. Held together by the strong hand of the Austrian Government, these two sections of the community have never become united or even assimilated. Strangers in race and in religion, they keep separate and aloof, each regarding the other with jealousy and dislike. ‘ For many generations,’ says the Reverend Father Philas, a witness for the plaintiffs, who was a travelling missionary in Galicia and knows ‘ the whole of it,’ ‘ there has been a struggle between the Polish and the Little Russians, and the latter have been kept down.’ The Poles to a man are Roman Catholics. The Little Russians are, as Father Philas tells us, ‘ devoted to the religion, rites, and ceremonies of the Greek Church.’ The Orthodox Greek religion is proscribed in Galicia. For fear of Russian intrigues it is not tolerated there. Adherents of the Orthodox Church, as the Ruthenians

or Little Russians originally were, are liable to be arrested and punished if they are suspected of an intention to revert to that faith. As a condition of being allowed to use their own liturgy and rites and to have their services conducted in the old Slavonic language, the Little Russians in Galicia are compelled to acknowledge the supremacy of the Pope and so to accept those points of doctrine which the Roman Church holds, and the Greek Church rejects. In other countries and other provinces which, in course of time, have been detached from the Greek Empire and have fallen under the sway of devout Roman Catholic sovereigns, something of the same sort has happened. The result has been the creation of a composite church, half Roman and half Greek—Roman to the educated priesthood, but Greek to the ignorant peasantry. Its proper style is the 'Uniate Church,' a title derived from its enforced union with Rome." When the settlers arrived in Canada "they were free. They seem to have been intoxicated with their freedom. They had come to a land, says one of them, where there was 'no must.' They had escaped from their oppressors. But the past was not forgotten. At one of the services held in the early days in a schoolhouse before the church was built, they were reminded by the officiating priest of the heavy yoke laid on them in their old country, and then the whole congregation burst into tears. They were an impressionable people, and not unlikely to be influenced in the choice of a religion, when free to choose for themselves, by sentiments of patriotism and the memory of past oppression."

They built a church, and the rest of the story turned on the question whether it could be claimed for the Orthodox Greek congregation or the Roman Catholic party. Judgment was given for the former.

---

In South African politics the principal event of interest has been the resignation of Dr. Jameson's ministry, and the accession to power of Mr. J. F. X. Merriman with a cabinet drawn from the South African party, and including Mr. Sauer and Mr. Malan. Dr. Jameson has succeeded in living down the stigma of the Raid, and in gaining the respect even of his political opponents. In resigning before the result of the elections for the Lower House is known, he has adopted an unusual course, but the circumstances were peculiar. It will be remembered that it was the action of the Legislative Council in blocking the Appropriation Bill which brought about the dissolution, and it is, therefore, not unnatural that the result of the elections for the Upper House should be regarded as having, on this occasion, more than their usual significance. But the main reason for Dr. Jameson's early resignation is no doubt to be found in the fact that an Inter-Colonial Conference is to assemble in April, at which

subjects of first-rate importance to South Africa will come up for discussion, and it is obviously desirable that the Ministry which will represent the Cape at that Conference should be given time and opportunity to formulate their policy beforehand, and not accede to power on the very eve of the Conference itself. The new Cape Ministry, like that of the Transvaal, while primarily Dutch, apparently numbers a considerable English element among its supporters.

---

The Australian Government is determined to prevent rings and trusts from doing injury to the public. A clause in the new mail contract with the Orient Company provides that if the contractors or their agents shall "be convicted of being engaged in or continuing in any combination, commercial trust, or conspiracy," in contravention of the Australian Industries Preservation Act, 1906, or any amendment of that measure, the Postmaster-General may require the mail contractors to withdraw from "such combination, commercial trust, or conspiracy," and, failing compliance within a week, may determine the contract. During the discussion in the House of Representatives, it was suggested that the Australian Courts would have no authority over a shipping ring in London. Mr. Deakin's reply was that "he believed it would be possible to provide against any serious detriment to the public of Australia by the London ring."

White labour is to be exclusively employed on the steamers, although not necessarily in the case of coaling or loading outside the limits of the Commonwealth, and no discrimination is to be shown as between unionists and non-unionists. The Australian Government may purchase the mail ships at any time as a going concern at a valuation or by arbitration. In the event of purchase the Postmaster-General would take over all the current obligations of the contractors as to engagements entered into by them in relation to the trade in which the mail ships are engaged.

---

The first number of the *Orient Review* has a special interest for us, as the founder of the magazine is an ex-Trinidad government scholar, and the views of a class of educated Orientals are set out with great frankness. We read that "Orientals have learnt the deep significance of a peculiarly Western dictum, that 'man is a political animal,' and not merely a fragment of the Universal Soul." The times, therefore, have passed when:—

"The East bowed low before the blast,  
 In patient, high disdain,  
 She let the legions thunder past,  
 And plunged in thought again."

The mind of young Asia is turning from metaphysics to constitutionalism. It is beginning to demand representative government. The editors claim the right to express boldly what they think, "even if they share the fate of Socrates and Galileo." We believe that fortunately no proceedings of this character have as yet been commenced.

---

It is a significant sign of a wide-spread movement that the Malay newspapers, week by week, pour out a flood of translations from Egyptian journals which are engaged in the pan-Islamic agitation. The able editor of an account of Malay Literature, published by direction of the Federated Malay States Government, observes that the feeling of vague unrest that is thrilling the Mussulman world may be exploited by political agitators to serve their own ends, but certainly cannot be due to any sudden appreciation of the merits of Turkish rule. Paralleled by corresponding movements in China, in Hindu India, and in Shiite Persia, it simply represents the awakening of certain peoples to a knowledge of the undignified part that they are playing in the politics of the time. In the Straits at least, he remarks, the pan-Islamic movement is defensive; it would not exist at all but for the fear that Malay and Moslem ideals are being menaced by the changing conditions of modern life.

---

We publish in this number an article by Dr. Mason, of Dominica, on "The Future of the West Indies," in which proposals for a new federal organisation of the smaller Colonies are put forward. Schemes for the federation of the West Indies are familiar to all who take an interest in those Colonies, and they have on many occasions engaged the attention of Parliament and the Press. Of the more ambitious of these projects it may generally be said that they proceed from persons who have neglected the advice of the late Lord Salisbury, to "use large scale maps," and who are misled by the use of the general appellation, "West Indies," into regarding the islands as a small and compact group, which might easily and cheaply be brought within the sphere of a single administration. It is very seldom realised that Jamaica and Barbados are separated by more than a thousand miles, and that the distances between Jamaica and Trinidad, and between Trinidad and St. Kitts are not very much less. The effect of geographical distance is increased by the comparative infrequency of opportunities of communication, and a Governor-General of the whole of the West Indian Colonies would either spend the bulk of his term of office at sea, or remain in less close touch with the outlying parts of his dominions than is the Secretary of State in Downing Street.

---

Dr. Mason, who has a practical knowledge of the West Indies, naturally avoids the error of putting forward impossible paper schemes of this kind, and he confines himself to the more modest proposal of a federal union of Barbados with the Windward and Leeward Islands. As the islands at present included in the Windward group were, together with Tobago, formerly administered from Barbados, this arrangement would be not altogether untried and unfamiliar; and it may be at once admitted that it would certainly promote economy and very likely the efficiency of government as well. But these are not the only considerations to be kept in view, and we are inclined to think that Dr. Mason underrates the strength of the sentiment of independence which characterises the various Colonies, each of which has special historical and social conditions which it is reluctant to jeopardize. Any successful scheme of federation or unification must in any case derive its inspiration from inside, and not from outside the Colonies affected. To mention a difficulty of another kind, a tangled skein of Imperial Acts and Orders in Council, and local Ordinances would have to be unravelled before Dr. Mason's apparently simple scheme of judicial reorganisation could be carried into effect.

---

The growing production of wheat in Canada lends increasing interest to the question of the value of the advantage which the farmer at home possesses in having the market close at hand. The cost of transport of grain from the great interior markets in America to the Atlantic seaboard is, taking a rough average, about 5d. a bushel, and the ocean rate to Liverpool, 2d. These figures, however, do not include the cost of moving the crop from the farm to the interior market, and this cost may be greater than that of the long distance transport. The farmer has first to cart the grain to the local railway station, and the cost of doing this varies, of course, considerably; in the United States it has been estimated at an average of about 2d. per bushel, and the transport by rail to the interior market, 5d., making the total cost of transport from the harvest field to Liverpool 1s. 2d. The distribution from Liverpool may perhaps be fairly set for general purposes against the cost of sending a home crop to market.

---

The comparative smallness of the ocean rate—for a distance of about 3,000 miles—is striking. From the Russian Black Sea ports the freight averages 3½d., from India 4½d., from the Argentine 5½d., from Australia 7d., and from the Pacific coast, by sailing ship, 8½d. The blessings of being an island are great.

---

The Southern Nigerian Government has entered into an agreement with the Nigeria Bitumen Corporation, Limited, under which it is to provide £25,000 to accelerate the drilling for oil. The quarterly payments will cease upon oil being struck and will be repayable out of the oil produced. In consideration of this assistance the royalty will be increased from 5 per cent. to  $7\frac{1}{2}$  per cent. The Corporation think that they have profited by their experiments and that they have now ascertained the whereabouts of the true oil belt. It is greatly to be hoped that they will succeed.

The growth of cotton enterprise in Nigeria is reflected by the opening at Oshogbo of what is said to be the largest and most complete ginnery in the world. When running full time it will turn out 12,000 bales a year, and it is anticipated that in 1909 it will be fully occupied. The Lagos railway will shortly reach Ilorin, and it is probable that a similar ginnery will be built there.

The cocoa crop of the Gold Coast in 1907 was exceptionally large, the value being about £800,000. It will no doubt increase, and will lead to further railway construction at an early date.

In the German African Colonies 402 kilometres of railway were added in 1907, thus:—

Togoland	...	...	...	66
South-West Africa	...	...	...	148
East Africa	...	...	..	188
				402

There are about 350 kilometres under construction. The lines are being built partly by the Government and partly by private enterprise.

## AUSTRALIA AND THE NEW PROTECTION.

THE proposals which Mr. Deakin has submitted to the Commonwealth Parliament under the title of the "New Protection," possess an interest by no means limited to the people of Australia; and we believe that many readers in the United Kingdom and elsewhere will be glad to have an opportunity of reading the full text of the memorandum which embodies them. They are presented as the natural corollary of the system which protects the manufactures against external competition. Among the motives of the old protection are stated to be the desire "to promote regular employment . . . to render stable the conditions of labour, and to prevent the standard of living of the employés in these industries from being depressed to the level of foreign standards." "The 'old' Protection contented itself with making good wages possible. The 'new' Protection seeks to make them actual." "Having put the manufacturer in a position to pay good wages, it goes on to assure the public that he does pay them." Australia, then, began by protecting the manufacturer against his foreign competitor. She is now invited to advance a step further and protect the workman against his employer. Nor is this the last stage. It may become necessary to protect the consumer against a combination of employers and workmen to raise prices, and this contingency, it will be seen, is directly contemplated by the memorandum. "The establishment of machinery to prevent the undue inflation of prices" is "an essential part of the completed scheme." The details are not given; but the "Board of Trade" will investigate the prices charged, and if it finds them to be unreasonable, will report that fact to the Minister, who "will then be empowered, with the assent of Parliament, to take appropriate action." What form of action would be "appropriate" we are not told; but if we may conjecture from the analogy of the means proposed for maintaining wages, the Government would make use of the taxing weapon to enforce its view as to what constitutes fairness and reason in prices. This method is of course no

new one in Australia ; it was adopted some years ago as a means of inducing the Queensland sugar planter to employ white in preference to coloured labour ; it possesses some obvious advantages over the alternative method of the issue of express injunctions as to wages, prices, and industrial conditions ; and it appears to be capable of indefinite extension.

From the point of view of English politics, the Australian scheme is interesting in two connections. The first has reference to the fiscal controversy. The picturesque title of "the New Protection" seems likely to cling to the scheme, and will perhaps lead to its being considered almost exclusively as an adjunct to protection in the ordinary sense. The *Spectator* has already suggested that a willingness to accept it should be taken as a test to distinguish the altruistic Protectionist from those who seek only the advantage of the employing class. But it will be unfortunate if the predominant interest taken in the fiscal question is allowed to obscure the other aspect of the scheme, in which it appears simply as an extension of the system of State regulation in industrial matters, in which Australia and New Zealand have shown such a readiness to make bold experiments. Mr. Deakin's "New Protection," whatever may be the political motives which inspire it, is capable in theory, at any rate, of standing by itself, and its merits or defects can be discussed without reference to the standing issue of Free Trade *versus* Protection. At a moment when the suppression of "sweating" is an object desired by all political parties, any proposal which has that object in view is worthy of dispassionate consideration.

There has already been a statutory move in the direction aimed at. Last year the Harvester Exeise Act came into operation, under which an Exeise duty of £6 a machine (the import duty being £12) is levied unless the manufacturers give fair conditions of employment. A doubt has arisen whether the Commonwealth Legislature was within its powers in making this provision, and arrangements have been made for a test case. This is a technical difficulty, and hardly bears on the merits of the present programme, but the trial will no doubt elucidate facts and facilitate discussion.

---

### Text of the Memorandum.

"1. Protective duties were originally imposed in order, among other things, to promote regular employment, to furnish security for the investment of capital in new as well as existing industries, to render stable the conditions of labour, and to prevent the standard of living of the employés in these industries from being depressed to the level of foreign standards. Australian rates of pay have hitherto been fixed by the bargaining of employer and employés, except where the State has intervened, by means of Wages Boards and Arbitration

Courts. The standards of these tribunals appear to have been determined on the basis of a minimum wage.

"2. The aim of the proposals about to be outlined is more ambitious. The 'old' Protection contented itself with making good wages possible. The 'new' Protection seeks to make them actual. It aims at according to the manufacturer that degree of exemption from unfair outside competition which will enable him to pay fair and reasonable wages without impairing the maintenance and extension of his industry, or its capacity to supply the local market. It does not stop here. Having put the manufacturer in a position to pay good wages, it goes on to assure the public that he does pay them. This of course involves a careful adjustment of the duties to the double purpose they are intended to serve. For that reason the proposals for the 'new' Protection include the establishment of permanent machinery for investigating and ascertaining whether the duties are really effective for these purposes. If they are, fair and reasonable wages must be paid. If they are not, the alternative is to alter the duties

"3. It has been objected that the term 'fair and reasonable,' as applied to wages, is too vague to be put into an Act of Parliament, and that some definition is required from the Legislature of the meaning to be attached to the words. As they stand, they express the intention of Parliament clearly though generally, and it is not imperative to attempt a complete definition of them in the Statute. The difficulty lies not in their interpretation, but in their application. Hence it has been deemed best to leave these words to be interpreted, whenever necessary, by a well-informed and impartial tribunal, possessing the fullest opportunity for investigation and consideration before it arrives at a decision, and also of varying that decision should occasion require.

"4. It need hardly be said that in framing proposals of this character, and providing for their appropriate application, we require to take into account the vast area, the sparse settlement, and the great distances characteristic of Australia; as well as the complexity of the industrial conditions upon which the proposals are to operate. One of the chief difficulties arises out of the fact that the manufacturing establishments of Australia include a large number of workshops, small in themselves, but engaged in a variety of operations, only some of which affect the goods which will come under the proposed duties. The policy will have to be carried out under the most diverse conditions, and must in the first instance be applied with circumspection; but the general ideal aimed at implies a minimum of official interference and control with a maximum of adaptability to the circumstances of each business. This ideal, of course, involves the utmost simplicity and elasticity in all the necessary procedure.

" 5. The method by which it is intended to secure the payment of fair and reasonable wages is, as already indicated, an exercise of the taxing power. Excise duties will be imposed on certain classes of goods, which enjoy the benefit of a sufficient protection, and an exemption from the duties so imposed will then be made in favour of those in the manufacture of which fair and reasonable wages are paid. In this way, wherever effective protection is granted, its benefits will be limited to those manufacturers whose employés are allowed to share in them to this extent.

" 6. The first requirement is obviously to provide machinery for the determination of the question what are fair and reasonable rates of wages. The authority to make this determination will be a tribunal, to be known as the Board of Trade, consisting of three members. These will be placed in a position of judicial independence. They will be appointed for a fixed period. They will be paid adequate salaries, and will be placed entirely out of the reach of party influence. The important and far-reaching nature of their functions will, it is thought, fully justify conferring upon them this degree of independence.

" 7. This Board will be clothed with all the powers that are necessary to enable it to discharge its difficult and important functions. It will be empowered to perform its duties in any place, and at any time, that may be convenient, and the procedure in all matters before it will be made as simple and inexpensive as is possible.

" 8. The varying conditions of Australia make it improbable that any single scale of wages, which would be fair and reasonable in every instance, and under every condition, throughout the Commonwealth could be determined for any industry. The Board will, therefore, be empowered to appoint, without regard for State Divisions, industrial districts, within which a certain scale shall be regarded as fair and reasonable. In this way, there will ultimately be declared, as soon as possible after the Bill is passed, for every industry affected by the proposals, and in every part of Australia, definite rates of remuneration which must be complied with in order to secure exemption from the Excise duties.

" 9. The scale of wages which is to be regarded as ' fair and reasonable ' having been ascertained and published, manufacturers will then be in a position to decide whether or not they will adopt it. If they wish to do so, they will at once register their factories as exempt, and accept the responsibility of paying the rates fixed. Registration will virtually amount to a definite undertaking to pay those rates, and anything in the nature of fraud or misstatement in this connexion will expose the offender to penalties. In this way, exemption can be secured with the minimum of expense and delay. To facilitate it as much as possible, provision will be made to enable

registration to be effected in the industrial district in which the factory is situated. The exemption, it may be mentioned, will be granted in respect of the factory in which the goods are produced, so that all goods manufactured in a factory which has been registered as exempt will be *ipso facto* free from Excise. These provisions will only apply to places in which four or more persons other than the family of the manufacturer are employed.

“ 10. Possibly even the district scale of ‘fair and reasonable’ wages first determined may not remain permanently satisfactory. The cost of living, and other conditions, may change, and the Board will, therefore, be empowered to amend the standard as occasion may require. It will also have power to alter the limits of any industrial district, so as to secure that uniformity of rates shall only prevail, and shall always prevail, so far as possible, over areas in which there is uniformity of economic conditions.

“ 11. The Board will also be in a position to determine, with some degree of precision, the question whether the measure of protection given to any particular industry by existing rates of duty is sufficient for the purposes that were referred to in paragraph 2 of this memorandum. Part of its duty will, therefore, be to report to the Minister on this question, and thus to afford to Parliament an opportunity of revising the scale of import duties on any class of goods, where they are proved to have fallen short of the necessities of the case.

“ 12. The chief difficulty is, perhaps, to devise a simple, inexpensive, and at the same time effective, method of securing the continuous observance of fair and reasonable conditions in exempt factories. It is estimated that there are some thousands of factories in Australia which will come under this scheme. It will be readily recognised, therefore, that reliance cannot be exclusively placed on official inspection, though the Board and its authorised officers will have access, at any time, to all books and documents which contain any relevant particulars, with due safeguards against the disclosure of confidential information. The powers of the Board, in this regard, will be similar to those of the United States Inter-State Commission. In the second place, the employés in every exempt factory will be kept informed by the posting in some conspicuous place in the factory of the schedule of wages which the Board has declared to be fair and reasonable, and power given to any person or association to inform the Board of any departure from the standards. In the third place, every exempt manufacturer will be required to furnish, at regular intervals, a declaration of compliance with the requirements of the schedule. Any wilful misstatement in this declaration will be visited with punishment. Continued misconduct will expose a manufacturer to the risk of losing altogether his right to manufacture under exempt conditions.

" It is hoped that these three sets of provisions will together amply secure the maintenance of fair and reasonable conditions in all exempt factories.

" 13. Further security for the maintenance of the standard wage will be afforded by the requirement that all goods manufactured in exempt factories shall bear, either an exempt stamp, or the Commonwealth Trade Mark. The presence of these marks on any goods will be *prima facie* evidence that the conditions of exemption have been complied with, and will thus enable purchasers to distinguish between goods which have been produced under standard conditions and those which have not.

" 14. The burden imposed upon the Board under this Act will obviously be heavy, although there is no reason to suppose that when the system has been once placed in working order, it will be unduly heavy. Provision will, however, be made at once for relieving the Board of a good deal of detail work, and for gaining the advantage of intimate local knowledge, by empowering the Board to delegate the duty of inquiring into any matter within its cognizance to local tribunals, such as Police Magistrates or State industrial authorities. If the co-operation of the States Governments can be obtained for this purpose, there is no doubt that the control of industrial conditions throughout the Commonwealth can be made very much less expensive, more effective, and more uniform than it is at present. Although extensive powers of delegating its function of inquiry will be given to the Board, it is intended, in order to preserve uniformity, that the authoritative administration of the system shall be carefully retained in its hands.

" 15. It is implied in what has been already said that if any manufacturer fails to obtain exemption for his factory, or if the exemption is revoked, all goods produced in that factory will be subject to Exoise, and all the provisions of the Excise Act of 1901 will apply to the goods and to the factory in which they are produced. It will, of course, be open to any manufacturer to manufacture under those conditions if he desires to do so.

" 16. So far, reference has been made only to that aspect of the proposals which is concerned with the protection of the manufacturer on the one hand, and the employes on the other. An essential part of the completed scheme, however, is the protection of the consumer by the establishment of machinery to prevent the undue inflation of prices. It is enough to say here that the Board will be charged with the duty of investigating the prices charged by protected manufacturers, and, if these are found to be unreasonable, of reporting that fact to the Minister. The Minister will then be empowered, with the assent of Parliament, to take appropriate action.

" 17. These proposals, to some extent, cover the ground that is already occupied by legislation in some of the States. Every exercise

of power by the Commonwealth, in matters in which Commonwealth and States have concurrent authority, must be subject to this condition. The co-operation of the States Governments is most desirable in every aspect; but the Commonwealth cannot ignore its obligation, so far as the Constitution allows, to secure equitable and uniform industrial conditions in all the industries which come within the range of its fiscal legislation.

“18. The proposals for requiring the maintenance of fair and reasonable conditions in protected industries are simply a corollary to the power of imposing protective duties. To restrict the powers of the Commonwealth to the mere imposition of these duties, while the conditions under which the manufacture of protected articles is carried on differ so widely in the different States, would be to permit inequality, discrimination, and discord. The ideal of the Constitution is equality and uniformity in all national matters. With that end it prohibits the imposition of taxation in such a way as to discriminate between States or parts of States. The ideal can hardly be realised if uniformity of protection is coupled with wide diversity in the conditions of manufacture. Effective and useful as State industrial laws have in many cases proved, their operation is circumscribed by State boundaries, and it can hardly be claimed for them that they either do or can secure uniformity in the conditions of manufacture throughout Australia. No authority but the Commonwealth Parliament can do this, and the attempt to do it, in the way that has been outlined, is in fullest harmony with the Federal aims and character of the Constitution.”

## THE PREVENTION OF STRIKES IN THE COLONIES.

THE social and political problems which present themselves for solution in the United Kingdom are to a considerable extent reproduced in the self-governing Colonies ; and the value of Colonial experience, as a guide or a warning to statesmen at home, is being increasingly realised every day. To take two recent instances in the discussions which have taken place in England on the subject of Old Age Pensions, and on Wages Boards as a means of suppressing sweating, arguments drawn from the practical experience of New Zealand and Victoria have figured very largely. Such arguments are, it is true, never conclusive ; they rest upon nothing more than an analogy more or less exact. The conditions of a Colony, though they may be closely similar to those of the United Kingdom, are never identical with them, and the obvious differences are precisely such as materially affect the validity of an economic argument. In even the most advanced of the British Colonies we have to deal with a society which, in comparison with that of the United Kingdom, is relatively small and relatively simple, a society in which industry has attained to nothing like the degree of complexity which characterises it at home, and in which nothing like the same importance has to be attached to the force of custom and tradition. Hence, though apparently the same problem may exist in New Zealand and in England, a solution completely successful in New Zealand may in England be hopeless ; and difficulties which are insuperable in England may in New Zealand prove no more than slight hindrances. But although it is important that the limitations of the argument from analogy should be recognised, its usefulness is great and undoubted. To the English politician Colonial experience serves much the same purpose as the method of experiment does to the scientific enquirer. It supplies him with actual ascertained data by which he can supplement theoretical arguments, and enables him to study in a working model the operation of new systems and devices the introduction of which may be in contemplation at home. In comparatively young communities there is generally a much

greater readiness to experiment than in those of older growth, and in consequence expedients are put to the test of actual working which would probably never be tried at home, just because the untried is so great an object of suspicion to English statesmanship.

The contrast between the English and the Colonial attitude is nowhere more clearly apparent than in the matter of industrial disputes. In the Colonies there has been a variety of daring and far-reaching experiments. In England there has been a rigid and implacable adherence to the doctrine of *laissez faire*. At the present moment the subject is one of immediate and pressing interest. The British public has been subjected to a succession of "scares" in connection with one after another of the principal industries of the country. The railways, the ship-building and engineering industries, and the cotton industry, have all contributed their share to the general panic, the last-named having taken the palm by providing two successive sensations within a few weeks of one another, and by having postponed the settlement of the later and bigger difference until the very last moment before a struggle had become inevitable. It is true that in every case the threatened strike or lock-out has been averted, except, unhappily, in the case of the dispute in the North-eastern shipbuilding trade. But it must not on that account be supposed that there has been no injury to British trade. The machinery of modern industry and commerce is so delicately adjusted, that it is quickly and adversely affected even by the rumour of impending disputes. The constant recurrence of acute differences between masters and men, which may easily lead to open industrial war, produces a general atmosphere of distrust which is peculiarly harmful when, as at present, a period of good trade appears to be giving place to the inevitable reaction. On the injuries which would have resulted from the actual occurrence of a general strike or lock-out in any of the industries above mentioned it is unnecessary to enlarge. We have, unfortunately, ample experience in the past of their nature and significance, and they are admitted by all parties. The methods of industrial warfare, the strike and the lock-out, are an unmitigated evil with no compensating advantage. They contribute nothing to the settlement of a dispute except brute force, and the power of the purse. A settlement which is reached after a strike or lock-out might equally well have been reached before it. No new element has been introduced into it, except perhaps the exhaustion of one or other of the two parties. Both have suffered financially and have involved in similar misfortunes a number of persons quite unconnected with the dispute; for the effects of the dislocation of a great industry stretch far beyond the limits of the industry itself. And to the material injuries caused by the dispute must be added the legacy of bitterness and resentment which it leaves behind it, and which constitutes, perhaps, in some cases an even greater evil to society at large. These are

## The Prevention of Strikes in the Colonies. 307

trite and obvious considerations ; but this circumstance does not seem to have made them in any way operative as a stimulus to action. The only recent piece of legislation on the subject of industrial disputes has been an Act designed to remove certain obstacles which tended to reduce the frequency of their occurrence ! There is, of course, no intention to suggest that the object of the Act was to promote trade disputes. The motive which inspired it was the desire to equalize the conditions for the two parties to such disputes, but it is none the less significant that the only possible functions of government in the matter should be regarded as those of "keeping the ring," and ensuring a fair fight. Earlier English legislation on the subject has not ventured beyond the eminently cautious expedient of empowering the Board of Trade to do what it might equally well have done without any legislation at all,—viz., to undertake the task of "conciliation," with the consent of the parties to the dispute. Before turning to the attempts which have been made in the Colonies to solve a problem which English statemanship appears to have pronounced insoluble, it may be of interest to compare the attitude of the State towards the particular kind of dispute with which we are now dealing with its attitude towards other disputes incidental to the life of an organized social community. When an industrial dispute appears to be imminent, what are the influences which, in England to-day, can be brought into play to avert it? A disinterested mediator may, by tact and persuasive power, succeed, as Mr. Lloyd-George succeeded in the case of the railway dispute, in bringing the disputants to terms. Or the parties to the dispute may, as they did in the case of the threatened cotton strike, show themselves ready in the last resort to sacrifice something of their personal pride as well as of their personal interests, and agree upon a workable compromise. But if neither of these two things should happen, no alternative remains except a trial of strength in what approximates to open warfare. Now, in a community like that of Great Britain, which is largely industrial, disputes between private citizens as to the limits of their legal rights and mutual obligations are not more certain to occur than are disputes between employers and employed as to the conditions under which an industry shall be carried on. And when they do occur, in their effects upon society they are infinitely less far-reaching. Yet we do not leave the settlement of such civil differences to be dependent upon the reasonableness of the parties concerned or the judicious intervention of some voluntary mediator ; nor do we regard it as reasonable or tolerable that, in the absence of such pacific influences, the parties should be left to starve, or worry or intimidate one another into submission. On the contrary, we recognize, as a matter of course, that, in the interests of the community at large, peaceful means of settlement, which shall be at once certain and

final, must be provided. Is there any valid reason for refusing to recognize a similar necessity in the case of industrial disputes? At the outset it may be frankly admitted that the judicial determination of such disputes does present one serious difficulty. The matters at issue cannot as a rule be regulated by appeal to any recognized code of law or right or reason. There are no admitted principles of justice, or even of policy, which determine what wages should be paid or what hours worked in a given industry, and industrial disputes often turn upon questions still more intricate, and still less susceptible of solution by accepted and ascertainable rules. Consequently, a judicial decision will be not, as it should be, the application to a particular case of a general principle based upon enactment or long precedent, but simply an expression of the personal opinion of the judge, and that opinion may easily be the outcome of sentiment, or caprice, or eccentricity. This argument has its force, but it is a force which may be easily over-estimated. The whole history of legal institutions in England is a history of the gradual extension of the sphere of judicial activity, of the constant application to fresh material of the forms of legal procedure, and the reduction to workable rules of principles apparently too vague in content and uncertain in origin to admit of formulation. Many of the matters which the Chancery and Probate Divisions determine in the ordinary course of their day's work are, at first sight, as little susceptible of a judicial settlement as the questions which give rise to industrial disputes; yet they have succumbed to the ingenuity of lawyers. The task of the Railway Commissioners in determining what is a "fair and reasonable" railway rate is certainly not less difficult than that of a judge required to fix wages or hours; yet its performance by means of a quasi-judicial procedure is accepted as a matter of course. The fact is, that where it is obviously desirable that a question should be settled, the argument that there are no accepted principles by an appeal to which it can be settled will never be allowed to carry much weight; and it is this fact which constitutes the strongest of all arguments in favour of a judicial or quasi-judicial settlement of industrial disputes.

But to the practical Briton an ounce of experience is worth a ton of theory, and the final answer to the contention that industrial disputes cannot be settled by judicial means is the fact that in New Zealand they are; though, as we were at pains to point out earlier in this paper, it must not be lightly assumed that what can be done in New Zealand can necessarily be done in Great Britain. The New Zealand system is in fact the absolute antithesis of the British practice. In place of a policy of complete *laissez faire* we have a policy of complete State control. When the scheme was originally introduced by Mr. Pember Reeves, the Colony's present High Commissioner in London, provision was indeed made for a preliminary attempt in

every case at "conciliation," with arbitration as a last resort, in the background. But experience has shown that both parties as a rule prefer the greater certainty and finality of an arbitral award as opposed to an agreement which the parties reach voluntarily and which is not binding upon them. As to whether the New Zealand system has been a success, there are, of course, two opinions. An intermittent attack on it is waged in the columns of the *Times*, and there are many who will regard with some alarm the more far-reaching results which it is understood to have had as a means of standardising wages and industrial conditions in almost every form of employment. We observe, however, that Sir John Gorst, in his recent visit, was agreeably surprised at its good results; that he found that enterprises were not discouraged or crippled, that profits were not lowered, and that the cost of living was not increased, although wages had risen and all industrial conditions greatly improved. In any case, that it has been a success in the sense that it has proved to be a perfectly workable system admits of no doubt. The New Zealand Labour Gazette contains, month by month, the text of a number of awards covering almost every conceivable incident of an industrial dispute. Some of them might have been specially designed to answer the arguments which we have quoted above as to the impossibility of settling by judicial procedure differences in which no legal principle is involved. The judge fixes wages for time and piece work, regulates hours, determines holidays, lays down rules for the employment of apprentices, limits overtime, and prescribes the extra rate of payment to be allowed for it. With an unconscious irony he fines a workman for accepting, as well as an employer for offering, too low a rate of pay. He is in no way staggered when required to determine the singularly difficult question whether preference shall be granted to members of a trade union. Here is one decision, typical of many others, on this point: "So long as the rules of the union shall permit any person of good character to become a member of the union on payment of an entrance-fee not exceeding five shillings, upon his written application, without ballot or other election, and so to continue upon payment of subsequent contributions not exceeding sixpence per week, employers shall employ members of the union in preference to non-members, provided that there are members of the union equally competent with non-members to perform the work required to be done and ready and willing to undertake it. This clause shall not compel employers to refuse to continue to employ persons now in their employment."

To the judge of the New Zealand Arbitration Court questions like this are evidently no more thorny than are the niceties of the common law or the law of real property to a judge of the High Court at home. That they should be capable of settlement without a strike or lock-out is obviously an incalculable advantage; and

opinion in New Zealand, so far as it asks for any change in the law, appears to demand that it should be strengthened, so that its effectiveness as a means of finally determining all matters of dispute may be made more certain.

In this matter Australia has to some extent followed the example set by New Zealand, but Canada has taken rather a different line, and her experiment is of especial interest to Great Britain because it is in the nature of a compromise, and therefore more accordant with our home traditions than the logical thoroughness which characterises the Antipodes. A beginning was made, in 1903, with an Act which applied only to railway disputes, under which the Minister of Labour was empowered to appoint in the first instance a "Committee of Conciliation, Mediation, and Investigation," and subsequently, should the Committee fail to effect a settlement, a "Board of Arbitrators." In either case there were to be three members, one representing each party, and the third chosen by them, or, should they fail to agree, by the Minister. The findings and recommendations of the Board were to be embodied in a report which was to be made public, but to have no binding effect upon the parties, its effectiveness depending upon the power of public opinion to prevent a resort to extreme measures in defiance of formal recommendations put forward after full investigation by a semi-independent authority. The same principle governs the "Act to aid in the prevention and settlement of strikes and lock-outs in mines and industries connected with public utilities," passed by the Dominion Parliament in March of last year and generally known as the Lemieux Act. It provides for the appointment of Boards of Conciliation and Investigation on the lines laid down in the Railway Act above-mentioned; but it expressly prescribes that no person may act as a member of a board who has any direct pecuniary interest in the issue of a dispute referred to it. It is the duty of the Board under the Act to endeavour to bring about a settlement, and it is empowered to "make all such suggestions and do all such things as it deems right and proper for inducing the parties to come to a fair and amicable settlement of the dispute." In other words, the Board is expected to make an earnest attempt at "conciliation" before it essays the task of "arbitration." But if no settlement is reached in this manner, the Board is to make a report stating "in plain terms and avoiding as far as possible all technicalities, what, in the Board's opinion, ought or ought not to be done by the respective parties concerned." The report may be made binding upon the parties by agreement, failing which it is not binding, and can be enforced, if at all, only by the influence of public opinion; but, by a very important provision, it is made "unlawful for any employer to declare or cause a lock-out, or for any employé to go on strike, on account of any dispute prior to or during

## The Prevention of Strikes in the Colonies. 311

a reference of such dispute to a Board of Conciliation and Investigation. . . . Employers and employés shall give at least thirty days' notice of any intended change affecting conditions of employment with respect to wages or hours; and in every case where a dispute has been referred to a Board, until the dispute has been finally dealt with by the Board, neither of the parties nor the employés affected shall alter the conditions of employment with respect to wages or hours, or on account of the dispute do or be concerned in doing, directly or indirectly, anything in the nature of a lock-out or strike . . . but the relationship of employer and employé shall continue uninterrupted by the dispute or anything arising out of the dispute." It will be seen that the Act provides for a systematic attempt at conciliation, and for an impartial investigation of the points at issue, the results of which are to be made public, and that it prevents any precipitate recourse to hostilities. Its limitation to "services of public utility" emphasises the fact that its motive is rather to protect the interests of the public than to render justice between the parties; but it can hardly be defended logically, for in a modern industrial state, every substantial industry performs "services of public utility," and the public interest suffers whenever it is unnecessarily interrupted. A demand for the extension of the provisions of the Act to industries at present outside its scope has already sprung up, and will probably sooner or later be satisfied.

The Lemieux Act became law on the 22nd of March, 1907. To show the manner in which it has operated, we can hardly do better than quote the summary of its results down to the close of the year, which appears in the January number of the Dominion *Labour Gazette*.

"From the enactment of the measure until the end of the year there had been thirty-one applications for Boards of Conciliation and Investigation. A number of these related to disputes in industries other than coal mines and public utilities and not therefore expressly included within the provisions of the Act, though by a special clause the machinery of the Act may be invoked in such cases should both parties concerned be agreeable to such a course. In the case of several applications of this nature the consent of both parties not having been obtained no Board was established. In the case of a number of further applications the existence of the Act exerted a conciliatory influence on negotiations between the disputants, and settlements were reported before the establishment of the Board had been effected. In twenty-two cases Boards have been established. With regard to four of these the proceedings of the Boards were unfinished at the end of December. Formal agreements were effected in eleven cases and informal settlements in five

other cases. In the case of the two remaining Boards, both of which related to differences between the same disputants, the differences remained unsettled by the investigation before the Board, and a strike occurred which continued for three months and ended in a resumption of work on lines recommended by the Board. In three cases also in which no Board was established, settlements were reported which were directly attributable to the influence of the Act, making in all nineteen disputes adjusted by virtue of the Act.

“The disputes referred under the Act during these first nine months of its operation, during the earlier portion of which period its provisions were but imperfectly known, have directly affected considerably over twenty thousand men and many millions of dollars of capital, apart from the vast interests indirectly affected, and the great public interests at stake in several instances. Of the disputes referred under the Act, fifteen related to the coal mining industry in the provinces of Nova Scotia, Alberta and British Columbia, and seven to differences between railway companies and various classes of their employés. The remaining disputes affected longshoremen in Nova Scotia and Quebec, metal miners in British Columbia and Ontario, and cotton operatives in Quebec.”

For the first nine months' operation of an entirely novel piece of legislation, this must be pronounced a highly successful record; and Canada may fairly claim to have reached a half-way house on a road which the Mother-country has hitherto feared to tread at all.

## THE LABOUR PARTY AND THE EMPIRE.

IN a tiny volume comprising 112 very small pages, a volume rather dear at one shilling, if the value of paper, print and binding alone be considered, Mr. Ramsay Macdonald discusses most of the fundamental problems of the British Empire from the standpoint of the British Labour Party. It is explained in the introduction that the volume is not to be taken as an authoritative statement of the policy of the party, for "the Labour Party has as yet sanctioned no Imperial policy"; but Mr. Macdonald believes that he is entitled to claim that his conclusions "are those which the Labour Party ought to adopt if it is to be consistent with the principles of its domestic politics." Whether Mr. Macdonald is or is not the most satisfactory spokesman of the party, in the sense of being a typical representative of its opinions, he possesses two very substantial qualifications for the task which he has undertaken. He is the master of a clear and vigorous literary style; and he writes with a first-hand knowledge of a good many different component parts of the Empire. It is hardly necessary to say that he deals with a number of matters which are in the highest degree controversial, and that his sympathies or antipathies are strongly, not to say pugnaciously, expressed. We shall in this notice endeavour to avoid following Mr. Macdonald into the regions of party controversy. Our aim is to emphasize a few of the general principles which he lays down, and such criticism as we shall have to offer will not be directed against his doctrines, but against what appear to us to be certain defects in his method of treatment. The most striking characteristic of the book is the thoroughgoing Imperialism which runs through it. A reader, whose eye is first caught by the dedication "To my friends called Little Englanders," may suspect that this statement is paradoxical; but a study of the succeeding chapters will satisfy him

of its justice. Mr. Macdonald finds much in the Empire to criticise and to distrust, but there is nothing in it to which he is indifferent. He will not lightly believe that it is the best of all possible Empires, but he is convinced of its immense power for good, and determined to help in making of it the best thing that can be made. The tendency with which he deals most severely is that of parochialism, whether at home or over-seas—the tendency which looks only to the local and domestic interest, and ignores the wider issues which touch every country under the British flag. It is this line of thought which has led him to what is perhaps the most daring part of his policy, which he himself christens “the policy of the Imperial standard.” He urges that the claim of each component state to manage its own affairs in its own way is pushed at present to an unreasonable extreme, and has the effect of destroying the reality of Imperial unity. He is no advocate of “interference from Downing Street”; but he claims that the British democracy has a right to make its voice heard if it believes that fundamental principles of British justice, British honour, or British administration are being transgressed by another British democracy in an over-sea dominion; and that the democracies of Canada, Australasia and South Africa of course enjoy a similar right. In concrete terms this means that Great Britain may criticise the native policy of Natal, and Australia the Irish policy of Great Britain, or the labour policy of South Africa, without affording any ground for resentment at an illegitimate interference. And he would seek to make such criticism more authoritative and more effective by bringing up such subjects before an Imperial Conference which might claim the right to enunciate general principles of policy applicable throughout the Empire. Restiveness under such criticism is, in Mr. Macdonald’s opinion, the outcome of what is really a separatist sentiment. In discussing the organisation of the Empire, he dismisses Imperial Federation as an ideal always impossible, and now obsolete, and regards the establishment of a permanent Imperial Council as impracticable. But he favours, as indicated above, Imperial Conferences exercising very extensive functions. He would like to see them attended by the Leaders of the Opposition as well as by the Premiers; but he does not seem to take sufficient account of the difficulty which would result from the increasing tendency of the group system to displace the two-party system in British democracies, nor is it clear how any State could speak with a single voice in the Councils of the Empire when represented by two hostile politicians. This section of the book, in fact, suffers seriously from the sketchy nature of the treatment. In the last of his chapters dealing with the self-governing colonies, Mr. Macdonald considers the fiscal question and pronounces emphatically against the scheme of preferential trade. We have reserved for the last the two sections of

the book in which we find it easy to criticise without trenching on party politics. The first of these is the preliminary historical sketch, which was bound, on account of the limited space available, to be inadequate. But it has other faults which were not equally inevitable. It abounds in superficial generalities, and it is written in a rhetorical style which is very ill adapted for conveying reasoned historical judgment. The other section which we find very disappointing is the short chapter entitled "The Dependencies." The sketch of the system of Indian administration which it contains is a mere caricature, and in the criticism of Crown Colony government there is nothing which can be pronounced practically helpful, though the picture of Fijian schoolchildren chanting "Bonny Dundee" is entertaining. Mr. Macdonald has expended little thought on this chapter, and we shall be sorry to think that any British party would be content to deal so lightly with some of the most difficult problems which the Imperial statesman has to face. But the book as a whole can be cordially recommended to all who seek to know how the question of the Empire is likely to present itself to the newest of our political parties.

If we may indulge in some speculation on the subject, it does not seem to us at all likely that the Labour Party will seek to disturb the constitutional rights of the Dominions, or to devise any machinery for joint legislation. When the Canadian Legislature passed a resolution in favour of home rule for Ireland, Mr. Gladstone replied in effect that this was not their business, and this attitude is fairly characteristic of the Empire at large. No doubt the influence of the party will be cast against militarism and in favour of international arbitration, and it will endeavour to promote the extension among native races of representative institutions. The party is in favour, on general grounds, of the assumption by government of increased responsibilities, and will probably be ready to support proposals for co-operation between the Home and Colonial administrations in enterprises of an industrial character.

## THE STATE AS LANDLORD.

IN many parts of the Empire the State is the owner of a large portion of the land, the title being generally based on the absence of any effective occupation, and in a few cases an agreement with the natives. The problem in dealing with this property is how best to study the future interests of the State, while at the same time offering sufficient inducements to capitalists and workers to make use of the land. If the immediate present is alone considered, there is a considerable danger that this, often the most valuable asset of a Colony, will be squandered for a very small return. The history of the Crown lands in Australia illustrates the hardships which may result from a short-sighted policy. In the first half of the last century, the home authorities restricted the alienation of land by granting leases for only short periods, putting a comparatively high price (£1 an acre) on sales in fee simple, and imposing conditions with regard to the cultivation of the soil, or the maintenance of a certain number of labourers. A great demand, however, grew up for the abolition of such restrictions amongst an influential section of the Colonists, who wished, naturally enough, to convert their short leaseholds into freeholds or long leaseholds, and raised the cry of the "three F's"—fixed tenure, fixed rents, and free sales. Their views eventually triumphed in all parts of Australasia, and from 1850 onwards enormous areas of land were alienated from the Crown without any adequate return, either in the way of purchase-money or in the improvement of the lands granted. The result was that, in 1891, in New South Wales 42 million acres had been alienated in freehold, 22 millions of which were in the hands of only 677 farms, while only two per cent. of the 42 millions and one-tenth per cent. of the 22 millions were cultivated. Similar results were arrived at in the other Colonies. The consequence was that, while little or no use was made of the best part of the land, new immigrants, instead of settling in the country, were driven to the towns. The evil of this situation is now realised. Several of the Governments have been

driven to repurchase at high rates. The necessity for encouraging development of the land by agriculturists is recognised. But a dear price has to be paid for the lavishness with which the possessions of the Crown were dealt with in former years.

The first deduction from this and similar cases is that some restriction should be placed on the size of territorial holdings. It was the "latifundia" which as much as anything else contributed to the decline and fall of Imperial Rome. The owner of a vast estate is not under the inducement to cultivate that a labourer is; he will often neither do it himself, nor let others do it. He may hold up the land for speculative purposes. The general success on the other hand of the "homestead" plan points to the economic advantage of the small holding.

There appears to be four possible ways of restricting the size of holdings and securing a fair return to the State:—(1) short leases, (2) a graduated land rental or tax, (3) a tax on unimproved land, and (4) an absolute limitation of size.

We will take these points in order. In Australasia the system involves what is practically a perpetual tenancy in the occupier. Thus, it is stated in the New Zealand Official Year Book that "a very large proportion of the Crown lands are now disposed of for 999 years. The rentals are based on the assessed value of the land at the time of disposal, without increase or recurring valuations. Under this system there is a fixity of tenure practically equal to freehold, and which, like freehold, necessarily carries with it the power of sale, sub-lease, mortgage, or disposition by will. At the same time the improvements made in the soil by cultivation, &c., are secured to the tenant should he from any cause be obliged to forfeit or surrender his lease." The values placed on the Crown lands are, as a rule, low. The settler therefore, who gets a long lease, gets his land cheap and for a rent, and not purchase-money. He has then no initial outlay to face; he can use his capital to improve the land, and can even borrow money on the security of his title. "When," the above-quoted authority adds, "it is taken into consideration that, with few exceptions, the Crown lands are, in their prairie condition, incapable of profitable use, the advantage to the settler of setting free his capital to develop the capabilities of the soil, rather than having to expend it in the purchase of a freehold, is very apparent." This advantage is, of course, a very solid one. Settlers as a class are everywhere short of ready money, and it is sound policy to let them into possession on easy terms and to provide them with a title which is sufficiently certain and substantial to allow them to borrow money on it whenever the holding is of sufficient value. But the weak point in the arrangement, from the view of public policy, is that the term granted is so long that the State will get no share in the increased value which the growth and prosperity

of the Colony may bring about. The tenant is, of course, entitled to the results of any improvements which he makes himself, but there may be in addition an enhanced value due to the progress, industry and expenditure of the community. There has, as everyone is aware, been much discussion in this country as to whether it is fair and practicable to intercept, so to speak, any such added value for the benefit of the community, and there are not wanting politicians who are so incredulous as to suggest that unearned increment is a mere metaphysical abstraction, and that if it does exist the credit is due to the external communities which take the exports. But the abstraction certainly clothes itself with reality when, for instance, the State plumps down a Uganda railway in a wilderness. In this country the matter is much more delicate and complicated, and the question of the enhanced value has been mixed up with that of the taxation of ground rents—a wholly different point, inasmuch as the owner of such a rent receives a fixed sum and does not, so long as that is paid, profit by any enhancement of value. In places where a clear start is made from the first grant by the Crown, and where the Crown remains the landlord, it would be practicable to re-assess the rent at periodical intervals, and if the required grant is made with a condition to that effect no injustice would be done. On principle it is clearly fair that whatever is an equitable rent should be paid, and this can only be secured by re-valuation from time to time. On the other hand, this object must be limited by the condition that the rent of the land must be fixed for a sufficiently long period to encourage a tenant to improve the land and to enable him to get an advance of money, if the land is marketable, on his title. But this period need certainly not be 999, or even 99, years. The tenant who means to set to work at once on the land will get his profit year by year, and does not really need a long tenure at a fixed rent. The agricultural bank of the locality, or whatever lender of money may be available, does not look so much to the length of the lease as its security as to forthcoming crops and takings. The mortgagee in such circumstances is not concerned with what becomes of the land at a distant date, and would not be deterred by a condition for re-assessment which would only follow an actual improvement in the value of the property. These considerations, therefore, do not stand in the way of re-valuations at moderately long intervals. What the interval should be is a matter of judgment in each case: it should be comparatively short where the work done and produce sold is of an annually recurring character, and long in the case of plantations where the settler has a considerable time to wait before his enterprise becomes remunerative. In New Zealand small grazing runs are leased for 21 years, with a right of renewal for another 21 years at a rent of  $2\frac{1}{2}$  per cent. on the then value of the land. This might be taken as the minimum period.

For ordinary agricultural holdings it may be suggested that a lease of 99 years should be granted, subject to re-assessments of the rent at the end of 33 and 66 years. The tenant would then have fixity of tenure for a long period, subject only to such additions to the rent as would correspond in some degree to the greater profit which he would make in consequence of improvements in the particular locality and the general growth of population and trade. It should be borne in mind that in the Colonies the State, as a rule, plays a large part in developing the country. The common case is that of the construction of a railway, which enormously improves the land in the vicinity, besides generally increasing supplies and demands. The saving which this and other public works secure to the settler can be calculated with some precision, and the imports and exports would give a general indication of any improvement in the position. Having regard to the general lowness of rents there should be little difficulty in practice in fixing reasonable amounts from time to time.

Secondly, a graduated land tax, the principle of which corresponds to that of the death duties in this country, may be imposed to limit holdings to a reasonable size and to check speculation. Unrestricted speculation in land leads to discreditable incidents, and either the land is held up for an unconscionable time or a "boom" is engineered at inflated prices, which are followed by disappointment, depression and stagnation. It is not a good policy for the State to lend itself to such transactions, even if it receive a trifling rent in the meantime. A progressive tax, increasing in some proportion to the size of the estate, is an obvious means of discouraging larger holdings than the tenant is prepared to make use of. The expedient, however, has been rarely adopted. The only Australasian Colony in which anything of the kind exists is New Zealand. Here the ordinary land tax is 1d. in the £ of the unimproved value of the land, but estates of less than £500 value are exempt, and there is partial exemption up to £2,500: above the value of £5,000 estates pay a progressive land tax in addition to the ordinary one. This extra tax is at the rate of  $\frac{1}{8}$ d. per £ for estates from £5,000 to £7,000, and  $\frac{2}{8}$ d. for those from £7,000 to £9,000; the tax continues to rise till it reaches 3d. in the £, at a value of £210,000. Absentee owners, it may be mentioned, pay 50 per cent. additional tax.

At the time of the imposition of this tax there were immense quantities of land which had been alienated in freehold at very low prices and which were contributing nothing to the State. The progressive tax in such a case not merely brings in revenue, but penalises the waste of land and sends a current of industrial activity throughout the community.

The third expedient, a tax on unimproved land, may be advisable to prevent speculation and enforce the use of land in cases where the

value is too low for the progressive tax to exercise much influence. The usual rule is that occupied land is rateable, but this is interpreted to mean rateable at the value to the occupier in its existing state, and not at its selling value. In this country the agitation for a site-value rate has reference mainly to land which is supposed to be withheld from building for speculative purposes, and as some use is generally being made of the land the questions of proper uses and value are difficult; but in a comparatively undeveloped country there is a clearer line between township and country areas, and the cases where agricultural or pastoral land is being held up with a view to a prospective rise in prices are fairly obvious. The object in these cases is indisputably to reap the advantage of the general economic improvement, without doing any work to help it; on the contrary, such holdings retard development. It seems sound policy to persuade capital to take some other form of employment which will be more to the public advantage.

Fourthly, an absolute prohibition may be added to prevent estates in one hand exceeding a certain size. This consideration does not apply to tropical or semi-tropical regions, where from the nature of the climate or country the land cannot be developed by white labour, and where therefore exploitation is most effectively conducted by capitalists who deal with large areas and organise production and trade on a large scale. Even then it is usual to stipulate in Government concessions for the outlay of a certain sum of money in improvements, and the employment of a certain amount of labour. But in places where white labour is possible and should be encouraged, there may well be an absolute limit to the size of estates.

Such a country as the Uplands of East Africa affords a good opportunity for the application of these principles. The East Africa Syndicate has acquired some 320,000 acres under lease with the option of purchase, and Lord Delamere has 163,000 acres. It would not be fair after allowing these acquisitions to penalise them, but they may be used as arguments for legislation against any such cases in future. The restriction in area, the New Zealand Year Book remarks, "has been forced upon the attention of the Legislature by defects in former systems, under which one individual with means at his disposal could appropriate large areas, to the exclusion of his less wealthy fellow-settlers." The New Zealand Act defines the amount of land anyone may hold at 640 acres of first-class and 2,000 acres of second-class land. The Secretary of State, in a recent despatch, has observed that "it is not merely the question of the discreditable incidents which characterise the periods of inflated speculation known as 'land booms,' or the losses to individuals who may happen to purchase land at artificially enhanced prices. If this were all, the dangers referred to might be incurred, in view of the advantage

of attracting settlers and capital to the country, even by speculative attractions partaking of the nature of a lottery. But the evils of allowing land in a new country to be transferred freely, without any regard to the intention of the transferee to utilise within a reasonable time the resources of the land, are not confined to the period of depression and stagnation which inevitably follows a time of inflated speculation, but have a wider scope." The evils are more or less permanent. The taxation of land should be of course as light as possible on the actual cultivator, and one way of securing this is to manipulate the levies so that they will press with increasing weight on the large holders. A general division into two or three qualities of rural land may be made for the purpose, but as a rule a detailed valuation is out of the question on the ground of expense. Area is a simple basis and reduces the work of collection to an easy matter.

If the rent is low, it is reasonable to grant in the first instance a temporary occupation licence, and to require that the occupier shall improve the property within, say, five years in some stipulated way. The improvement should embrace farm buildings and all the work involved in clearing and laying out the land and providing the necessary requisites for cultivation, and a minimum value, proportionate in some way to the rent, should be specified.

## THE FUTURE OF THE WEST INDIES.

IN the *Empire Review* for July, 1903, in an article on "The Needs of the West Indies," I referred to the question of Confederation, and made certain suggestions as to how it might be carried out. The chief of these was, that each Island should put aside a fixed percentage of its annual revenue for Confederate expenses, which would include the whole cost of the machinery of Government, plus a sum for defence and communications, and should be free to spend the balance of its revenue on local projects, as seemed best to the Governor, and the local Administrator and his Council. A common West Indian legal, medical, and civil service, with a proper entrance examination, such as the London Matriculation or the Senior Oxford or Cambridge Local Examination, good pay, and a pension, was also touched on. From subsequent experience I desire to modify somewhat the proposals then made, in the hope that they may assist, in some way, in the practical solution of this problem in the near future.

The first factor in the situation is, that all these Colonies, except Barbados, are under the Crown; therefore, all arrangements as to confederation can be made from Downing Street. Whether it is desirable to appoint a Commission to enquire as to the best method of confederation or not is a matter which rests with the Crown.

In the article referred to the suggestion was made that it was possible to confederate the Colonies without interfering in any way with the constitution of Barbados, and this, I still think, is the case.

The Barbadians have done very well with their constitution, and have managed their affairs well on the whole. The members of the Legislature are educated men, and are not so blind to the interests of

the Colony they represent as not to realise how much it would benefit them if Barbados were the seat of Government of the Windward and Leeward Islands. This is the first point to emphasise, viz., there should be one Governor for Barbados and the Windward and Leeward Islands (the Antilles) resident in Barbados, with a salary of £4,000 per annum, paid by each Island in proportion to its revenue. The late Sir Robert Hamilton made a similar suggestion in his able report on the Island of Dominica, which was laid before Parliament in 1894. The present arrangement of an Administrator or Commissioner in each Island, with a nominated Council representing all interests and classes, should be left untouched. The Colonial Secretary of the Antilles could also be appointed the Lieutenant-Governor of Barbados, and act while the Governor was visiting the other Islands. It should not be forgotten that when the closer union of St. Vincent and Grenada was brought forward the other day, the St. Vincent people were against it, but said they were quite willing to join Barbados.

One instance will show how confederation could benefit Barbados. It is proposed to raise the salary of the Attorney-General there from £750 to £900 per annum; this seems a large salary for Barbados to pay, but it is well known that the present officer has made more than £900 per annum by private practice; he, therefore, loses by accepting the post of Attorney-General. With confederation, the Attorney-General of the Antilles could be paid £1,000 per annum for the whole Colony, and the present Solicitor-General of Barbados could become the legal adviser of the Barbados Government at £250 per annum, with private practice. Besides this, their Governor and Colonial Secretary, and other heads of departments would cost the Barbados taxpayers less, their salaries being paid by the other Islands of the confederation, as well as Barbados. The Colonial Secretary of the Antilles, and the heads of departments would all have assistants in each Island needing them, with salaries of from £250 to £400 per annum, according to the importance of the Island. The Chief Justice of Barbados would become the Chief Justice of the Antilles, at increased pay, with a puisne judge in each Island requiring one. The Appeal Court of the West Indies would consist of three of the Chief Justices on the Bench in the Antilles, Trinidad, British Guiana, and Jamaica, while that of the Antilles would be made up of the Chief Justice and two Puisne Judges. The saving which confederation would bring to the Windward and Leeward Islands, in the salaries of high officials, would be very great; 37·7 per cent. of the revenue is spent in administration in the Leeward Islands, and the cost is 7s. 3d. per head of the population, according to the Blue Book. In a paper read at the Royal Colonial Institute two years ago, Sir Nevile Lubbock pointed out how much expense was saved these Colonies by their Governor-General being practically

resident at Downing Street. This is such a sound argument, that it effectually disposes of the question of a Governor-General for the West Indies. With a good mail service, and the telegraph, these Colonies are constantly in touch with the Colonial Office. But it would be of advantage if the Governors of the West Indian Colonies could confer annually, being attended by such members of their staffs as they need. These conferences would aim at co-operation and uniformity in the laws, and general business of the Colonies, and could be held in each Colony in turn. The facilities afforded by the new mail service, and other steamers, can be utilised in this direction. With such an arrangement the Confederate Council could consist of the four Governors of the Antilles, Trinidad, British Guiana and Jamaica, with such numbers of their staffs as they wish, the Imperial Commissioner of Agriculture for the West Indies, the General Officer commanding the troops in the West Indies, the Senior Naval Officer on the station, the Archbishop of the West Indies, the Archbishop of Port of Spain, the Federal Treasurer, and such prominent West Indians as the Secretary of State nominates from time to time. Each Colony would pay the cost of transport of its own officials, and the transport of the others could be paid from Confederate funds. The Confederate Council need not exceed 20 in number, and would dispose of the funds contributed by each Island for Confederate expenses. The President, *ex officio*, would be the Governor of the Colony where the Council meets. The nominated Councils in each Island would be able to give the Governors all the advice they require through their administrators, and there would be four Governments in the West Indies instead of six, as at present.

No one who knows the West Indies could say that they are ripe at present for representative Government, whatever they may be in the future. With a rapid mail service, landowners live in England when they can, instead of on their estates, as in the old days, and the best men are not available for local assemblies. The men whose money is in the land, and who are educated, and able to give good advice, join the West India Committee, and go to Downing Street in person. This material can be organised into a West Indian Advisory Council, if the Secretary of State requires their help.

Two things are needed to develop the West Indies besides improved government, one is capital, the other is labour. Since the Brussels Convention was entered into, capital has been coming into the West Indies, though slowly. If Canadians would wake up it would come more rapidly. There are many sound projects for Canadian capital in these Islands in hotels, electric lighting, railways, harbour works, fruit steamers, central sugar factories, cotton and sugar planting, &c. It cannot be said the present agricultural

labour is good, nor is it cheap; the negro's wants are few, and he prefers to work for himself, rather than for the white man. Where cane farming, rice farming, and cotton planting exist, the best result can be obtained from negro labour by sharing profits, not by paying wages. One of the alternatives to negro labour is the importation of indentured Indian coolies, which, though troublesome, seems to be a success in British Guiana and Trinidad. The English engineers of the harbour works at La Guayra, in Venezuela, found that their best labourers were Spaniards from the Canaries, who are white men, and require higher pay than the negroes, but are far cheaper in the end. One advantage of this class of labour is they do not settle in foreign lands, but return to their native country. Neither Chinese nor Japanese labour is wanted in the West Indies, though there is no doubt as to its cheapness and efficiency. As regards the proposal for the exchange of the West Indies for the Philippines, recently made in a London review, no British Government could consent to such an arrangement, by which they would lose heavily. The West Indian Colonies may be backward, but they do not require an arduous campaign, costing millions, to subjugate an uncivilised warlike race, such as is found in some parts of the Philippines, before they can be developed. Besides this, the people are too loyal to wish for any change of flag, however much the United States may want them to join the union. Nor have the United States the class of men available for civil service, such as are to be found serving in the West Indies for very moderate salaries, and living up to the best traditions of the English public service for honesty and straight dealing.

The question of a common tariff for the West Indies will, no doubt, be considered at the approaching Conference to discuss trade relations with Canada, which it is proposed to hold in the near future, on the initiative of the Imperial Commissioner of Agriculture for the West Indies. It is to be hoped that one result of this Conference will be a common tariff, so far as is possible, and common revenue regulations, with free trade between the Islands, a preference to British and Colonial goods, and reciprocity to those countries which give the West Indies reciprocity. The success of the present Quarantine Conference shows how useful the services of a tariff expert would be to assist this Conference at arriving at some practical result. A reference to the Colonial Office List for 1907 will show that the population of the West Indies, British Guiana, British Honduras, the Bahamas and Bermuda in 1906 was 2,078,477; the public debt was £6,937,494, the total imports were £10,229,196, and the total exports were £9,355,139; a trade worth cultivating by Canada. The best policy for the West Indies is the closest possible union with Canada, while keeping on the best terms with the United States. A Government Commissioner, travelling in Canada for the

West Indies, and one travelling in the West Indies for Canada, would be of the greatest help in promoting trade between the two countries. With the Canadian market, and with good management, the future of the West Indies is well assured, especially if good fruit steamers are built to run between the Islands and Canada, and a West Indian sugar refinery is put up in Halifax or Montreal, owned by the planters themselves and their friends, in connection with the central factories in each island. There is no German bounty-fed beet sugar in Canada, and no free imports.

West Indies.

## FERRO-CONCRETE FOR PUBLIC WORKS AND BUILDINGS.

By J. S. E. DE VESIAN, M.Inst. C.E., M.I.M.E.

THE Mouchel-Hennebique Ferro-Concrete construction was the first system of its kind introduced into England. Its present general recognition by the various departments of His Majesty's Government and by public bodies and corporations throughout the United Kingdom is mainly due to the untiring efforts of Mr. L. G. Mouchel. His labours for the past twelve years have had the most gratifying results. Up to the present time no less than 14,000 contracts have been carried out under the above system in England, the colonies, and other parts of the world.

There can be no doubt but that ferro-concrete will be much more extensively employed for engineering and architectural structures in the future than it has been in the past.

Ferro-concrete is a combination of first-class Portland cement concrete and steel, the steel taking up all the tensile strains, leaving those due to compression to be taken by the concrete itself. This ensures the greatest possible economy in construction, one square inch of steel in tension interesting an area of some 30 inches of concrete in compression. If concrete alone were used to take the tensile strains carried by the steel, the cost would be six times that of steel. On the other hand if steel were used to take the compression taken by the concrete in ferro-concrete, it would cost a great deal more; therefore, by using the two materials for the stresses for which they are naturally adapted, the greatest possible economy is achieved.

Generally speaking a building can be erected in ferro-concrete for from 10 per cent. to 30 per cent. less than the ordinary construction. Besides economy of first cost, ferro-concrete possesses other advantages, such as absence of necessity for painting and annual upkeep generally, increased durability, lightness, cleanliness, absolute immunity from the effects of fire; in sea works it is invaluable, as it is proof against the attack of marine insects.

It has been proved repeatedly that Portland cement is the best possible protection to steel. It effectually prevents any corrosion or damage occurring to the steel from water or surrounding atmosphere. This is one of the great factors in the Mouchel-Hennebique system.

An instance came under the writer's personal notice which proved the preservation of steel when embedded in good concrete. Some piles at Southampton were originally made too long; the tops were cut off and thrown upon the foreshore, where they remained for more than eight years, being covered and uncovered by the tides four times a day by the double tides prevailing in Southampton Water. Some of these stumps were examined by various eminent engineers, and in every case the steel was found to be perfect  $\frac{1}{2}$  inch only below the cut off surface, while the bars, which had been protruding where they were cut off, were, of course, completely rotted away.

Ferro-concrete, as generally understood in the United Kingdom, means the Mouchel-Hennebique system. Not that this is the only system, but about 95 per cent. of the work in England at present in existence has been carried out under Mr. L. G. Mouchel, who invented the name "ferro-concrete" to describe his system.

As is only natural with corporations having a large public responsibility, the railway companies of England have been somewhat slow to avail themselves of its advantages, but a number of buildings and lately several railway bridges carrying their main traffic have been successfully constructed.

It would be impossible, within the limits of this paper to enumerate at any length the works that have been carried out, but the following may be taken as typical instances of structures in which ferro-concrete has been adapted.

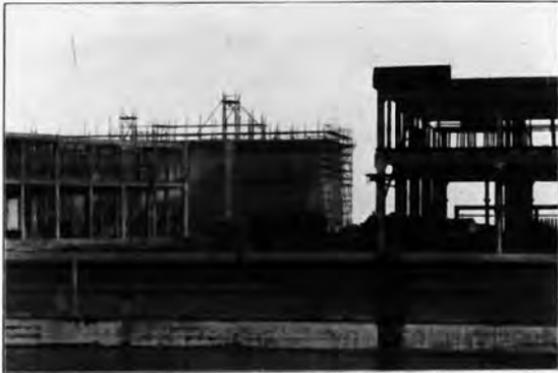

The Alexandra Dock and Railway Company are carrying out some extensive additions to their system at Newport (Mon.), which, when finished, will make the Alexandra Dock the largest single dock in the world. In addition to the Hennebique ferro-concrete jetty in the river, it became necessary to lay a crane road 2,140 feet in length on the south side of the main dock extension, and this led to the design and execution of some particularly interesting work in ferro-concrete.

The construction of the crane road was necessarily deferred until the greater part of the dock wall had attained quay level, and the original idea was to provide for its support by building a lateral extension of the wall in mass concrete.

The alternative proposal suggested by Mr. Mouchel, and accepted by the engineers responsible for the main scheme, was to apply a continuous ferro-concrete beam with suitable supports and bracing to

NEWPORT DOCK.—CRANE ROAD. MOULDS FOR FERRO-CONCRETE STRUTS (*see page 329*).

AVONMOUTH DOCK.—TRANSIT SHEDS AND GRANARY (*see page 330*).

carry the outer rail of the crane track, the supports being in the form of ferro-concrete raking struts bearing upon one of the steps at the back of the dock wall, and the bracing consisting of ferro-concrete tie-beams anchored into the concrete of the same wall. This simple solution of the problem obviated the necessity for additional foundation work. A photograph showing the construction of the beam raking struts is given.

The inner rail of the crane road is laid on longitudinal sleepers carried by the main wall, and the outer rail of the same road is laid upon similar sleepers carried by a ferro-concrete beam 2,140 ft. long by 12 ins. wide by 24 ins. deep. The beam is supported at intervals of 10 ft. apart by raking struts of ferro-concrete 14 ins. thick by 20 ins. wide, each of these members having an extended base measuring 2 ft. 6 ins. by 3 ft., bedded on the second step of the dock wall. The horizontal tie-beams are 8 ft. long by 8 ins. wide by 12 ins. deep, the outer end of each being extended to form a knee-braced connection with the raking strut, and the inner end moulded so as to make a dove-tailed joint in the concrete of the dock wall. Moreover, the main reinforcing bars of the tie-beams were made of sufficient length to provide further anchorage into the main wall.

The struts are reinforced by longitudinal steel bars tied at frequent intervals by lateral links of steel. The continuous beam carried by the struts is monolithic with these members, and the reinforcing bars of the beam pass through them. Similarly the tie-beams are monolithic with the struts, while the reinforcement of the beams and of the knee-brace extension passes into and is anchored into the concrete of the struts. Thus the entire support of the crane road is a perfectly connected monolithic structure without a single joint. Its strength is fully equal to that of steel, and its rigidity is far superior to that of any articulated frame, while in respect of durability it stands on the same footing as the main dock wall. The outer rail of the crane road was subjected during the official trials to a total load of 144 tons, represented by two 6-ton cranes and four jacks, each carrying the load of 33 tons, the load being distributed over the length of 35 ft. 4 ins.

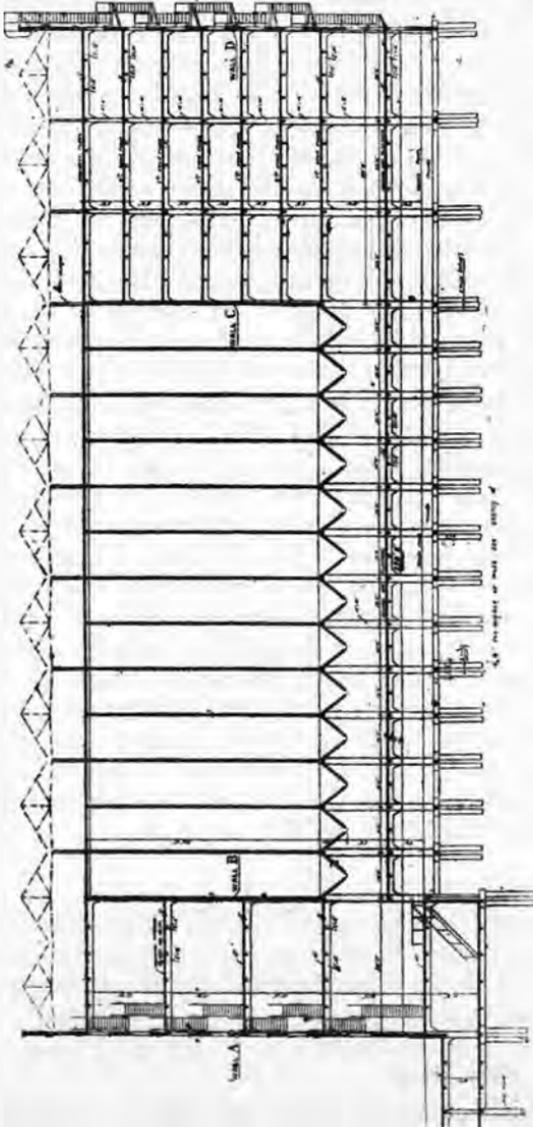

### Road Viaduct.

At Waterford (Ireland) a road viaduct, constructed for the Great Southern and Western Railway, on ferro-concrete piles, was carried out at one-third of the original estimate for the same work in steel. This was stated by the engineer at a meeting in Dublin.

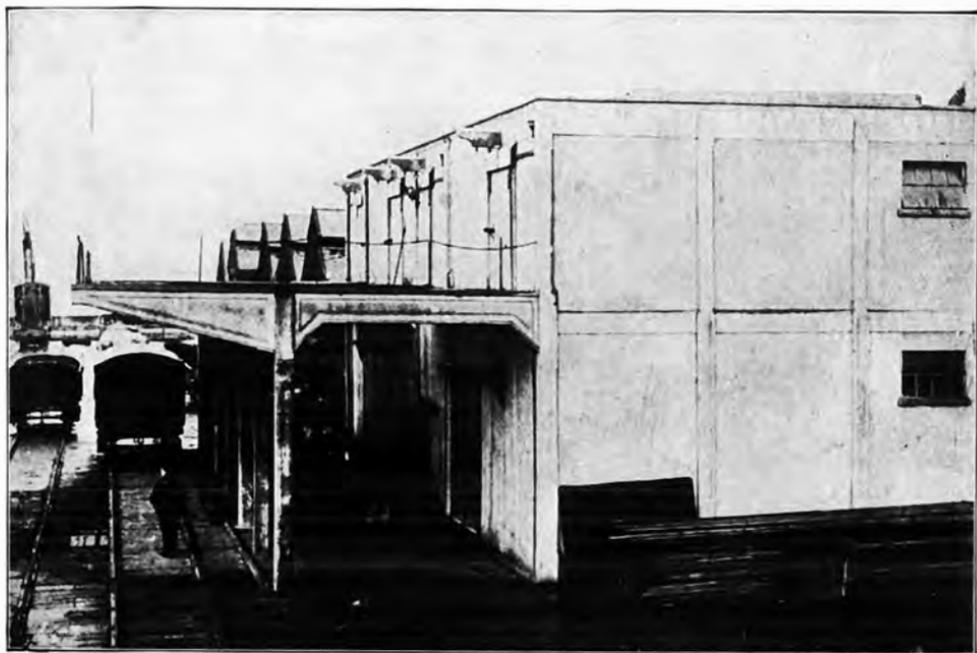

### Avonmouth New Dock.

At Avonmouth, where new docks are under construction at a cost of some two and a-half millions, three most important examples of

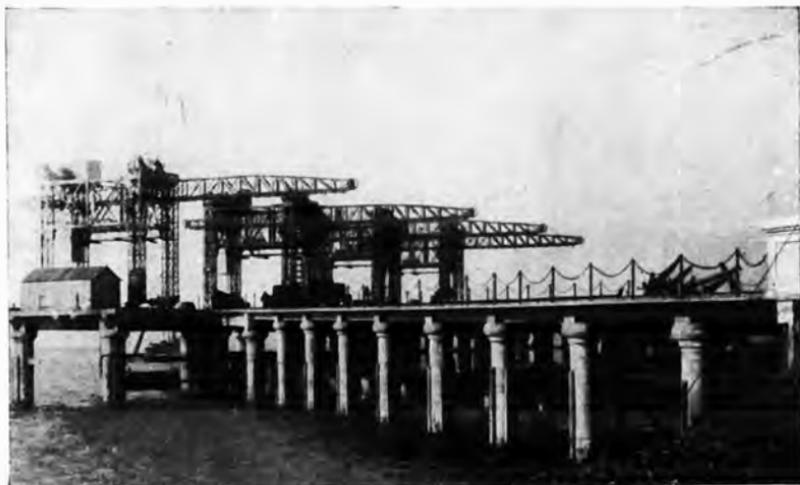

ferro-concrete construction are to be found in two transit sheds on the eastern side of the new dock, and behind these a large granary and weigh-house connected with the dock by an underground tunnel for the transport of grain. The two transit sheds are shown on the extreme right and left of the photograph, and in the centre is the large granary.

AVONMOUTH DOCK.—LONGITUDINAL SECTION OF GRANARY.

VIEW UNDER FIRST FLOOR (*see page 331*).

NEW BRIDGE STREET GOODS STATION, NEWCASTLE-ON-TYNE.  
SOUTH AND WEST ELEVATIONS (*see page 331*).

Each transit shed is 500 ft. long by 96 ft. wide and includes two stories.

A longitudinal section of the granary is given on page 330. The building is divided into three parts: the first 60 ft. long, the second containing 78 grain silos, each 56 ft. 4 ins. high by 10 ft. square, and the third having six floors. There is a tunnel between the sheds, the foundations consisting of Hennebique piles connected longitudinally and transversely by strong beams of ferro-concrete. The sides are built of ferro-concrete columns and slabs, the columns supporting the beams upon which comes the weight of the two railway lines above.

It is now abundantly evident that any distrust which was formerly entertained by railway engineers concerning the reliability of ferro-concrete is fast vanishing. On most of the leading railways, structures built on the Mouchel-Hennebique system of ferro-concrete are now to be found, and the use of this method is being extended day by day. On the Great Western Railway half-a-dozen or more ferro-concrete goods stations and warehouses have already been built, and the Company are now busy in the erection of several ferro-concrete railway bridges, culverts, bridge foundations, and foundations for their new locomotive sheds and depôt in Bristol. A photograph of the Great Western Railway Company's warehouse at Plymouth is given.

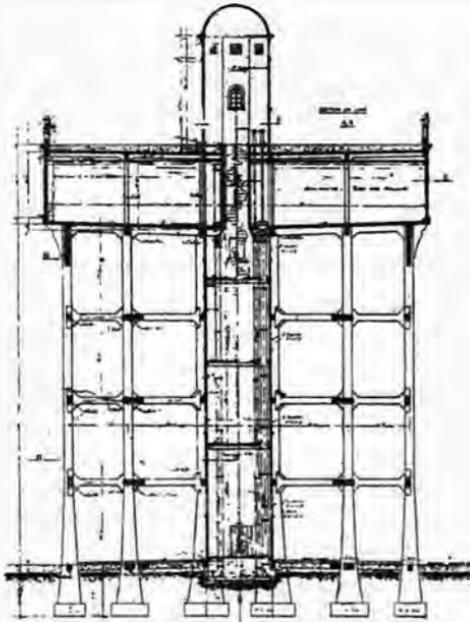

Two photographs are given, the first is a view under part of the first floor of the New Bridge Street Goods Station at Newcastle-on-Tyne, showing columns carrying 1,150 tons each, constructed for the North Eastern Railway; the second shows the south and west elevations, with the cantilever elevator hoods and platform brackets. The same company are also constructing two office buildings at Newcastle, and some important bridges and wharf work in Mouchel-Hennebique ferro-concrete.

Not only has H.M. the King adopted Hennebique ferro-concrete for some of the floors at Sandringham House, but the various departments of H.M.'s Government have also favoured the system. Ferro-concrete work has been carried out for the Admiralty at Keyham, Devonport and Portland, at Gosport, Woolwich, and other places. At the present moment the New General Post Office at Newgate Street, London, E.C., is being erected entirely of ferro-concrete. This building when completed will contain over 15 acres of flooring. This extension of the General Post Office system is an example of the enlightened policy of H.M.'s Office of Works, whose Chief Architect, Sir Henry Tanner, it is presumed has satisfied himself, after mature deliberation and collaboration with other public officials, that it is the best system to be adopted. It is estimated that by the adoption of Mr. Mouchel's system a saving of over 20 per cent. of the public money has been effected.

For quays, wharves, &c., ferro-concrete is specially adaptable. A photo is given showing a jetty on the River Thames at Dagenham, entirely constructed in Hennebique ferro-concrete.

### Elevated Reservoirs.

This is a class of work where, in addition to members subject to flexure and compression, there is an outward pressure of water as well as the effects of other forces. There is an elevated reservoir built on the Hennebique system at Newton-le-Willows. The reservoir proper commences at the height of 63 ft. above ground level. It is 72 ft. in diameter inside, and holds 300,000 gallons of water. The total height to the domed top of the valve tower is 117 ft. 6 ins.

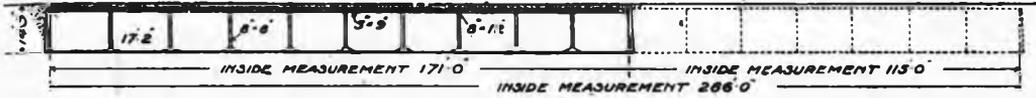

NEWTON-LE-WILLOWS.

Another interesting building is the water tower at Bourne-mouth, constructed entirely in ferro-concrete for the Corporation. It contains 15,000 gallons. The total height of the structure is 45 ft.; the diameter of the reservoir is 20 ft. 10 ins., with a height of 10 ft.; the thickness of the sides at the top part is 4 ins., at the lower part 5 ins., and at the bottom part 5 ins. The pillars are 35 ft. by 18 ins. by 18 ins.

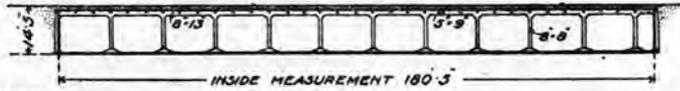

The largest ferro-concrete service reservoir hitherto constructed in this country is in connection with the Luton Corporation Waterworks. It is constructed on the Hennebique system, and when filled to normal level holds 2,000,000 gallons of water.

SECTION ON LINE A-B.

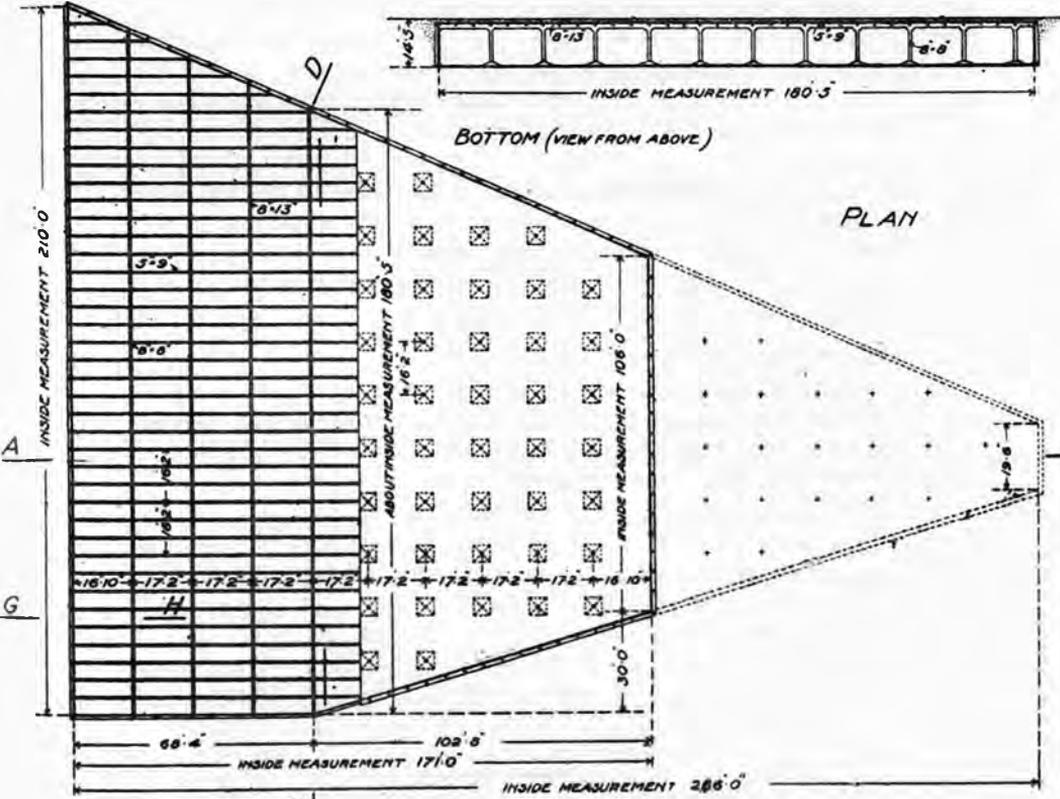

ROOF (VIEW FROM BENEATH)

SECTION ON LINE C-D.

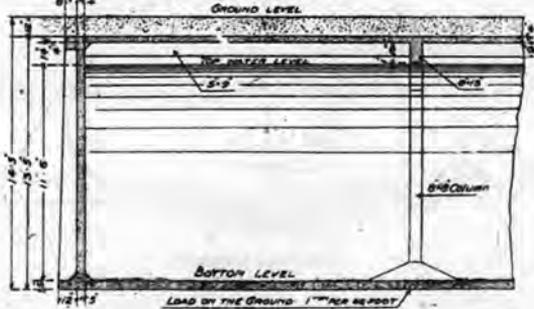

BOTTOM (VIEW FROM ABOVE)

PLAN

SECTION ON LINE G-H.

The reservoir forms a five-sided polygon. From the floor to the underside of the roof beams, the height is 12 ft., the normal depth of water being 11 ft. 6 ins. The whole structure rests upon a continuous foundation slab of ferro-concrete from which are built up the walls, and some ninety columns for supporting the roof. All these columns are built to the uniform cross-section of 8 ins. square, and are provided with bases 5 ft. square, of triangular elevation, 12 ins. high.

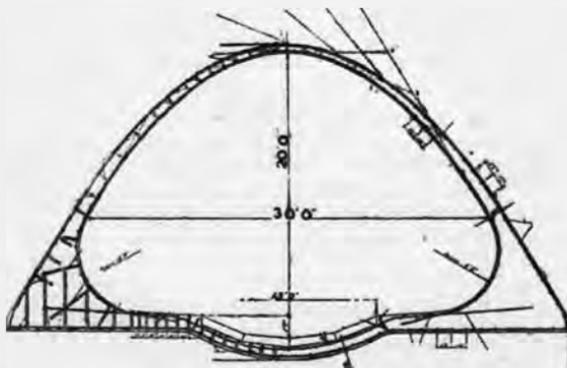

The column reinforcement is of the usual Hennebique type, comprising four vertical bars hooped in four divisions, by lateral ties, which serve the purpose of reinforcing the concrete against the swelling resulting from longitudinal compression, and thereby adding very considerably to the compressive resistance and stiffness of the members.

The walls consist of vertical slabs, 4 ins. thick at the top, and 5 ins. thick at the bottom, calculated as beams for withstanding the bending moments developed by outward pressure of the water when the reservoir is empty. A plan of the reservoir is given on the preceding page.

#### Culverts and Pipes.

Culverts having to sustain earth loads and pipes to resist hydraulic pressures are reinforced with longitudinal bars at regular intervals, and circumferential hoops. In one case the pressure is exerted from the outside, and in the other from the inside.

The usefulness of ferro-concrete in culvert construction is shown by the conduit recently completed in Newcastle-on-Tyne to carry the waters of the Ouseburn for a length of about 700 yards along the valley separating the city from the suburbs of Heaton and Byker. The intention of the Corporation is to fill in the valley and to use the newly made ground as the site for roads and houses. The conduit is 30 ft. wide, by 20 ft. high, and its walls are only 12 ins. thick at the

OUSEBURN CONDUIT.

CREWE BRIDGE (*see page 335*).

MILLENUM MILLS, RIVER THAMES (*see page 337*).

bottom, and 8 ins. thick at the crown, the reinforcement consisting of round bars placed longitudinally and circumferentially for resisting tension and compression, and stirrups for resisting shear. In spite of its apparently daring design, the tests officially made by the city engineer have proved that the work is perfectly capable of withstanding the pressure of earth which will be filled in upon the crown to the depth of about 120 ft.

### Piles.

One of the most interesting uses of reinforced concrete is for the construction of ferro-concrete piles. The fact that baulk of concrete, 60 ft. to 70 ft. long with some steel rods in it, can be carried about like a piece of wood, and driven through the hardest strata is wonderful.

### Bridges.

Ferro-concrete bridges, of which more than 800 have up to now been constructed, need not be discussed at length, because their essential parts are main and secondary beams, slabs, piers, and walls designed on the principles already described. Still, although the design of the separate members may appear to be a very simple thing, it is not by any means an easy task to satisfactorily design a complete bridge.

A good example of a ferro-concrete arch is shown in the photograph of the bridge designed by Mr. Mouchel for the Earl of Crewe, and erected under the supervision of the writer of this paper. The clear span is 90 ft., the rise 7 ft. 6 ins., and the total length 131 ft. 6 ins. The two arch ribs are braced liberally by cross beams, and a continuous decking slab connected with the spandril walls and the crown of the arch, the whole being of monolithic construction.

The Gorgie Road Bridge, Edinburgh, commenced at the end of August, 1907, is one of the most handsome and interesting examples of Mouchel ferro-concrete bridge work hitherto built in Great Britain.

The bridge crosses the Water of Leith on the south-western outskirts of the city, and as shown in the elevation (Fig. 1) includes a river arch of 36 ft. clear span, with open spandrils, between abutment piers and wing walls of corresponding architectural treatment.

The roadway is 20 ft. wide, with 4-ft. footpaths on either side. The curved wing walls are terminated at each end by the piers, which are extended upwards to form lamp pedestals, and in addition to the

wing walls ferro-concrete retaining walls are built for a sufficient distance along each bank of the river.

Figs. 5 and 6 are longitudinal and transverse sections, which make clear the light and elegant nature of the construction in the arch and abutments. These drawings bring into striking relief the difference between true ferro-concrete design and solid masonry, and suggest the theoretical advantages and practical economy of the former.

The bridge is designed for the safe rolling load of 30 tons.

#### Alum Chine Bridge, Bournemouth.

As another example of recent ferro-concrete bridges we take the elegant footbridge in course of construction over Alum Chine from the designs of Mr. W. F. Lacey, M. INST. C. E., the borough engineer of Bournemouth.

Fig. 7 is an elevation of this graceful bridge which crosses the chine in a single arch of 67 ft. clear span, and the rise of 8 ft. 4½ in. The thickness of the arch ribs is 16 in. at the springings and only 9 in. at the crown.

The spandrels are of the open type, being formed of columns between the arch ribs and the longitudinal beams of the deck platform.

In cross section the two arch ribs and the two deck beams are braced by transverse tie beams, built monolithic with

FIG. 5.—LONGITUDINAL SECTION: SECTION A B (View from beneath.)

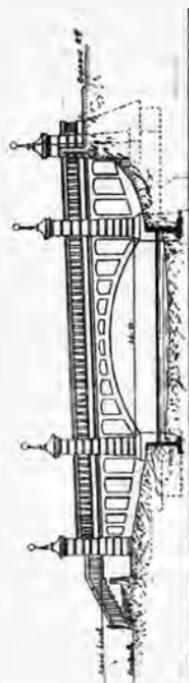

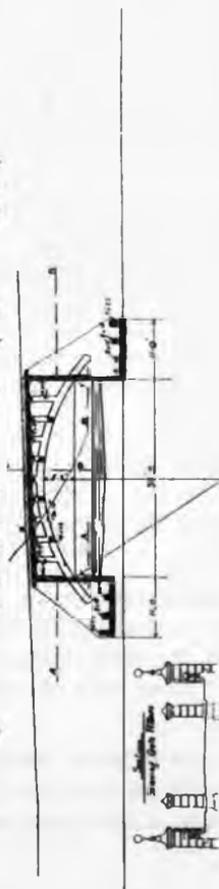

FIG. 1.—ELEVATION.

(GEORGIE ROAD BRIDGE, EDINBURGH.)

FIG. 6.—TRANSVERSE SECTION.

the other parts of the construction, and the decking consists of a 3-in. ferro-concrete continuous slab with the cantilever projection of 11 ins. at each side upon which the parapet is supported.

The horizontal thrust of the arch is 5 tons per lineal foot, and the vertical load  $2\frac{1}{2}$  tons per lineal foot of width.

These bridges were designed in accordance with the Hennebique system of ferro-concrete, the details of which were prepared in general conformity with the engineers' drawings by Messrs. L. G. Mouchel & Partners, of Westminster.

A photograph is given of the Millenium Mills, erected on the banks of the Thames, for Messrs. Vernon & Sons, of London and Liverpool, embodying the Mouchel-Hennebique system of ferro-concrete throughout. These gigantic premises occupying a frontage nearly 400 ft. long on the river side, in the neighbourhood of Victoria Dock, are approached by a ferro-concrete jetty of unique design arranged so as to accommodate barges on one side, and ocean steamers on the other. The jetty is equipped with travelling cranes of high

power. On the left hand is the granary building, having a frontage of 53 ft., a depth of 140 ft., and a height of 103 ft. 6 ins. from the ground to coping level. Next comes, a building with a frontage of 20 ft., a depth of 50 ft., with a height of 96 ft. Beneath the packing floor a tunnel passes through the building to serve the purpose of a cartway. Below the tunnel is another, termed the coal alley and communicating with the river side, whence coal is delivered by conveyors to the boiler house. The screening house is

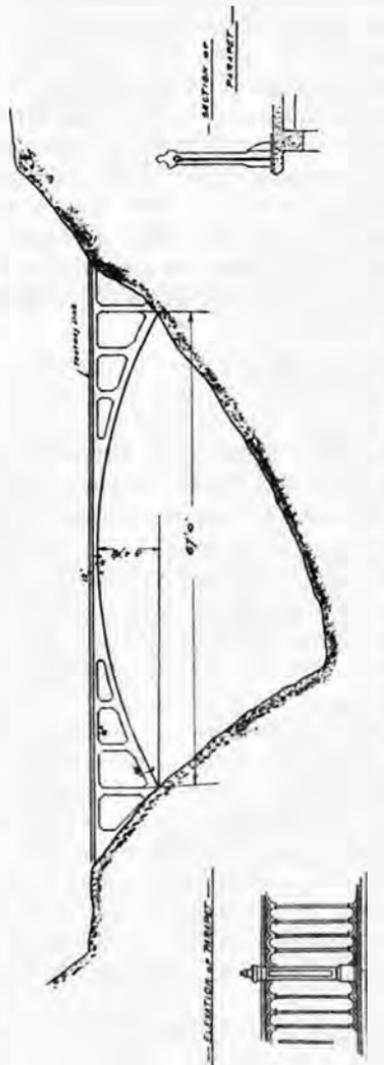

FIG. 7.—ALUM CHINE BRIDGE, BOURNEMOUTH.

66 ft. wide, 56 ft. deep, and 96 ft. high, and is a seven-story building adjoining the grain-cleaning tower, which is 120 ft. above ground level. The mill building is 124 ft. wide, 56 ft. deep, and 96 ft. high. Finally, there is the flour warehouse at the right hand, a building with a frontage of 84 ft., a depth of 120 ft., and a height of 80 ft. The buildings are founded on ferro-concrete piles driven to the average depth of 32 ft. 6 ins. below ground level.

In conclusion one cannot help quoting the remark made by an eminent F.R.I.B.A. after the works at the New G.P.O. above referred to had been fully explained to him :—" Ferro-concrete has "come to stay, and the sooner this is realised by professional men "the better for the community at large."

---

NOTE.—In a future paper the writer proposes to show the desirability of constructing buildings of ferro-concrete in those countries that are subject to seismic disturbances.

## COLONIAL STAMPS.

IN our last issue we stated that we hoped to be in a position to discuss definite schemes for rendering impossible the manipulation of the values of stamps.

One method would be for all the Colonies which employ the Universal key-plate system to purchase a new set of duty plates for use with a new Universal key-plate, which has been made and which shows only the head of His Majesty the King in an oval frame, somewhat similar to the Transvaal key-plate. The cost of this change, however, would have been very great. The following alternative plan which is on the point of being submitted to the various Colonial Governments would involve no expenditure except in very few cases. We may be able to announce the decisions arrived at in our next issue. The scheme, which will allow of the existing plates being retained, is the adoption of single singly-fugitive colours for all stamps of less value than 3d., stamps of the value of 3d. and upwards being each printed partly in doubly fugitive ink on the following coloured papers, *i.e.*, red, yellow, blue or green. It would occupy too much space to detail the varieties thus obtainable, but it would be essential for all Colonies to agree upon the same colour for the same, or approximately the same, values. The colours chosen will be seen as the issue of stamps of the different values is announced from time to time.

Of the four coloured papers mentioned above, red, yellow and blue have been fairly frequently used in the past, but it so happens that green paper has only been used for the 25 cents. stamp of Mauritius.

We may mention that a fifth kind of paper of a buff colour has hitherto been used in the case of the five and eight cents. stamps of Mauritius, and the 4d. stamp of Trinidad, but in all probability no more of this paper will be made.

The only Colonies whose stamps so far have been, or are being, printed in accordance with this new colour scheme are Grenada, Cayman Islands, St. Helena, and the Nyasaland Protectorate, the

issues of each of them being of a description to a greater or less degree new. The details of these issues will be found below, and it will be noticed that green paper is used in the case of the 1s. and 10s. values.

Now, as green paper has been so little used, no fresh supply has been required since the introduction of the new multiple watermark, so that the paper given out for the 1s. and 10s. stamps of the above four Colonies, was of the old single watermark kind, except in the case of the 10s. stamp of the Nyasaland Protectorate, which is of a large size. It was the necessity for paper with the new watermark for this stamp which called the attention of the authorities to the fact that the other stamps were all on the old paper, which will not be used again for the printing of stamps.

Thus, the watermark of the paper will show the first "Editions" of the various stamps. The number issued of each kind of stamp will be duly announced.

---

Articles have appeared in recent numbers of *Truth*, and in the daily press, on the subject of the alleged unnecessary surcharging of stamps in some of the smaller Colonies. These have been copied into several Philatelic Journals, accompanied by comments more or less severe.

We are far from defending the intentionally speculative treatment of stamps, nor are we in possession of the facts of the several issues referred to, but we may suggest that the point of view of the officials who are responsible has been somewhat lost sight of.

We will take the imaginary case of a small Colony, in which it is believed that an issue of stamps of a certain value would be useful. The official preparing the order estimates the number required for local consumption, and, strictly speaking, this is all he is concerned with. But occasionally it happens that a stamp is in demand by philatelists, and the stock is rapidly exhausted.

How, then, is the postage to be prepaid by residents some distance from a post office? It is easy enough for a Londoner to say, as does *Truth*, that the letters could be marked "no stamps available," and that the money for postage could be paid at the counter, but this usually involves sending a messenger with the money and is clearly inconvenient.

In these circumstances the responsible official considers whether he has a larger stock than is immediately required, of some stamps of higher value, and he surcharges these with the values required. These stamps in their turn become valuable, but he would rightly or wrongly be greatly blamed if he refused to sell them to dealers at their new face value.

It is clear that the smaller the Colony the likelier are such cases to occur, as every stamp issued by such a Colony is bound in time to be rarer than stamps issued in larger numbers by a larger Colony.

---

Since our last issue a document of much interest has come into our hands. This is the Official Report of the Board appointed to consider and report on the best methods to be adopted to ensure a suitable issue of Commonwealth of Australia Postage Stamps.

The first point which we notice is, that the stamps are apparently intended to be available for postage purposes only. The use of doubly fugitive ink, therefore, does not complicate the choice between surface or electro-plate and steel-plate printing. The report is, therefore, in favour of the latter process, but it lays great stress on the necessity for the fineness and excellence of the engraving of the plates as a protection against forgery.

The report admits that the initial cost of the plates for this process will be much heavier than for surface or electro-plates, four plates being required for each value, but we do not notice any reference to the greater cost of printing the stamps by the copper-plate process. This would be fully realized by anyone who watched the process of printing. We may mention that really finely engraved plates cannot be entirely mechanically cleaned after each inking, so that it is absolutely necessary to have a skilled operative to give a final wipe by hand to each of the four plates as it revolves. Now, not only is the labour itself expensive, but the speed of revolution of the plates is limited by the dexterity of the cleaner, and the rate of production must, we should think, be enormously below that of the surface process.

Besides this, the renewals of the plates for printing so many millions of stamps as will be required will surely be a very expensive matter, for the finer the engraving the sooner will defects be perceptible.

One other point is particularly noticeable in the report. This is the high estimate of the number of stamps likely to be bought by philatelists.

The philatelic expert who appends a separate report on the subject, puts it at £40,000 worth the first year and £20,000 worth in succeeding years, and he appears to think that he is well within the mark.

The estimate appears to be based mainly on the fact that there are over 1,000,000 stamp collectors in the world, and that a limited issue of stamps of low value by New Zealand went to a considerable premium.

Now, of the 1,000,000 stamp collectors an enormous majority never buy an unused stamp, certainly none of high values, and the

number of purchasers of 20s. and 40s. stamps is strictly limited. The Australian issue is, besides, to be an unlimited one and to last for years, so that there is no hope of the premium, the probability of which was no doubt one of the principal attractions of the New Zealand issue.

---

BRUNEI.—It has been decided to adopt the Postal Union colours for 1 cent., 3 cents., and 8 cents. This will involve the following alterations:—

1 cent.	...	...	...	All green.
2 cents.	...	...	...	Border chocolate, centre black.
3	„	...	...	All red.
5	„	...	...	Border yellow, centre black.
8	„	...	...	All blue.

Of these, only the 1, 3 and 5 cents. values are at present on order.

CEYLON.—5 cents. Postage and Revenue Stamps, and 6 cents. Postage Stamps have been supplied with the values shown in Arabic numerals, as was stated in our issue for October, 1907. The former stamp is now printed in singly fugitive instead of doubly fugitive purple, and is on unsurfaced paper.

GOLD COAST.—1d. and 2d. stamps, referred to in our January issue, have been despatched to the Colony.

GRENADA stamps of the new “Badge” design, referred to in our October issue, have been shipped, the numbers of the 1s. and 10s. duties being respectively 25,000 and 10,000.

MALTA 2½d. stamps and DOMINICA ½d., 1d. and 2½d. stamps will, in future, be printed entirely in the Postal Union colours.

CAYMAN ISLANDS.—Stamps of the type referred to in our last issue, of the values of 2½d., 3d., 4d., 1s., 5s., and 10s., have been despatched. They are printed in accordance with the new colour scheme and (with the exception of the 2½d. value) on surfaced paper. The numbers of 1s. and 10s. stamps are 6,000 and 3,000 respectively.

EAST AFRICA and UGANDA PROTECTORATES.—10 and 50 rupees stamps have been supplied on surfaced multiple watermark paper.

MONTERRAT.—3d., 6d., 1s., 2s. and 2s. 6d. stamps have been supplied on surface multiple watermark paper.

NATAL.—2d., 4d., 5d., and 2s. 6d. stamps have been supplied on ordinary multiple watermark paper, and £1 10s. stamps on surfaced paper of the same kind. The colour of the last-named stamp was described in our January issue.

ST. HELENA will shortly issue 2½d., 4d., 6d. and 10s. Postage and Revenue Stamps printed from the old Universal key-plate. The 10s. stamps, of which 3,000 are being supplied, are on single watermark green paper, and all four stamps follow the new colour scheme.

ST. VINCENT is adding a 2d. stamp to its new copper-plate issue (arms design), the colour selected being yellow.

TURK'S ISLANDS have ordered 3d. stamps for the first time. They will be of the existing design and printed in brown on yellow paper. This is the first occasion on which coloured paper has been used for copper-plate stamps.

BRITISH CENTRAL AFRICA PROTECTORATE.—The name of this Protectorate having been changed to NYASALAND PROTECTORATE, it has been necessary to make a corresponding alteration in the stamps of the Protectorate. They will in future be printed from the two new Universal key-plates and will be the first stamps to be so printed. The stamps will not be despatched until April, and their colours will follow the Universal colour scheme. There will be one new value, i.e., ½d.; the other values ordered being 1d., 3d., 4d., 6d., 1s., 2s. 6d., 4s., 10s., £1 and £10. The new colour scheme will be followed throughout, and the 1s. stamps, of which 60,000 are being supplied, are on single watermark green paper. The last four values are of the large size, and have, in our opinion, a very fine appearance.

BERMUDA stamps of the values of ½d. and 1d., printed entirely in the Postal Union colours, have just been ordered. The 2½d. stamps will be printed entirely in blue when more are required.

---

It may have been observed that some stamps are printed on thicker paper than others. This is only supposed to apply to stamps printed by the steel- or copper-plate process, as it has been found that the wetting necessary in printing by this process tries the thinner paper too much. The paper referred to is about 25 per cent. thicker than the ordinary paper, and it has been inadvertently used for printing the last two issues of the large Antigua stamps.

---

We have received the December number of the *British Guiana Philatelic Journal*. The size, get up and quality of the contributions show the lively interest taken in Philately in British Guiana, and reflect great credit on the Society which produces it, and the membership of which numbers upwards of 50.

## REVIEWS AND NOTICES.

**In Australian Tropics.**—By A. SEARCY, fourteen years Sub-Collector of Customs at Port Darwin, and now Clerk-Assistant of House of Assembly, South Australia. (*Kegan Paul, Trench, Trübner & Co.*, 10s. 6d. net.)

ONE of the administrative questions of the future is the use which the Australian democracy will make of the Northern Territory. In the early eighties an Australian governor propounded a scheme for converting this territory into a Crown Colony, but the time for any such step had passed, and this great tropical region must be governed by the laws and ideas of the Southern States. We can recall the time when German map-makers refused to admit the British claim to the whole of the Continent, and studiously confined the red colour to the recognised Colonies. The acts of occupation were certainly at the time of a nominal character, but step by step they increased, and the partition of New Guinea and the Southern Pacific, in effect, recognised finally the British claim.

The first real government occupation was that established by the writer of this book in 1882. Mr. Searcy was despatched by the South Australian Government to collect licence fees and Customs duties from the Malays who paid annual visits in their proas to the northern coast in quest of trapang, gourds, pearl-shell and tortoise-shell. He had also the function of preserving order and administering justice. The success with which he carried out his mission, almost single-handed, among the wild blacks and the unruly Malays, testifies to his courage and common sense, and also to the moral power of a uniform.

The description of the country will be a revelation to those who derive their ideas from the experiences of the travellers who have explored the sterile regions in the centre of Australia. It is clear that the Northern Territory contains vast areas of the most fertile tropical country. Few people will expect to hear of such big game as buffalo on the north coast; they are, of course, not indigenous,

but have increased marvellously from a small stock imported long ago. A story is told of an attempt to utilise them for transport purposes :—" A man managed to get a team of buffalo to Southport, and in due time they were hitched to a dray. A start was made, and that was the last ever seen of the man, buffalo or dray."

Port Darwin, the author says, is one of the finest harbours in Australia, a harbour into which the largest steamer afloat can enter at any state of the tide. Some day a transcontinental line will be constructed, the significance of which will be seen from the fact that Port Darwin to Calcutta, via Singapore, is only 3,450 miles, while Sydney is 6,305. Port Darwin might become one of the greatest entrepôts of trade in Australasia—perhaps the greatest—an Alexandria or Singapore of the future. But this is, of course, a mere vision, unless Asiatic immigration is permitted. Mr. Searcy has no doubts on this subject. He points out that in the Northern Territory there were recently some seventeen hundred Europeans and a few thousand Aborigines, while the islands of Java and Madura—not one-sixth the size—carried over thirty millions. " Why should not the Northern Territory carry a few millions instead of lying neglected? Let those who are responsible answer the question. It cannot for a moment be supposed that with such lands, backed up by the finest cattle and horse-breeding country in Australia, the Northern Territory is to remain dormant, and the great harbour of Port Darwin wasted."

He emphasises the fact that the territory is a veritable tropical Australia, and that the conditions, good and bad, are the same as in other portions of the tropical world, although for a tropical country it is one of the healthiest in the world. Cultivation, therefore, can only be carried out by coloured labour. That Australia is to be a white man's country is settled policy, but it remains to be seen whether this necessarily implies the exclusion of coloured labour in the tropical area. Possibly, when the working classes in the established Colonies feel that their position is secured, they will be willing that the Northern Territory shall be treated specially. Its development would undoubtedly feed their industries and afford a market for their output.

Collecting the dues naturally entailed some rough work at times, but Mr. Searcy was always equal to the occasion and could certainly give points to many heroes of romance. When the master of a proa warned him off in a contemptuous manner, " the only recourse was to show the cloven foot, so we three Customs officers leaped on board with drawn revolvers. . . The soothing influence of the revolvers was wonderfully effective." Mr. Searcy adds that, " as in duty bound, I made a full report to the authorities in Adelaide. After consulting the law officer, I received an intimation that killing on the high seas was not murder under the circumstances The law

officers were evidently under the impression that the proas were outside the legal limit, viz., one nautical league from the shore, which was not the case." It would be interesting, from a technical point of view, to see that opinion, and we cannot say that we quite follow the point of the "legal limit," but, at any rate, the opinion had the merit, not always characteristic of law officers' judgments, of being administratively convenient.

The Chinaman has so far been a conspicuous feature in the Northern Territory, but his days are now numbered. Mr. Searcy does not disguise his admiration for him. "People may cry out against them, but the conclusion I arrived at was that it was their virtues, and not their vices, we had to fear. I say straight out that you could not find a better and more straightforward lot of business men anywhere. My experience was that a Chinese merchant's word was his bond. To give you an idea of how the Chinese merchants viewed the Customs, I have a cable in my possession from a merchant in Hong Kong, notifying that he had omitted to invoice, in some cargo sent down—two shillings' worth of washing stuff (towels). Now, you can't cable for nothing, but the Chinese merchants had realised that they had to toe the mark so far as the Customs were concerned." Of the Chinaman's business acumen there is no doubt. "I remember one of the Chinese merchants, Yet Loong by name, being in the Custom-house one day when the Pine Creek Mine was spoken of. The principal mine was being worked by an English company. Yet Loong said, 'Say, what for that man along Pine Creek—fool—what for him spend forty thousand pounds topside? Much better spend him along bottomside first time.' The Celestial just struck the keynote of so many failures caused by companies spending money on the surface instead of putting the capital into the shafts to properly test the mine."

The book is written throughout in a simple and straightforward fashion, and abounds with good stories as well as solid information. There is not a dull page in it.

---

**Canadian Constitutional Development.** By H. E. EGERTON and W. L. GRANT. (*John Murray*, 10s. 6d. net.)

This volume is primarily meant as a text-book in the modern history school at Oxford, but it should appeal to a wide class of readers who can take an interest in the unfolding of a very important case of constitutional growth. Its contents are made up of selections from the writings and speeches of the men who were concerned in the work, with short explanatory reviews, and the passage of Canada through various political crises, at the bottom of which always lay the difficulty of assimilating two races, is shown in this way with

vivid, almost dramatic effect. Through all these controversies there runs a strong view of common sense and high principle, and the general standard of political discussion will bear comparison with that of present times. There is frequently a clearness and serenity in the old time despatches which is very attractive. Nor was faith in the future lacking in the storm and stress. Thus in 1850, Lord Elgin wrote: "I have never been able to comprehend why, elastic as our constitutional system is, we should not be able, now more especially, when we have ceased to control the trade of our colonies, to render the links which bind them to the British Crown at least as lasting as those which unite the component parts of the union. . . . One thing is, however, indispensable to the success of this or any other system of colonial government. . . . You must allow the colonies to believe that, without severing the bonds which unite them to Great Britain, they may attain the degree of perfection, and of social and political development, to which organised communities of free men have a right to aspire."

---

**Three Voyages of a Naturalist.** By M. J. NICOLL, with an introduction by the EARL OF CRAWFORD. (*Messrs. Witherby & Co.*, 7s. 6d. net).

This is an account of three voyages on Lord Crawford's yacht "Valhalla," and gives graphic descriptions of many out-of-the-way islands in the South Pacific, the South Atlantic, and the Indian Ocean. The British Museum has largely benefited by Mr. Nicoll's collections, and his notes on the natural history of the islands will be of permanent value. Any one who is interested in bird and fish life will find a quarry of material here, and at the same time will enjoy the record of these delightful cruises. The descriptions of Pitcairn Island, Easter Island, and Samoa may be particularly mentioned for the general reader.

---

**Recent Hunting Trips in British North America.** (By F. C. SELOUS. *Messrs. Witherby & Co.*, 16s. net.)

No living writer, we believe, equals Mr. Selous in the clear detail with which he describes the excitement and joys of the hunter's life. From the sporting point of view it must be readily admitted that civilization has grievously spoiled the hunting grounds of Africa, where his earlier life was spent; even the lion of East Africa, who was reported not long ago to be in the habit of stopping trains and collecting tickets on the Uganda Railway, has to be searched for. But Mr. Selous has found touch again in Newfoundland and the Yukon Territory of Canada, and his record of experiences tells many a tale of moose and caribou. There is a useful chapter on equipment for cold climates.

Journal of the Society of Comparative Legislation. (New Series, Vol. VIII., Part 2. *John Murray.*)

Every legislature should supply itself with this number, which contains a review of the world's legislation in 1906. In that year, it is remarked, nearly 2,000 Acts were passed in the British Empire alone, and a general inspection of them shows how widely the communities re-adjust themselves to new ideas and changing conditions. The Australian Act directed against monopolies and dumping is singled out for special notice. Under this Act any person, who enters into a contract with intent to injure, by means of unfair competition, any Australian industry which is advantageous to the community, is punishable with a fine of £500. Unfair competition includes any commercial trust, and any competition which would probably or does in fact result in inadequate remuneration for labour, or disorganizing an industry.

Any attempt to monopolise any part of trade, to the detriment of the public, is similarly punishable. Dumping is to be considered presumably unfair, if it results in an inadequate remuneration for Australian labour, or if the sale is at an unreasonably low price.

The care of the young is a prominent feature in the year's work, legislation having been made in Victoria, Tasmania, Queensland and New Zealand, for the institution of Children's Courts and other modes of protection. Anticipating the intentions of the Home Secretary in the present session, New Zealand passed a measure dealing with habitual criminals, under which they may be imprisoned during the Governor's pleasure.

Very noteworthy is the Victorian Act, which precludes a man from disinheriting his family. This State also passed an Act for the prevention of disorderly conduct at public meetings, disturbers being made liable to a fine of £5, or one month's imprisonment.

In Canada the Lord's Day Act makes unlawful all buying and selling, or exercise by a man of his ordinary vocation on Sunday, except in the case of works of "necessity or mercy." No excursion for hire is allowed. Another Act prohibits the lending of money at more than 12 per cent. interest on any loan under \$500.

Under Newfoundland is found the Act relating to the fisheries which brought on a diplomatic controversy between the British and United States Governments. Its object was to prevent United States fishing vessels from procuring bait, and from employing colonial fishermen in colonial waters. The Act, it is observed, has been rendered practically inoperative by the action of the British Government in exercising their powers under the Imperial Act 59 George III., c 38, which enables the Crown by Order-in-Council to issue directions for securing to United States' fishermen the rights granted to them by the Treaty of 1818. Another Act abolishes the

barmaid, a step which must be a severe blow to the local W. Jacobs, if there is such a delineator of the ways of the fisherman. The same Act prohibits the selling of more than two gallons of liquor at any one time to any one person; the allowance certainly seems a sufficiently liberal one.

There are, of course, numerous Acts for the encouragement of local industries, and among them may be mentioned an act of the Leeward Islands, under which advances of money may be made to possessors of land who desire to grow cotton.

---

**Cape Colony To-day.** By A. R. E. BURTON, F.R.G.S. (*Cape Town.*)

This volume, which is issued under the authority of the Cape Government Railway Department contains a remarkably full account of the Colony. The greater part of the book is taken up by a descriptive narrative of the tours in different districts of the Colony. Convenient section maps, showing the railway connections, accompany each tour, and the whole volume is profusely illustrated from photographs. Special articles at the end contain a variety of information, not only on official matters, but also on such subjects as "The Flora and Fauna of Cape Colony," "The Origin and Status of South African Natives," &c., &c. The author is to be congratulated on his success in imparting an immense amount of information without impairing the interest of his narrative, and the book should prove very useful in making the resources and attractions of the Colony better known.

---

The Commercial Intelligence Committee of the Board of Trade has issued two highly interesting reports on the

**Conditions and Prospects of British Trade in New Zealand and Canada respectively.** (Cd. 3,867, price 8d. Cd. 3,868, price 1s. 6d.).

The New Zealand Report is based mainly on information collected by Mr. R. J. Jeffray, the Committee's Special Commissioner, but it has been supplemented by information drawn from other sources. The ready and valuable assistance given to the Commissioner by the Dominion Government, by Chambers of Commerce, and by private individuals, is gratefully acknowledged. The general conclusions drawn from the survey are as follows:—

"The Dominion of New Zealand presents a market which, though small in comparison with Canada, Australia, or South Africa, is yet considerable, is steadily expanding, and presents great possibilities for the future. In that market British merchants and manufacturers have by far the greatest share, and, although that share did decline slowly for some years, the downward movement appears to have been checked since 1902.

"This improvement is undoubtedly due in part to the greater energy displayed by British manufacturers and traders, who have succeeded in some instances in recovering ground which they had lost ; and to some extent also to the effect of the preferential arrangements made in 1903. It may be noted that whilst the new tariff of New Zealand does not, except in a few cases, lower the barriers against imports from the United Kingdom and British Possessions, it increases the advantage which British traders enjoy over against their foreign rivals.

"Nevertheless there is considerable and active foreign competition from the United States, Germany, France and Belgium, and evidence of active efforts on the part of those countries to promote their trade with the Dominion. There are a few classes of goods which the United Kingdom might supply, in which the trade is held almost entirely by foreign countries, but with the exception of certain goods for which the countries named have acquired a special reputation, such as agricultural and some other machinery, tools and a few other metal manufactures from the United States, dress goods, and some articles of apparel from France and Germany, and glass from Belgium, the goods obtained from foreign countries are in the main either cheap lines with which British manufacturers—rightly or wrongly—have not cared to trouble themselves, or miscellaneous articles and fancy goods of many kinds which have never been important in British trade.

"It appears then that, with the exercise of reasonable vigilance and attention to the desires and perhaps the prejudices of the consumers, there is no reason why British traders should not maintain and even improve their position in the New Zealand market."

Fencing wire is obtained from America, being made of basic steel, and cheaper ; no doubt this process will be resorted to more in this country. Birmingham and Sheffield could sell more metal ware in Australia and New Zealand if they studied cheapness and attractive appearance. On the whole, however, there is little to complain of, as we secure 60 per cent. of the imports with New Zealand, and the articles in which foreign supplies are preferred are mostly of the cheap order. It is stated that the preferential tariff has diverted a portion of the foreign trade to the United Kingdom. Manufacturers should notice what articles are specially affected by the preference—they include food commodities, drugs, chemicals, metal manufactures, electrical machinery, some leather goods and furniture.

The Canadian report is the work of Mr. Richard Grigg who, like Mr. Jeffray, was the Committee's Special Commissioner. It is an elaborate piece of work, the value of which cannot be adequately represented by a summary, but we may endeavour to emphasise the

more important of Mr. Grigg's conclusion. He dwells on the one hand on the great advantage which geographical proximity gives to the manufacturers of the United States, and on the other, on the fact that to a limited extent those advantages are counteracted by the fact, that "British products enjoy preference both in goodwill and tariff." But he attaches especial importance to the fact, that Canada is herself rapidly becoming an important industrial country.

"The output is increasing rapidly, the efficiency of the Canadian works is rising fast, the industrial resources of the country are great, the tariff policy of Canada is largely directed towards the maintenance and promotion of home industry, and it may not unfairly or unreasonably be assumed that before many years have passed the most serious competitor with the United Kingdom in the Canadian market will be Canada herself. Between Canada on the one hand and the United States on the other, it is self-evident that only the most strenuous and persistent efforts can maintain (to say nothing of extend) the British trade with the Dominion. The Americans have both obtained controlling interests in works in Canada and built branch factories to an important extent. While Canadians regret that capital other than British should be so employed, they can do no other than welcome a proceeding which helps to build up the country by offering employment and so increasing population. I venture to suggest that British manufacturers should consider the placing of branch factories there; such a course would not only gratify Canadians, and so enlarge sales, but it would give manufacturers a more intimate acquaintance with the market than anything else could do, and enable them to maintain stocks there more easily. It is obvious that in some lines at least such factories could receive partly finished materials from home works, completing the work upon them in Canada exactly as the Americans are doing."

Then follows an enumeration of the steps which might be taken to promote British trade with the Dominion. Communication might be made quicker and cheaper; Canadian conditions might be more carefully studied by British traders; British merchants and manufacturers might secure more effective representation in the Dominion; they might show a greater readiness to adapt their products to the special requirements of the Canadian market. Most of this has been said before, with reference not only to Canada, but to other markets which the British trader is charged with losing by neglect. But there are one or two special points of some importance. Canada has for the most part adopted American standards, particularly in regard to iron and steel, and if the British manufacturer wishes to obtain his share of the trade, he must conform to these, even at the cost of inconvenience and special outlay on plant. The recent postal changes will, Mr. Grigg hopes, promote the circulation of British

trade journals in Canada, where their American counterparts have hitherto enjoyed almost a free field. By obtaining more accurate information as to the standing and financial position of Canadian firms, English manufacturers would be able to allow greater elasticity in terms of credit, and might thereby gain many customers. In conclusion, Mr. Grigg strongly advocates the appointment of British commercial correspondents in Canada, who would provide the "national trade representation," which is at present provided for the United States by their consuls.

The report points out the obvious advantages which the manufacturers of the United States derive from their geographical position, and adds that the preference of one-third of the duty is "of undoubted value to British imports, gives equal skill and energy in business conduct." This is putting the matter very generally, and we think does not sufficiently recognise the value of the preference. Against the nearness of the United States industrial centres, may be set the low freights over the Atlantic from east to west. The United Kingdom is Canada's principal market, and there is a large tonnage moving eastwards; low freights the other way are the necessary result. The fact which is vastly operating against British trade is not so much American competition as the extension of manufactures in Canada, largely with American capital. In many of the cases where the imports are still large, and when a few days difference in the delivery is no drawback, the preference should be a very substantial help. Practically all metal manufactures come under this description. At present the United States supply four times as much as the United Kingdom. Probably if manufacturers had used for the purpose American standards of steel and iron goods, which are adopted in Canada, and Canadian currency, weights and measures in their catalogues and advertisements, much more of the trade would be captured.

---

**The Principles of Railway Stores Management.** By W. O. KEMPTHORNE, Chief Storekeeper, Nigerian Railways. (*Messrs. E. and F. W. Spoor, Ltd.*, 10s. 6d. net).

This is a detailed account of the methods of keeping the store accounts on a line of railway either under construction or when the line is open for traffic. The methods are very well described, and easy to follow, and for purposes of a line of railway owned and constructed by a company could probably not be improved on. The author at the beginning of the book gives a number of trees, showing how the responsibility devolves from the head of each section or department to his different subordinates or deputies; in Government undertakings a greater extent of combination of duties would, we think, be usually contrived.

The author makes the store department of the railway somewhat of a water-tight compartment of its own; this, no doubt, has its advantages on a large railway system, when the department is so large that it must practically work on its own, but in small Colonial railways the stores department must often dovetail in with the other departments of the Colony, such as the Public Works, which require stores, and whose store accounts require to be audited and indented for.

The book is written largely from a storekeeper's point of view, and very naturally gives a great prominence to that department, and somewhat enhances the importance of the officials in charge of it. It may be argued, on the other hand, that the personnel of a stores department should be restricted to the smallest number compatible with efficiency, and that the easiest way of arriving at this is to make the store department responsible only for the numerical value and the condition of the stores, and for the receipt and issue of stores numerically, the actual money value being left in the hands of the accounts branch of the railway, with the general manager or chief resident engineer (in case of construction) as the final authority over both departments—this would undoubtedly avoid the duplication of work and staff.

The inspection of the stores should, in the first instance, be carried out by the stores department, but it should not be possible for the stores department to write off any stores or to reduce their value owing to depreciation without the sanction of the final authority; this is a very essential point in Government undertakings.

The duties of the different officers required in a store department, and the qualifications required in the selection of such officials, are well described. There are also forms for various purposes, which ought to be useful to officials in charge of stores, and which appear to be well thought out, and the result of experience.

---

### Report on the Emigrants' Information Office for the Year 1907. (Cd. 3,918, price 2d.)

This report shows that the Office continues to perform very valuable work, and that its usefulness as a source of accurate information is being increasingly recognised. There was an increase of nearly 22 per cent. in the amount of correspondence dealt with, and of over 49 per cent. in the number of personal applications. We understand that in view of the expansion of the work the Treasury have recently agreed to an increase in the annual grant from £1,500 to £1,700. Mr. H. C. M. Lambert, who has been chairman of the managing committee for eleven years, retired towards the close of the year, and the appendix to the report contains warm expressions of appreciation of the value of his services from the Secretary of

State and from the committee. He has been succeeded by Mr. F. G. A. Butler. The report refers in the following terms to the experiment made by the Queensland Government in the recruiting of labourers in the United Kingdom for service on the sugar farms :—  
“The committee felt it incumbent on them to place on record their opinion that emigrants from this country are not suited for work on sugar plantations in the tropics. The attitude of the committee on this question was criticised by Mr. Deakin, the Prime Minister of Australia, at the meeting of the Imperial Conference on the 25th of April, but their action in the matter was explained and defended by Mr. Burns, the President of the Local Government Board. The committee see no reason to modify their opinion that the ordinary emigrant from this country is not suited for such labour in the tropics.”

Reference is also made to the resolution passed by the Imperial Conference :—

“That it is desirable to encourage British emigrants to proceed to British Colonies rather than foreign countries ;

“That the Imperial Government be requested to co-operate with any Colonies desiring immigrants in assisting suitable persons to emigrate.

In a letter from the Colonial Office communicating this resolution to the committee, it was stated that “Lord Elgin is aware that . . . the influence of the Office has, in fact, been exerted . . . in the direction of diverting emigration from foreign countries to the great British Colonies, and that the committee are alive to the importance of keeping in touch with the representatives of the various Colonies.” This last statement is strikingly borne out by a letter, in which Mr. Bruce Walker, the late head of the Canadian Emigration Office in London, acknowledges in cordial terms the value of the work which the Emigrants' Information Office is doing.

## BUSINESS NOTES.

## Motor Boats.

THE following extract records the very great success which has attended the introduction of motor-boat transport on the Cross River (Southern Nigeria) :—

“The very light draught necessary for all craft navigating the Cross River in the dry season renders the employment of steam craft with any accommodation for Europeans impossible. The large boilers required, and the space boilers and engines occupy, leave but little room for passengers and cargo in small light draught steam craft, such as the steam canoes in use in Northern Nigeria, and the heat from the engines and boilers makes travelling in such craft very disagreeable and unhealthy for Europeans. This led to the experiment of the purchase of the motor-canoë ‘Spider,’ an enlarged steel canoë of the type which has long been in use on the Cross River.

“The trials of this boat on the Thames created great interest in engineering circles, and I have since seen articles, with photographs of the boat, in many of the English illustrated papers, and also in the *Scientific American*. The boat has now run over 10,000 miles. Its engines are still in perfect condition, and two native firemen have been taught to act as drivers, and have taken it successfully on trips of over 250 miles unaccompanied by any European. The engines use ordinary kerosine oil, no petrol is used, even for starting.

“The draught of the boat is only 12 inches, and the work it does is well evidenced in the report on her work for November last, a copy of which I enclose.

“In all our Colonies and Protectorates where navigation in shallow rivers is desired, I doubt if this type of boat can be much improved on, except that magneto ignition should be provided in order to dispense with the trouble of recharging accumulators. In the Federated Malay States a boat of this type on the Perak and Pahang rivers would be of the greatest use to officers whose work takes them up and down the rivers, and also in transporting supplies to up river stations.

"The 'Spider' is supplied with 'tunnel screws.' The sister boat, the 'Sandfly,' is of the stern-wheel type, and has hitherto not proved successful owing to faulty design, by which the draught aft was increased to over 18 inches. It is hoped, however, by placing the engines amidships and modifying the transmission gear, that this boat will ultimately be as successful as the 'Spider,' and some engineers think that the stern-wheel type will prove more serviceable, as trouble has been found in the 'Spider' by the rapid wearing away of the 'bushes' on the shafting near the screw, owing to the unavoidable entrance of the sand stirred up by the screws into the shaft bearings.

"The boats were both built by Messrs. Thornycroft at Chiswick, and the Crown Agents can supply full particulars of price, size, etc. I have travelled 300 miles in the 'Spider' with my wife, and can testify to the comfort of this boat, compared with a steam-engined craft, and the ease with which it can be pushed off any sandbanks on which it may be aground."

---

### The Most Powerful Motor Steam Fire Engine in the World.

A NEW motor steam fire engine has just been constructed by Messrs. Merryweather & Sons, of Greenwich Road, London, for the Shanghai Fire Brigade. It is of the "Fire King" pattern, and is especially interesting as being the largest of its kind in the world, its pumping capacity being 800 gallons per minute, while the powerful single jet thrown is  $1\frac{1}{2}$  inches diameter at the nozzle. The boiler is of the quick steam raising water-tube pattern, and, as with other engines of the same type, is fired with oil fuel by means of an improved spray burner, enabling steam pressure to be raised from cold water in six to eight minutes, but by keeping a head of steam in the boiler whilst standing in the fire-station a turn out can be effected in one minute. Solid indiarubber tyres are fitted to the wheels, those in the rear being of twin-section. A capacious box enables a full quantity of hose and all necessary gear to be carried, and tanks are provided for carrying an ample supply of feed-water for the boiler while on the road, as well as a supply of oil fuel. A speed of 20 to 30 miles an hour on the level can be attained, whilst gradients as steep as 1 in 6 can be ascended. The steering is irreversible, and the powerful brakes enable the machine to be efficiently controlled. Before being shipped to its destination it was subjected to severe road tests in the neighbourhood of the makers' works. The steep hills leading to Blackheath were negotiated with ease, and the engine was afterwards taken along the Bromley Road to the picturesque pond at Southend. Here an exhibition of its pumping powers was given, commencing with a powerful  $1\frac{1}{2}$ -inch jet, and afterwards throwing two, three and four jets simultaneously. The

tests were highly satisfactory, the road running and pumping capabilities of the engine being in every way efficient. Although Messrs. Merryweather & Sons have built several other motor steamers the Shanghai engine far exceeds in power any other machine of its type, the largest engine previously made being of 500 gallons per minute capacity. However, the motor "Fire King" pattern steamer has been very extensively adopted. London has six engines of this type, and has decided to have all new fire-stations equipped entirely with motor appliances; Liverpool has five, and Edinburgh two; whilst it is also to be found at several other British towns, and in the Colonies at Cape Town, Johannesburg, Kimberley, Port Louis, Luoknow, Bassein, Penang, Selangor, Singapore, etc.

---

### Wireless Telegraphy.

The following report on the service between Trinidad and Tobago will be of interest.

"The power now used is so small that there is little danger of breakdown, and the plant is in duplicate.

"The more powerful, but less economical set is run about once a month to keep it in order.

"The temporary posts erected in the first instance have started to rot, and hard wood butts will have to be fixed soon if the present stations are to be permanent. I understand from Mr. Hahn this is receiving his attention.

"I experimented with the Lodge Muirhead most recent arrangement of raising the lower aerial capacity from the ground. It was evident that this is an improvement leading to less power being required, and greater freedom of interference from both atmospheric disturbances and signals from other stations. I have given instructions to the Chief Wireless Operator to carry this improvement out at a cost not exceeding £20, from the working estimate of this financial year.

"The Operators have made several experimental receiving transformers, and they are now able to exchange satisfactory signals under most conditions.

"From trials I made whilst two or more American battleships were signalling at the same time, it was evident that under ordinary conditions the station at North Post could be arranged to receive by sound two sets of signals at the same time, with wave lengths differing ten per cent. or even less. The sound detectors recently installed work satisfactorily. It was only after receiving with these that I could advocate the use of wireless stations in preference to the telephone for outlying districts."

---

### Paints.

The following letter shows the deleterious influences of hot and moist climates. Speaking generally, the paints used should be zinc oxide, as lead oxidises quickly.

"We have experienced great trouble with paint on the Gold Coast. In many cases paint both sent out ready mixed, and also that mixed locally has turned black in a few weeks. During the last 18 months some sage green paint used at Kumasi turned black, being covered with a black mould. Several other bungalows at Tarkwa, Sekondi and Accra, were painted with similar results. The exterior paintwork suffers more than the internal, and the walls of rooms which are more exposed to the wind suffer most.

"An addition was made to Sekondi Hospital recently, and the interior of one of the wards painted some light colour. A curious growth was observed, not exactly a growth of a sooty character, but more like small black stalks or fibres projecting at right angles to the surface of the wood. The wood came from England (pitch pine). I did not send home a sample of this as I could not make certain when all the constituents of the paint were received in the Colony.

"At Accra, this black growth is not noticed to the same extent as at the out-stations, probably due to the fact that Accra is very much drier. My bungalow was painted in 1904, and is still in fair condition. In some cases the black growth can be washed off but leaves the paint underneath discoloured, and it soon reappears. Torbay paints do not appear to be affected so badly. In Sierra Leone, I did not notice the same defect in the paint, and though some of it did not stand well it was much better than the paint on the Gold Coast. For external work I used Gay's Impenetrable Paint with good results, but the cost of the paint is considerable. Paintwork is at present so unsatisfactory that I think a combined enquiry or investigation carried out in all the West African Colonies and possibly some others might produce some useful result. |

---

### Engine Oils.

There is a considerable difference of opinion whether the best oil is a pure mineral oil or a "compound" oil, *i.e.*, partly mineral and partly vegetable. On the one hand, it is argued that the heat of the engine room causes a pure mineral oil to thin down very rapidly, thus preventing perfect lubrication. For marine work it is necessary that the engine oil should saponify when mixed with water, otherwise the oil and the water will not amalgamate, and consequently the water will wash the oil from the bearings. Mineral oil does not possess this quality, while a com-

pound oil does. If, however, sufficient care can be taken to prevent water from getting at the oil, mineral oil is probably the best, and is, we understand, used by the Admiralty and the India Office. A small amount of saponifiable matter is found in all natural black mineral oils, in quantities varying from about 0·4 to 5 per cent., and the process of removal is costly, but if the proportion is left large, there is a danger of acidic decomposition. In a strict specification the proportion allowed is ·05.

---

### Light Houses.

The introduction of the incandescent oil burner has made greater intensities than was possible with smaller apparatus. A second-order lantern will now give a candle power of greater intensity than a first-order lantern under the old conditions, and can be put up in a smaller tower. The old first-order light had an intensity of 80,000 candles, and the new second-order light has one of 140,000.

## MEDICAL NOTES.

### Outbreak of Plague in the Gold Coast.

THE outbreak of a suspicious disease at Accra was reported on the 4th of January, and on the 10th the Acting Governor, Major Bryan, was satisfied that it was bubonic plague. Accra was immediately declared an infected port, and vigorous measures were set on foot to check the speed of the epidemic. The local chiefs were assembled, and the gravity of the situation was explained to them; and the co-operation of the native community in the campaign against plague was effectually secured. Extra medical assistance was engaged locally, and extensive scavenging operations were carried out.

The Secretary of State was informed by telegram on the 11th of January, and acting on the advice of Sir Patrick Manson, he at once engaged the services of Professor W. J. Simpson (of King's College, London, and the London School of Tropical Medicine), who had had great experience in dealing with plague in India, South Africa and Hong Kong, and had also visited the Straits Settlements, to report on the sanitary condition of Singapore. Dr. J. A. Haran, of the Medical Service of the E.A.P., was selected as his assistant, and both these gentlemen left for the Gold Coast on the 18th of January, arriving on the 2nd of February. Professor Simpson has been appointed President of a Committee of Public Health, specially appointed to carry out the sanitary and other measures necessary to suppress the outbreak. These measures include wholesale inoculation with Haffkine's prophylactic, removal of suspected persons to solitary camps; evacuation and disinfection or demolition of infected houses, and removal of all the inhabitants from a congested and insanitary quarter of the town; systematic destruction of rats and mice; inspection of cargo shipped from Accra, and fumigation of sacks, &c., and the establishment of a land cordon round Accra, through which no one may pass without a permit which certifies that the bearer has been inoculated.

With a view to insuring the detection and suppression of any outbreak in the smaller coast towns, six medical men are being selected and sent out to the Gold Coast for plague duty for six months. At the same time no such outbreaks are apprehended. There have been isolated outbreaks in four small places between Cape Coast and Prampram, but the latest returns go to show that these have been successfully suppressed, whilst the number of deaths at Accra itself, which in the week 15th to 21st January was 25, had dropped to five in the first week in March.

Professor Simpson will, if possible, visit Freetown, and other important coast towns in British West Africa, and report upon their sanitary condition.

---

An elaborate report on Plague in Queensland, 1900 to 1907, by Dr. B. Burnett Ham, Commissioner of Public Health, has been presented to both Houses of the State Parliament. The Report is in four sections, dealing respectively with the Statistics, the Incidence, the Medical aspects and the Epidemiology of Plague, and is illustrated by a number of charts, diagrams and photographs.

---

A further paper has been presented to Parliament (Cd. 3,854. Price 2d.) containing the French text and English translation of a report on Sleeping Sickness by Dr. Louis W. Sambon, one of the Italian delegates to the recent International Conference.

---

A report on the Prevalence and Distribution of Leprosy in Fiji, by Dr. B. Glanvill Corney, Chief Medical Officer of the Colony, has been laid before the Legislative Council. Dr. Corney comes to the conclusion that "leprosy is an endemic disease which has endured in these islands from remote times; and that it has for untold ages been accepted by the Fijians as a permanent factor in their collective existence." He estimates that about 1 per cent. of the population are affected with the disease, and that this proportion has tended to remain constant for many years; and he advocates measures for the compulsory segregation of lepers.

---

Vol. II., No. 1, of Annals of Tropical Medicine and Parasitology, which is published by the Liverpool School of Tropical Medicine, and has been sent to us by the Liverpool Chamber of Commerce, contains two valuable papers by Sir Rubert Boyce and Sir Patrick Manson, on the treatment of Sleeping Sickness by Atoxyl. Sir Patrick Manson gives an account of the cases of the disease in Europeans which have come under his notice, and definitely concludes that the disease is not necessarily fatal in its results.

In a letter to the *Manchester Guardian* Sir Rubert Boyce, of the Liverpool School of Tropical Medicine, claims attention to the fact that the use of atoxyl as a remedy for sleeping sickness, on the value of which great stress has been laid by Dr. Koch in his account of his work in German East Africa, was first brought to the notice of the medical profession by three of the workers at the Liverpool School, Doctors Thomas, Breinl and Todd. The suggestion of the employment of arsenic in the treatment of the disease originated with Doctor Livingstone and Doctor Braid, of Manchester, but it was Doctor Thomas who first hit upon the particular compound of arsenic known as atoxyl as the most suitable for the purpose, and it was only after elaborate investigations, carried out by him in conjunction with Doctors Breinl and Todd, that it became possible to recommend its use in our tropical possessions with confidence "Practically stated," says Sir R. Boyce, "atoxyl accomplishes for sleeping sickness what quinine accomplishes for malaria. This is surely an enormous gain, and it cannot but stimulate commercial men still further to support the investigations taking place in the tropical schools of England."

---

#### **Rat Poisons.**

"Danysz" is being used by Professor Simpson in combating the attack of bubonic plague at Accra. The "Liverpool" rat virus is, we believe, practically the same preparation; it is issued by the Institute of Comparative Pathology. The anti-rat campaign is important everywhere, but most of all in hot countries, and the trials of these preparations will be watched with interest. In Mauritius alone hundreds of thousands of pounds have been spent in the attempt to get rid of them; indeed it has been said that the Dutch were driven out by them, though this is somewhat of an exaggeration. One difficulty is that virus is most efficacious when fresh, and a long voyage, especially in a hot position, may render it more or less inert.

## LETTERS TO THE EDITORS.

## The Growth of Empire.

THE rise of the British Empire has been accounted for in various ways, according to the predilections of the writers, but there seems to be an increasing disposition to attribute it largely to accidental causes. The greatest political structure the world has ever seen has been ascribed to a prolonged fit of absence of mind. More than one influential statement delivered lately seems to reflect this attitude. Lord Curzon, in an eloquent address at Birmingham, ascribed the Empire to an "instinct"—"that ineradicable and divinely implanted impulse which had sent the Englishman forth into the uttermost parts of the earth, and made him the parent of new societies and the architect of unpremeditated erections." The Englishman, as a matter of fact, is not distinguished by an ability, instinctive or otherwise, to found new societies or to construct new erections. Wherever he goes he retains his original characteristics. He does not meddle more than he can help with the ideas and customs of the races with which he is brought into contact; neither, on the other hand, does he mix with them. His main object in emigrating is to make money or money's worth, and so far as is consistent with this to leave other people alone.

There would be no occasion to criticise Lord Curzon's phrases, if they were merely meant to be a picturesque mode of stating that the empire-builders did not foresee the vast developments to which they were contributing. But there is more intention in them than that. They lead towards a conclusion that we must be more wide-awake in future; that we must realise that we have been singularly lucky in piling up the structure; and that some definite political principle must be imported for future guidance. Language which would otherwise be unobjectionable may, when used for an ulterior object, be insidiously and dangerously inaccurate. Let me, therefore, repeat—there is a clear and explicit object running through the history of the Empire, and that was trade. Great Britain has never

occupied territory for the sake of governing. The flag has followed the trade—often very reluctantly; and the more the history of our eastern or western possessions is studied the clearer it is that the movement was commercial and the wars we waged economic.

Let us look at the facts. It is amply clear that the Empire consists of a group some members of which are now for business purposes on the same plane as Great Britain. This has been of course a matter of growth. It is not due to a change of ideas or a revolution in spirit, but simply to material progress. But it seems to be held that political ideas ought to have had some place in the matter. "The political ideas which prevailed in the time of our youth," Lord Milner has observed in a recent address, "were in the main ideas not wholly favourable to the organisation of our Empire such as ours, or to the creation of the only bond which can hold together its self-governing states."

He went on to say that these ideas were losing their "evil dominion." Yet it was in the period that Lord Milner referred to that, despite the "evil dominion," the dominions grew into greatness. The "ideas" in fact, whatever they were, had nothing to do with the growth. Without going the length of suggesting, with the school-boy, that idea is the feminine of idiot, I submit that the vague use of the word is baneful. The British Empire is not a problem or a theorem, and the men who have made it have not worked on paper. The real "ideas," if one must use the word, which have made it are those which are now recorded in the Board of Trade statistics of imports and exports.

There is no difficulty in realising the nature of past processes if attention is paid to those now going on. In Nigeria we have a territory which may prove to be almost a second India. Development is now being pushed on, and the real object is to open up the country to trade. In particular the growth of cotton is aimed at for the advantage of our Lancashire looms, and it is hardly open to question that the railway, now being laid towards the interior, would not have been decided on without that consideration. We are of course forced into administrative questions of great interest and importance by these movements, but this is a secondary matter, not desired but inevitable. It is work and enterprise, capital and labour, that have made the modern Empire, and the chief meed of thanks that we owe to the "organisers" is that, on the whole and as far as in them is, they have meddled little.

But we are to understand that although the Empire has got on excellently well so far, in some mysterious fashion, without the help of constitution-mongers and political theorists, all that is going to be changed. It appears that there is an "enormous peril" hanging over us. We are on the point, unless something is done and that

quickly, of ceasing to be a united community. Forces of "disintegration" are at work and the branches of the fabric are likely to fly asunder. To prevent this collapse some sort of brickwork and cement is called for. All this, if it is to be taken seriously, is very alarming. But what is the evidence for it? One description of evidence, as we all know, is something you want to be true to support some ulterior object of your own. This sort of evidence is greatly in favour at election times, and on other occasions when you cannot be found out until too late. But it must be admitted, when there is time to do so, that it is unfair to mould premises by conclusions. Let us look at the actual position. Is there any sign of fissiparous division at present? Does any State want to stand out? It is abundantly clear that nothing of the kind is going on. There never was a time when the general union was so strong and so harmonious. It would be a plain libel on the common-sense and patriotism of the Empire to assert that there is a movement in the direction of disunion. The breaking up of the British Empire will never be a voluntary act. There may conceivably some day be danger from without; whenever that occurs we must take up sword and buckler, and assuredly every member of the union will rally to the flag. But this is not the sort of danger that is in question. It is urged that the real danger will be, in a sense, from within. We are, it seems, to anticipate that the dominions will proceed to construct "bonds" with certain foreign countries, the effect of which will be to place those countries in a more favourable position than Great Britain. But all the actual signs are the other way about. The dominions, which are really now as free as ever they will and can be to conclude preferential engagements are, with an extraordinary unanimity, actually giving Great Britain preference.

The cry of the Imperialist orator is for more federation of the machinery description. The idea, of course, has its attractions. Machinery to the outward eye means strength, and the more of it the better. "There must be," the *Times* has recently written, "common institutions as well, besides the link of the Crown, if the fabric is to be permanent and endure. What these institutions are to be, and how they are to be created and developed is the true Imperial problem. We must find them at our peril. The Empire cannot stand still." This puts this kind of thought plainly. No evidence is offered on this and similar occasions to show that the Empire is in danger. Usually, what facts are presented are all the other way. But the assumption is necessary to lead up to the conclusion that salvation is only to be found in more parliamentary institutions. No one really has any definite idea of what the proposed machinery is to be or what it is to do. Rarely, indeed, in political literature has any scheme been put forward in language so vague, in form so nebulous.

Surely if the necessity is so great as is represented, the actual requirements would leap to the eyes.

But the remedy is for a disease which does not exist. The union is not weak, but strong; the consolidation of the Empire is not a fiction, but a fact. It may be possible to strengthen the connection by commercial agreements; it is no part of my purpose to deny this. But let us start fair. I protest against the belittling of present results merely for the purpose of introducing the argument for tariff reform. I further protest against the ignoring of elements of union which are not material, which lie deep in our nature, and which I believe are essential and permanent. The greatest bond of union which we have, and can have, is that of intellectual fellowship. The common language, the common literature, the common associations of the past, make us all children of the same family; and the natural love and affection which are inspired by these things are kept alive by the genius of the race. Tennyson and Kelvin were real Empire-builders. London, with its satellite band of ports and manufacturing towns, appeals to us as an intellectual centre, and so long as Great Britain commands the respect of the Colonies by the vigour of her output, moral and industrial, so long may she count upon them for support.

FAMAGUSTA,

20th February, 1908.

GENTLEMEN,

I see in your journal for January, 1908, on page 259, that you consider the Cyprus railway a failure, because the ancient port of Famagusta has been chosen for the railway to start from. Now, east of a line joining Alexandria and Rhodes, Famagusta is the only natural harbour in the Mediterranean, and from time immemorial Salamis just to the north of Famagusta or Famagusta itself has been the port of the country. In Cyprus it is the only port, as Larnaka and Limassol are open roadsteads.

When the Turks took Famagusta after a sanguinary siege at the beginning of the 16th century, the Sultan of the time was so impressed by the strength of the place that he decided to allow the Venetian harbour to shut up, closed the entrance, and turned the fort into a political prison. He was afraid to garrison Famagusta with Turks, lest the Governor might declare its independence, and he was afraid to leave it as a commercial port lest the Venetians should retake it. The European consuls and colony were sent to Larnaka on the south-east coast where there was an open roadstead where ships could lie. Larnaka filled a temporary need, while Famagusta was suppressed. After the British occupation there was no fear of the Turks in Cyprus rebelling or other powers possessing themselves

of Famagusta, and the Government decided to dredge the old Venetian harbour, build a large fine quay, and make Famagusta the terminus of the railway which runs the whole length of the island through Nicossea.

The harbour and railway was completed in 1905.

Steamers drawing 23 feet of water can lie along the quay and load on to the railway, or unload direct from the railway, and for this reason Famagusta is fast developing as the export place of live stock for the island and for the importing all heavy machinery and engines. Goods sent to Nicossea from all parts of the world can be taken direct from the steamers on to the railway, and then be delivered in bond in the bonded warehouses of Nicossea, the trade and distribution centres of the island. The merchants of Nicossea are petitioning the Government to get the Austrian Lloyd boats to come to Famagusta. Between Famagusta and Morphu, along the whole length of the island lies the the Mesarria plain where nearly the whole of the grain of the island is grown. The railway goes through the very middle of the plain. With all these advantages in its favour, Famagusta and the railway have one serious difficulty before them. The export merchants, traders, landing agents and, money lenders of Larnaka have their vested interests in Larnaka, and are opposing the development of the port and railway by every means in their power, and as the peasantry are deeply indebted to them, and financed by them, the grain produced along the railway has to be taken in carts across country to Larnaka and not down the railway. The recently opened agricultural Bank of Cyprus is gradually freeing the peasantry, while the natural advantages of Famagusta and the railway alignments are so great that, in spite of everything, great progress is being made. The peasantry are far from conservative, as you say; they are helpless in the hands of the creditors and financiers.

Here are figures for 1905, 06, 07.

Year.	Famagusta Harbour.				Railway.	
	Exports.	Sailing Ships.	Steamers.	Imports.	Passengers.	Goods.
	£	Tons.	Tons.	£	£	£
1905	70,788	12,792	21,542	45,752	2,080	1,560
1906	70,226	11,472	22,113	55,787	4,160	3,120
1907	125,992	17,180	81,133	79,422	6,240	4,680

For any enterprising merchants there is a great opening in Famagusta, and the local people though energetic are not wealthy, while the Larnaka merchants refuse to come. Famagusta and the railway are fast justifying the wisdom of the Government which

decided on utilising the ancient harbour of the island as the modern one, and taking the railway through the middle of the agricultural lands of the island.

Yours faithfully,

W. WILCOCKS.

[ We did not say that the Cyprus railway was a failure, but that " it does not seem likely that the railway will succeed in converting Famagusta into the leading port of the island, and the case is an instance of the importance of fully recognising established commercial habits when fixing the base of a railway." We should look more to Egypt than to Syria for the trade development of Cyprus. But, the railway is doing good work, and the figures for 1907, which Mr. Wilcocks gives, certainly show excellent progress. Ed.]

---

GENTLEMEN,

In the January number of THE COLONIAL OFFICE JOURNAL (p. 211), you quote a statement from the *Daily Express* that " Government experts who have visited the territory are convinced that before long Nigeria will be one of the greatest oil-producing regions in the world."

If I am one of the Government experts referred to, I should be greatly obliged for permission to say that the very optimistic remarks of the *Daily Express* are not in accord with any opinion given by me.

I am, Sir, &c.,

JOHN PARKINSON,

January 11th, 1908.

## OFFICIALS ON LEAVE OF ABSENCE IN THIS COUNTRY WITH DATE OF EXPIRATION OF LEAVE.

—

This List is compiled from the Leave Certificates sent to the Crown Agents for the Colonies. The Editors will be glad to receive notice of any other cases of Colonial Officials on Long Leave.

### GUARANTEE DEPARTMENT.

The Bonds of the Company are accepted by:—His Majesty's Home and Colonial Governments, the High Court of Justice, the Board of Trade, Local Government Board, the City of London, and other Municipal Corporations, and by various Banks and Railways, and other large Companies throughout the United Kingdom and the British Dependencies.

The different kinds of Risk have been carefully classified. The Company is therefore in a position to undertake the best at the lowest possible scale of premium.

**Special Attention** is called to the Company's Floating and Schedule Policies, under which any number of, or the whole staff of employes (provided the number is at least five), are guaranteed in one Bond. The cost is considerably less than for Ordinary Guarantees, and the risk that, through an oversight, individual Bonds may lapse is removed. Full particulars of these Special Policies will be forwarded upon application.

Policies are issued to cover:—Accidents of all kinds, Workmen's Compensation, Burglary and Theft, Lift Accidents, Employers' Liability, and Fire Brigades.

Applications are invited for Agencies where the Company is not already represented.

S. L. ANDERSON, } Joint  
W. R. STRONG, F.I.A., } Secretaries.

# "HANDBOOK OF THE BRITISH COLONIAL EMPIRE."

BY

**W. H. MERCER, C.M.G.,**

*One of the Crown Agents for the Colonies :*

AND

**A. J. HARDING,**

*Of the Colonial Office.*

---

"Whilst the 'Colonial Office List' is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring succinct and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts."

*Journal of the Royal Colonial Institute.*

# "HANDBOOK OF THE BRITISH COLONIAL EMPIRE."

BY

**W. H. MERCER, C.M.G.,**

*One of the Crown Agents for the Colonies :*

AND

**A. J. HARDING,**

*Of the Colonial Office.*

---

"Whilst the 'Colonial Office List' is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring succinct and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts."

*Journal of the Royal Colonial Institute.*

• • • • •  
"The book is intended for educational purposes, and is so attractively written, and contains such a fund of information, that it cannot fail to become popular."

*Education.*

### GUARANTEE DEPARTMENT.

The Bonds of the Company are accepted by:—His Majesty's Home and Colonial Governments, the High Court of Justice, the Board of Trade, Local Government Board, the City of London, and other Municipal Corporations, and by various Banks and Railways, and other large Companies throughout the United Kingdom and the British Dependencies.

The different kinds of Risk have been carefully classified. The Company is therefore in a position to undertake the best at the lowest possible scale of premium.

**Special Attention** is called to the Company's Floating and Schedule Policies, under which any number of, or the whole staff of employes (provided the number is at least five), are guaranteed in one Bond. The cost is considerably less than for Ordinary Guarantees, and the risk that, through an oversight, individual Bonds may lapse is removed. Full particulars of these Special Policies will be forwarded upon application.

Policies are issued to cover:—Accidents of all kinds, Workmen's Compensation, Burglary and Theft, Lift Accidents, Employers' Liability, and Fire Brigades.

Applications are invited for Agencies where the Company is not already represented.

S. L. ANDERSON, } Joint  
W. R. STRONG, F.I.A., } Secretaries.

# KAHN

## TRUSSED BARS

THE KAHN TRUSSED BAR, ALTERNATING TYPE

FOR

# REINFORCED CONCRETE.

**METHUEN & Co.,**  
**36, ESSEX STREET, LONDON, W.C.**

**Baden-Powell (R. S. S.),** Major-General. **THE DOWNFALL OF PREMPEH.** A Diary of Life in Ashanti, 1895. Illustrated. *Third Edition. Large Crown 8vo. 6s.*

A Colonial Edition is also published.

The diary of the officer commanding the native levy. After giving the reasons for the expedition, the author describes the journey through the bush and the arrival and seizure of Kumassi. An appendix by Sir George Baden-Powell deals with the political and commercial position of Ashanti.

**THE MATABELE CAMPAIGN, 1896.** With nearly 100 Illustrations. *Fourth Edition. Large Crown 8vo. 6s.*

A Colonial Edition is also published.

A volume of sketches taken on the spot during the campaign in Matabeleland.

**Hall (R. N.) and Neal (W. G.).** **THE ANCIENT RUINS OF RHODESIA.** Illustrated. *Second Edition, revised. Demy 8vo. 10s. 6d. net.*

This book gives an account of the ancient gold workings of Rhodesia, and contains descriptions of two hundred ruins of temples and forts. The ancient gold industry in Rhodesia was extensive, continuous, and successful, the continuity of the ancient workings being recognised by prospectors as a guide to payable reefs. The ancients never sunk further than water-level, below which depths the most successful gold mines are now working. The ancient ruins are shown in red on the large map supplied with the book.

**Hall (R. N.).** **GREAT ZIMBABWE.** With numerous plans and Illustrations. *Second Edition. Royal 8vo. 21s. net.*

In 1902, Mr. R. N. Hall resumed his archaeological researches at Great Zimbabwe, and continued the work of exploration at this central group of monuments down to the year 1904. The results, which have exceeded all expectations, are embodied in the present volume, which thus forms a necessary sequel to 'The Ancient Ruins.' It comprises full descriptions of the chief edifices—Elliptical Temple, Conical Tower, Acropolis, Terraces, Platforms, Enclosing Walls, Passages, and Approaches—together with detailed accounts of the hitherto almost unknown detached groups in 'The Valley of Ruins,' and the many other remains covering a space of fully a mile radiating in all directions from the great central structures.

**Hosie (Alexander).** **MANCHURIA.** With Illustrations and a Map. *Second Edition. Demy 8vo. 7s. 6d. net.*

A Colonial Edition is also published.

The first four chapters give a history of the important events which have happened in Manchuria since 1899, and the remaining chapters are devoted to a study of the country, its people, products, industries and trade.

**Johnston (Sir H. H.), K.C.B.** **BRITISH CENTRAL AFRICA.** With nearly 200 Illustrations and Six Maps. *Third Edition. Crown 4to. 18s. net.*

A Colonial Edition is also published.

The volume includes chapters on (1) The History of Nyasaland and British Central Africa generally, with detailed accounts of events during the last seven years. (2) A detailed description of the various races, considered anthropologically and ethnologically. (3) The language of British Central Africa. (4) The European settlers, their mode of life: coffee cultivation, etc. (5) The Missionaries. (6) The fauna of Nyasaland, with much information concerning its big game. (7) The flora and the minerals. (8) The scenery (copiously illustrated to show the remarkable natural beauty of the country); and (9) A concluding chapter on the future prospects of the country.

**Robertson (C. Grant) and Bartholomew (J. G.), F.R.S.E., F.R.G.S.** **A HISTORICAL AND MODERN ATLAS OF THE BRITISH EMPIRE.** *Demy 4to. 4s. 6d. net.*

The Atlas contains 64 Maps, with numerous inserts, Historical Tables and Notes, an Introduction, a Historical Gazetteer, a Bibliography, and an Index. The combination of modern maps on physical geography, trade, industry, etc., with the special and extensive historical maps of the Empire as a whole and of each part of it (e.g. India, Canada, etc.), give the Atlas a character and completeness not hitherto offered by any other Atlas.

**Scott (A. M.).** **WINSTON SPENCER CHURCHILL.** With Portraits and Illustrations. *Crown 8vo. 3s. 6d.*

An appreciative record of an adventurous career and of a new and powerful force in politics. The scope and intention of the book are best indicated by the Table of Contents: Youth and Genius—Subaltern of Hussars—'The Bright Eyes of Danger'—The South African War—The Member for Oldham—'The Tattered Flag'—Army Reform—The Fair Trade Issue—The Parting of the Ways—Ballying the Opposition—A Future Leader.

**Dunn (J. T.) D.Sc., and Mundella (V. A.).** **GENERAL ELEMENTARY SCIENCE** With 114 Illustrations. *Second Edition. Crown 8vo. 3s. 6d.*

An intermediate course in Physics and Chemistry for London Matriculation. It is the text-book adapted by the Admiralty for Elementary Science at Greenwich College.

THE PERFECTED PAINT

# Velure

There is no paint on earth SO ELASTIC as Velure, nor, BECAUSE OF THIS, so perfect in surface, so free from flaws, cracks and blisters, so easily kept clean or so durable for indoor or outdoor painting, especially if exposed to sun & weather which quickly destroy ordinary paint but leave Velure unaffected for years. No varnish required **ITS SECRET IS ELASTICITY.**

PROVED BY LETTERS FROM HUNDREDS OF USERS.

# "HANDBOOK OF THE BRITISH COLONIAL EMPIRE."

BY

**W. H. MERCER, C.M.G.,**

*One of the Crown Agents for the Colonies :*

AND

**A. J. HARDING,**

*Of the Colonial Office.*

---

"Whilst the 'Colonial Office List' is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring succinct and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts."

*Journal of the Royal Colonial Institute.*

. . . . .

"The book is intended for educational purposes, and is so attractively written, and contains such a fund of information, that it cannot fail to become popular."

# MERRYWEATHERS'

LONDON-MADE

# "DUB-SUB" CANVAS HOSE

WOVEN AT

Merryweather & Sons' Works, Greenwich Road, London, S.E.

THE BEST TO WITHSTAND CHAFING.

In order to meet the demand for a

**SPECIALLY STRONG CANVAS HOSE,**

necessitated by the more general use of Steam Fire Engines and High-pressure Hydrants, Messrs. Merryweather & Sons have introduced their "DUB-SUB" (Double Substance) Canvas Hose.

This Hose is made of specially selected long flax of the very highest quality, and woven on greatly improved looms, which enable a hose of great strength to be manufactured, and with 15 strands instead of the 9 or 10 usually employed, and each individual thread is extra stout and strong. It is

**CAPABLE OF STANDING GREAT PRESSURE,**

and is therefore suitable for the most powerful Steam Fire Engines and Pumps. It represents the very

**LATEST & BEST PRACTICE IN WEAVING CANVAS FIRE HOSE.**

The special stoutness of this Hose ensures for it a very much longer life than that of ordinary Canvas Hose, as it is much better adapted to withstand the effects of the chafing and rubbing unavoidable in course of ordinary work.

The "DUB-SUB" (Double Substance) Hose, when first used, allows the water to pass through the pores somewhat freely, but after it has been in use a short time it becomes as tight as more finely woven hose.

## MERRYWEATHERS' INDIA-RUBBER-LINED "DUB-SUB" HOSE

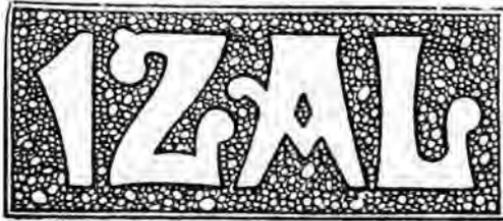

Is a Watertight Hose of the Very Highest Class.

*CAUTION—See that the name "MERRYWEATHERS," as well as the brand, appears on every length. Indent for MERRYWEATHER HOSE.*

# MERRYWEATHER & SONS,

GREENWICH ROAD, S.E., and 63, LONG ACRE, W.C., LONDON.

Telegrams: "Merywether, London."

## The Ideal Disinfectant

**NON-POISONOUS. NON-CORROSIVE.**

---

OFFICIALLY ADOPTED BY H.M. GOVERNMENT.

---

MIXES EQUALLY WELL in SALT, BRACKISH or FRESH WATER.

---

THE PRODUCT OF SYSTEMATIC SCIENTIFIC RESEARCH.

---

**T**HE STANDARD DISINFECTANT for all Public Health Work. Retains its germicidal power in the presence of organic matter.

**A MORE EFFICIENT AND ECONOMICAL GERMICIDE**  
**THAN CORROSIVE SUBLIMATE.**

For Personal Health and Comfort those who use "Izal" enjoy a happy freedom from many ills, especially in the tropics.

# COLONIAL POSTAGE STAMPS.

---

## WANTED TO PURCHASE

Stamps from Asia, Australia, North, Central and South America, the West Indies, and, in fact, from all British Colonies in large or small quantities, used or unused.

**PROVISIONALS** and **HIGH VALUES** particularly desired.

Accumulations from Firms' Correspondence, Government Reminders, &c., purchased. No quantity too large for me to handle.

All offers are promptly attended to and the best prices paid. Goods sent instead of cash if preferred.

*Old issues especially wanted, used or unused. Extra high prices paid for Stamps in complete sheets or large blocks.*

---

## AFRICAN STAMPS

are a speciality with me, and I will buy at good prices any of the following (particularly High Values and Provisionals):—British Central and South Africa, Bechuanaland, Cape Colony, Somaliland, East Africa, Uganda, Gambia, Gold Coast, Lagos, Mauritius, Natal, Niger Coast, Northern and Southern Nigeria, St. Helena, Seychelles, Sierra Leone, Transvaal, Orange River Colony, Zanzibar, Zululand, &c.

Residents in all parts of the world should send me any Stamps they may wish to dispose of. Satisfaction Guaranteed.

Newly issued Provisionals purchased at a good percentage over face value if sent to me within a few weeks of issue, while they are still novelties.

Highest references, Banker's or otherwise, given if desired.

ALL KINDS OF STAMPS BOUGHT, SOLD AND EXCHANGED.

Publisher of "The West-End Philatelist." Price 1/6 per annum, post free. The best paper for stamp collectors.

EDITORIAL NOTES.

THE Franco-British Exhibition is attracting a very large number of visitors from the Colonies, and the size of the Australasian contingent is particularly noticeable. The occasion will cause many persons to regret that the All-Red route between Australasia and Great Britain via Canada is not yet in existence, and that the signs are not promising. Everyone sympathises with the arguments in favour of a great line of communication being established through Canada. The scheme contemplates nine days as the duration of the journey to Vancouver from Great Britain, and 28 to Sydney, as against 30 or 31 by the eastern route. The new Australian mail contract, however, the service under which will begin in February, 1910, will shorten the time by the latter route by about two days, so that the reduction hoped for by the Canadian route will disappear. The heavy cost of maintaining a fast line between Vancouver and Australasia—the mileage between Vancouver and New Zealand being double that between Liverpool and New York—and the breaking of bulk in the case of through freight are the principal difficulties. It is clear that the enterprise would be expensive. There is no popular movement in Australia in favour of it, and all that can be said at present is that it languishes for want of definite proposals from the other parties interested.

In connection with the Australian naval defence discussions, attention may be called to a report by Mr. R. Lister, his Majesty's Minister at Paris, on the latest views entertained by the French Government on the subject of colonial defence. Mr. Lister states that the question of the best means of guaranteeing the external and internal security of the Colonies has been very freely discussed during the last few years. In 1898, in a sudden moment of panic, Parliament voted a number of credits destined to secure the Colonies against a sudden attack. A naval programme was hurriedly drawn up, bases were selected all over the globe for receiving fleets which existed mainly on paper, troops and provisions of war were despatched to them, and hundreds of millions of francs were expended with very little practical result.

M. Gervais, in his Report on behalf of the Budget Committee, examines the whole question, and arrives at the conclusion that the idea of defending the Colonies in the Colonies is fundamentally wrong; that their fate will be decided either in land battles in Europe or on the high seas, and will depend on the effectiveness of the French armies and fleets; that the feeble squadrons in colonial waters would be useless to resist the attack of a foreign fleet, and that no amount of money, however great, spent on fortifying and garrisoning the Colonies would enable them to resist an invasion by an enemy mistress of the sea. At the same time, in the course of a war it might often prove necessary to despatch a fleet to the Colonies, and for this purpose it is essential to create naval bases stocked with every possible requirement, and sufficiently strong to resist an attack pending the arrival of the home fleet.

This represents substantially the view of the Admiralty.

---

A good deal of attention has been attracted by the recent adoption by the Canadian Government of two measures which are to a certain extent restrictive of emigration from the United Kingdom. The first of these measures is the requirement that all emigrants landing in Canada must have in their possession twenty-five dollars at the time of landing, as well as money for their inland railway fare, unless they can satisfy the emigration officers at the time of landing that they are going to already assured employment, or will be cared for by friends. This requirement, originally enforced temporarily during the winter months, is now continued for the whole of the current year. The other measure is the regulation that all emigrants sent out by British charitable societies, or by public funds, must obtain certificates from the Canadian emigration authorities in London that they are suitable settlers for Canada. The fact that it has hitherto been the settled policy of the Canadian Government to

encourage emigration has, we think, led to a somewhat exaggerated view being taken of the significance of the new regulations. The first regulation is not likely to result in the disqualification of many intending emigrants, and we fancy that few of the agencies which direct emigration from this country would ever have advised emigrants to risk starting life in a new country, when work was not already assured them, with a smaller cash balance than twenty-five dollars. The second regulation is no doubt the outcome of a fear that Canada was becoming, or might become, a convenient receptacle for the waste products of British city life. Wisely administered, as we have no doubt it will be, it should cause little trouble. There is no reason to suppose that the Canadian authorities are less sensible than they were of the fact that the Dominion wants more men for the full development of her resources. But the effects of the financial crisis in the United States last year and of an unusually severe winter have been temporarily to diminish the country's power to absorb fresh population, and there is undoubtedly a feeling that for the moment the proper policy is to "go slow." But we do not for one instant believe that the door of Canada is in process of being closed to the British emigrant, or that more than a temporary slacking in the westward tide is to be anticipated.

---

Mr. Mackenzie King's report on his mission to England to confer with the Imperial Government on the subject of Oriental immigration into Canada is an interesting document, though the more important part of his report has been embodied in a confidential memorandum, which has not been published. Mr. King makes cordial reference to the nature of his reception in England.

"Of the interest taken in the subject of my mission by the British Ministers and officials of the several departments with whom by their direction I was privileged to confer, I cannot speak too strongly, nor can I lay too great emphasis on the sympathetic manner in which the representations made on behalf of the people of Canada were received, or the frankness and fulness with which the whole subject in its many bearings was discussed. Notwithstanding that Parliament was in session, and that in some respects the pressure of their duties was exceptional, the time accorded by the Ministers was so considerable that it was possible, within the duration of four weeks, to effect such an interchange of views and to conduct such negotiations as afford reason for believing that a satisfactory understanding of the situation has been reached, in so far, at least, as an appreciation of Canada's position in regard to Oriental immigration is concerned, and as may serve to prevent such immigration from India as may not be desirable in the interests either of the natives of that country or of the people of this country."

Mr. King finds that the recent growth of emigration from India into Canada has been not a spontaneous movement, but the result of artificial causes, prominent among which are the circulation in India of misleading accounts of conditions in British Columbia and the activity of steamship agents anxious to secure commissions and of certain individuals and industrial concerns in British Columbia eager to reap the benefit of exploiting cheap labour. These influences can be counteracted without any heroic or drastic measures, and the Government of India has shown a readiness to co-operate, particularly in disseminating accurate information and by letting it be known that they do not view this form of emigration with favour. Mr. King's report concludes with a paragraph which will be read with pleasure as a testimony to the reality and effectiveness of co-operation between the different constituent parts of the Empire.

“ Whilst effective as a means of restricting a class of immigration unsuited to Canada, it will be apparent that the arrangement as herein set forth is one which finds its justification on grounds of humanity as strong as are the economic reasons by which it is also supported. The liberty of British subjects in India is safeguarded rather than curtailed, the traditional policy of Britain in respect to the native races of India has been kept in mind, and the necessity of enacting legislation either in India or in Canada which might appear to reflect on fellow British subjects in another part of the Empire has been wholly avoided. Nothing could be more unfortunate or misleading than that the impression should go forth that Canada, in seeking to regulate a matter of domestic concern, is not deeply sensible of the obligations which citizenship within the Empire entails. It is a recognition of this obligation which has caused her to adopt a course which, by removing the possibilities of injustice and friction, is best calculated to strengthen the bonds of association with the several parts, and to promote the greater harmony of the whole. In this, as was to be expected, Canada has had not only the sympathy and understanding but the hearty co-operation of the authorities in Great Britain and India as well.”

---

In connection with the question of Asiatic immigration it is interesting to notice that Lord Lamington, in a recent paper read to the Royal Society of Arts, points out that in India itself there are general complaints of the lack of labour and of the rise of wages. “ Closely bearing on this question [factory labour],” he observed, “ is the noticeable fact of the great scarcity of labour. This is due to plague, famine, and emigration, as well as to the increase of manufacturing and the development of mining enterprise. Wherever I

went, I heard complaints of the lack of labour. Lands in remote or unhealthy tracts are lying waste, factories cannot be run, and recently I read that the new harbour scheme at Karachi would be retarded by the difficulty of getting workmen. A further proof of the demand for labour is found in the continual rise in the wages of every class of subordinate service. Shortly before leaving Bombay, I was told that a skilled working coolie on the railway could earn a rupee (1s. 4d.) a day. This may not sound much to a British audience, but it is a fortune compared with the daily wage of 2 or 3 annas prevalent 30 years ago." This state of things does not indicate that there is any solid ground for the apprehension that there will be a great emigration from India, and, probably, as time goes on, similar forces will operate to restrain the vast exodus from China which some thinkers prophesy. There is everywhere an adventurous and roaming class, but the great populations of Asia will remain stationary, proof against the seductions of Western civilisation.

---

While the Dominions and some Crown Colonies are showing strong opposition to Asiatic immigration, there is good reason for noticing any case in which it might be legitimately developed. The British Guiana Immigration Law of 1891 provides only for immigrants who are destined for the plantations and the public departments. They cannot be engaged for the gold mines or the forests. The main reason for this limitation is that supervision can be easily exercised over a plantation, and the authorities can easily see whether the coolies are properly treated in accordance with the regulations laid down. There would be more difficulty in making and enforcing provisions for labour of a less organised character, but the task is by no means insuperable, and in a place which is largely under popular government much reliance can be placed on the spirit of equity and justice. If it is the fact that it is desirable from the Indian point of view to encourage emigration, it seems hardly likely that the Indian Government would insist on the retention of the present limitation.

Then there is the condition that at the end of five years half the return fare to India shall be paid to the coolie if he wishes to go back. The half is about £5, while the savings of returning immigrants average £100. The coolie could, therefore, well afford to pay the full fare. But it is not merely a matter of money. The payment of the half-fare tempts many a coolie to go back who is far better off in British Guiana than he ever will be in India. On the other hand, the colony wants permanent settlement. Instances frequently occur of coolies who pay the £5 for a trip to India and shortly afterwards engage again for the colony. If the Indian is to be regarded as an ordinary emigrant, and if the Colonies are to be encouraged to take him, it is

difficult to see why this onerous condition should be imposed. The coolie in this case goes back for his own pleasure, and should pay the cost if he can do so without any difficulty. A general power might be given to enable the Colonial Government to deal with any special cases.

---

In connection with the article on Compulsory Arbitration which we published in our last number, we may note that a new Arbitration Act has recently been passed in New South Wales, the principal features of which are the continuance of Conciliation Boards, as the first means available for the prevention of strikes, and the establishment of a single industrial Court of Appeal, whose decision is to be absolutely final. An interesting account of the Act and of the circumstances out of which it has arisen is given by the Sydney correspondent of *The Times*; and in view of the unfavourable views which that journal has generally taken of legislation of this character his approval of the Act must be regarded as a good augury for its success.

"As it now stands," he writes, "the Act may be reckoned as nearly perfect as Acts can be. That is to say, considering that the actual industrial situation, the strength of the unions, and the genuinely valuable work done under the expiring Act make the demand for compulsory arbitration irresistible, it would be difficult to suggest a fairer method of enforcing it on both parties in the public interest. It would be quite easy to raise dozens of abstract objections—to the compulsory principle, to the judicial control of private enterprise, to the 'side-tracking' of 'freedom of contract,' to the Judge's power of investigating an employer's profits (this power is given unless the employer admits that he can afford to raise wages if so ordered), and to many other details of the new law. But the answer to all these objections may be found in the history of the last six years and in the state of affairs to-day. Consider the Act as legislation for Utopia, and you must condemn it; consider it as legislation for New South Wales in 1908, and it deserves emphatic praise."

---

The scheme for the combination of the British South African Colonies into either a federation or some more compact form of union is perhaps nearer realisation than anyone would have ventured to predict a few months ago. Probably the most hopeful sign is the fact that the statesmen of South Africa are not inclined to under-rate the difficulties which confront them. The matter requires delicate handling; and any attempt to deal with it in a spirit of impatience or over-confidence would almost inevitably lead to disaster. At the recent Intercolonial Conference great wisdom

seems to have been shown in the attitude of the representatives of the different Colonies towards this question. It was decided to leave undisturbed the present arrangement, admittedly imperfect, with regard to customs duties and railway rates, in order not to provoke controversy at an inauspicious moment, and because it was felt that no final adjustment was possible so long as the Colonies participating in the Conference remain separate entities with no constitutional bond of union. As General Smuts expressed it, in a striking speech which he delivered at the Cornish banquet, "The time for patchwork arrangements is past." It will remain for the Conference or rather Convention which is to assemble in Natal in the autumn to lay the foundations of future union; so far no more has been done than to affirm the principle that such union is desirable. The resistance of the Transvaal Government to the demand for local protection affords another indication of the determination not to foster the growth, at the eleventh hour, of further separatist tendencies. The Imperial Government has indicated very clearly that it regards the question as one for the people of South Africa to settle for themselves, and there will be no repetition of Lord Carnarvon's unfortunate attempt at pressure from outside. But the movement inside South Africa is being very carefully and intelligently promoted. The first instalment has been issued of a work entitled "The Government of South Africa," which has been produced anonymously by a group of writers drawn from all the South African Colonies, whose labours have been assisted by the several governments. The book is designed to put before the South African public in a concise and readable form the facts of the present situation, with some account of their historical origin. If future instalments come up to the standard of the first, the complete work will be admirably adapted to fulfil this purpose.

---

In our last number we remarked that the distances between the West Indian Islands, which are much greater than is usually realised, stood in the way of complete federation. As to this, Mr. McCarthy, in the article which we publish, expresses the opinion that this difficulty will cease to be a serious one as soon as interinsular communication by steamer is established, and that the introduction of wireless telegraphy is inevitable before long, and will greatly facilitate the arrangements. Mere distance has not counted for much in many places, such as Queensland. On the other hand, it is urged that the advantages of federation would be considerable. A small place, left to itself, inevitably falls into a small groove; when it is constituted a part of a large body politic, wider ideas are fostered, greater interest is developed, and the natural result is greater energy and efficiency. There is much force in these considerations, and we anticipate that the improvement of trade in the archipelago will

eventually bring about a revival of the question, though at first Jamaica, British Guiana, and perhaps Trinidad will stand outside the project. We would also draw the attention of our readers to the letter which Mr. Joseph Rippon has addressed to us on this subject.

---

The article by the Chief Justice of Hong-Kong which we publish revives a question which was much discussed at the Colonial Conference of 1887, but has remained almost dormant since—viz. the enforcement of United Kingdom judgments in the Colonies and vice versa. The old principle was that no writ or notice could be served outside the jurisdiction of the court trying the case, but nowadays, when contracts are continually being made between people resident in different countries, this rule would be too inconvenient, and practically every country has therefore adopted the practice of serving writs in certain cases outside the jurisdiction, or, in other words, wherever the defendant is to be found. The action can thus proceed and judgment be given. But the judgment can only be enforced by bringing another action in the courts of the defendant's country. This is reasonable and proper, on the general principle that the plaintiff must come to the defendant's place of residence if there is a bona fide defence which the defendant could not conveniently set up in the original action. But there are a great number of claims to which there is virtually no defence, or which could be contested in the plaintiff's country if the defendant chose to do so, and in these cases the necessity for bringing a second action in a distant place constitutes a great hardship, and does much to prevent business. This consideration points towards reciprocal agreements for enforcing one another's judgments, under conditions to be settled. One difficulty is that the rules of practice and procedure are different in different places, but in the case of the United Kingdom and the Colonies this could probably be surmounted, there being a considerable resemblance among the systems, and a provision that the defendant should be served personally, or in such manner as the local law required, would obviate some objections. The judgment could be sent to the court of the defendant's country with a certificate that he had been served in the above manner. It would then rest with the judge of that court to direct that judgment should be enforced immediately, or to make such other rules as he might think fit. In a large percentage of cases the judge would have no difficulty, and the mere fact that this expeditious process is possible would tend to the easier recovery of debts without the help of the law. Under the present system the party in one country must employ a solicitor to represent him in the other, and as he rarely knows one, this obstacle is practically insuperable in comparatively small cases. The

reason why the matter has not advanced, lies, we believe, not so much in the difficulty of arranging details as in a sort of professional mistrust of courts in other places. But the proposal in 1887 only embraced superior courts, and the discretion which is left to a judge before a judgment is enforced by execution seems an ample safeguard. It is for the commercial communities to decide whether in the interests of business the question should be pressed.

---

Sir Francis Piggott also refers to the "Cash on Delivery" system under which the postal authorities collect the money due to the vendor when delivering parcels. The General Post Office proposed to introduce this system in this country, but the retail dealers organised a strong opposition and the idea was given up. This we imagine was a matter of votes and politics, as no question can arise of the usefulness of the arrangement to the buying public. But it has recently been decided that in the interests of the commerce of Empire the system should no longer be deferred as between the United Kingdom and the Colonies. Otherwise foreign competition for British Colonial trade would have the advantage of the system, while the British trader would not. The argument really applies equally to foreign countries, in which the British trader will be at a distinct disadvantage; but we understand that the opposition has had the effect of preventing the logical conclusion being carried out. Egypt, however, has been included, owing to repeated representations by Lord Cromer that Egyptian traders and customers were making large use of the system for exchanging goods with France and Germany, and the British trade must suffer unless it has the same facilities. The Colonies have been asked whether they wish to participate in this arrangement, and some, but not all, have agreed to do so; the General Post Office is issuing a notice on the subject.

---

The Colonial Office has arranged a scheme for a special three months' course of instruction in London for candidates selected for clerical appointments in East and West Africa, and the first course is now in progress. The subjects are tropical hygiene, law, accounting and economic products. Selected candidates are required to attend the course, and are paid at the rate of £150 a year during it and up to the appointed date of departure. Other candidates may attend on payment of £5 for each series of lectures, or £20 for the complete course. The training, brief as it is, is of a very practical character, and may lay the foundation for deliberate study. The age limit for candidates for appointment has, at the same time, been reduced from 25 to 23 in the case of West, and 22 in the case of East Africa, an alteration which may be regarded as evidence of the improvement in health conditions in our tropical dependencies.

In what town is the greatest number of living languages spoken? Entible, though a small settlement, has a strong claim to the distinction, as the inhabitant who assayed to converse with all his fellow-townsmen would have to grapple with 10 European languages, 13 Asiatic, and 29 African.

---

Mr. Mallock, in his "Critical Examination of Socialism," lays great stress on the thesis that the State can obtain ordinary labour, but that the exercise of directive ability is voluntary, and can only be obtained by adequate inducements, and that the public servant is not and cannot be of the energetic and inventive type. This view is generally current, but we venture to think that it rests on little or no foundation. The civil servant is invariably subject to fixed limitations—the rules of the service, estimates and statutes; the business is not his private business, and he must deal with it under direction. But these limitations are imposed from without. They are rigid, in comparison with those of private employment, because the real employer—the public—cannot be consulted at every turn, as is possible in commercial life. But it does not follow that the servant of the Crown is lacking in the power of initiation, and in the energy which makes things move. The expenditure of public money will certainly always carry with it a considerable feeling of responsibility, but on the whole we see no proof that civil servants are unduly slow or timid in proposing schemes or planning enterprises. The Empire-builders who have served under the Crown need fear no comparison with those who have been associated with private adventures. The inventive and originaive type will not be lacking in the civil service when it is allowed to come into existence. It is indeed probable that much of the research and discovery of the future will take place in institutions organised and subsidised by the State. We have already come to that stage in tropical medicine and agriculture, and it is abundantly clear that highly intellectual and interesting work will command willing and able minds whenever the State will pay reasonable professional salaries for such positions. The private inventor has not, on a general view, enjoyed such a good time as to warrant the conclusion that the present system is the only one that can encourage originality.

---

Even journals, which are by no means disposed to support Mr. Mallock's opinion, appear to admit that his analysis of motive is sound, and that the hope of large profits will always be a very much greater incentive to work of the energetic kind than any stimulus which can be created by State employment. We would submit that this conclusion is not an established one, and that it underrates the

hold which congenial work has upon a capable mind. Every hard worker demands reasonable pay, but the salt of his life is, in the vast majority of cases, his work and not the money. The colonial service abounds with instances of zeal and devotion in the public interests. It does not, however, speculate or float daring enterprises, and cannot, therefore, present spectacles of great coups and sensational profits to the eyes of the mammon-worshipping public. Government business is conducted on honest, and usually sound, lines, and, if it does not propagate the type of worker who flourishes by crushing his rivals, it encourages steady application and disinterested character.

---

We are accustomed in this country to vigorous onslaughts in the daily press upon different branches of the Civil Service for alleged want of business methods, and civil servants have not infrequently occasion to wonder whether the writers really possess the knowledge of the business world which they assume. The suggestion which is most strenuously put forward is that Government requirements should be much more largely put out to open tender and advertised. No responsible authority has ever countenanced this argument, and the plea for advertisements can hardly pass as disinterested; certainly, if one turns to the advertisement columns, no signs appear that the ideal buyer of commercial life adopts this method. Slowness of action and the stereotyped character of replies are fair matters for comment, but allowance must be made for the necessary formalities of public offices and the representative character of the officials. The work done is at any rate sound and accurate, and if it lacks the brilliancy of a comparatively few highly successful enterprises, it must be remembered that the civil servant cannot plunge his office into speculation or daringly skirt the edges of the criminal law.

The public and the service are in much the same relation in these matters all through the Empire, and as an illustration we reproduce the following vigorous article from the *Queensland Public Service Review*, evidently lashed into indignation by the criticisms of the local press. It is written with a freedom which we admire, if we cannot imitate.

#### “ RED TAPE.

“ When the public service of this State is attacked, it is our duty to defend it. We shall try not to fail in that duty.

“ A prominent Brisbane daily, of recent issue, contained the following:—

‘ It may seem too much to expect hide-bound departments to adopt vigorous business methods without passing some Act of Parliament to that effect; but the public gain would be immeasurable if only public departments were transformed into business firms.’

“ The above is one of those peculiar, irresponsible statements which are often made in regard to the public service, but when the assertion is analysed, and the case for ‘red tape’ fairly and impartially considered, one finds how absurd such irresponsible utterances often are.

“ Red tape means honest system, no more and no less, and the deplorable failures so often recorded of numbers of alleged business concerns are, more often than not, attributable to the want of honest system—or good old red tape.

“ We know what alleged business men and alleged business lines brought the Q.N. and other banks to, and we know what the result has been since our Q.N.B. has been subject to Government red tape methods.

“ One has only to wade through the statement of affairs of bankrupt businesses and bankrupt business men to learn that if there had been a little more red tape in their business methods, and a little less business speculation and business chicanery in their transactions, creditors would not so often deplore the payment of a dividend of three farthings in the pound, or less, instead of twenty shillings.

“ We have at the present time a prominent department of State administration which the Minister is doing his best to run on up-to-date business lines, but with proper red tape safeguards, and what is the result? Simply that the Minister is being politically bludgeoned for his red tape safeguards, and for his heroic refusal to completely disorganise his department by running it on the business lines which a section of the public press desire him to follow.

“ Government officials would indeed stand aghast at some of the business changes which the public would have them carry out, but public officials, fortunately for their masters, the public, have too wide a knowledge of ‘tricks of the trade’ to be hoodwinked or led astray by spurious business methods.

“ We believe that our Government Analyst could tell many a tragic tale of business methods were he put in the witness box, and we are inclined to think that the Official Trustee in Insolvency could also reveal many a remarkable instance of business methods and ‘sound commercial lines’ were he called before a Royal Commission.

“ Indeed, it is safe to say that when anything utterly bad, fraudulent, unpatriotic, or disgraceful happens, it is reasonably safe to assume that the ‘Commercial class,’ with their ‘sound commercial lines,’ is more or less responsible. Its record of Customs misdemeanours became so glaring that ‘red tape’ of the most drastic sort had to be introduced to check them. Its secret commissions in connection with the butter trade (Victorian) were so absolutely reprehensible that one began to wonder whether there was an honest commercial man in the community. Its press organs point out, with the most

lofty air imaginable, that if there were more commercial men in Parliament, it would be better for the country. As a rule, the 'Commercial class' produces about the most disastrous class of politicians that Australia has had experience of. When the periodical plague breaks out, the unfortunate city nearly always finds that it is the callousness and selfishness of business men that is responsible. Result: Government red tape methods have to be called in to clean up the sickening mess.

"We were going to say a little about the sweating evil on sound commercial lines, so much lauded by the commercial press, but, really, the subject is too sordid and too horribly infamous for a respectable publication like the 'Review' to tackle. It would be as well, however, to point out that Government red tape, with its factory officials, is exercising a salutary check on this evil, which is no doubt galling to the business and commercial world.

The business methods of the commercial world have forced the Commonwealth Government to pass a Commerce Act, in order that no more shoddy shall be imported as wool, or cotton as silk; no more paper masquerading as leather; no more rolled gold jewellery as best 18 carat; no more swindling preparations as good fertilizers for robbing the poor unsuspecting amateur public servant gardener, and the backbone of the country. With a vigorous red tape administration of the Commerce Act, half the alleged business men will find their nefarious business ruined. If they live on dishonesty, they cannot survive under honest conditions, and it is 'the hide-bound traditions of red tape' which are responsible for too much honesty in business, to make 'business methods' and 'sound commercial lines' pay.

"In fact, the general public owe so much to 'red tape,' and have so much to be thankful to it for, that they ought to petition the Government to erect a statue to it, and to proclaim a public holiday once a year as a sort of Thanksgiving Day, in order to salute it.

"The Special Inquiry Board was an instance of 'business methods,' but 'red tape' could give that concern a long start, and beat it easily. The payment of 8s. in the £ to public servants was another instance of 'business methods,' therefore, the less the public sees of business methods the better. The only thing approaching 'business methods' in the public service, is the salaries paid, but this is not intended to be flattering to 'business methods.'"

## HERBERT SPENCER ON COLONISATION.

THE search for immutable truths is always being prosecuted by keen intellects, but it is somewhat disconcerting to find that generalisations on political and social subjects follow to a large extent temporary fashions, and have exceedingly little effect in shaping the actual course of things. The fact is, that human relations are so complex and variable that particular cases which are very much in evidence at one time may point to conclusions which are wholly inapplicable at another. Situations are continually occurring which are so new and novel that past history gives little practical help regarding them. The student may interest himself by drawing morals from old events, or detecting analogies. But the world of the voter and the legislator is not governed and hardly affected by such considerations. It is necessary to distinguish clearly between the educational value of records and their utility in application to present day problems. There is an old story that Cobden thought there was more in an issue of the *Times* than in the whole history of Greece. If history is being looked to as a training for the mind, this is of course absurd. But if what is wanted is a contribution to the data of current politics, the newspaper of the day is obviously preferable. The general ideas which everyone derives from historical reading are too vague and remote to be made clearly applicable to questions of the day. The dynamics of social organisations are continually converting the rule into the exception, the exception into the rule. No little peril therefore follows the footsteps of the philosopher who endeavours to build up a stable structure for the future on the crumbling ruins of the past.

Herbert Spencer, however, understood the task with a force and consistency which showed no misgiving and undoubtedly largely influenced the thinking class. He took a fair number of strong instances of mistakes made by governments, and drew the inference that for the State to do more than is strictly necessary is immoral. Thus the duty of the State was simply to protect, to enforce the law

of equal freedom, and to administer justice. He argued that the State cannot add to our moral feeling. "No legislative manipulation can eke out an insufficient morality into a sufficient one." The State in short can do little. It is an easy step to the proposition that all coercion is immoral. "Will it not follow," he asks, "that it is immoral to use violence in opposing a trespasser?" and he answers, "certainly" ("Social Statics," p. 2,717); but it is some comfort to find that when you are attacked, you are to resist, notwithstanding the immorality of the act; and the explanation of this apparently contradictory position is that "action and reaction are equal; the blow dealt at morality in the person of the injured cannot end with itself, there must be a corresponding recoil."

Few people will think that these subtleties contain the pith of the matter. They have a forced appearance; they do not flow as natural consequences of given facts. The whole intent is to bolster up the conception that the State should not interfere. This conception is based on data which the latter-day observer will certainly pronounce insufficient, and to a great extent untrue. Thus Spencer contended that the attempt to suppress the slave trade on the coast of Africa was a mistake—an instance of the "unwarranted assumption that it is possible for the self-guided human judgment to determine, with something like precision, by what method it (the "greatest happiness") may be achieved." His reason was that the attempt "would only aggravate the horrors, without sensibly mitigating the extent of the traffic." The abolitionists of England he said, "dreamed not that when hard pressed a slaver might throw a whole cargo of 500 negroes into the sea." There were no doubt cases of this kind, but when the slightest regard is given to the general aspect of the matter—the infinite mischief done by the institution of slavery to slaves, employers, and the whole of society—it is clear enough that the philosopher's view of the matter, so far from being a profound one, was exceedingly shallow. Concrete cases, however, were not much to Spencer's theory. He proposed to generalise without them. "Why" he asks, "cite individual cases?" What is the Statute Book but a record of such unhappy guesses? Nearly every Parliamentary proceeding is a tacit confession of incompetence. There is scarcely a bill introduced but is entitled "An Act to amend an Act." The "Whereas" of almost every preamble heralds an account of the miscarriage of previous legislation."

It seems singular that the fact of continual changes in the laws should have appeared to be so fatal a feature to a philosopher whose creed was based on the principle that humanity is indefinitely variable, and that things are constantly undergoing modification. No one would question the fact that in public, as in private life, mistakes are frequent, and that experience is dearly bought. But that is no reason why the effort should be given up. Certainly it is

no proof that no progress is being made. It is idle to point to the instances where modern law and civilisation have failed if any regard is paid to the vast gulf which has been left behind in the progress from ancient times. The "Act to Amend" and the "Whereas" record on the whole a steadily growing desire to amend, and increasing wisdom in the way of doing it.

Spencer objected generally to Government colonisation, on the ground that, so far as this involves State expenditure, it implies the taxation of some class of the State's subjects for an object which is not necessary to them. "As it is the function of a Government," he says, "to administer the law of equal freedom, it cannot, without reversing its function, tax one portion of its subjects at a higher rate than is needful to protect them, that it may give protection to another portion below prime cost; and to guard those who emigrate, at the expense of those who remain, is to do this." To tax one class merely for the benefit of another is manifestly unsound, but the argument ignores the consideration that men may agree to co-operate for a common object. This country has undoubtedly made great sacrifices to develop the Colonies, but not merely in the interest of the emigrants; the money spent has been laid out as an investment. Spencer further contends that "Colonial Government, properly so called, cannot be carried on without transgressing the rights of the Colonies." The "law of equal freedom" is broken by any assertion of authority by the Mother country. This "law" is derived immediately from an "*a priori* view of creative design," and is also a "direct deduction from the necessities of existence." No doubt it is true enough that perfect freedom is necessary for the highest development. The difficulty in practice is that the administration is confronted with the fact that there are at present widely different standards of thought and civilisation. We may be all on the road to the millenium, but that goal is not in sight, and the rate of progress towards it is too palæontological in character to satisfy modern desires. In numerous places, were it not for autocratic government, a small superior race would be absolutely overwhelmed by a large inferior race. To contend that in such cases all should be placed on the same footing is equivalent to surrendering the accumulated advantages of the best education. The law of equal freedom might on the same theory be applied to proving that children should never be forced to attend school. It is necessary to discriminate, and every one does so when brought into contact with an alien community.

It is easy enough to collect examples of mistakes from our Colonial history. It is another matter to infer that the whole movement was wrong and has been unsuccessful. Spencer would have had to revise his cases considerably to meet recent developments. "If you object," he says, "to the expenditure of £110 000 per

annum on the government of Ceylon, it is thought a sufficient answer that Ceylon buys manufactures from us to the gross value of £240,000 yearly." We do not know how long ago the above expenditure was incurred in Ceylon, if ever it was, but in recent times the expenditure has been nothing, and the imports from the United Kingdom some £2,000,000 a year. The other economical instances given are much of the same sort. But the whole British Empire, according to Spencer, was in a bad way in his time.

"Chronic irritation, varying in intensity from that of which petitions are symptomatic, to that exhibited in open rebellion, is habitually present in these forty-six scattered dependencies which statesmen have encumbered us with." "All winds bring the same tale of a negligence caring for no expostulations, impertinence without end, blunderings, disputes, delays, corruption." It was not merely a matter of mal-administration by the Colonial Office; the vice was in everyone. Throughout colonial history there were "atrocities that disgrace civilization," and "even down to our own day kindred iniquities are continued." The picture is overdrawn for a special purpose, but no argument is forthcoming to show that these barbarities were due to the system of government. In truth they had nothing to do with it. It has always been the man on the spot and not the man at home who has really dealt with the natives. Much of the unpopularity of the Colonial Office has been due to the fact that, in deference to local opinion at home, they have endeavoured to intervene in some fashion between the settlers and the natives. In such matters the plain fact is that there are two standpoints, that of the man who has himself to meet the situation and that of the man who has not. There is inevitably a wide difference between the two. The thinker at home is, very rightly, endeavouring to apply the moral law to the political world. But the application may be, in the actual circumstances, premature; "*salus populi suprema lex*," the ideal must be waived when existence or necessary development is threatened. Whether this is the case the man on the spot is the best judge; he may exaggerate the danger from nervousness, but, on the other hand, he is the only one exposed to it. The conflict of the two standpoints has arisen everywhere—in North America, the West Indies, Australia, Africa and the East. The universality of the fact suffices to show that it has nothing to do with "colonisation under State management."

The doctrine of equal rights appears to be applied by Spencer without regard to person. He objects to any government from home, and urges that the inhabitants of every colony would prefer to administer their own affairs. This is certainly not the case in the inception. It might have been if every colony had had a clear field, but there are natives everywhere, and a young or small settlement is by no means anxious to dispense with protection from home.

Apparently the doctrine implies the recognition of equal rights in all persons of whatever race. The obvious differences of intellectual and moral standards are a matter of which it takes no note. They are merged in the ultimate perfectibility of all species. It is however, suggestive that on the first occasion when Spencer was asked for his opinion on an actual question of this kind—the claim of women for votes—he expressed himself decidedly against the grant, on the ground that women had a different intellectual standard from that of men. Such is the difference (sometimes) between thought and action. It is not that the habit of theorising is wrong, but the philosopher who emerges from the closet on to the open field finds new facts. Wherever the British flag goes it spreads education, and a constant endeavour is everywhere taking place to interest natives in questions of administration. As soon as they show that interest, they are generally given some share in the government. More than once the concession has been made too soon, and it has been found necessary to curtail it, as in the Cape Colony. If Spencer had lived in a colony with a large native population, the pride of race and intellect would have operated as much in his case as in that of the average man against admitting the inferior race to the level of his own. He argued in the printed book that class government reflects the selfishness of the class. It may be admitted that to a large extent it does. But an enlightened selfishness, is at any rate, better than barbarism, and it is now so generally recognised that the prosperity of the individual is bound up with that of the community, that class selfishness—while no doubt it still exists, as we cannot pretend to have eliminated self-interest—is very far from doing the mischief which it did in old times.

Spencer's doctrine was, in short, that mechanical remedies for our deficiencies do not promote, but retard, the process of adaptation. This may be so. But in many passages, at least, he assumed, in common with many thinkers of the time, that adaptation was synonymous with improvement. This is far from being true. The environment may be a bad one, and the process of change is in many cases in a worse condition. A pure policy of drift or *laissez faire* has resulted in too many palpable hardships to commend itself to the nations. Life is a struggle in all its aspects, and a vast amount of effort and combination is necessary to improve it. But Spencer's plan was simply to let things alone. Thus he says "all profitable trade with colonies will come without the outlay of a penny for colonial administration must flow to us naturally." Trade will of course follow its natural course, but it is another matter whether it cannot be increased by administrative measures. On this point the practice of all the progressive world runs counter to Spencer's principle. The philosopher who gave an ideal value to the possibilities of human nature, has been displaced by the politicians who

have a keen sense of present evils and shortcomings. The contest has not really been fought out on paper or on the ground of general principles. The complications of modern life; the rapacity of impersonal capital; the helplessness of the individual in the whirlpool of vast combinations, are facts which become more striking every year. All classes and parties come in turn under their influence. An irresistible tide of circumstances has established a universal practice of considering and regulating affairs from the corporate point of view, and no enumeration of past mistakes can affect the position that the State must undertake in multitudinous ways the task of improving the position of its members.

The British Empire shows this practice at its present highest point of development. A race which is personally strongly individualistic and has a large respect for private enterprise has passed all others in its applications of government resources to industrial works. It has been clearly realized that in many cases an expenditure will be remunerative to the State when it would not be to any private person. Thus a railway may barely meet its working expenses, and a low rate of interest on capital. But the State takes further into account a consideration which the investor does not benefit from, viz.: the increase in dutiable goods, and the saving of labour which is set free for the purpose. No doubt in many cases, it happens that, while all are taxed for the purpose, some benefit from the enterprise more than others, and some not at all. A public want which only helped a small class would obviously be unjustifiable, but a broad view has usually been taken and small interests have done little to oppose the large ones. The construction of the Canadian Pacific Railway, in which a considerable part of the eastern provinces saw no particular advantage to themselves, was an education in national feeling. It seems strange nowadays to read that in such undertakings "the state becomes self-contradictory—violates that very freedom which it proposes to maintain." The conception of the State has advanced far beyond this bare and cold affirmation of freedom. It stands for united action in relation to all the great affairs of life. Unlimited individualism would be a return to barbarism. The only way in which man can free himself from daily attention to the commonest necessities and find leisure for higher ideals is by State organization.

## LORD CROMER ON GOVERNMENT ORDERS.

Lord Cromer's memorable work on Egypt is a treasure-house of valuable information, but it does not and could not by any means cover all the administrative questions to which his practical wisdom and experience was applied. One of these questions was that of public tender for government supplies, and as this is a matter in which all governments are constantly concerned and which is continually exercising parliamentary bodies, we reproduce the following remarks from one of his despatches to the Foreign Office.

“The matter is one which has frequently formed the subject of discussion here, and on which very diverse opinions exist amongst competent authorities. That the system has its merits and also its demerits cannot be denied. Its principal merit is that it minimizes the possibility of undue influence being exerted in favour of any particular firm or individual. It cannot be doubted that this is a very great merit; for it is of importance, not only that there should be no favouritism, but that the public should be convinced that none exists. So far as my experience goes, the latter is far more difficult of attainment than the former of these two objects; for, whilst the public are, perhaps not unnaturally, prone to suspect the existence of favouritism on grounds which are frequently inadequate, the officials—or, at all events, those with whom I am principally brought in contact—appear to be wholly dominated by two ideas, namely: (1) To get the best and cheapest article they can for their Department; and (2) To studiously avoid any course of action which might possibly involve imputations of favouritism being cast on them. Indeed, the popularity of the tender system amongst the official classes, in spite of its recognized defects, is very largely due to the fact that it not only relieves them of a certain amount of responsibility but also minimizes the risk of imputations, such as those to which I have alluded above, being made. These imputations are often very

unfair, and must be singularly galling to honourable men who are endeavouring, often under circumstances of much difficulty, to do their duty irrespective of any considerations but the merits of the particular question with which they have to deal.

“The principal demerit of the system is that it not unfrequently fails to secure the main object in view, which is to obtain for the taxpayers, for whom various responsible officials act as trustees, the best and cheapest article which can be procured. That there have been some notorious failures in this connection cannot be denied. I need not, however, on this occasion dwell on the details of any special case.

“It is obviously difficult to combine the advantages and, at the same time, to obviate the disadvantages of the tender and non-tender systems. My personal opinion is that the question of which systems should be adopted depends greatly on the circumstances of each case. For instance, there would, I think, have been the strongest objections to the adoption of the tender system in the case of the reservoir works now being executed at Assouan and Assiout. In the case of works of these dimensions and of this importance, the paramount necessity of obtaining the services of a contractor of proved trustworthiness, and possessed of substantial means, must be placed before any other consideration. I may say that, in the particular case under discussion, I felt the force of the argument which I have stated above, so strongly that, at the time when the matter was under consideration, I should have advocated the abandonment or, at all events, the postponement of these most useful and necessary works, rather than have consented to any conditions under which the responsible officials of the Government would have been in any degree hampered, either in the free choice of the agents whom they might wish to employ, or in their liberty of control over those agents.

“In more ordinary cases, whether the question involved be the execution of public works or the supply of any particular article, there is sometimes no objection to the adoption of the tender system. One of the disadvantages of that system may, at all events, be greatly mitigated by restricting competition to firms or individuals of known standing and reputation. Several instances have occurred in this country of tenders being made at prices which obviously could not be remunerative. When this occurs, although, under the conditions of tender, the Government is not obliged to accept the lowest offer, a great temptation obviously exists to accept it, and, as a matter of fact, it is frequently accepted. Experience has, however, shown that the danger of paying too little has, in the case of Government contracts, to be guarded against quite as carefully as that of paying too much; for cases have occurred when, after finishing half the contract, the contractor has found himself unable to proceed with

the work. The Government then is practically powerless. The caution money, which the contractor has usually deposited, may, indeed, be forfeited, but it is in most cases insufficient in amount to compensate for the inconvenience and expense which would be caused by annulling the contract and starting afresh with some other contractor. The result is that the Government has to come to the defaulting contractor's assistance, and only ends by eventually obtaining what it requires after a great deal of trouble, and often at a price equal to, if not in excess of, some offers which were originally rejected. Hence the necessity of limited, in preference to unrestricted, competition."

In this country the practice is to provide in the contract for the detention of a certain percentage, say 2 per cent. per week, as liquidated damages in case of delay, and this provision can be enforced at law, even if no actual damage is shown. But many contractors take little heed of such provisions and lightly undertake contracts which are much beyond their powers. When delay occurs, the government can cancel the contract, but it is not likely to do so until the delay has been serious, and on this step being taken the whole process has to be gone through again, with the possibility of a similar failure. The matter of quality is even more important. In a large percentage of cases the lowest tenderer under the open system has put in a price which makes it absolutely necessary for him to scamp the work or supply inferior material, if he is to make any profit at all; and usually the cost of such detailed inspection or analysis as would be required to guard absolutely against his well-disguised methods would be prohibitive.

Lord Cromer further stated that his opinion was against the policy of accepting the lowest offer. It is difficult and invidious, when tenders have been invited, to reject the lowest; if the contractor in question is not to be trusted, why trouble him for a tender? The only solution seems to be that only firms should be applied to which have furnished reasonable evidence of fitness. If tenders are invited from several first-class firms, in a matter in which there is no ring, a fair price will certainly be secured.

Lord Cromer suggested that, in order that the risks involved in the system of public tenders may be minimised, attention should be given to three points—"more ample consultation, and more rigorous application of the system of limiting the number of competitors, and greater care in specifying the conditions of make and material to which tenders must conform." The first point refers to the calling in of technical advice. The expert should certainly be consulted whenever the expense is moderate in comparison with the total cost. But the common difficulty is that of fully specifying the particulars. This is Lord Cromer's third point. Theoretically it can always be done, but practically the cost of setting out the full details and of

seeing that they are observed in the performance often makes it impossible. When a very special article is required, or an assortment is required, or an assortment of different articles in small quantities of each, there is nothing for it but to go to a good firm which can be relied on to consider its permanent reputation as well as the interests of the buyer. This is the usual practice of governments and, indeed, of ordinary commercial life. But this course should be limited to the fewest possible cases. Efforts should be made to standardise all articles which are in frequent demand, so that several firms can be asked to send in quotations.

## FEDERATION OR UNIFICATION.

THE political situation in South Africa revives the old question as to how far local institutions can be reconciled and combined with a central authority. There are two systems of amalgamation. There can be established one sole Parliament and one purse for all the parties to the agreement. This is unification. Or each party, while being represented in the common Parliament, can retain its local Parliament, limited in its functions, as may be agreed, and keep its own property, subject to any contribution which may be resolved upon for the common purposes. This is federation. The first system gives, of course, the strongest central government and the full strength of combined power. The unified State can borrow money on the credit of the whole community: in a federation the individual parts are generally responsible only for their own debts. The law is uniform under the first system, and there is one authority in all matters; in a federation, the laws are different and there is inevitably some friction and frequently acute quarrels. The cost of government is greater under federation, and the consideration that the parts of working machinery should be as few and simple as possible is clearly in favour of unification. The influence which militates against unification and for federation is the very natural desire of a community which has had its individual civic existence, to retain its identity and to manage its own local affairs. Political ideas and material interests vary considerably within a comparatively small geographical range, and every locality cherishes a more or less definite suspicion that its particular views and wants will not be understood or appreciated by a distant legislature. Local feeling is, in fact, one of the strongest forces in politics, and a large amount of education and altruism is necessary before this feeling yields to a broad conception of national life. Man, as an object of political manipulation, is by no means a plastic material, and is at all times disinclined to surrender his powers if he can help it. Some strong force, such as war, or the fear of war, financial embarrassments, or trade troubles, is alone sufficient to combat the centrifugal instinct.

Even when union is accepted and carried out, it is largely begrudged and restricted. The thirteen American Colonies, after the war of independence, remained at first independent of each other; each followed its own lights and went its own way, and it was only the genius and moral force of Washington that, almost on the brink of internecine war, averted the danger by the creation of a central legislature. Canada has gone through an experience of a similar nature, and on the whole it may fairly be said that the general trend is towards greater consolidation. Not only is it more and more understood that union is strength, but the increasing part which government takes in administration and enterprise, renders combination continually more valuable.

Geographical distances and diversity of interests are, of course, considerations which tell in favour of the retention of local powers. It is found that it is hard to believe that a Parliament at a remote place can study the requirements so well as one on the spot. It is probable, however, that this apprehension can easily be exaggerated. In these days of universal railways and telegraphs mere distance counts for little. If a local object is opposed by a central body, this is not usually because it is not understood, but because there are some arguments against it which appeal to persons who are not directly interested.

It is naturally the smaller States that are disposed to favour federation as against unification. Thus, Natal may be expected to take a different view from that espoused by the Cape and the Transvaal. The subject will be fully discussed by the South African Convention, which is to prepare a draft constitution.

## SOME MINOR ASPECTS OF COLONIAL TRADE AND THE EXECUTION OF COLONIAL JUDGMENTS.

ENGINEERS, when they are constructing great reservoirs, make what is called a "catchment area," or gathering ground, for keeping up the supply of water, and they are careful to include in it every possible square yard of ground from which the rain will flow downwards to the reservoir, or which contains however small a spring. This catchment area is a practical application of the many mickles which make the muokle.

There is a great deal of talk about Colonial trade and the imperial duty of fostering it. Much attention is paid to the great feeders which go to swell the volume of it, but it has often struck me that those who have it in charge—the trade organisations—differ from the engineers constructing a reservoir, in that they are not very careful in the development of the catchment area, paying little attention to the discovery of the little springs and small rivulets which might tend to increase it, but which unfostered degenerate into the merest tricklets. I have seen many such trickling streams dry up for want of supervision, and some traders at home the worse therefor, the intending purchaser either going without or going elsewhere. The matters to which I am going to refer are indeed so trifling, as almost to be unworthy of notice. I cannot pretend to say that at the year's end the figures in the Blue Book returns would be altered for the better in the "hundred thousand" column if things were different, I can put it no higher than this, that some of the minor rivulets in the gathering ground of British Colonial trade would be somewhat swollen and run in greater volume to the benefit of some individual traders in the mother country.

The few points I have to note are in the main negative in character; to continue the metaphor, they are rocks in the course of the stream, which accumulate debris round them, ultimately blocking it altogether.

The Imperial Penny Post has been established for at least ten years; yet it is astounding how many letters are still sent to the Colonies by every mail with the 2½d. stamp. This may be due to the lack of elementary geographical knowledge in the stamping clerk of a firm; but it is noticeable in all classes of correspondents, and it is the visible sign of an absence of knowledge about the Colonies themselves, and there whereabouts: and not of an absence of knowledge only, but of an absence of any desire to know. As typical of this, letters for Mauritius are often superscribed "Mauritius, West Indies." I have seen greater attempts at accuracy—thus, "Mauritius, Indian Ocean," or "near Madagascar." In that Island the story is still current of the clergyman who was requested—by which Department it matters not—to take the afternoon service in Seychelles.

This astounding ignorance of all that concerns the smaller Colonies—at least it appears astounding to us whose fate it is to live in them—comes out in trade matters in a more important manner. One illustration will suffice to show my meaning and its bearing on the subject in hand. Good tobacco is a scarce commodity in the Colonies; and once upon a time some of us, knowing that tobacco can be obtained out of bond from home as good as was ever smoked, and imported to ——— much cheaper than any of the inferior stuff to be bought locally, put our heads together and decided to order an experimental consignment of x pounds. The period when pipes could be smoked with comfort and refreshment was drawing near, and we calculated that the justly celebrated firm of Z. Y. & Co., of ———, would consider it worth their while to despatch this consignment with commendable promptitude. Giving the parcel and its packers a large margin of grace, and adding yet another fortnight, it should have been with us and in our pipes by the beginning of July. The beginning of July came and went, as also did the beginning of August. The invoice announced despatch by the S.S. "——," due to arrive, according to her agent, somewhere in the middle of September, and she in fact cast anchor in the harbour towards the end of that month. Now the obvious cause of the delay was ignorance of the elements of trade with the Colony, failure to make the necessary enquiries as to sailing of the mail ships (which also carry cargo, it seems necessary to add), and general slackness all round, from the senior partner to the office boy. Had the tobacco come anywhere near the time it was expected it would have put us all in a good humour, its fragrant fumes would have permeated every hearth, and quite a lucrative little business would have sprung up, for in the Colonies more than elsewhere men recommend good things to one another, for in all conscience there are few enough of them. But what happened was that men saw what a bother it was getting things out from home, there were always a lot

of unexpected difficulties, and then someone had meanwhile discovered a "Mixture" supplied by the Hanseatic firm of X.W. & Co., which really wasn't so bad, and would "do." I believe this to be quite typical of what often takes place.

In connection with the subject of small orders for things to be sent out from home, there is a most convenient system inaugurated I believe in Switzerland, the introduction of which into the Colonies would be a great boon to those who live there, and would do much to foster trade with home; for small orders lead to bigger, and they in turn engender big ones. The system is known as "C.P.D.," or "cash paid on delivery," and it adapts the parcel post to most convenient ends. An order is sent to a tradesman in a distant town, the goods are despatched, and the post office collects the amount due, charging a small commission. It fosters trade because it panders to human weakness, saving people the trouble of going to the post office for a money order, and it is admitted by those who know that many things are sent for which otherwise would not be ordered. The convenience of having such a system in the Colonies would be very great, for the trouble of sending to the post in the hot weather is a very real one. But another less apparent advantage would result from the introduction of the system into the Colonies. A large proportion of the people draw their salaries monthly. It may not be convenient to get the necessary money order for, say a new parasol for the wife in time for the next mail, and the end of the month must be waited for, and then it may arrive too late for the wedding where it was intended to make quite a sensation. But with the C.P.D. system the order can be sent at once, the money provided in time for the arrival of the parcel, and everybody satisfied—the seller, the post office, the purchaser, the purchaser's wife, and also the other guests, whose husbands are bidden to do likewise on the next occasion—so does trade breed trade. There is no running into debt, nor is there any risk to the seller, for the system is worked on strictest cash principles, and if cash is not forthcoming the parcel may be opened and its contents sold.

It may be said that the introduction of this system would interfere seriously with local trade; as to this I have to make a few remarks which I think will not be very familiar to many of my readers.

Nothing is so unsatisfactory as making general statements concerning any class of persons which cannot from its nature be applicable to all of them. Those to whom they do not apply defend themselves vigorously, while those to whom they do apply keep silence in the protection which their friends' virtuous vigour affords them. This is especially true of the remarks I am going to make about the retail trade in the Colonies. No one will deny that good things are sometimes procurable in some Colonies more often than in others; but

the general feeling which is universal is that the best things are not to be had, and that a very large proportion of bad things find their way on to the colonial market. There has always been a veiled sarcasm in the word "colonial"; in spite of many improvements in many respects it is idle to deny that it still exists, and in the matter of supplies sent to the Colonies from home it is often more than justifiable. The following facts are I believe true. There is a very large amount of "commission" business, as distinguished from genuine retail trade, or ordinary agency business. The peculiarity of commission business is that the first rate firms do not as a rule go in for it; it therefore implies as often as not an inferior article foisted on the public by means of ingenious advertisement and tempting commissions to the so-called agent. The advertising firms live by means of this class of business, and from sheer force of circumstances thrive, because as often as not there is nothing else on the market. It is I believe a special feature of the wine and spirit trade, and I look back with a shudder on a whisky—we will call it the "Apocalypse Brand"—which for many months we had to drink in a certain place, because there was no other. Why should not the genuine agency business, with good articles on sale, be adopted? Ask Messrs. A. B. & Co., the celebrated wine merchants why they will not make Messrs. L. M. & Co., the leading merchants of Saint Phillips, their agents. The answer will be "We don't know them. Suppose anything went wrong &c., &c., "Although Mr. L. and Mr. M. are honourable gentlemen, taking their part perhaps in the Councils of the Colony, the firm Messrs. A. B. & Co. will not trust the firm Messrs. L. M. & Co." Yet the experiment has been tried in one Colony that I know of with conspicuous success, to the benefit of all concerned, including the consumer.

It is impossible to imagine the depths to which the retail trade of a Colony can descend. In one place I have a very lively recollection of having to depend on travellers' "samples" for some necessaries of life. There was, for example, an assortment of pipes of different shapes sewn on to a card from which we selected, till at last there were no more, and then we had to go without.

Yet another peculiar feature of the trade is what I believe is called the "colonial line" in commercial jargon. The process by which goods get into this line, where the colonial "buyer" is waiting for them, has been described to me somewhat as follows. New goods make their first bow to the public in the serene atmosphere of Bond Street. The length of their residence there depends of course on the favour with which they are received by customers. Some make a quicker descent than others in the social scale, the next stage of which is I believe Sloane Street. The large towns then have their turn, and after them the suburbs and the county towns. There are many stages, but there is one at which Chelsea is reached, and then the last

the Colonies. This gradual declension in the scale of fashion takes at least two years, sometimes longer, the time somewhat depending on the output of "new goods." As a matter of course the price declines *pari passu* with the remoteness of the age when the goods were "in fashion"; so that by the time the Colonies are reached they are long out of date, and the colonial buyer gets the "bargain" it is his business to be on the look out for. I fear that the purse of the colonial purchaser benefits little by this process, for the price—how shall I put it?—bears a favourable comparison with, we will say, the Sloane Street price. I will not touch more on the question of price, for it is a delicate subject, involving many things unknown at home; to use the text of the trade, the retail trader does not go out to the Colonies "for the benefit of his health," and perhaps this method of buying is in the circumstances the only one possible. To the long-resident in the Colony it perhaps does not much matter, for if a thing is good enough to have been in the fashion once, it must have some virtue in it, and with that he is fain to be content. But there are many other persons in the Colony, and their opinion counts for something; also they are potential purchasers, and the antique mode of the goods offered for sale prevents them; they won't so much as "look at them." I am convinced that the "colonial line" is seriously detrimental to the retail trade of the Colonies with the Mother country, and that it is one of the reasons why spruce bright-looking things from, say, the other side of the Atlantic, find there too ready a sale.

There are two causes which seem to me to lie at the root of the present unsatisfactory state of the retail trade between the Colonies and Great Britain—ignorance in the traders at home of the conditions of life in the Colonies, and want of confidence in the individual who lives there. I have given a few examples of the former; the latter, in so far as the facts are concerned, springs from this fundamental ignorance. But there is a legal aspect of the question, the proper understanding of which I believe to be of the utmost importance, and which I will now endeavour to make clear.

In the unseen and unnoticed operation of the law, in the constant unconscious obedience to its behests, is to be found the chief evidence of its strength and the secret of its efficacy. The less frequently its sanctions are invoked, the more potent is its influence; and contracts, for example, are fulfilled without the aid of writs of execution. To put this in another form; commerce is carried on with freedom and mutual confidence, because it is known that in case of default the law may be appealed to with certainty, and its processes set in motion with some approach to swiftness. There can be little doubt that the existence of the bills of exchange system in commerce depends in large measure, not merely on its convenience, but on the summary remedies by which it is supported. They lend the convenience the

stability which is not inherent to it. So Order XIV. gives a security to ordinary commercial transactions, and the same additional stability to credit. Business of all sorts is the more readily entered into when both parties have the certainty that default will be followed by certain judgment and swift execution. It is not too much to say that the law with its attendant procedure is sub-consciously present in all transactions. On the other hand, substitute uncertainty for certainty—even though it be but theoretical—dilatory delays for swiftness—even though this be but relative—and hesitation in entering into the commonest transaction becomes inevitable.

The simplest case will illustrate my meaning. A publisher receives an order for a book from a person in France. The would-be purchaser may be known to him, but inevitably one of the questions which will arise in his mind is—"In case of non-payment how shall I recover the money?" Let me bring the question nearer home. One of my readers is taking up an appointment in the Colonies. His outfit and the payment therefor becomes a most serious question. His tailor, his bootmaker, his haberdasher, perchance, if he be so blessed, his wife's dressmaker, when credit is suggested, will without doubt say, "Well Sir, of course you see, you are going to the Colonies, and . . . ." Perhaps a payment on account may ease off the difficulty, which is a very considerable one to those who are not given an outfit allowance. As it is with small, so it must be with large transactions. The uncertainty of the remedy in case of default must impede, if not prevent altogether, the entering into new commercial relations between persons residing in different parts of the Empire. The tailor and the dressmaker are conscious of no more than this, that if there is any difficulty as to payment of the bill there is no certainty of speedy recovery of judgment and execution. When the solicitor is consulted the client will be initiated into all the mysteries of "service out of the jurisdiction," and the delays attending the endeavour to get execution of English judgments in the Colonies, especially of judgments by default. If counsel is consulted he will probably give a learned opinion with much reference to the maxim *actor sequitur forum rei*; and the advice will waver between the advisability of suing in the Colony with all its attendant difficulties and expense, and suing in England followed by another suit in the Colony, to obtain execution of the English judgment. If counsel is very learned he will probably point to the manifest difficulty of reconciling the two decisions of the Privy Council in *Ashbury v. Ellis*, and *Sirdar Gurdyal Sing v. the Rajah of Faridkote*, given respectively in 1893 and 1894. Counsel will see a vision rising before his eyes of a leading case in which the whole law of foreign and colonial judgments will be threshed out before the House of Lords. And the tailor and the milliner will ponder these things deeply, and perhaps

wonder what all the talk of "Imperial Unity" means, when so simple a matter as the recovery of money declared to be due by a Court in one part of this great Empire cannot be recovered without so much trouble and uncertainty in another part. There will seem to him to be a hiatus between the promise and the fulfilment. One conclusion he most certainly will come to--that never again will he supply goods to gentlemen in the Colonies without prepayment.

These very homely illustrations will serve, I think, to show that alike in large and small matters the questions involved in the reciprocal execution of judgments in different parts of the Empire has an important bearing on their commercial relations. I am not riding a mere legal hobby once more. I believe it to be an eminently practical question, and I feel certain that if the procedure of the law with regard to it could be made more stable, there would inevitably result a beneficial reaction on the general trade of the Empire. Let me put this question: Is the Judgments Extension Act of 1868, of any use in promoting sound commercial relations between the three Kingdoms of Great Britain? I am certain that the answer must be in the affirmative. At least, it was found expedient to extend the principle of the Act to the judgments of inferior Courts. In order, so to speak, to link up my argument with the one with which I started, the true effect of these two statutes is not to be gauged by the number or judgments registered under them in different parts of the United Kingdom, but rather by the fewness of them. What it is necessary to realise is that they have had a beneficial effect on the general commercial relations of the three kingdoms, by the mere fact that they have rendered the appeal to the law when necessary certain and effective, and, therefore, have induced people to avoid that appeal except as a last resource.

I must now ask my readers to bear with me while I indicate, as shortly as possible, the lines on which the improvement in the matter of executing colonial judgments in Great Britain and throughout the Empire, and, conversely, judgments of the United Kingdom in the Colonies, must proceed.

The present cumbrous proceeding by way of action on the judgment should be abolished, and the principle of registration adopted as in the case of judgments of the United Kingdom under the Judgments Extension Acts.

I may say that this proposal was adopted in principle by the Colonial Conference in 1887, when a draft of a statute, which I had prepared, with the then Lord Chancellor, Lord Halsbury's permission, to form the basis of discussion, was approved.

Order XIV., which has been held to apply to actions on foreign judgments, is insufficient for the purpose, for, in the first place, the expense of issuing the writ and of the subsequent proceedings is far higher than that involved in mere registration; and, secondly

because it opens the door to defences, and the law on the subject of defences to foreign judgments is at the present time in too vague a condition. The two important heads of defence are "fraud" and "absence of jurisdiction." Of these fraud is the most insidious. It should not be recognised in the case of colonial judgments any more than it is recognised under the Judgments Extension Acts. Whatever may be said with regard to the defence in actions on foreign judgments, it can have no bearing in the case of colonial judgments, for there is a remedy in the colonial court where the judgment was given, and there is an appeal to the Privy Council. It has been laid down over and over again that the English Court, in which an action on a foreign judgment is brought is not an appeal court from the foreign court, the remedy being to that court alone, and this applies with additional force to colonial judgments.

The following example will illustrate what is meant by the insidious nature of the defence, and how it makes for delay. One of the last cases I was engaged in before I left for Japan in 1887 was an action on a judgment of the Cape of Good Hope. There had been a submission to arbitration; both parties had appeared, the award had been given and made an order of court. On the application for judgment under Order XIV. fraud was set up, and the defendant obtained leave to defend, the Divisional Court declining to take into consideration the fact that the judgment was of a colonial court. The defence involved a commission to the Cape, and, of course, great delay. In the spring of 1891, when I returned to England, the first brief on my table was in the trial of this same action, and when it came on judgment was obtained by consent. Comment on a procedure which allows such delay is superfluous.

The question of jurisdiction must be dealt with in another way. The subject is more than intricate, and I do not propose to discuss it in all its varied aspects, but must be content to state certain principles which I believe to be sound, leaving their discussion for another place.

I adopt Lord Esher's opinion (when Brett J.) in *Jackson v. Spittal*, that it is essential, in the interests of commerce, that there should be a procedure for reaching absent defendants in certain circumstances. I adopt also the opinion expressed by the Privy Council in *Ashbury v. Ellis* in the same sense, that it is within the powers of a colonial legislature to pass such laws, as being included in the phrase "peace, order and good government" of a colony. And I respectfully demur to the contrary opinion of the same tribunal in the *Rajah of Faridkote's* case.

I further believe that these opinions warrant Parliament in departing from the traditional doctrine expressed by the maxim *actor sequitur forum rei*, which was so forcibly adhered to in the last mentioned case.

I admit the argument, for the sake of this argument, that the inevitable fact that the details of this procedure, both with regard to the cases in which it is allowed, and the manner in which it is executed, vary in different Colonies, render it impossible for judgments by default given in actions begun against absent defendants to be executed in England. But I maintain that it is preposterous that in so important a matter the law of the Mother country and of her Colonies should so differ as to produce so disastrous a result to commerce.

I believe that it would not be impossible to arrive at an understanding as to the details of the procedure on the subject; for already many of the Colonies have adopted the English practice. I believe, therefore, that a uniform code for the Empire could be settled. Not the least curious part of the matter is that the procedure in some of the Colonies is based on the Common Law Procedure Act or the Rules of Court of 1875, which have been superseded by the Rules of 1883.

With the recognition of this code by the Imperial Parliament it would cease to be an extraordinary procedure, but would become effective; and its adoption would have this important result, that it would import an obligation on the absent defendant to appear, or to suffer judgment by default. From this it would follow that judgments by default given in actions begun according to this procedure would be included in the operation of the statute, and execution on them could be speedily obtained.

There are, of course, innumerable other details which would require discussion and settlement, but the broad lines I have indicated once settled, the others would follow as a matter of course.

I believe that, with a certain amount of *bonne volonté* on all sides, it would be possible to achieve what I have indicated, and that the resolutions of the Colonial Conference of 1887 could thus be put in force. If it were done, it could not fail to produce an appreciable effect on the commercial relations of the Colonies with the Mother country. It certainly would be a tangible link in the chain of Imperial Unity.

HONG KONG.

POSTSCRIPT.—The following are important periods in the official dealing with the subject, in which I have taken part.

In 1887, I drafted a bill for the execution of Colonial Judgments, which Lord Halsbury, then Lord Chancellor, agreed should be submitted to the Colonial Conference. It was discussed at two or three sittings of the Conference, and the principle of the bill was agreed to.

During the same year the larger question of the execution of

foreign judgments was under consideration of the Foreign Office. A draft convention with Italy was prepared, and a preliminary agreement as to the terms of a possible arrangement with that country was come to at Rome. Italy had at that time been making proposals to the Powers for a conference on the subject, and it was hoped that this draft convention would serve as a basis for discussion at the Conference, should it ultimately be agreed to. The Colonies were, of course, included in the scope of the convention, and had it been agreed to, the question of the mutual execution of judgments between the Colonies and the Mother country would have been dealt with separately.

In 1899, an ordinance was passed by the Legislature of Mauritius (No. 42 of 1899), dealing with the question of the enforcement of foreign and colonial judgments in that colony. This Ordinance was disallowed, if I may say so, quite properly; on the broad ground that the subject was not one which could properly be dealt with by one colony. The Bill of 1887 and the Ordinance of 1899 differed widely in the method of dealing with this question. The Bill was based on the same principle as the Judgments Extension Acts of the United Kingdom, which apply to English, Scotch and Irish judgments. This ordinance treated colonial judgments on the same footing as foreign judgments. I think there can be little doubt that this last method is the more correct of the two, for the following reasons.

It is probable, according to Story (Conflict of Laws, § 551), that the judgments of the Roman courts were executable as of course throughout the Roman empire. It is a fact that French and German judgments are executed *de plein droit* in the colonies of these countries respectively. But the constitutional system on which the British empire is based—and which in the application of its cardinal principle is the same for Hong Kong, Mauritius, the Commonwealth of Australia, or the Dominion of Canada—I think requires that the question should be looked at from a different standpoint. Subject to the rule of precedent the courts in the smallest as well as the largest colony are independent of the courts of the Mother country, they are, strictly speaking, “foreign” to those courts, and some of them administer an actually foreign law. This principle is in harmony with the great spirit of independence of all its parts which pervades the Empire. If, then, it were possible to determine a code dealing scientifically with foreign judgments generally, I think that it should be applicable to colonial judgments. I do not think this is so hopeless a task as some seem to think; but perhaps we are still a long way off from a second endeavour being made to settle the question. But the question as it affects the Colonies is not only easier of solution but lies more within our grasp. Some of the problems do not bristle with difficulties as in the case of judgments coming from foreign courts. I think the principle of the Judgment Extension Acts is hardly

sufficient for the purpose. We want to get farther back. It ought not to be a very difficult task to establish once and for all a code for the Empire for service out of the jurisdiction. And when once this is established the recognition of judgments is robbed of half its difficulty. And then, these two questions finally settled, intercolonial commerce would have the same benefit of legal sanctions as home commerce, with, I have little doubt, most beneficial results. I am disposed to think that the present state of the question is hardly realised. At the risk of reiteration I venture to state it once more. A judgment in a colonial court against a non-resident Englishman may be upheld on the question of jurisdiction by the Privy Council (as in *Ashbury v. Ellis*, 1893, A.C. 339); the only means of enforcing it would be by action in England, and (as in *Turnbull v. Walker*, 77, L. T. 667) it would not be enforced; and if the principles established in *Gurdayal Sing v. Rajah Faridkote* (1894, A.C. 670) are accepted, the decision would be upheld by the House of Lords. This can hardly be said to be a scientific method of dealing with an important Imperial question.

## NOTES ON WEST INDIAN FEDERATION.

By R. H. McCARTHY, C.M.G.

THE April issue of the COLONIAL OFFICE JOURNAL contains an article on the Future of the West Indies, in which confederation is discussed, and this part of the subject is also touched upon by the Editors. An old and interesting part of the Empire, the West Indies collectively display an absence of that vitality which is as conspicuous elsewhere in the British Dominions. From time to time palliatives have been administered, but the disease is deep-rooted, and there is a growing feeling that more drastic remedies are needed if these Colonies are to become prosperous, or to be rendered able to work out their own salvation.

Last year in the *Fortnightly Review* a writer signing himself "Imperialist," proposed to exchange the West Indies for the Phillipines. The proposal exhibited more boldness than wisdom, and was very effectively dealt with by Mr. Norman Lamont, M.P., in the *Contemporary*, and it is here only referred to as showing the lengths to which some thinkers go in search of an effective cure. The remedy most usually dwelt upon, and the most obviously reasonable, is the union of these Colonies either by unification or confederation. The home authorities have encouraged movements in that direction, but so far the only result has been the federation of the Leeward Islands. It is to be feared that one consequence of this step has been to discredit the idea of federation. With an area of 704 square miles, a population of 130,000, and a total revenue of £120,000, this little group was given five executive and five legislative councils, with 47 and 73 members respectively, while each port continued to levy customs duties on imports from the other ports. Unification would apparently have been more appropriate in this case than federation, whose machinery is unsuited to units so small. The JOURNAL article already referred to advocates union over a larger area, while regarding the confederation of the whole of the West Indies as impracticable. This makes the question one of

degree, but it is not quite easy to prove that while union over, say, a line of 500 miles is advisable, it would be unworkable over a line of 1,000, or even 1,500. In passing, the author's suggestion may be noted that even the governors of Colonies outside the confederation with members of their staffs, should be invited to general conferences with the authorities of the federated Colonies. This suggestion seems to weaken somewhat the argument against a wider federation, as it implies the existence of common interests.

The present writer would welcome the confederation of Barbados, the Windward, and the Leeward Islands as a step in the right direction. However, while admitting that there are difficulties attending a larger scheme (about most things worth doing there are difficulties), he is satisfied that they are not insuperable; and as a contribution to the discussion he will examine, necessarily very briefly, the objections most commonly urged. These are:—

1. *Mutual remoteness, lack of means of communication, and diversity of laws, races and interests.*

2. *Consequent difficulties of administration, conspicuously with reference to inspection by Governor, or Governor-General. Alleged to be easier practically to govern from London.*

3. *Disinclination on the part of the West Indies, with which the initiative rests. Difference in resources and unfairness of partnership to the more prosperous.*

4. *Absence of advantages.*

*Distance; communication; and diversity.*—The Australian Commonwealth measures approximately 2,700 miles by 2,000, and Canada covers from east to west over 3,000 miles, but the remoteness of the various parts has not prevented confederation. In these cases land forms the barrier of distance, and in that of the West Indies, water, a difference entirely in favour of the West Indies, though the fact is not always realized. When you have at immense expense spanned a continent with a railway, you have only rendered accessible a strip on either side, while on the sea you already have an easy road in whatever direction the head of a vessel is turned. Were the Atlantic land instead of water, probably the West Indies would still await their discoverer. Take a local illustration. Practically, as regards ease, speed, or cheapness of transit, is not the capital of British Guiana nearer to Jamaica than to her own interior, say 300 miles away?

It is true that means of inter-communication both by steamer and by telegraph are defective, and urgently call for improvement. If a reform be instituted which is needed in any case, the present defects will cease to be an argument against federation. On the

other hand, had the West Indies a single authority and a joint purse these defects would beyond any reasonable doubt be speedily removed.

Assimilation of laws would be useful, and would probably take place by degrees were the Colonies under one legislature, but it is not absolutely necessary. Even now the laws of England, Ireland, and Scotland present many discrepancies.

The alleged diversity of interests is purely imaginary. There is more of such diversity in any one English county than there is throughout the whole of the West Indies, which are—broadly speaking, of course—purely agricultural, and with no greater variety of products than may be found on a single English farm.

Racial diversity is an equally fanciful difficulty. Trinidad alone has as varied an assortment of races as have the West Indies collectively.

*Difficulties of administration.*—Surely too much stress is laid on frequent visits by a Governor (why "Governor-General"?) Is there any large state or dependency whose every part is frequently visited by its head?

How often does the Governor-General of Canada visit Vancouver, or even Winnipeg? or the Viceroy of India ten per cent. of the cities in his charge? One is tempted to ask a similar question respecting the Governors of Jamaica, Trinidad and British Guiana. During a recent tour Sir Henry McCallum was told by the inhabitants of an important district in Ceylon that they had not seen a Governor for 25 or 30 years. It is suggested that except for perhaps an annual tour, occupying a month or so, the Governor of the West Indies would be better employed at head-quarters, leaving inspection to his officers. With a special steamer, preferably a man-of-war, he would be actually at sea about ten days.

Governing the West Indies from London and government from a local centre have scarcely a feature in common. Even if the Secretary of State had such a body of advisers as the Indian Council, that is to say of men who had spent many years on the spot, and were familiar with local circumstances, there would still be a very material difference. Government by cable has its disadvantages, and in practice a distance of 4,000 miles is a factor of some importance. A governor stationed in, suppose, Barbados, would be fairly near any part of the West Indies, and could within three days reach any Colony. Meanwhile, he would have at his side officers possessing an intimate knowledge of every Colony.

*West Indian disinclination or indifference.*—Bearing in mind the number of separate governments in the West Indies, and the arguments based on the remoteness and difficulties of communication, it seems unreasonable to expect these small communities to take the

initiative in a movement as important and whose details are necessarily complicated. It will also be remembered that West Indians have long been struggling with economic troubles, with the heart-sickness engendered by hopes deferred. Nor must it be forgotten that the Crown Colony system of government, whatever be its merits, and however necessary it may be in the West Indies, does not encourage initiative.

An objection commonly urged in the West Indies is based on the relative poverty of some of the Colonies. "Why should we be linked with a miserable island like ——?" is a natural question. However, everything depends on the financial arrangements made. It would be possible to keep the purses separate, each Colony making a contribution to the Federal exchequer. That is not to be recommended, and in the opinion of the writer the best means of meeting this difficulty is by what may be called a wedding gift from the Mother country on the occasion of the happy union. What direction this should take there is no need to discuss. It might take that of wiping out certain debts, or of a contribution towards setting up house; whatever its direction, it might be made to serve the purpose of removing glaring inequalities. The expectation of such a gift is not unwarranted. These Colonies have contributed largely to the wealth of great Britain in the past; now that many of them have fallen on evil times they have a claim to assistance. There is a more material reason. Looking back over the long list of grants and subsidies to the West Indies, it evidently would be well worth the while of Great Britain to contribute handsomely towards an arrangement calculated to put a stop to the stream of doles, and to diminish her responsibility for the poorer members of the group.

*Absence of Advantage.*—This point could not be discussed adequately except at considerable length, and here the benefits which might be expected will only be briefly indicated.

What has led to the development of the family into the tribe and thence into the nation? What prompted confederation in Canada and Australia, and is going to bring it about in South Africa? The knowledge that union is strength. In contiguous communities like those of the West Indies, mainly of the same race, with histories very similar, subject to the same economic conditions, and free from commercial rivalry, it must be obvious that Customs barriers, differences in laws, separate administrations and separate treasuries mean loss and inconvenience and, in external affairs, weakness. How little is known in Britain of the West Indies, and how little attention their affairs receive from the public! For weeks together these Colonies are unmentioned in the London Press. The fact must be recognised that the West Indies do not fill a large space in the public eye. Compared with other possessions, they are small and poor. Excluding British Guiana and the Bahamas, their total

area is 7,500 square miles. That of the comparatively insignificant Gold Coast Colony is 40,000, of Northern Nigeria 310,000, and of Australia nearly three million square miles. These possessions appeal more strongly to the investing public, and touch more forcibly the pride and the imagination of the masses than do small Colonies which, whatever their past, are now best known by their misfortunes. The combined West Indies, though still relatively small, would have more weight than they have now, and the existence of a common treasury, by enabling them to help one another and to dispense with Imperial doles, would cause them to be held in more respect by the materially minded, and would at the same time improve their credit.

The best thing done for the West Indies during the past fifty years has been the establishment of the Imperial Department of Agriculture. That Department derives strength from its centralised character, but at the same time its independence of local authority is a source of weakness. Similar work would undoubtedly be carried on, and under more favourable conditions, by a federal government. Science has, speaking generally, overlooked the West Indies, because the separate Colonies cannot afford such a luxury. Education, defence, communications—these are only some of the many matters for efficiently dealing with which a central authority and a joint treasury are necessary. It is said that much might be done by conferences. These have an educational value, but they are necessarily only advisory, and confined to one subject, and they could not be a substitute for a central legislature and executive.

If it were possible to calculate the total cost to the West Indies of the barriers they erect against one another by customs tariffs and quarantine restrictions, it would be universally admitted to be appalling. If delay and expense be inflicted on your carriers, and obstacles be thrown in the way of your traders, sooner or later you pay for it in one form or another. Lately, on the initiative of the Colonial Office, quarantine law and practice, both of them discreditable to British communities, were amended, and, it was hoped, made uniform. A great deal of discretionary power, however, was left to the different health officers, with the result that the degree of loyalty and intelligence with which the law is now administered varies very considerably, and in the absence of central executive control uniformity shows an irresistible tendency to disappear, and with it much of the value of reform.

Though the average rate of pay in the West Indian Public Service is considerably below that of public departments at home, in spite of the lower cost of living in Britain, and very many of the officers are miserably underpaid, the total cost of administration is out of all proportion to the resources of these Colonies. This fact is mainly due to the number of separate governments, each with its crowd of small separate departments. Not only governors, but

other officers with high-sounding titles, are by far too numerous, and to a great extent they are necessarily employed on work which might well be committed to cheaper men, were there more centralisation, with an efficient system of supervision. One result of federation would be a great reduction in the number of these high officials.

The writer, however, lays less stress on economy than on the increased efficiency which might be expected. The want of uniformity in the conditions of service precludes the free movement of officers between the Colonies. In one colony no pension is payable unless a man has served in it for ten years; in another an officer is compelled to contribute to his own pension; scales of salary vary, not with the volume or nature of the work, but with the financial position of the respective colonies; and the policy, explicable but disastrous, of regarding recruits from outside as trespassers, prevails almost throughout the West Indies. Some years ago, in the course of a Parliamentary enquiry, attention was called to the large sums spent by certain departments. At home, on the removal of officers, it was explained that the money was considered to be well spent in keeping men fresh and broadening their experience. A similar policy might be adopted, with immense advantage, in the West Indies, the drawbacks attending the retention of a public officer in one small community for many years, especially if he be a native of the place, being very grave. A Public Service, properly paid and graded, such as is found for the Eastern Colonies by open competition, would be by far more efficient, and probably, in the end, by far cheaper than is the present service. The formation of such a service, which is practically impossible in present circumstances, would be one of the most striking benefits likely to accrue through federation.

Other advantages might be anticipated from confederation, but the writer thinks that the case for union rests securely on the following: Increased ability to develop resources and to meet passing difficulties by means of a central authority and a common exchequer; increased intercourse and trade through the abolition of customs barriers; more liberal quarantine administration; improved means of steam and telegraphic communication; the growth of a more progressive spirit and of wider views in legislation; greater administrative efficiency, and probably economy, by the consolidation of establishments; more influence in England and elsewhere in advancing West Indian interests; and improvement of West Indian credit by mutual assistance and independence of help from outside.

## GOLD COAST RAILWAYS AND HARBOUR WORKS.

IN such a country as the Gold Coast the first question of railway policy is whether the lines to be constructed should radiate from one port, or should run, more or less, perpendicularly from different points on the coast into the interior. Ten years ago the former plan was contemplated. The idea was to make Accra the starting point, and the first line contemplated was one from Accra to Kpong, a place on the Volta River. This railway would take up the transport of goods brought down the river, at a point above some difficult rapids and shoals.

The other plan has, however, so far prevailed. The sea is the main line of communication, and it is believed that the most economical results will be effected by connecting the coast towns with the various planting and mining centres, at as many points as possible, by means of roads, rivers and railways. It would be different if there was any natural harbour on the coast. But there is none, and it would be a very expensive matter to convert Accra into a commodious harbour. The making of the Sekondi railway to Kumasi went far to settle the policy. The railway was urgently wanted, and for a special purpose, and the mining companies gave the Government a guarantee to get it. It was out of the question under the circumstances to continue this line along the coast to Accra, and, even if it had been clear that such a work would be remunerative, it would have been obviously wasteful to carry goods over the additional distance from the eastern side. While, however, there was a good case for allowing that side to have its own system, it may be urged that the multiplication of bases is costly and inconvenient, and that the advantages of converging any future lines upon Accra are considerable. The organisation of a separate base in each case is expensive at the outset, and necessitates a separate staff and workshops. A reduction of the customs and other Government staff would also be possible by concentrating the trade. The increase of business at Accra would, no doubt, lead in time to the construction of a harbour, such as has been long talked of; but if imports and

exports are spread all over the coast, the case for any large expenditure at any one point is weakened and any project of great improvement remains in the domain of pious aspirations. Another point well worth consideration is that the construction of a harbour would invite many steamers, which, under present conditions, are quite unable to load or discharge cargo along the coast, and that, therefore, the railway policy, if moulded to that end, would greatly increase facilities.

The Kpong project has been given up, at all events for the present, as it has been found that another direction to the interior is more promising. An alternative scheme has been under consideration and has recently been sanctioned by the Secretary of State. This is for a railway from Accra to Mangoase.

The line would pass through twenty-one villages, near most of which there are cultivated tracts, but good land is not reached till about six miles before Mangoase; at this point plantations of cocoa, yam and plantains begin and extend for four miles beyond Mangoase. Mangoase lies in the Densu valley—that is, in the valley of a river which flows to the sea near Accra. This position is in itself some indication that the engineering difficulties will not be great, and a survey has made this clear. Nearly all the food supplies of Accra come from places on the route. The unofficial members of the Legislative Chamber were unanimously in favour of the route selected. The distance between Accra and Mangoase is about 35 miles.

The tract has been staked out on a gradient of 1 in 80. The need for the line has become pressing largely in consequence of the great increase in the export of cocoa, an article which it is difficult to transport in any other manner, and it is anticipated that it will prove remunerative at once. It is an important consideration that a large number of natives were engaged in carrying will be rendered available for other purposes by the construction of such a line.

An interesting feature of the scheme is that the Secretary of State has decided to invite tenders for the construction of the railway. Hitherto the railways on the West Coast, and generally in the other Crown colonies, have been constructed by the Colonial Governments; but many schemes have been put forward by contractors, and there is a considerable volume of opinion in the commercial world that a contractor would do the work in such cases more cheaply and expeditiously than a Government department. There can be no doubt that a contractor who has undertaken to lay a line for a stated sum, and in a stated time, under penalties for failure, has a greater incentive to be economical and speedy than Government officials have, and probably under his control there would be less wastage in some ways. On the other hand the contractor lays himself out to make a profit and does the work as cheaply as is

possible; he is not particularly concerned with the question of the permanency of the construction, so long as he complies with the letter of the specification. The result has been in some cases that a railway built by contract has soon had to bear a heavy expense for repairs and renewals, and the financial position is in the long run worse than if it had been built more laboriously and at a greater cost. If the specification could provide for everything in detail, this objection could be met, but in a rough and new country it is impossible to foresee everything. Much of course depends on the character and position of the firm, and the great resources and experience of the big contractors are considerations of the first importance. The Colonial Office have long thought of trying the experiment; the occasion has now come, and the result will be watched with deep interest. The advertisements were issued about 10th June and tenders may be sent in till 10th September.

Much of the belief that a contract system would work well comes from the fact that the contractor binds himself to do the work under a penalty if he does not do it; in other words he is a responsible party from whom compensation is obtainable if things go wrong. On the other hand, under the departmental system, neither the public works office or special staff which carries out the work on the spot, nor the consulting engineer who advises from home, have any pecuniary liability. If a mistake is made, or the estimates of money or time exceeded, there is no redress, except the inadequate one of dismissing somebody. The unofficial world naturally enough views such a position with dissatisfaction. It may be—and generally is—the case that the contractor in like circumstances would plead some excuse successfully; contractor's delays are many and fines are few; but at any rate he is liable, and it is an act of grace to let him off. This power to deal with the case on its merits makes all the difference in the feeling with which the case is regarded.

There is no doubt an advantage in resorting to contractors of good repute for works which can be fully specified and carefully inspected. A harbour or a pier is a work of this class. A railway is a much more doubtful matter, and general experience points to construction by Government. But, whenever the work is done by Government, the above considerations show that it is important that the responsibility should be definitely allocated. The object to be aimed at is, we would suggest, that the general responsibility should be taken by the Colonial Government, and that the Consulting Engineer should only be referred to on purely technical matters.

The construction of a deep water harbour, capable of giving shelter to ocean going ships, is practically out of the question on the Gold Coast, and all that can be arrived at under present circumstances is the making of landing facilities which will afford secure shelter and berthage for barges and other craft not drawing more

than five feet of water. The present method of landing and shipping cargo by means of surf boats is both crude and expensive, and it would be impossible to land in this way the heavy material required for a railway.

The work which has been commenced at Accra consists of the construction of a breakwater 800 feet in length and 30 feet in width, running partly over a reef of rocks, and of a jetty under the lee of this work, 270 feet in length and 52 feet in width, from which the rails would start. The depth alongside will be sufficient for surf boats. The work now in progress was decided upon in October, 1905. It was found that the stone near the works was not suitable for making blocks, and it was necessary to open a quarry three miles away and to build a railway to it. The retaining wall for the railway has been built to the point where the breakwater proper begins with blockwork, and the work of setting the blocks commenced last summer. To make the scheme complete it would be desirable to make the jetties and increase the length of the breakwater to 900 feet, on this basis the estimated cost is £185,000.

At Cape Coast there is a reef of rocks running south-easterly, which affords considerable protection from the surf, and it would be fairly easy to construct a concrete breakwater 470 feet long, and a pier 150 feet long by 30 feet wide, inside the protected area. The cost of these works has been estimated at £21,500. The country behind the town is densely populated and used to produce considerable trade, equal in fact to that of Accra, but the Sekondi railway has lately diverted a great part of the traffic from the Northern Territories through Kumasi, and the trade has fallen off considerably.

At Sekondi there are two iron jetties put up by the railway department, but it is necessary to enlarge the quay room. The great increase in the timber trade has caused the want of space to be severely felt, and as agricultural industries increase a much larger area than is now available will be required. In the last two years the railway freight rose from £130,000 to £170,000, and that of 1907 will probably reach £200,000. As an instance of the development which has taken place since the construction of the railway, we may mention that in 1898 the African mail steamers called as required five or six times a year, while in 1906 as many as 426 steamers used the port. A new jetty has just been completed, and a scheme has been approved for the prolongation of the railway to the customs warehouse, for the construction of a breakwater, 750 feet long, and of a new jetty, 255 feet long, and for the extension of the railway quay on the north side of the harbour for stacking timber. The breakwater would run from the southern margin of the bay in a north-easterly direction, and is estimated to cost £82,000. A reclamation of  $2\frac{1}{2}$  acres is contemplated.

## FERRO-CONCRETE BUILDINGS IN COUNTRIES SUBJECT TO EARTHQUAKES

By J. S. E. DE VESIAN, M.Inst.C.E., M.I.M.E.

THE appalling loss of life which follows any serious convulsion of nature, must render doubly welcome any suggestion made to adopt a form of construction calculated to lessen the fearful holocaust and wide-spread devastation and misery inseparable as the result of seismic disturbances.

The most recent of the earthquakes, resulting in great loss of life and damage to property, occurred at San Francisco, in April, 1906, and in Jamaica, in January, 1907.

At Kingston, Jamaica, the number of deaths resulting from the shock and from consequent fires which broke out in various parts of that city, have been variously estimated at from 1,200 to 1,500. In the official report included in the correspondence presented to Parliament the following passage occurs:—"It is not too much to say that there is not one single brick-built house remaining intact in the whole Town and very few that are not, more or less, completely wrecked."

Buildings of the ordinary type of construction, whether of steel, iron, stone, brick or wood, have not withstood the shocks of an earthquake, and when one considers the enormous loss of life caused through the sudden destruction of buildings alone, any suggestions made with the view to lessening such loss, or probably obviating it altogether, should command the serious attention of every member of the community.

Ferro-concrete is so essentially a modern type of construction (it has only come into general use during the last thirteen years), that, with one exception, no recorded instance can be given of the effect which a serious earthquake shock has on buildings entirely constructed on ferro-concrete principles. One is, therefore, driven to the conclusion that at the best it is only possible to theorise the result which tremors of the earth surface would have on ferro-concrete edifices.

But while one has of necessity to deduce conclusions which can only be partially substantiated by actual experience, it must be borne in mind that many, and probably the majority of inventions and systems have been but the outcome of theories arrived at by the

embodying of known facts. And it is by the embodying of known results as to the construction of concrete and steel during the past decade that leads the writer of this paper to advocate the use of ferro-concrete buildings in those parts of the world that are subject to periodical visitations of earth convulsions or, what has been described as "nature's death toll on suffering humanity."

There are, of course, a number of so-called reinforced concrete methods of construction, but the writer is only concerned to show in this paper the advantages of a building of monolithic character, which, in his opinion, is the keystone to its adaptability for successfully resisting earth shocks.

But to obtain this monolithic result, the strictest observance and adherence to the principles governing the production of ferro-concrete must be adhered to. It is this rigid adherence to known rules that has led the various departments of H.M. Government, and the principal Public Bodies and Corporations throughout the United Kingdom as well as some of the Dependencies abroad, to adopt the monolithic system which the writer has the honour of being actively associated with—that known as the Mouchel-Hennebique system of ferro-concrete.

Briefly stated, ferro-concrete or reinforced concrete is a combination of concrete and steel, in which the steel takes the tension stresses and the concrete the compression. It may rightly be termed a new material conforming to laws of its own. For instance, if a beam of concrete alone will extend under tension for, say one-tenth of an inch, a similar beam reinforced properly with steel will extend one inch, or ten times as much, without showing signs of cracking or distress. The more the steel can be sub-divided throughout the tension area of the concrete the better, or, in other words, small round bars are preferable to rolled sections of considerable area. By the suitable employment of such bars, the designer is enabled to secure monolithic construction, in which all parts are connected absolutely without joints, and the reinforcement extends throughout the concrete, imparting the necessary resistance to tensile and other stresses to individual members, and by passing from one member to another the bars perform a most valuable duty by helping to distribute the forces over the different parts of the structure.

It is in a thorough comprehension and understanding of the foregoing—though necessarily brief—formula, that one arrives at the conclusion of the great safety factor given by the employment of ferro-concrete. Of course, proper discernment must be shown in the selection of the steel most suitable for the reinforcement, the quality of the Portland cement, and the sand used in the-mixing of the concrete, the aggregates for the concrete, and the proportions of the materials, &c., to be mixed.

GRAIN ELEVATOR, TUNIS.—FIG. 1.

GRAIN ELEVATOR, TUNIS.—FIG. 2.

## Ferro-Concrete Buildings in Earthquakes. 49

Before enlarging on the style of structure which the writer thinks the most suitable, it will be of great interest to cite two instances where ferro-concrete buildings have been subjected to movements of the ground, although in one case only was the movement attributable to earthquake shock.

The first showed the inherent strength and wonderful tenacity in ferro-concrete, and occurred at Tunis. Two Grain Elevators had been erected, but, owing to the unstable character of the soil and consequent unequal settlement, the two outside buildings tipped as a whole away from the central structure, until in one case an angle of 25 degrees from the vertical was reached, it being nearly 12 feet out of plumb. Both buildings were returned to a vertical position by loading the elevated sides with sand, and at the same time making excavations along the foundations on the same side. Throughout this severe test the buildings remained whole and uninjured.

Photograph No. 1 illustrates the angle at which the buildings inclined, and supports the writer's theory that a monolithic building properly constructed can reasonably hope to escape damage from the shock of an earthquake.

Photograph No. 2 gives the interior view of one of the inclined buildings, showing the method used in bringing them to a vertical position; the plumb line at the left conveys some idea of the extent to which the building leaned over. It will be observed that not one of the panes of glass shown in the photo was damaged. A building constructed under ordinary conditions would, in all probability, have totally collapsed.

The second instance is that of ferro-concrete buildings in the district of Calabria, in the south of Italy. Calabria is situated two degrees of latitude nearer the Equator than that of Mount Vesuvius, and is subject to earth tremors every year. These earth shocks, although at times severe, have not hitherto been of a very serious nature, nor can they be compared to the disastrous earthquakes already mentioned, yet it is important to note that no damage of any kind whatever has been done to any of the ferro-concrete buildings in the Calabrian district.

Passing now to the details of the buildings which the writer recommends should be erected in localities subject to earthquakes, it may be stated that these details are arrived at after serious deliberation and after a careful research and study of the reports made by public bodies and various authorities on the earthquakes at San Francisco and Jamaica above referred to.

The following two typical illustrations of ferro-concrete buildings suitable for resisting movements of the ground on which they are built will exemplify the ease with which this system of construction can be adapted for the purpose.

The building at Quayside, Newcastle-on-Tyne, illustrated in Figs. 3 and 4 was erected several years ago for the Co-operative Wholesale Society of Newcastle on ground which had been condemned as unfit for such a heavy building, as borings showed there were some 60 feet or 70 feet of peat slush. It was decided to erect a ferro-concrete building on a general sill as being the only possible means of using the site for the purpose for which it was required.

This building consists of eight floors calculated and used for 6 cwts. per square foot superload, exclusive of the weight of the floor itself. The foundation consists of practically a ferro-concrete floor with beams designed to resist a reaction of the ground of 23 tons per square yard. This sill or floor spreads the load evenly over the ground, and being one with the building itself, which is without joints from foundation to roof, a structure is formed like a hollow casting, which could be tipped in any direction by a subsidence of the ground without injury. The water level in the ground being above the foundation slab, the basement becomes a ferro-concrete reservoir, watertight without the use of asphalt.

Fig. 5 illustrates the Submarine Store erected at Woolwich for the War Office, which is also of monolithic construction and built upon a general sill much in the same manner as the foregoing.

In districts subject to earthquake the height of the buildings should be somewhat limited, so as not to exceed a certain low multiple of the base. Moreover, it is important to note that in ferro-concrete buildings a definite lateral stability must be furnished, with less reliance upon the indefinite internal rigidity of the finished structure.

Much evidence, fully supporting the writer's contention, could be taken from the official reports made by the various authorities on the San Francisco and Jamaica earthquakes, proving the enormous advantage ferro-concrete buildings possess in withstanding earth shocks, but the following may be taken as illustrating the great resistive power of such buildings over those of ordinary construction.

In the Report of the San Francisco earthquake, undertaken by a Committee of the San Francisco Association of Members of the American Society of Civil Engineers, it was stated that geologists pronounced the opinion that the upheaval was due to the relief of accumulating stresses in the earth's crust along a previously known fault plane. From the ruins of the buildings the engineers inferred that a building designed to withstand a wind pressure of 30 lb. per square foot, and equipped with bracing necessary to prevent distortion under that pressure, would withstand a shock equal to that in violence which threw down lofty structures in that city.

Repeated public tests have shown that a properly constructed ferro-concrete building can withstand a very much greater pressure than

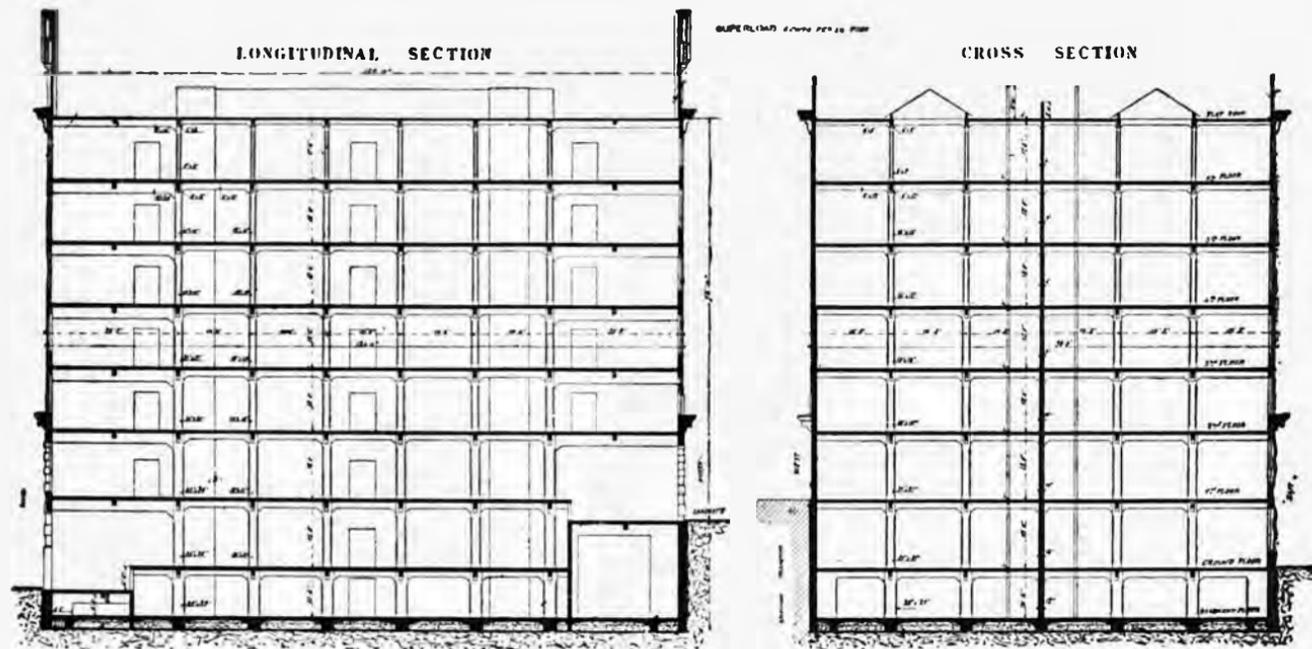

FIG. 3.

## Ferro-Concrete Buildings in Earthquakes. 51

30 lb. per square foot. The grain elevators at Tunis above referred to proved that no distortion could occur. Again in a report on the conflagration consequent on the San Francisco earthquake, prepared by the Engineers to the National Board of Fire Underwriters, it was stated that reinforced concrete arched floors had stood the test of the fire; they were thus entirely unaffected by either earthquake shocks or heat.

The result of investigations made subsequently to the San Francisco conflagration, by the California Promotion Committee, further supports the writer's contention. It is well known, for example, that the Museum at Stanford University was built 17 years ago of reinforced concrete, being the first building of its kind in California. As compared with our modern methods it was a very crude example of reinforced concrete construction. Nevertheless, it stood the earthquake admirably, the marble statuary in the interior was toppled over and broken and the pictures damaged, but the building sustained no damage, not even being cracked in the slightest extent. The girl's dormitory was also of concrete construction except in the roof. The roof was badly damaged, but the remainder of the building was only slightly injured.

The *Speaker* in its issue of the 22nd September, 1906, stated that the Chairman of the Associated Portland Cement Manufacturers had announced in his recent speech that "from photographs of the recent disaster in San Francisco practically no buildings were saved except those erected with cement and steel."

The result of observations made by eminent seismologists upon buildings damaged by earthquake shocks reveal the fact that cracks or fissures made by such shocks are either lateral in direction or oblique. Lateral cracks occur where the upheaval of the earth's crust has been in a horizontal direction, the fissures made passing from left to right or from front to back of the building, those in an oblique direction show that the movements of the earth's crust took a circular direction, causing fissures in the building of an oblique or wavy character. The latter is far the more dangerous, as the structural character of the building is fatally affected, causing the walls to fall and thereby entailing great loss of life. It may be of interest to note that, in connection with these two forms of fissure, seismologists are able to locate the centre of the disturbance.

The sketches given of the buildings constructed in ferro-concrete show that, in either case, whether the movements of the earth take a horizontal direction, or are oblique or circular in direction, no damage to ferro-concrete-constructed buildings can result.

Briefly summarised, the result may be likened to that of a well-formed ocean-going vessel, which, rising and falling with the action of the storm waves, receives no injury, and on the subsidence of the movements of the waves, remains intact. Similarly uninjured would

ferro-concrete structures remain, due to the jointless or monolithic character of their construction.

In conclusion, it may not be amiss to quote the opinion of the Board of Underwriters, a thoroughly representative body in New York, who made exhaustive investigation after the San Francisco earthquake and conflagration.

EXTRACT FROM *New York Times*, DATED 30TH JUNE, 1907.

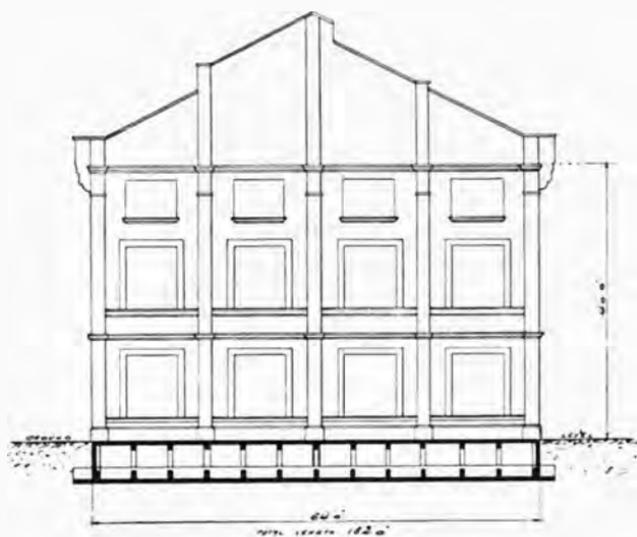

“A special committee appointed by the Board of Underwriters has been investigating for a considerable period the general subject of cement and concrete as used in various types of buildings, with the view of determining their value as fire-resisting material, and to formulate a standard specification for their use which should be both safe and commercially practicable. Experiences of the last year or so, particularly those in the fire following the San Francisco earthquake, have added materially to the knowledge of these materials as fire-resisting agents, and figure largely in the results of the investigation as reported to the underwriters.

“Among the three general features upon which the committee lays special emphasis, that of the design of reinforcement is taken up first.

“*We would call attention to a point omitted in the specification,*’ says the report, ‘namely, that the design of such buildings should be undertaken only by engineers of special training and experience along this line. Some of the alluring advertisements of patent systems of reinforcement may seem to indicate that the erection of a building using some particular design is easy, and does not require much experience, but the fact is, there are many intricate questions which cannot be solved by the aid of advertising text books or stereotyped specifications, and we would urge that the design of a building of this type should only be entrusted to trained engineers of recognised ability in this particular direction, just as would be the case if a steel-frame building or bridge of equal importance was under consideration.’”

 SUBMARINE STORE, WOOLWICH.—FIG. 5.

## COLONIAL STAMPS.

IN our last number we endeavoured to explain how it happened occasionally that colonial postmasters issued surcharged stamps—the explanation being simply that sometimes a particular stamp finds favour with philatelists and the stock is rapidly exhausted; some other available stock is then surcharged. This explanation has been severely assailed in *Truth*, which contends that no stock of any particular stamp should ever be exhausted, and that the postmaster should in his estimate allow for all contingencies, and should be muloted himself if his stock runs out. *Truth* adds the almost inevitable remark that the permanent officials, in this case the editors of this journal, show themselves more sympathetic towards official abuse than concerned for the public interest. We must admit that we did not realise that the public interest was particularly affected. We were not passing judgment on any specific case, but simply stating facts which occur in different places from time to time, with the object of showing that surcharging could come about in a natural way, and without any intention of manipulating issues for profit. As to the suggestion that in all cases a supply should be stocked large enough to meet all requirements, we would point out that, when once a particular issue has attracted the attention of collectors, it is impossible to say how far the demand will go; if, on the other hand, the demand is normal, the large stock necessitates continual auditing for a number of years; also the gum in hot climates would deteriorate, and sometimes the colours would be affected. After all, stamps are essentially only a convenient and economical method of collecting postal charges, and it is hardly reasonable to expect colonial Governments to go to any extra expense and trouble, because surcharging creates extra issues which are eagerly bought by some philatelists and objected to by others. So long as the issue has been made simply for postal and revenue purposes, it seems to us that the “public interest” is not affected. It is of course another matter if it has been made deliberately with the object of alluring collectors.

The following completely new issues of stamps may be expected before our next number:—

BRITISH SOLOMON ISLANDS PROTECTORATE (a dependency of Fiji) will issue  $\frac{1}{2}$ d., 1d., 2d.,  $2\frac{1}{2}$ d., 5d., 6d., and 1s. stamps printed by the steel plate process. The design will be similar to the existing lithographic issue, and the colours will follow the new colour scheme with the exception of the 5d. value, which will be in sage green instead of purple and sage green.

MALDIVE ISLANDS (near Ceylon) will issue stamps of four values, *i.e.*, 2, 3, 5 and 10 cents. The principal part design will be a representation of a minaret.

CAYMAN ISLANDS are about to issue  $\frac{1}{4}$ d. stamps for internal postage in Grand Cayman.

MALTA will issue a 5s. revenue stamp, which will simply be a 10s. stamp printed in red and surcharged 5s. revenue.

The following Colonies have been the first to adopt the new colour scheme for existing series of stamps, *i.e.*, SIERRA LEONE and BRITISH HONDURAS, but no order has yet been received from either.

NATAL will in future use a separate series of stamps for postage and revenue purposes above the value of 6d. Particulars of the colours will appear in our next issue.

BRUNEI.—An order has just been received for 2 and 8 cents stamps, which will be in the new colours described in our last issue.

BERMUDA  $\frac{1}{2}$ d. and 1d. stamps have been supplied for the first time in single Postal Union colours.

DOMINICA.—1d. and  $2\frac{1}{2}$ d. for the first time in single Postal Union colours. These and the  $\frac{1}{2}$ d. value are on unsurfaced paper; 2s., 2s. 6d., and 5s. (previously on unsurfaced single watermark paper) have now been supplied on multiple watermark surfaced paper.

FEDERATED MALAY STATES.—3 and 8 cents for the first time in Postal Union colours.

FIJI 1s., previously on unsurfaced single watermark paper, now on multiple watermark surfaced paper.

LEEWARD ISLANDS 6d. and 1s. (hitherto on unsurfaced single watermark paper), now on multiple watermark surfaced paper.

MALTA 2d., 2s., and 2s. 6d. revenue stamps for the first time on multiple watermark paper.

MONTSEBART, 1d. and  $2\frac{1}{2}$ d. stamps for the first time in single Postal Union colours. These values and the  $\frac{1}{2}$ d. value on unsurfaced paper.

ST. KITTS—NEVIS— $\frac{1}{2}$ d. for the first time in single Postal Union colour. The paper is unsurfaced.

SOMALILAND PROTECTORATE 1 anna stamps will in future be printed completely in red, this and the  $\frac{1}{2}$  anna stamp will be on unsurfaced paper.

The note in our last issue about buff paper seems to have been misunderstood. There has never been, and, as the colour has been abandoned, never will be any such paper with multiple watermark. The paper may, of course, be found both surfaced and unsurfaced according to the date of printing. The surface is, as we explained in the October No. of this journal, applied after the paper leaves the manufacturer's hands, so that the fact of its being surfaced does not give grounds for a belief that a fresh supply of paper has been manufactured.

### BUSINESS NOTES.

In the Board of Trade report on British trade with New Zealand, on which we commented in our last number, the statement was made that hosiery and Berlin wools from Germany were preferred to British on account of dyeing. The figures given of the imports of hosiery did not seem to bear this statement out, being about £140,000 from the United Kingdom and £2,000 from Germany; and in order to get to the bottom of the matter we consulted the Nottingham and Leicester Chambers of Commerce, those being the hosiery districts. Nottingham have replied that "English hosiery dyers supply colours in all kinds of materials, wool, cotton, or silk, quite equal to German. Enquiries have recently been made in Nottingham by German dyers as to how certain colours are produced, whilst large quantities of silk yarns are regularly sent here to be dyed. The statement referred to has come before us previously, and appears to have been made by German manufacturers to secure attention to their own products." Leicester replied that "the bulk of the hosiery imported into New Zealand is of British manufacture and British dyed. Of the yarn trade, the worsted knitting and fingerings are entirely British, while the Berlin yarns are now limited to a very small trade." It is very satisfactory to find that the British manufacturer does so well with this important class of goods.

---

We have remarked, in commenting on the Board of Trade commercial reports, that the British manufacturer holds his own in the production of articles of a superior class, and that if the foreign maker frequently beats him it is mostly in cheap lines. We notice that Lord Brassey in his presidential address to the Chambers of Commerce (17th March) put this matter strongly. "It is," he observed, "in the cheap and low grade goods that we lag behind. As to the quality of some of these productions, I can speak from experience. I have been a buyer of ready-made white duck trousers

at Aden. They were shabby in an hour, and worn out in a day. (Laughter.) I recall the purchase of a bale of blue dungaree at Valparaiso. It was made up into trousers by the most skilled tailors on board the *Sunbeam*. The first time they went aloft to loose topsails the crew came down in rags. Let us not say that reluctance to engage in competition for the supply of goods of these descriptions does discredit to our British manufacturers. (Hear, hear.) It is commendable to take a pride in doing good work, and to look with contempt on shoddy. It were unwise to regard cheapness as being in itself contemptible. Whether it be the European immigrant into South America, the Asiatic, the West Indian negro, or the well-paid workers of our self-governing Colonies, all think more—and doubtless too much—of the low price than of the quality and wear of the goods they buy. It is more difficult to sell high-class goods at high prices than less valuable goods at low prices. Manufacturers must consider customers.”

It is no doubt sound advice that customers should be considered, but a reputation for sound and honest work is a valuable asset, and the British manufacturer may fairly argue that it pays him in the long run to confine himself generally to good articles. The too cheap article soon tells its own tale. Thus the United States turn out windmills at £20 upwards, and numbers of these flimsy erections may be seen abandoned and cumbering the ground in South Africa. A defect may of course be thoroughly disguised for the moment, as when an apparently innocent paint contains some 75 per cent. of clay; but to any one who studies the matter the price reveals the true character.

---

The railway locomotive is an excellent case for examination from the point of view of comparative price and quality. A few years ago the India Office was somewhat embarrassed, and the home manufacturers greatly exercised, by the fact that German manufacturers tendered at about 20 per cent. below home prices. The tenders were not accepted, as the Secretary of State for India decided to wait for experience of the working of German locomotives. Clearly in such a case nothing but use and the whole record during the lifetime of the engine can determine the matter. In Egypt, where a very full comparison was made between British and American locomotives, the results seem to have been decidedly in favour of the former. The American locomotives were about 19 per cent. cheaper, but were so much more costly to run that the difference in price was covered by the difference in coal consumption within two years; while in about fifteen years, say half the average life of an engine, the cost of the extra coal burnt by the American type would cover

not only the difference in price, but the cost of a British engine as well.

---

It was also found that the average life of the boiler tubes of a well-known English make was nine years and eight months, against five years and five months in the case of those of the Franco-Belge Company.

---

We have on previous occasions drawn attention to the merits of zinc oxide as a pigment in place of white lead. It is not affected by sulphurous fumes, and when ground in oil is exceedingly durable. The best grades are quite white, while lead has a yellow tinge. But it must not be mixed in the way customary with lead: dryers and turpentine should be used sparingly. It is unlike lead in being non-poisonous. Some white lead is often mixed with it to make it more adhesive.

Ready mixed paints save labour and have much improved recently. A paint compounded from a mixture of pigments must be thoroughly mixed, and this is best done by machine. It is also finely ground. Ready mixed paints, however, are hardly suitable for houses where an exact shade is desired.

Genuine American turpentine is getting more and more expensive, and much stuff is sold which is distilled from sawdust, &c., and is of very inferior quality. The use of turpentine is mostly to thin the paint so that it can be easily taken up by the brush, and wholly evaporates. White spirit is now produced which evaporates equally slowly as turpentine and may be safely used for it. The old test of the characteristic smell of turpentine is not sufficient nowadays, as inferior productions are given enough of the genuine article to serve that purpose.

---

Steel rusts more rapidly than iron, and a steel structure corrodes rapidly in the presence of salt spray or gases from the smoke stacks of locomotives. It is essential that all rust, dirt, and scale shall be removed before repainting, otherwise they come off and bring the paint with them. The paint must then be worked well in, so as to expel any air, moisture, and carbonic acid which would produce rust. The most effective way of cleaning steel is by the sand blast, which in the shop or yard is little, if any, more expensive than hand cleaning, though more expensive on bridges after erection.

---

It is proposed to provide for the Niger a dredger of an American type, similar to those used on the Mississippi, to cost about £23,000. It is said that the capacity of these dredgers is such that they can reduce an ordinary bar or "crossing" to navigable condition in from two to three days. The design is that of a light-draught river steamer fitted in front with dredging apparatus, and having a floating discharge pipe 800 feet long, of the deflecting type. This dredger can set its own anchorages, and make a cut of 18 feet wide by 3 feet deep at a rate of advance of 350 lineal feet per hour in ordinary sand. This is equal to a capacity of 700 cubic yards per hour. A stern paddle-wheel is preferred to a tunnel screw as being more accessible for repairs, slower, and therefore subject to less wear, more effective in manœuvring, and less liable to be broken or clogged. The engine to drive the pump is of the high speed type with forced lubrication, and the boilers are "locomotive marine," which are well adapted for burning wood.

### Dredging.

It is often inadvisable to deposit the dredgings in some other part of the channel which is being cleared, and, in order that they may be tipped where required, it may be desirable to place steel wagon bodies or skips in the lighters, which skips would be filled by the grab dredger. The lighters would then be brought alongside the wharf, and the skips lifted out of the lighters by a crane and placed upon under-carriages, which would be run along a light temporary railway and tipped where required. Some of the wagons, if not all, should be "universal," i.e., adapted for either end or side tip. The cost of the plant is approximately, as follows:—

	£	s.	d.
Side tip wagons, $\frac{3}{4}$ cubic yard capacity, each ...	7	15	0
Universal wagons, each ... ..	9	0	0
Railway complete, 20 inches gauge, per lin. ft....	0	1	0
Points and crossings, set ... ..	4	10	0
Turntables, each ... ..	4	0	0

A two-ton portable hand crane costs about £150.

### Motor Cars.

The account of Southern Nigeria in the Colonial Office List states that, in 1907, a Government road motor transport service of three *Lacres* cars was inaugurated between Oyo and Ibadan, a distance of 35 miles, and that further road extension is in progress to develop

motor traffic. This pioneer service has proved very popular, and has already decreased the cost of transport by at least 50 per cent.

---

### Wooden Wheels.

The War Office Mechanical Transport Committee remark that "the question of wooden wheels for lorries is a troublesome one. It is very difficult to obtain properly seasoned wood, and, unless the very best is used, trouble is sure to come. The attention required to keep the wood from shrinking as practised in India is as follows—cover all wooden parts with kus-kus or similar absorbent material and keep damp with water. The wheels under this treatment are never allowed to get dry. Soaking the wheels periodically and then allowing them to dry is not so effective."

If the wooden wheels of motor vehicles shrink, the rims are apt to get loose, and the tyre may come partly off.

---

### Inks.

The permanency of inks is an important matter for Government documents, and special care must be taken in damp climates. Any paper containing alkali is bad; it should therefore be made entirely from rags, without any mixture of wood pulp, if permanence is desired. Parchment is worse, as it contains very destructive chemicals. When paper is blotted, it is reckoned that four-fifths of the colouring matter may be removed, and for any permanent purpose, as distinguished from ordinary commercial correspondence, specially strong inks are required. The only absolutely indestructible colour material is carbon, and, as this not a soluble colour, it could only be held in a menstruum, which would make it very unpleasant to write with, and would require occasional stirring; it is not, therefore, much used except where out-door exposure has to be considered and for typewriters. The black record ribbon used with typewriters varies with the amount of carbon which it contains. Under exposure to light or after long periods, the writing changes in tint owing to the colours, other than the carbon, perishing. Aniline must be used in copying ink ribbons in order that copies may be taken; it is not itself permanent against some influences, such as sunlight, but becomes so in conjunction with a carbon pigment.

---

### Photographs.

In some tropical countries bromide prints are attacked by certain insects, and cannot be protected. The carbon and platinotype processes can be made secure against this danger.

The **Bye-Products of Gas Works** are fast becoming an immense industry. Several hundred thousand tons of pitch are now shipped annually to different parts of the globe for the manufacture of patent fuel from small coal.

Sulphate of ammonia is largely used as a fertiliser in every agricultural country, and with the ever-increasing scarcity of timber, the necessity of preserving is being more and more realised. Of all the preservatives generally used, none is as efficient and cheap as coal tar creosote, and of this to-day many millions of gallons are annually shipped from England, in addition to the large quantity used by English railways and others.

Besides carbolic acid, quite a series of the best disinfectants is produced from gas tar and various fluids for dipping sheep.

The mining industry is also largely dependent upon the gas works for the supply of cyanides of potassium and sodium for gold-extracting purposes. Prussiates of potash and soda, used for dyeing purposes, are also bye-products of this manufacture.

Naphthaline is a very good preservative for skins and furs, whilst picric acid, which is "tri-nitro-phenol," is the chief ingredient in the well-known explosive "lyddite."

Benzole and toluole, the bases of the aniline colour trade, are derivatives of coal tar, as also naphtha, the solvent for india rubber. Black varnish is also made from tar.

---

### Locust Destruction with Arsenite of Soda and Sugar.

The use of arsenite of soda for this purpose is greatly increasing, and the following extract from the *Midland News* (Cape) gives an instructive account of its application.

"Mr. W. S. Marais, of De Poort, De Aar, reports that during December several swarms of locusts have hatched out on his veld, and a great many swarms have also invaded his veld from other veld in his vicinity. Mr. Marais has completely destroyed all swarms so far, and the means he used are as follows: He dissolved 1 lb. of arsenite of soda and 4 lbs. of sugar in 5 gallons of water in a 10 gallon drum. He then took green grass (osgras and klitgras) out of the garden and cut it very fine, not more than one inch long, and filled up the drum with it. This he allowed to soak during the night, and in the early morning spread the soaked grass very thinly round the bushes on which the locusts were sleeping. They began to feed on it directly they began to move, and it completely destroyed the swarms. The amount of grass used was about a quarter to half of a grain bag, and it was sufficient for most swarms. The grass was

spread so thinly that it was impossible for stock to pick it up, and if the locusts did not eat it all, what was left was dried up by the sun. The above was the amount used for locusts in the hopper stage, and in the case where the locusts were more advanced the amount of arsenite of soda was increased to 2 lbs. and 8 lbs. of sugar, and Mr. Marais advises plenty of sugar, as he noticed they liked the sweetest best, also the younger the grass was the better it acted. Mr. Marais advocated that in parts of the Colony where grass was not to be obtained out of the gardens, then veld grass should be used in preference to spraying the liquid on the veld, which takes so much water and too much work, and is not so effective, as the solution soaks into the ground, and does not soak thoroughly into the grass. Mr. Marais considers the time has arrived for the compulsory destruction of locusts of the 'voetganger' stage with arsenite of soda and sugar. This should be enforced unaccompanied by taxation."

---

### Uses of Lime in Agriculture.

A leaflet, No. 170, of the English Board of Agriculture, deals with the practice of liming the soil, and can be recommended to the attention of farmers. We extract the following :—

Besides its indirect value in neutralising acids in the soil, lime has several other uses, all of which are of importance to the farmer. These uses may be given as follows :—

1. Lime improves the nature of the soil by coagulating the finest particles of the clay and rendering the land more open and friable. Thus drainage goes on more readily, the land is warmer, and it is more easily worked to a good tilth. It is difficult to exaggerate the value of this action of lime on the heavier soils; it is frequently possible to secure a seed bed when the unlimed land is still too wet to work, and the character of the crop may depend as much upon securing a good tilth as upon manuring.

2. Lime is an essential plant food, and without it soils cannot produce good crops. Soils are generally considered to be deficient in lime when they contain less than from .5 to 1 per cent. Some soils, however, which are provided with a considerable amount of organic matter may respond to lime, although they contain much more than these amounts.

3. The insoluble reserves of nitrogenous and potassic material in the soil are brought into action and rendered available for the plant by the presence of lime. The following table shows the result of applying in January, 1903, 2,000 lbs. per acre of ground quicklime to

some of the grass plots at Rothamsted, where there was a good deal of residue from past manuring looked up in the soil :—

YEAR.	Plot 7.		Plot 9.	
	Yield with Mineral Manures only.		Yield with Complete Artificial Manures.	
	Unlimed.	Limed.	Unlimed.	Limed.
1903 ... ..	Cwt. 49.5	Cwt. 51.9	Cwt. 50.1	Cwt. 60.5
1904 ... ..	61.9	61.8	63.7	69.8
1905 ... ..	44.3	47.2	36.9	52.2
1906 ... ..	34.4	41.4	39.0	50.0

4. The leguminous crops usually cultivated on the farm flourish better when a good supply of lime is present in the soil. Clover, in particular, is very intolerant of acid soil conditions, and is much more subject to clover sickness when lime is deficient.

5. It seems to be established that the soil organism (*Azotobacter*), which fixes nitrogen without the aid of leguminous plants and is probably a great factor in the gain of fertility when land is laid down to grass, cannot develop properly unless a good supply of carbonate of lime is present.

6. Lime in one form or another is the best remedy for finger-and-toe disease in turnips and swedes. These root crops are always liable to the disease when the soil is deficient in lime.

The fertility of many farms to-day is undoubtedly due to the liming and chalking that was done by the farmers of the eighteenth and earlier centuries; they, indeed, made the soil, for it is through their labours that it remains in profitable cultivation at the present time. Owing to the very large amounts of chalk and lime which were then applied, it has been possible for later generations to live upon the capital thus accumulated and dispense with any expenditure of their own in this direction. But this spending process cannot continue indefinitely, for natural causes alone—the percolating rain-water—are steadily removing the lime in the surface soil.

### The Application of Lime.

The most common method of liming is to put quicklime on the land in small heaps and allow it to slake naturally, or to slake it with

water from a water-cart. It may then be spread with a shovel and harrowed in at once. Lime shells may also be slaked as is done by a mason's labourer, reducing them to a fine powder. They are spread in layers a foot deep, one above the other, each layer receiving about 6 cwt. of water per ton of lime, or rather less water if the lime is inferior. The heap is then covered in about half a ton of sand for each ton of lime. The lime in such a heap will keep for a considerable time. Before using, the heap may be screened through a three-eighth-inch gauge locking screen. Lime thus slaked should be in a fine powdery condition, and the sand mixed with it renders the spreading a somewhat less dusty process. Lime when overlaked becomes pasty, after which even distribution in the soil is impossible. The lime may be carted to the land and distributed by hand direct from the carts, a process which must be thoroughly done. It is much better, however, when small quantities are being applied, to adopt the American plan, *i.e.*, to use a suitable manure distributor, to which old bagging should be attached at the sides and behind. This trails along the ground, ensures better distribution, and prevents much of the discomfort that is otherwise caused by the blowing about of the fine lime. Glasses for the eyes and protective devices for the nostrils and mouth are also used by men who do this work.

Since lime is used for many purposes the proper quantity to apply varies widely. Common dressings are from 2 to 3 tons of lime shells at intervals of from six to ten years. Smaller dressings of about 1 ton per acre once in four or five years are now becoming common. Considerably larger quantities than the above may be used in the treatment of newly reclaimed land rich in organic matter and plant food.

---

### Export of Fruit.

The following report is made by the Cape Trades Commissioner in London (Mr. C. du P. Chiappini) on the subject of exporting pineapples :—

“The price of pines here depends very much upon appearance, so much so that even if a box of pines arrives in a perfectly sound condition, but with shrivelled tops and packed in an untidy manner, it would not make half the price that a box packed neatly in wood-wool or mealie cob leaves would, with the tops green and fresh, though the fruit in both cases might be perfectly sound.

“*Packing.*—I am strongly in favour of wood-wool being used in packing. I am convinced that the small extra cost would add to the appearance, and thus increase the value of the fruit by at least 20 per cent., besides which, wood-wool is an excellent material for packing fruit, as it permits a great deal of ventilation, which is essential in the pine export trade. A few large dealers in pines on the market

suggest mealie cob leaves. Remember, not the leaves from the stalks of the mealies, nor the outside rough leaves of the cobs, but the *clean white, thin leaves* covering the cob of the mealie. These leaves should be shredded with the hand before packing, so as to make them thin and pliable, and, when farmers are collecting these leaves for purposes of packing fruit, every care should be taken with them that they do not get wet. They must be very dry indeed before using same, and it is in consequence of the danger of the leaves not being dried enough that I am reluctant to recommend them.

"The fruit should be packed 12 in a single layer box (and two boxes battened together) of a size to fit the fruit, but it is not necessary to put a lid on the lower box, the upper box serving as a lid. I have already tried 12 pines in a box, and think that the following measurements will be suitable:—Length, 25 inches; breadth, 15 inches; depth, 6 inches. Outside measurements.

"The packing must be very tight between the pines, to prevent the fruit from shaking, and the box should have a good appearance, and must not be made from all manners of scrap wood. Further, to give a neat appearance when opened, after the fruit has been well packed, before the lid is put on, a sheet of thin dark blue paper (the kind which boys use for making kites) should be nicely placed on top of the packing. What is usually done by the retailers when they open their boxes is to remove the fruit and then replace this sheet of paper on the packing, and lay the fruit thereon when exposed for sale. The blue paper shows up the colour of the fruit and makes it more attractive.

"*Prices.*—My opinion is, after my own experience and after consulting several dealers, that if the Cape Queen Pines arrive in a good, sound condition they will make from 4s. to 6s. or perhaps more per box of one dozen. I have estimated the cost of shipment, and with the information at my disposal I make it that

Freight will be ... ..	£0	0	10
Cost of box and wood-wool ...	0	0	8
Railage and dook dues in South Africa ... ..	0	0	6
Dook dues and cost of selling on this side... ..	0	0	7
	<hr/>	<hr/>	<hr/>
	0	2	7 per dozen fruit.

"Of course, this is a minimum calculation. Should the fruit, therefore, only realise 4s. a box, the growers and packers will have to be satisfied with 1s. 5d. for a dozen pines; but it is quite possible, and may be probable, that the fruit will realise about 6s. a dozen or more; but this, as I have said before, depends upon the condition and the get-up of the fruit upon arrival. I must again state that

should the fruits arrive in a bad or rotten condition, then it is, of course, impossible for me to realise at a profit, or perhaps to get any price at all for them."

---

Mr. Winston Churchill has pointed out, at a meeting of the British Cotton-growing Association, the enormous possibilities of Uganda for the production of cotton. "It is no exaggeration," he observed, "to say that within a hundred miles of Lake Victoria there are one million landowners—eager, willing, intelligent landowners—willing to cultivate cotton and possessed of nearly 20,000 square miles of the finest cotton-land in the world." What is now wanted is scientific supervision and organisation, and it is good news that the Treasury have sanctioned the expenditure of some £10,000 a year for three years for this purpose. Such an expenditure is an investment which will probably lead to a vast return.

---

Thus may cotton return more and more to the East, from which it came. Alexander the Great's admiral, Nearchus, wrote of the "fleeces that grow on the trees in India," and in later times the "fleeces" had a holy character. Thus a cotton robe was one of the treasures of the Chinese Emperor, and in India the Brahmans adopted cotton for the sacred cord of their caste, hemp being allotted to the soldier and wool to the trader. This was in days when the cotton tree was known as a perennial; the modern development took its rise in the discovery that it could be cultivated, with vastly better results, as an annual. Now cotton is again king, in an improved sense, and governs millions of workers.

---

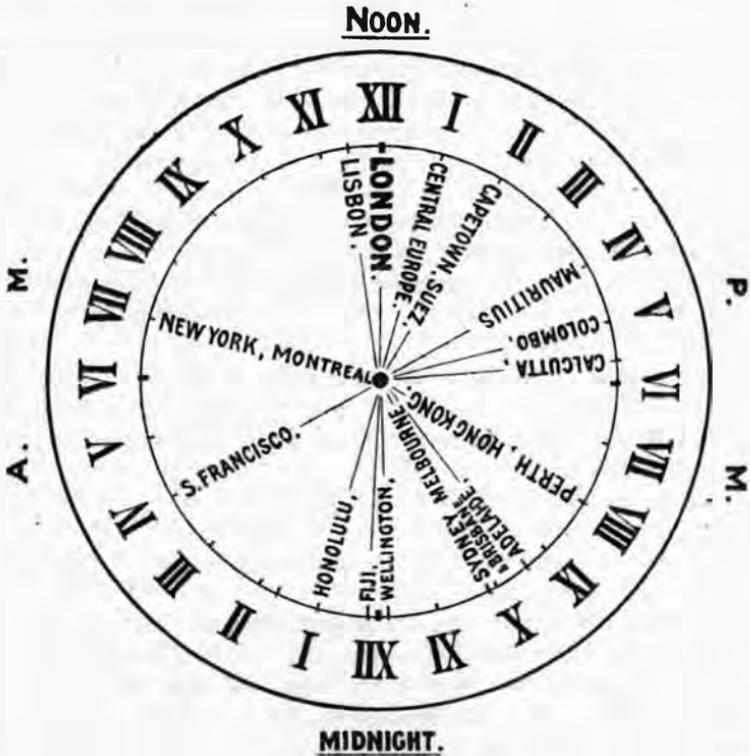

**Concrete Steel Sleepers** have now been tried on some railroads for over two years, and it is said that they have remained in perfect condition and alignment. They are made of two blocks of concrete moulded on the ends of a pair of 3 by 1½ by 3-pound steel channels, 7 ft. 11 ins. long, placed back to back and spaced 2 ins. apart. The blocks centre under each rail so that the centre of pressure coincides with the centre of the base of the sleeper. It is claimed that these sleepers eliminate the tendency of rails to incline outwardly.

---

There will be an "International Rubber and Allied Trades' Exhibition" in September next, under the presidency of Sir H. A. Blake, G.C.M.G., at the Royal Horticultural Hall, Westminster. Its main object will be to direct public attention to the enormous advances by the rubber producer and manufacturer during recent years.

**A Universal Time Indicator.**

It is often useful to merchants and officials, especially when telegraphing, to know the time at some distant place; and a way which anyone can adopt of doing this is to mark the twenty-four hours on a circle, on paper, and inside this circle to fix a smaller circular piece of paper which can be turned round on a stud; this inside circle bears the names of the leading places at correct intervals. Setting the inside circle so that London is in line with XII. noon on the outer circle, the time at other places would be shown approximately, thus:—

## MEDICAL NOTES.

At the instance of the late Secretary of State for the Colonies and with the co-operation of the Government of the Sudan and the Royal Society, His Majesty's Government have decided to establish in London a Bureau for the collection and general distribution of information with regard to sleeping sickness. The Royal Society will find accommodation for the Bureau at Burlington House, and one-fourth of the cost of upkeep will be borne by the Sudan Government. The Treasury have agreed to grant £1,200 for one year.

The Bureau will be under the general control and direction of an honorary Committee of management, appointed by and responsible to the Secretary of State for the Colonies. The Committee will be composed of the following:—

*Chairman.*—The Right Honourable Sir J. WEST RIDGEWAY, G.C.B., G.C.M.G., K.C.S.I., P.C., who is also Chairman of the Advisory Committee of the Tropical Diseases Research Fund.

Sir PATRICK MANSON, M.D., K.C.M.G., F.R.S.

Sir ROBERT BOYCE, F.R.S.

Dr. ROSE BRADFORD, F.R.S. (representing the Royal Society).

Colonel D. BRUCE, C.B., F.R.S.

Mr. E. A. WALROND CLARKE (representing the Foreign Office).

Mr. H. J. READ, C.M.G. (representing the Colonial Office).

With Mr. A. B. KEITH, of the Colonial Office, as Secretary.

The main function of the Bureau, which will be administered by a paid director, will be to collect from all sources information regarding sleeping sickness, to collate, condense, and, where necessary, translate this information, and to distribute it as widely and quickly as possible among those who are engaged in combating the disease. The publications of the Bureau will be divided into two categories, viz., scientific publications intended for those who are engaged in research work or in carrying out medical administration in the infected districts, and publications of a less technical character for the use of Government officials, missionaries, and others, whose duties involve residence in those districts. One important piece of work will be the preparation of a map of the whole of tropical Africa

showing the distribution of the disease and of the different species of blood-sucking insects which are suspected of conveying it. A map of this kind, showing, as it would, the extent to which the distribution of the disease coincides with the distribution of the different species of insects, is expected to supply valuable information to scientific investigators and to give guidance to the different administrations by indicating the lines of advance of the disease and the districts which require special protective measures.

The duties of the Director of the Bureau will for the present be undertaken by Dr. A. G. Bagshawe, of the Uganda Medical Staff, who has been seconded from the Protectorate service for the purpose.

It was at one time contemplated that an international bureau should be constituted, but difficulties arose; information, however, will be distributed to France, Germany, and the Congo Free State, and no doubt these countries will reciprocate.

---

Owing largely to the exertions of the Bishop of Queensland, an institution for research in tropical countries is likely to be established at Townville. It is understood that the Commonwealth Government is prepared to grant £450 a year, Queensland, £200 a year, and the Australasian Universities, £300, as a donation. It is possible that a grant may be made from the Tropical Diseases Research Fund. An annual income of £1,000 is required, and it is to be hoped that it will be forthcoming.

---

The June issue (Volume II., No. 2), of *Annals of Tropical Medicine and Parasitology*, published by the Liverpool School of Tropical Medicine, is largely devoted to the subject of Sleeping Sickness. It contains report by Drs. Kinghorn and Montgomery on the Sleeping Sickness Expedition to the Zambesi, and on Trypano somiasis of domestic stock in North-Western Rhodesia, in both of which especial attention is paid to the connection of the disease in human beings with the infection of animals. There is also an interesting account of the work of the Greek Anti-malaria League during the year 1907, which included a systematic campaign, to be continued during present year against malaria in the Plain of Marathon.

---

In the American quarters on the Panama Canal it is thought better to screen the verandahs rather than the doors against mosquitoes. The expense is put at 60 cents a square yard; the advantages are that the plan protects persons near by the verandahs in the evening, and that mosquitoes are less likely to enter when an outer door is opened, or when any fracture occurs than they are when attracted by a lighted room. It is recommended that doors should be as small as possible, and should open outwards.

## REVIEWS AND NOTICES.

**Cross River Natives.**—BY CHARLES PARTRIDGE, F.R.G.S., Commissioner in Southern Nigeria. (*Hutchinson & Co.*)

THIS is not a new book, but it has not been displaced, and in view of the rapidly increasing importance of Southern Nigeria, attention may be called to the very full and clear account which it contains of the customs and characteristics of the Cross River natives. It is nowadays fully realised, in theory at all events, that every native race should be developed in the first instance along the lines of its own best institutions. The attempt to impose an alien civilisation on primitive people, without regard to their customary modes of thought, is usually a failure. It is not till a sympathetic inquiry has been made into their ideas and manners, that a successful attempt can be made to improve them. And the first essential is patience. "Our own ancestors," Mr. Partridge writes, "of 100 B.C. would find it rather difficult even willingly to adapt themselves all at once to the strenuous life of thought and action to which their present descendants have attained after two thousand years of very gradual evolution. Keeping this fact in his mind, the Political Officer deals 'softly, softly' with Nature's children of the bush, and humours them, and tries to see things from their point of view, and does his best to smooth matters amicably when a misunderstanding occurs between them and their "big father," the Government. If he begin with an open mind, free from any preconceived antagonistic prejudices, he will learn to like the people over whom the Government has placed him, and the more he can like them, the better will it be for him and for them, for the success of his work and for their advancement. The personality of the District Commissioner is an element of no small importance. His 'subjects' are very human, very observant of numerous everyday forms and ceremonies of religious and social etiquette, and very apt to form their opinion of the 'white stranger' and his policy from his observance of such points—'mere details' which are being crowded out from the strenuous life of modern England, but which were duly observed by our great-grandfathers, and still survive among old-fashioned people in quiet corners."

Diplomacy is, in fact, as necessary in the wilds as at Whitehall. "In diplomatic relations with primitive peoples, as in all other situations of life, it is highly desirable to attain to the proverbial happy mean, and the more the District Commissioner 'condescends' to study the everyday details and intricacies of the life of the people whom he has to govern—their fetishes and jujus, their festivals and dances, their customs at birth, marriage, and burial, their likes and dislikes, wants and aims—the more quickly will he acquire that knowledge which will keep him in the 'middle of the road where perfect safety is.'"

The customs, of course, mean much more than is apparent on the surface. The savage is very far from being the remarkably unfettered person he is often taken to be. He is the slave of many fears, and governed by multitudinous ceremonies and minute observances. Convention rules him with as strong a rod as can be found anywhere.

The first practical object is to find a paramount chief, so as to take advantage of an authority ready to hand. Sometimes this is difficult, as in many parts there are numbers of small communities which are essentially democratic. One way of securing civil independence is to make the chief a fetish. The fetish is too sacred to leave his palace, and his devoted tribe sees that he does not do it.

---

### Cotton-Growing.

A collection of reports on the quality of cotton grown in British possessions which have been prepared by the Imperial Institute, has been issued by the Colonial Office in the Miscellaneous Series of Colonial Reports. These reports constitute striking evidence of the advance which has been made in the development of cotton-growing within the British Empire. We extract from Professor Dunstan's introductory remarks the passages which appear to be of most general interest:—

"Largely owing to the efforts of the British Cotton Growing Association, cotton cultivation in British Possessions has made great strides during the past two years, and certain facts of general importance may now be regarded as established.

"It is clear, especially in West Africa, that the best chances of success lie in most cases in the improvement of native cottons rather than in the introduction of foreign cottons.

"The history of Egyptian cotton cultivation shows the great results which have followed from the systematic cultivation and improvement especially by hybridisation of plants native to the country. The success which has attended the revival of cotton-growing in the West Indies is largely due to the fact that the cotton to which attention has been given is the Sea Island variety, which, although taking its name from islands on the coast of the Southern

States of America, where it has been successfully grown in recent years, is stated to have been cultivated long previously, if it did not actually originate, in the West Indies, and is, therefore, known to be suitable to the conditions of West Indian soil and climate.

“It is probable that several varieties of Upland American cotton might be acclimatised and established in our African Colonies, but careful and prolonged trials will be needed in order to demonstrate with certainty that this is the case. There can, however, be little doubt that many of the more valuable American varieties will not prove to be satisfactory when grown in countries of different soil and climate, and in which manuring and other accompaniments of highly advanced cultivation are not at present possible.

“The British Cotton Growing Association has already found that by establishing ginning and buying stations in the African Colonies and Protectorates an immense impetus has been given to native production; in fact, in West Africa, the increased output is largely due to these circumstances. The native West African cotton is often of inferior quality, but in some instances has brought even better prices than American cotton of similar type. Since African cotton-growing must for the most part be carried on as a native industry, it cannot be too strongly urged that every encouragement and facility should be given to the improvement of native cultivation, both by direct instruction and advice to the farmers and also by demonstrations at selected centres of the results of systematic experimental work. The British Cotton Growing Association, with the aid of Government contributions given for the purpose, has made provision for the conduct of experiments and the supply of information to native growers, chiefly through European agriculturists specially appointed to those African Colonies and Protectorates in which cotton-growing shows possibilities of success.

“The extent to which cotton-growing will be resorted to by the natives obviously depends on several factors, of which the most important are the price which can be offered and the competition of other occupations and of other agricultural crops. The collection of palm kernels and the preparation of palm oil in West Africa is so easy and remunerative an occupation, that it is at present useless to attempt to introduce cotton cultivation in the palm-oil regions of that country. Moreover, it must not be overlooked that cotton cultivation is one of the higher forms of tropical agriculture, and its successful pursuit calls for qualities which are not always to be found in the West African native, who frequently prefers the simple and, at least, equally profitable occupation of growing the food stuffs of the country. Fortunately, the growth of certain food stuffs may be carried on in rotation with cotton, and the extended adoption of this practice is to be recommended. In fact, cotton cultivation will have to be made a part of general agricultural practice if it is to become

a permanent industry. The steps which are now being taken by Government to teach the natives of West Africa better agricultural procedure must therefore exercise an important influence on the extension and improvement of cotton cultivation. What is urgently needed in addition are the systematic experiments in improving native cotton, which can only be successfully conducted on scientific lines and by trained specialists.

“In this connection difficulties have been encountered by the British Cotton Growing Association, chiefly owing to the virtual impossibility of securing at short notice the services of properly educated men with experience of the special problems of cotton cultivation. The ordinary American farmer from the Southern States of America is not likely to be successful in solving the problem of cotton growing under new conditions, whilst agriculturists trained in Great Britain have no knowledge either of cotton cultivation or of tropical agriculture. Progress, which must in any case be slow, is rendered slower by these circumstances. At the same time, the problem is not likely to be solved except by continuous work on these lines, and it is now necessary that plant-breeding experiments should be conducted on some definite plan. Whilst much is to be learned from the work on seed selection, breeding, and hybridisation of cotton, which has been carried on by the United States Department of Agriculture, breeding operations, on the lines first laid down by Mendel, would seem to afford most promise of success. Through experiments on Mendel’s method, much has been already done at Cambridge in breeding in England a description of wheat and barley of the kind required by the miller and the British consumer.

“It is, however, obvious that such experiments are not likely to be successful unless they are conducted under the supervision of scientifically-trained men who are familiar with the details of the method and also have previously directed special attention to the problems of plant breeding. This subject is of special importance to all our African Possessions, both in those countries like West Africa where, as will be seen from the present reports, the chief problem is the improvement of native varieties, and also in South Africa, and East and Central Africa, where the problem may prove to be to find the best type of exotic cotton to introduce and, if necessary, to improve.

“Reference has been made to the successful revival of cotton-growing in the West Indies, where the long stapled Sea Island cotton is now being grown with profit, often commanding higher prices than the Sea Island cotton of the Southern States of America. The efforts of the British Cotton Growing Association in the West Indies have been greatly aided by the information and guidance which have been afforded to growers by the Imperial Department of Agriculture under the direction of Sir Daniel Morris.

Whilst growers in the West Indies appear to have reason to be satisfied with the success of Sea Island cotton, it would not be well for other countries to depend entirely on the production of this variety, which, although it fetches at present a higher price than any other kind of cotton, is used for special purposes only, and is therefore employed in comparatively small quantity. It is also to be noticed that Sea Island cotton gives a much smaller yield, and is more difficult to establish and maintain of high quality than any other kind. In most countries in which Sea Island cotton succeeds the Egyptian varieties are also likely to do well. It is said that there is a steadily increasing demand in the English cotton mills for Egyptian cotton of fairly long staple, and the cultivation of this kind is in most cases less precarious than the growth of Sea Island cotton, whilst it is likely to be more remunerative than the cultivation of ordinary American Upland.

“One of the most striking features of the accompanying reports is the excellent quality of cotton which has been grown in South Africa, especially that from American seed. In the Zoutpansberg district of the Transvaal, it will be seen that cotton grown from American seed has been valued at a higher price than the corresponding cotton grown in the United States. The results of succeeding crops will be watched with much interest. In this district of the Transvaal and in North-Eastern Rhodesia, labour in some districts appears to be sufficiently abundant, but transport requires improvement before cotton-growing can be successfully established. It is also interesting to notice that American cotton has apparently proved successful on the high ground of Nyasaland and in Uganda. Among the British Possessions in which cultivation on a small scale may prove to be remunerative are Ceylon, Fiji, and Cyprus. In the latter island conditions are exceptionally favourable, but systematic experiments are needed in order to ascertain the kind of cotton which is best suited to the island.

“At the Cotton Exhibition, which was held at the Imperial Institute in the summer of 1905, a large number of samples of cotton grown in British Possessions and also in foreign countries were shown. These included a unique collection of cottons which had been examined at the Imperial Institute, displayed so as to exhibit the length of staple and other characteristics. Owing to the interest with this collection created, it has been placed on permanent exhibition in the Public Galleries, and will be added to from time to time as additional material is received and examined.”

---

#### Natal.

We have received from the Agent-General for Natal a copy of an Illustrated Official Railway Guide and Handbook of General

Information, which we commend to all who are interested in the Colony. It is at once a manual of practical information and a record of the historical associations of the Colony, including those connected with the South African War. It is lavishly illustrated, and contains some excellent maps. A companion volume contains a valuable account of the Port of Durban, with full particulars of all dues and charges and a description of the railway connections. Like the more general guide, it is excellently illustrated.

---

### The Romance of Empire Series.—

Canada, by BECKLES WILLSON.

Australia, by W. H. LANG.

Outposts of Empire, by JOHN LANG.

(*T. C. and E. C. Jack.* 6s. each.)

These well-printed volumes, with their vigorous style and picturesque illustrations in colour, give vivid accounts of the more romantic incidents of Colonial history, and would be treasured by any boy with a liking for the adventurous. At the same time a large amount of solid instruction is contained in the narratives, and the most striking features in the development of the Empire are skilfully brought into relief. The "Outposts of Empire" takes in Gibraltar, Malta, and the West Indies. The volumes would make excellent school prizes.

---

### The Natural History of the Seychelles Archipelago.

A very careful investigation of Aldabra and other islands of the group, by Mr. R. Dupont, is recorded in a Seychelles report. At Aldabra about 3,000 turtles can be captured per annum, but owing to the lack of shipping facilities it appears that only about 500 are taken. The cartilaginous substances in these reptiles are boiled and then exposed to the sun, after which they become hard and constitute the calipee of commerce, from which turtle soup is made. One turtle produces 3 lbs. of calipee, which is worth 2s. per lb. There is a considerable amount of guano on the islands. The following observations on the water supplies in coral islands are interesting:—

"This question of fresh water in the coral islands is deserving of careful study, and those places where hollows and depressions of ground form a catchment area for rain water should first be investigated. There is general tendency amongst the inhabitants of coral islands to think that it is sea water which percolates through the ground and is turned into fresh water simply by filtering through sand and limestones. This belief is, I think, far from being correct, and if the presence of limestones in underground layers is necessary to form impervious strata for the water to collect, it is

impossible to think that sea water can be deprived of its salt by filtration through carbonates of lime. This is a chemical impossibility, and fresh water is present in the islands only in those places where are found impermeable layers, which on being tapped permit the creation of a well. Islands of a very small size are said to contain a supply of fresh water even when they are nearly destitute of trees such as African Banks, &c., but the question is how much fresh water can be produced on these islands.

"In digging wells and in examining wells already dug, it became clear to me that rain water in collecting underground has a rise and fall according to the time of the tide. This rise and fall can be followed easily in the spring at Takamaka when the water level fluctuates about 8 ins. It is this fluctuation which probably led persons to suppose that fresh water is simply sea water filtered through the corals; but on examining a certain number of wells, I found that sometimes the fresh water forms a film on the surface, and that the underlayers of water are brackish or saltish. This is sufficient evidence that fresh water in the wells is derived from rain water, and that the porous sand being filled with air, the rising sea water forces the descending fresh water to keep a certain level and even to reproduce to some extent the movements of the tide."

---

**The Defence of Duffer's Drift.** (*W. Clowes and Sons, 1s. net.*)

This little brochure embodies some recollections of "things actually done and undone in South Africa, 1899-1902." A series of sketches shows how unfortunate incidents and regrettable mistakes could and did occur in small engagements. The last one is meant to show how the experience could be utilised, the mistakes avoided, and success secured. The narratives are life-like and the reasoning seems plausible. The book would interest any one who has been engaged in such conflicts or wishes to study the subject.

---

Among recent Colonial Government publications may be mentioned the Report of the Customs Tariff Commission, Cape of Good Hope. A considerable number of increases are recommended, but the duty on catalogues, "which is vexatious in its collection," should, it is advised, be limited to catalogues printed abroad to the order of South African firms. Many applications were not encouraged, and the following remarks, showing the opinion of the Commission as to the limits of Protection, may be quoted:--

"The question as to whether the industries established in this Colony can become permanently established, even if any protection afforded by the Customs Tariff is subsequently removed, has been a very difficult matter to deal with.

“Your Commission feels that, as a general rule, it is right to afford protection only to such industries as would be natural to the country; that is, such as would use the raw products of the country and are in other ways adapted to local conditions. It, however, finds that owing, as indicated earlier in this Report, to a high Customs Tariff on certain articles, intended primarily for revenue purposes, and to the action of the preferential railway rates, many industries have been created which could not stand this test, but have in the course of years obtained a claim to recognition.

“The Commission has endeavoured, while respecting vested interests, to avoid giving further encouragement to many claims for protection put forward, as it felt in these cases that the industry could never become firmly established, and this being so would always remain a tax on the consumer.”

The Customs Tariff Enquiry Commission in Natal has also issued a report, which discusses the general principles of Protection.

A copious report on immigration is issued by the Inter-Colonial Irrigation Commission, Pretoria.

A report of a Select Committee of the Legislative Council of the Straits Settlements discusses the question of Sunday labour at the ports.

The Commission on the Central South African Railways Reports on the various administrative questions, and Mr. Conacher on the distribution of oversea traffic between the railways (Pretoria).

## LETTERS TO THE EDITORS.

## The Future of the West Indies.

LONDON,

*2nd June, 1908.*

SIR,

I beg leave to hand you the following notes on the "Future of the West Indies" for insertion, if you will, in your journal, as a contribution influenced by the sincere desire to make those valuable colonies more effective to their common good in the great world-wide competition now in progress. To those who, with experience of the past, have studied the question of the future of the West Indies in relation to other colonies and foreign countries, some effective union has long appeared to be an absolute necessity, and the general utility of coming together for certain purposes, so as to give greater effect to representations coming from the West Indies, does not seem to need further discussion.

The area of the West Indies, and value of the united trade would reach an aggregate which would command permanent attention from other parts of the Empire, like Canada, as well as from foreign countries.

In order to give effect to a union it would be necessary to have a central council. This council should be representative of the several executive and legislative bodies in the West Indies. It would accept from them such powers as they cannot make use of for themselves. To such a central council, I think, the following subjects would most likely be remitted :—

(i.) Trade and commerce with other countries and among themselves.

(ii.) Bounties on the production or export of goods, but so that such bounties shall be uniform throughout the West Indies.

(iii.) Postal, telegraphic, telephonic, and other like services.

(iv.) Lighthouses, lightships, beacons and buoys.

(v.) Astronomical, meteorological, seismic, and other allied observations.

(vi.) Quarantine.

(vii.) Census and statistics.

(viii.) Currency, coinage, and legal tender.

(ix.) Marine and fire insurance.

(x.) Weights and measures.

Codification of the West Indian Acts and Ordinances on the following subjects:—

(a.) Bills of exchange and promissory notes.

(b.) Bankruptcy and insolvency.

(c.) Copyrights, patents of inventions and designs, and trade marks.

(d.) Foreign corporations, and trading or financial corporations formed within the limits of the West Indies.

(e.) Marriage.

(f.) Divorce and matrimonial causes, and in relation thereto to parental rights and the custody and guardianship of infants.

(g.) The civil and criminal process of the courts of the West Indies.

(h.) Immigration and emigration.

I am, Sir,

Your obedient Servant,

JOSEPH RIPPON.

---

### Votes for Women.

The points of similarity and of difference in the development of political ideas in the self-governing communities included in the British Empire supply interesting material for speculation and study. The original indebtedness of the dominions to the Mother country in the matter of ideas will hardly be disputed, even by the perfervid Canadian professor, who wants John Bull's children to come in and manage his affairs for him, or by the select circle of the devout to whom Mr. Kipling appeals in the columns of the *Morning Post*. The form and spirit of the constitutions set up, wherever self-government prevails within the Empire, are a standing record of the debt. But there is some ground for the opinion that matters have changed in this respect, that the spirit of inventiveness is now especially characteristic of the younger communities, and that the Mother country has relapsed into the position of a pupil, and is at

times in danger of seeming a backward one. Great Britain may claim to have been the pioneer of the democratic idea, and so complete has been her apparent acceptance of it that she has to-day no political party which is professedly hostile to it. Yet in her realization of the idea she has been, compared with her Colonies, curiously half-hearted and illogical. She recognises manhood suffrage as good for the Transvaal. She shows no disposition to adopt it herself. She patiently endures tiresome and unreasonable anomalies, which New Zealand and Australia long ago swept away. She disfranchises more than half her adult population by continuing to confine the Parliamentary vote to a single sex. There are many things which may be said against democracy, but in England they are not said; or rather they are said freely and fervently in clubs and drawing-rooms, but carefully eschewed upon the platform. But the necessary implications of democracy are sturdily resisted not less in public than in private, even by professed democrats. The course of the Female Suffrage controversy in England can hardly fail to be a source of infinite amusement to the Australian or the New Zealander. There was an Australian contingent in the London procession of June 13th, who carried a banner with the inscription "Trust the women, Mother, as I have done"; but they must have found themselves in strange company. For the favourite argument of the British suffragists is the contention that the women of the British Isles are fully competent to form a systematic and considered judgment upon the questions which are submitted to the electorate, that they understand the issues involved in political controversy, and form their opinions by the light of reason and not in the heat of emotion. It is a disastrous argument; it is essentially anti-democratic; and it is not in accordance with facts. The anti-suffragist proceeds to demolish it with a laborious or painstaking accumulation of reasons, and thinks that he (or she) has finally answered the case for Female Suffrage. Occasionally the physical force is brought in to give the *coup de grace*. "The underlying assumption in the national franchise," says the *Times* leader-writer, "is that the voter who has to decide on the well-being and even the existence of his country can argue out his views for his country's good on equal terms with his fellow and in the last resort can knock him down if he chance to be the better man." Mr. Asquith urges the women to convert their fellow-citizens; the *Times* prescribes a course of Sandow training as an additional pre-requisite to the franchise. The friends and foes of the movement alike seem to live in a world remote from the realities of modern politics. Yet every sincere person who passes outside the walls of the study knows that the votes of the vast majority of the electors are determined by anything rather than by systematic and considered judgment; that political issues are seldom if ever rightly under-

stood by the mass of the people; and that emotion plays a far larger part than reason in their determination. The women of the British Isles obviously do not possess the extreme mental enlightenment and freedom from prejudice which advocates often claim for them. But neither do the men. It would hardly be possible to devise a qualifying examination for the right to vote so elementary that even a tithe of the electors would succeed in passing it. Yet there is no clamour for the decimation of our voters. In practice there is a tacit recognition of the fundamental principle of democracy, that the vote is given to people not because they are capable of exercising it wisely—they scarcely ever are—but because they are most likely to submit to a Government which they have helped to create. Democracy is based, not on capacity, but on consent. The simple truism which the Sevenoaks women displayed on their banner, "What concerns all should have the consent of all," conveyed a more cogent argument than the parade of the many great names which women have contributed to the rolls of literature, art, and science. The *Times* leader-writer dreams of the voter straitly questioning whether it is better for his country "to be or not to be," before he drops his paper in the ballot-box; yet he must know perfectly well that he is at least as often influenced by a wild panic or a momentary caprice, by a fancied slight or an adroit compliment, a gross misrepresentation or an inherited prejudice. But it is alleged that women are subject to a special disqualification by reason of their inexperience of "business," and in a nation of shopkeepers the argument is not without weighty influence. But it springs from a very odd conception of the nature of political issues. That the city clerk who performs his daily journey from Shepherd's Bush to the Bank, and from the Bank to Shepherd's Bush, and makes the appointed number of entries in the appropriate ledger, comes into closer contact with the real and abiding interests of life than the wife who stays at home, cooks the breakfast, does the housekeeping, and minds the baby, is certainly not an obvious truth. The baby and the breakfast are more fundamental than the ledger-entries; and they are tending to play an increasing part in politics. The idea that the home has nothing to do with politics is based upon an old idea of the antagonism of the individual and the state which is rapidly passing away; there is nothing in the whole world which ought to concern the statesman more nearly than the home, and, if this is still to be regarded as woman's peculiar sphere, she possesses at least one pre-eminent qualification for the vote.

Brief allusion has already been made to the physical force argument. It is not often advanced in the crude form quoted, because we do not at present in practice disfranchise the physically inefficient, or confine the enjoyment of plural votes to prize-fighters,

and the expedient of counting heads is commonly regarded as an advance upon the earlier one of breaking them. It usually takes the form of arguing that the voter should be, theoretically at any rate, capable of rendering military service. Its advocates do not seem to reflect that even those burly guardians of the law who have so often protected the homes of our Cabinet Ministers from outrage had, every one of them, a mother; and that the like is true of our soldiers and sailors, themselves so frequently disfranchised.

It is only quite recently that the Woman's Suffrage question has become anything like a reality to the British public, and the New Zealander, who settled it so long ago that he has forgotten all about it, may be pardoned for watching the bewilderment of that public with a smile. It has treated serious appeal or argument as a jest, and mischief and practical jokes as an outrage and a peril, and it has not yet recovered its equilibrium. But the period of seriousness and sobriety is at hand. There is one test by which the British public determines the sincerity and significance of any movement, whether it be in favour of the Salvation Army, or Tariff Reform, or a National Theatre, or Anti-vaccination. If it has money behind it, there must be something in it. The Suffragists have given ocular proof of the fact that they have substantial means at their disposal; for ceaseless activity up and down the country, and monster demonstrations, cannot be organized without money. They have money. Their day is at hand. The women of the Antipodes will soon cease to fear lest they should be doing something improper when they vote. The seal of British respectability is about to be set on the practice.

ISHMAEL.

**RECENT TRANSFERS AND PROMOTIONS  
MADE BY THE SECRETARY OF STATE.**

- Mr. T. H. HAUGHTON** (retrenched from the South African Constabulary), Assistant Resident, Northern Nigeria.
- Dr. J. B. ADDISON** (Assistant Medical Officer, Seychelles), Chief Medical Officer, Seychelles.
- Mr. W. J. ROBSON** (late Auditor-General of the Transvaal), Auditor-General of British Guiana.
- Mr. F. H. GOUGH** (Solicitor-General, Sierra Leone), Solicitor-General, Gold Coast.
- Mr. S. A. DICKSON** (of the Colonial Secretary's Office, Pretoria), Assistant District Commissioner, Southern Nigeria.
- Mr. ST. C. E. STOBART** (of the Native Affairs Department, Transvaal), Assistant District Commissioner, Southern Nigeria.
- Mr. J. H. DONDS** (retrenched from the South African Constabulary), Assistant Medical Officer, Somaliland.
- Mr. G. A. SHAKESPEAR** (retrenched from the South African Constabulary), District Resident (Third Class), Nyasaland.
- Mr. A. C. J. ROSS** (late District Commissioner, Gold Coast), District Resident (Third Class), Nyasaland.
- Mr. H. R. MONTGOMERY** (formerly in the South African Constabulary), Assistant District Commissioner, East African Protectorate.
- Mr. W. R. MACPHERSON** (retrenched from the South African Constabulary), Assistant District Commissioner, Uganda.
- Mr. A. WILLOUGHBY OSBORNE** (Attorney-General, Gold Coast), Chief Justice, Southern Nigeria.
- Mr. H. F. MCKAY** (late Chief Clerk, Irrigation Department, Transvaal), Clerk in Treasury, Nyasaland.

Lieutenant-Colonel H. C. MOORHOUSE, D.S.O. (Commandant of Southern Nigeria Regiment, West African Frontier Force), Chief Assistant Secretary, Southern Nigeria.

Mr. A. W. MAHAFY (Colonial Secretary, Fiji), Assistant to the High Commissioner for the Western Pacific.

Mr. EYRE HUTSON (Colonial Secretary, Bermuda), Colonial Secretary Fiji.

Mr. R. POPHAM LOBB (late Second Class Resident, Northern Nigeria), Colonial Secretary, Bermuda.

Mr. J. J. KILLINGBECK (Postmaster, Nyasaland), Assistant Postmaster-General, Northern Nigeria.

Mr. J. C. D. FENN (Assistant Treasurer, Gold Coast), Senior Assistant Treasurer, Gold Coast.

EDITORIAL NOTES.

THE celebration of the Birthday of Canada was a brilliant success as a pageant, and unique as commemorating the most striking and romantic instance in the world's history of the union of two warring races under one flag. The international and inter-imperial courtesies were marked by a cordiality in which no *arrière pensée* is to be traced. The Prince of Wales's visit was productive of the greatest enthusiasm in Canada, while the participation of official representatives of France and the United States gave to the celebrations a significance far exceeding that of an ordinary memorial ceremony. Quebec is a name which stands at once for international rivalry and international reconciliation. It is possible for the French Canadian to acknowledge ties of affection with both Great Britain and France without any thought of divided allegiance, and an Englishman may admit ungrudgingly how many of the great names in Canadian history are French. In the whole Empire there is no spot more suitable than the Plains of Abraham for such a celebration, and great credit is due to Lord Grey for the fine imagination which conceived the idea, and the energy and determination which have made of it so complete a success. The record ride of the "Impregnable" back to England was a fitting sequel to the festivities.

---

EDITORIAL NOTES.

THE celebration of the Birthday of Canada was a brilliant success as a pageant, and unique as commemorating the most striking and romantic instance in the world's history of the union of two warring races under one flag. The international and inter-imperial courtesies were marked by a cordiality in which no *arrière pensée* is to be traced. The Prince of Wales's visit was productive of the greatest enthusiasm in Canada, while the participation of official representatives of France and the United States gave to the celebrations a significance far exceeding that of an ordinary memorial ceremony. Quebec is a name which stands at once for international rivalry and international reconciliation. It is possible for the French Canadian to acknowledge ties of affection with both Great Britain and France without any thought of divided allegiance, and an Englishman may admit ungrudgingly how many of the great names in Canadian history are French. In the whole Empire there is no spot more suitable than the Plains of Abraham for such a celebration, and great credit is due to Lord Grey for the fine imagination which conceived the idea, and the energy and determination which have made of it so complete a success. The record ride of the "Impregnable" back to England was a fitting sequel to the festivities.

Admiral Sperry and the United States battleships have been welcomed in Australia and New Zealand with a degree of enthusiasm which must have surpassed the most sanguine expectations. It is pleasant to recognise in this reception an appreciation of the kinship and inner sympathy of the two great unions of Anglo-Saxon peoples. But the incident has a further significance which cannot be overlooked. Australia and New Zealand have always watched the encroachment of other powers in the Pacific with a nervous jealousy. They have viewed the settlement of other European powers in those waters with a sentiment akin to that which gave birth to the Monroe doctrine in the United States; and of late years they have come to regard the danger from Asia as far exceeding any to be anticipated from Europe. The recent differences between Japan and the United States on the subject of the emigration from the former into the latter country have led the Australians to see in the American Republic a nation, related to themselves, exposed to a like danger and committed to a like policy. Though there was no discussion of the Asiatic problem, the visit of the American fleet undoubtedly served as an opportunity for a demonstration of the solidarity of interest among all the white nations who occupy territories in the Pacific.

---

The subject of Asiatic immigration was raised by Mr. A. E. W. Mason, on the motion for the adjournment of the House of Commons for the summer holidays, and, in the course of his reply, Colonel Seely showed an understanding of the Colonial attitude which has given much satisfaction in Australia. The *Sydney Morning Herald* observes that "his speech implies a most useful recognition of the fact that this question, which is largely an academic one in England, is acute in many of the colonies. The commonest source of failure in statesmanship is inability to look at a question from the point of view of a distant and imperfectly understood colony. That English Liberalism is beginning to realise what Asiatic immigration means to us is the best assurance that no conflict will arise over the issue." The *Sydney Daily Telegraph* writes in similar terms, and adds:—

"Colonel Seely's subsidiary point, that civil rights must be granted sooner or later to every immigrant who has been admitted into a British dependency, is difficult to answer. A voteless alien population, within, but apart from the general population, would not only introduce a factor inconsistent with democratic thought, but would be a constant and pressing danger for the whole community."

---

The amount of British capital invested in Canada has grown from £116,600,000 in 1897 to £262,400,000 in 1907. The amount invested in the United States is valued at £449,500,000, and it is remarkable that Canada, with its comparatively small population and

trade, should figure with more than half this sum. Much of the British capital which is invested in the United States is in the form of personal undertakings which are well advertised: that which Canada receives is mostly in the form of purchases of Government and railway securities, and it is therefore absorbed more quietly. It is clear that the United States are now being pushed out of their place by Canada for the favours of the British investor. Even now, however, the British funds invested in South Africa and Australia exceed those invested in Canada, and the fact that the banks in those countries have been controlled by London capital has much to do with the facility with which money has been borrowed. But neither South Africa nor Australia are now borrowing greatly.

---

One rather curious result of this flow of money to Canada is the activity of Canadian enterprise abroad. *The Canadian Annual Review* remarks on this as follows:—

“Mr. H. N. Casson had an interesting article upon this subject in which he said: ‘Montreal has capital—hundreds of millions. She has millionaires—forty-two of them all told, it is said. She has mills and factories—nearly four hundred of all sizes. But the vast bulk of her wealth is invested in enterprises that lie outside of the Province of Quebec. Her capitalists are at present building a railway in Cuba. They hold two million dollars’ worth of United States steel stocks, and they have placed large amounts at the service of the Wall Street banks. They are the principal pioneers in the development of electric power in Mexico. They control the Street Car companies in Detroit, Toledo, Cleveland, Akron, St. Paul, Minneapolis, Havana, Trinidad, Jamaica and Rio de Janeiro.’

“He added that two prominent Montreal citizens held \$30,000,000 of stock in J. J. Hill’s Railways, and he might have stated that Sir W. C. Van Horne and other Canadians held large interests in Guatemala and were extending their holdings and enterprises in Brazil; that W. R. Ross, K.C., and R. E. Harris, K.C., of Halifax, were interested in Porto Rico Railways; that a group of Toronto capitalists, including William Mackenzie, Sir H. M. Pellatt and Fred. Nicholls, were largely interested in Brazil investments; that James Ross, Sir G. A. Drummond and E. S. Clouston, of Montreal, and J. H. Plummer and E. B. Wood, of Toronto, were at the back of the Mexican Light and Power Company; that some \$2,000,000 of bonds and \$500,000 of common stock in the Chicago and Milwaukee Electric Railway were said to be held in Canada. These and other concerns were, however, profitable and the investments were more or less signs of natural prosperity and enterprise. In the main they were controlled and managed by Canadians, and while this movement of capital abroad was a little curious in a debtor country, yet the intrinsic merits

Admiral Sperry and the United States battleships have been welcomed in Australia and New Zealand with a degree of enthusiasm which must have surpassed the most sanguine expectations. It is pleasant to recognise in this reception an appreciation of the kinship and inner sympathy of the two great unions of Anglo-Saxon peoples. But the incident has a further significance which cannot be overlooked. Australia and New Zealand have always watched the encroachment of other powers in the Pacific with a nervous jealousy. They have viewed the settlement of other European powers in those waters with a sentiment akin to that which gave birth to the Monroe doctrine in the United States; and of late years they have come to regard the danger from Asia as far exceeding any to be anticipated from Europe. The recent differences between Japan and the United States on the subject of the emigration from the former into the latter country have led the Australians to see in the American Republic a nation, related to themselves, exposed to a like danger and committed to a like policy. Though there was no discussion of the Asiatic problem, the visit of the American fleet undoubtedly served as an opportunity for a demonstration of the solidarity of interest among all the white nations who occupy territories in the Pacific.

The subject of Asiatic immigration was raised by Mr. A. E. W. Mason, on the motion for the adjournment of the House of Commons for the summer holidays, and, in the course of his reply, Colonel Seely showed an understanding of the Colonial attitude which has given much satisfaction in Australia. The *Sydney Morning Herald* observes that "his speech implies a most useful recognition of the fact that this question, which is largely an academic one in England, is acute in many of the colonies. The commonest source of failure in statesmanship is inability to look at a question from the point of view of a distant and imperfectly understood colony. That English Liberalism is beginning to realise what Asiatic immigration means to us is the best assurance that no conflict will arise over the issue." The *Sydney Daily Telegraph* writes in similar terms, and adds:—

"Colonel Seely's subsidiary point, that civil rights must be granted sooner or later to every immigrant who has been admitted into a British dependency, is difficult to answer. A voteless alien population, within, but apart from the general population, would not only introduce a factor inconsistent with democratic thought, but would be a constant and pressing danger for the whole community."

---

The amount of British capital invested in Canada has grown from £116,600,000 in 1897 to £262,400,000 in 1907. The amount invested in the United States is valued at £449,500,000, and it is remarkable that Canada, with its comparatively small population and

trade, should figure with more than half this sum. Much of the British capital which is invested in the United States is in the form of personal undertakings which are well advertised: that which Canada receives is mostly in the form of purchases of Government and railway securities, and it is therefore absorbed more quietly. It is clear that the United States are now being pushed out of their place by Canada for the favours of the British investor. Even now, however, the British funds invested in South Africa and Australia exceed those invested in Canada, and the fact that the banks in those countries have been controlled by London capital has much to do with the facility with which money has been borrowed. But neither South Africa nor Australia are now borrowing greatly.

---

One rather curious result of this flow of money to Canada is the activity of Canadian enterprise abroad. *The Canadian Annual Review* remarks on this as follows:—

“Mr. H. N. Casson had an interesting article upon this subject in which he said: ‘Montreal has capital—hundreds of millions. She has millionaires—forty-two of them all told, it is said. She has mills and factories—nearly four hundred of all sizes. But the vast bulk of her wealth is invested in enterprises that lie outside of the Province of Quebec. Her capitalists are at present building a railway in Cuba. They hold two million dollars’ worth of United States steel stocks, and they have placed large amounts at the service of the Wall Street banks. They are the principal pioneers in the development of electric power in Mexico. They control the Street Car companies in Detroit, Toledo, Cleveland, Akron, St. Paul, Minneapolis, Havana, Trinidad, Jamaica and Rio de Janeiro.’

“He added that two prominent Montreal citizens held \$30,000,000 of stock in J. J. Hill’s Railways, and he might have stated that Sir W. C. Van Horne and other Canadians held large interests in Guatemala and were extending their holdings and enterprises in Brazil; that W. R. Ross, K.C., and R. E. Harris, K.C., of Halifax, were interested in Porto Rico Railways; that a group of Toronto capitalists, including William Mackenzie, Sir H. M. Pellatt and Fred. Nicholls, were largely interested in Brazil investments; that James Ross, Sir G. A. Drummond and E. S. Clouston, of Montreal, and J. H. Plummer and E. R. Wood, of Toronto, were at the back of the Mexican Light and Power Company; that some \$2,000,000 of bonds and \$500,000 of common stock in the Chicago and Milwaukee Electric Railway were said to be held in Canada. These and other concerns were, however, profitable and the investments were more or less signs of natural prosperity and enterprise. In the main they were controlled and managed by Canadians, and while this movement of capital abroad was a little curious in a debtor country, yet the intrinsic merits

of the undertakings and the profits—actual or probable—may be considered to largely meet the criticisms suggested.”

To these statements we may add that there is a considerable, and increasing, amount of Canadian capital invested in the West Indian Colonies.

---

This export of capital, however, is by no means liked in Canada, and when the Dominion appears to be suffering from a stringency of money, complaints of course make themselves heard. This happened last year, and want of money to move the crops was alleged to have caused a loss of some \$15,000,000. The newspapers especially fulminated against the employment of about \$50,000,000 in outside call loans, chiefly in New York. There was a great demand for money locally, and there was a good deal of human nature in the view that the banks should give accommodation in the Dominion instead of sending money abroad. But the answer in such circumstances is that the funds lent are a liquid reserve. This reserve the banks are bound to maintain, and the only way in which it can be used is by lending it at call. This mode of lending, however, was not what the Canadian public wanted; for the development of industries permanent investment is necessary, and in a time of crisis banks naturally restrict their advances. If the Canadian banks were freely abused on this occasion, on the other hand they received the highest possible compliment in the complete confidence which the Canadians showed in their system.

---

The Commonwealth of Australia is anxious to make the resources of Australia more widely known so as to attract emigrants. The States endeavour to disseminate information, but one trouble is that newspapers do not care much for such matter. “The despatch of articles for publication in newspapers free of charge cannot be regarded as a permanent method of advertising, if unsupported by paid advertisements, as, on a second application, newspapers promptly ask for a *quid pro quo*. To push newspaper publicity, however, to anything like a permanent or semi-permanent plane of success, a considerable amount of money must be expended, for while the State wishes only a record of its pleasing features and happy occurrences printed, the newspaper controller, as a rule, has little use for such reports.” What is mostly wanted for journalistic purposes is polemical and aggressive material, and it is no use to lament the fact that bellicose controversy and local incidents are the most attractive pabulum for the general reader. The difficulty of Australia in the matter of emigration is that the Crown lands of the States are either small or unsuitable for settlement. Mr. Deakin invited the Premiers to make declarations as to the amounts of suitable land available. The answers were not all as explicit as might be desired, but it appears

that in New South Wales, Victoria and South Australia the available suitable land is not substantially more than enough to satisfy the existing local demand. But great efforts are being made to repurchase land and to improve what is already available: in particular Victoria is spending £400,000 a year on new works, which will, in the near future, open up large areas for closer settlement, and provide for a greatly increased population. In Queensland and Western Australia there are, of course, enormous areas awaiting occupation.

---

It is clear that the expediency of encouraging immigration is recognised by the Federal Government. The clauses which led to the "six hatters" case have been repealed, and that much discussed and misrepresented incident need no longer be dragged into the matter. That Mr. Deakin is anxious to open up the land and attract immigrants is clear from the strong position which he has taken up. "It is noted with interest," he wrote, "that a considerable amount of work of this character has been undertaken by the State Governments, and is bearing fruit in the introduction of immigrants; but the numbers who have, so far, been induced to come to this country with the intention of settling are small when compared with the vast areas to be occupied, and further efforts on a much larger scale are essential if the stream of immigration is to assume proportions which may fairly be regarded as commensurate with the needs of Australia. The Commonwealth, by its industrial legislation, has done all that was in its power to render the country self-sustaining in the direction of promoting manufactures and rural developments generally. It is upon those engaged in agriculture and dairying that Australia must rely for the fuller utilization of the advantages with which nature has endowed us; and it is on the wide range of products which our varying climates and soils enable us to raise that we must chiefly depend for the further enlargement of our growing export trade."

---

The decision of the Australian High Court in the "harvester" action is a notable addition to the cases which show how difficult it is to divide the power of legislation between two authorities. The Federal Government has, under the constitution act, the power to levy taxes, but not to regulate the conditions of employment. In the desire, however, to introduce the "New Protection," which we described in our April number, it imposed an excise duty on locally made agricultural implements, with an exemption in favour of those manufacturers whose rates of pay to their workmen should be considered satisfactory by the Court of Arbitration. This was clearly an attempt to regulate the conditions of employment by means of a

taxation act, and the High Court has decided that it was *ultra vires*. It seems, however, unsatisfactory in point of principle that the authority which has to decide what taxes should be imposed should not be able to frame the policy underlying them. The various labour questions are under the present constitution matters for the different States, but it can hardly be said that they are purely local. One State cannot well maintain restrictions as to pay and hours of labour if its neighbour is at liberty, as it is, to pour its goods over the border without adopting any such restrictions. There must eventually be one policy in such matters for all, and the Federal Government is now seeking to obtain the further legislative power required. The act would require an absolute majority of both Houses and the approval of the electors on a referendum. Difficulties of this kind should be borne in mind when the union of South Africa is considered in detail.

---

The memorandum issued by Mr. Churchill, announcing the establishment by the Board of Trade of a Standing Court of Arbitration to deal with industrial disputes, may fairly be regarded as one more example of the influence of Colonial upon British legislation. It is true that the memorandum is very guarded in its terms. The fact that no change will be made in "the voluntary and permissive character" of the proceedings under the Conciliation Act of 1895 is emphasized twice in a single paragraph; and that this emphasis is wise in the existing state of public opinion is indicated by the fact that at the recent Trade Union Congress a resolution in favour of compulsory arbitration was, for the second time, defeated by a large majority, while the traditional attitude of the employers towards the proposal has been equally one of opposition. There are some reasons for believing that the views of both parties on this matter are undergoing a change, and Mr. Churchill significantly remarks that "the state of public opinion upon the general question of arbitration in trade disputes may be very conveniently tested by such a voluntary arrangement." The procedure followed in this instance illustrates in an instructive manner, on the one hand, the tendency of English legislation to wait upon rather than to anticipate public opinion, and, on the other, the considerable powers which the heads of our public departments possess to initiate changes of policy by administrative action independently of legislation.

---

A report by the Comptroller-General of Customs of the Commonwealth of Australia shows that, although the importation of opium has been totally prohibited since 1st January, 1906, the consumption is much the same as before. As this was anticipated, it cannot be considered that the result is disappointing. The price has gone up

considerably, a smoke now costing 2s. 6d.; but the Commonwealth has given up £60,000 revenue without any other result. The rise in price, it appears, has induced Europeans to take a hand in the trade, and this has enormously increased the difficulty of keeping out the drug. Apparently there is an organised system of importation from Europe and America, as well as from China, and it would require a very vexatious system of examination to stop it. Most of the opium is said to be hidden in the coal. The most effective means would be for the other States to follow the example of Victoria and make it penal to be in possession of opium. A considerable quantity of opium is now grown in Australia, and more would no doubt be grown if the importation were effectually stopped. The result, however, of the effort to put down the vice is not so discouraging as may appear from the above. The high price does not prevent the hardened offender from keeping up the practice, but it does prevent the young Chinese from acquiring it, and the habit will probably die out.

---

In both Australia and Canada there is a striking example of newspaper enterprise which has no parallel in this country. A number of important newspapers band themselves together and enter into an agreement with a telegraph company under which they are exclusively supplied with foreign news. The combined newspapers are under an obligation to take news only from the company, and the company to supply news only to the combination. The leading newspapers in Australia and New Zealand have an agreement of this character with the Eastern Telegraph Company, and the understanding is carried out with such strictness that, when the first news of the San Francisco earthquake came along the Pacific cable, the newspapers refused to publish it. Some newspapers are, of course, left in the cold by these arrangements, and recently there has been some agitation in Australia on their behalf. In Canada, the Canadian Pacific Railway has an Associated Press Service, and last autumn some of the western newspapers made an effort to establish an independent press service. Thereupon the C.P.R. increased its press rates, and insisted that press despatches should be used "only at the point addressed," so that the same matter could not be used by more than one paper. The matter was warmly taken up, and in the end the C.P.R. made some concessions, but not so far as to bring down the rate to the new service down to the ordinary press rate.

---

The union of South Africa is at present the most prominent political question in the colonial empire, and there are indications that there is now a steady industrial improvement which will go far

to facilitate a settlement. It is true that the oversea traffic remains poor, and owners of ships, which are being laid up for want of return cargoes, will be hard to convince that matters are mending. But the railway and other reports contain unquestionable evidence that local production is actively growing. Farming is the industry for which South Africa, generally speaking, is best adapted, and the development of this business will not only benefit the large part of the population engaged in it, but will reduce the cost of living and render the competition of the railways for the oversea traffic less important.

---

Mr. J. Conacher, in his report on the distribution of oversea traffic between the South African Railways, considers the question whether any of the main lines from the coast are unnecessary, and have been built chiefly from motives of competition, and answers the question decidedly in the negative. All the lines have become inevitable as the development of the country proceeded. No railway manager, he intimates, viewing impartially the situation in South Africa, could do otherwise than recognise the favourable position of the port of Lourenco Marques, with its connecting railway, in relation to the trade of a large, and what is now a very important, district in the interior of the country; and no final settlement of the railway question is practicable which does not give to that circumstance its appropriate weight. At the same time it is impossible to dissociate the commercial and general interests of the district referred to, and especially of the competitive zone in the Transvaal comprised within it, from the welfare of the more distant ports, and the efficient working of the railways connecting them with the interior. Large portions of that district can be served more quickly and, with some goods, more cheaply through the Cape and Natal ports than through the nearer port of Lourenco Marques, and the additional facilities for the trade of the country which those ports provide are of such undoubted commercial value that had the position been reversed, and Lourenco Marques been the first instead of having been the last of the ports to be connected by rail with the interior, there is little doubt that the efforts of the inland communities, dependent as they are upon oversea communications, would early have been directed to finding additional outlets to the coast through the older Colonies. Even from the exclusively railway point of view this would have been a matter of the greatest moment; as no system of railways for which such an outlet is vital can be regarded as secure with only one, of which part is in the hands of an authority over which the owners of the system do not possess a control capable of being exercised by them at all times and under all circumstances.

---

It follows from this that the true position of both of the inland Colonies is that of partners with the coast Colonies in all the routes from the sea; jointly interested in their efficiency and in equity bound to concur in the fixing and apportionment of such through rates as may be necessary to maintain them in that condition. That this is not the principle on which existing through rates have been fixed is clear, and the Cape Ports have been deprived of trade which they used to possess. What is wanted is a readjustment which would remove such grievances, and this is only possible by using the economies which the consolidation of the railways would lead to. The harbours and docks of South Africa are really an integral part of the system, and no scheme would be complete or effectual which did not include them.

---

Sir Francis Hopwood took the opportunity of his visit to Canada to discuss informally the subject of trade relations between Canada and the West Indies, and a statement on the subject will probably be made before the year is out. The matter is obviously complicated by the fact that the West Indies represent several administrations, and their interests are not altogether identical; but this difficulty is capable of solution. It would be a great advantage to the West Indies if the market which she now enjoys in Canada could be made secure. There seems to be a reluctance in financial circles to embark capital in the group, and the memory of past misfortunes is not yet wiped out by the steadily increasing prosperity; if it could be established that the trade now done with Canada is not precarious, there would, we believe, be much more hope for industrial developments.

---

The regrettable death of Sir H. M. Jackson removes one of the most efficient and popular governors the West Indies have had. It is particularly unfortunate for the public interests at a time when the political situation requires tact and patience, and when several big subjects, such as the Customs Tariff and Harbour Improvements, are coming on.

---

The recent visit of the West Indian cotton growers' delegates to this country, to confer with the British Cotton Growing Association, brought about some pleasant gatherings and good understandings. The object was plainly expressed by Sir A. L. Jones—that each party wanted to make something out of the other and would not make much unless the other was energetic and successful. A good deal of economic science is summed up in this. The West Indies are expected to supply a quarter of a million sterling worth of cotton this year—a splendid result; but Lancashire wants ten million bales,

and there is plenty of room, therefore, for more producers. The Association is likely to spend a million in the purchase of cotton this year from the West Indies and West Africa.

---

It was remarked that the share of Jamaica in the movement had been small, but that, on the other hand, they had been rather rich in natural phenomena. One hundred years ago a large quantity of cotton came from Jamaica, which at any rate proves that cotton can be grown there. The agreement of Messrs. Elder, Dempster & Co. to carry Jamaica cotton free for one year will no doubt bear fruit. The earthquake of January last year was a disaster from which it takes a long time to recover. The effects were much worse than on previous occasions. The destruction of houses in Kingston was almost universal, and a large area was swept by fire. The reports of the General Relief Committee and the Assistance Committee reveal an enormous amount of careful and generous work on behalf of the sufferers. It is no small thing to be able to say that a supply of daily food was at all times assured to all. Small houses were speedily repaired to the number of 1,147. It is pleasant to see how promptly and liberally the neighbouring colonies sent help. Barbados and British Guiana each sent over £2,000, and contributions came in from every part.

---

The Mansion House fund of £54,053 and the Imperial grant of £150,000 enabled the rebuilding to be taken in hand, but difficulties soon arose.

“As soon as the Committee began to make building grants questions arose as to the best method of insuring the economical application of the money to the purposes for which it was intended. The offices of the Committee were besieged by contractors, and some attempts were made to tamper with the Committee's officers. At this period no contracts (save three) had been given out directly by the Committee, and it was decided that the recipients of grants should be notified and requested to make their own arrangements, submitting the name of the contractor they desired to employ, with plans and specifications, after which the money should be paid as the work progressed, on certificate that it had been done to their satisfaction.

“It was not long before this method, which had been adopted largely in concession to the desires of applicants, was found to be working unsatisfactorily. Unreliable contractors having discovered the amount of a grant would manufacture a tender for work to precisely that amount, and in several cases there was reason to suspect collusion between the contractors and the grantee, to enable

a cash balance to be divided without carrying out repairs to the full value intended. Moreover it was found that many of the grantees were not able to protect their own interest, in negotiations with contractors or to secure the proper carrying out of the work. It, therefore, became necessary for the Committee to arrange for closer supervision and in a great number of cases to make themselves responsible through a Building Sub-Committee for the expenditure of the money voted."

The applicants themselves, however, it is satisfactory to observe, were reasonable, and the Assistance Committee found that the claims sent in were, on the whole, very fully justifiable. In all 4,283 grants of various character and amount had been made by April last.

The decision which the Judicial Committee of the Privy Council has given in favour of the policyholders in an action to recover losses caused by the fire which followed the earthquake will relieve property owners and commercial firms in Kingston from a great anxiety. This action was initiated in Jamaica. In the case of an almost identical action originated in England an opposite decision was given.

---

In the House of Commons debate (27th May) on the West-Indian Inter-colonial mail service vote, the question was raised whether it was right to omit, as had been done in this particular contract with the Royal Mail Steam Packet Company, the clause known as "No M.P. to benefit." An Act of 1782 forbids Members of Parliament from entering into Government contracts, and imposes disabilities and penalties on them if they do, but it is expressly provided that nothing in the Act should affect or apply to any incorporated trading company. The effect of this is that a Member of Parliament cannot himself enter into a contract with Government, but that a company in which he is a shareholder can. Cases might occur in which the distinction amounts to little; a Member might be so largely interested in a company that his opinion and influence in the House of Commons might be affected to the same extent as if he were a sole contractor. The ideal immunity from such influences could never be reached unless every Member of Parliament kept out of all industrial concerns which have, or might have, contracts with Government, and as this is impracticable the distinction between owning a business and owning shares in one is convenient and serves a sound purpose.

As the provision is statutory it is mere surplusage to repeat it in a contract, but it has been the custom to do so in mail contracts.

---

The British Honduras Railway starting from Stann Creek has been satisfactorily constructed so far; some seven and a half miles have been laid with rails, and the line shows no signs of having been

affected by the heavy rains, and appears to be safe from floods. It is expected that over 15 miles of line will be available for the carriage of fruit in October. The whole length will be 25 miles, and the principal difficulty is that of labour. The British Honduras Creole or Carib leaves off work as soon as he has earned enough money to satisfy his extremely modest requirements; higher wages, therefore, do not mean more work. Labourers have accordingly been brought from Jamaica under agreement for one year, but the process was expensive, and it is intended to finish the work without resorting to it again. With the completion of the line labour will be liberated which will be available for new plantations, and there is good reason to believe that the line will encourage development. Certainly it is much to be hoped that the colony, the history of which is marked by extraordinary tenacity and heroism, will gain a much-needed advantage from the undertaking.

---

The Cayman Islands are, we are afraid, little known except to the stamp collector, but small as they are they are remarkable among the West Indian Islands in having a population the majority of which is white or partly white. This is to some extent due to the circumstance that the first patrons of the group were pirates. The tortuous passages of such archipelagos were, as every schoolboy knows, eminently favourable to that form of enterprise, and even quite recently buried spoils of Spanish coins have been unearthed. It is almost to be regretted that the advance of civilisation leaves no room for the spirit of adventure even in so suitable a place. An interesting handbook on the islands has been written by the Commissioner, Mr. G. S. S. Hirst, and published at Kingston.

---

In March last the Earl of Elgin addressed a despatch to the Governor of the East Africa Protectorate which is specially interesting as devising modes for securing to the State the "unearned increment" in land and for preventing the growth of vast estates. Some arguments for action in this direction, based largely on Australian experience, were put forward in our April number. The first proposals to keep down leases to comparatively short terms were naturally received with some adverse criticism in the Protectorate, which was unkindly described in the *Nairobi Star* as the home of the leopard, the tick, the baboon, and the amateur official. The object, however, is undeniably good, and settlers cannot legitimately object to the conditions laid down so long as land can be freely dealt in. At one time a lease of grazing land for 21 years was talked of, but this period is too short to make the lease a reasonable mortgageable security or to encourage development; it is to be hoped that the more

liberal provision made in the despatch will conciliate the objectors. The tenour of the despatch may be gathered from the following passages:—

“On the one hand, the settlers are naturally anxious that the land on which they spend their labour should be a marketable and mortgageable security. On the other hand, it is clear, looking to the experience of other Colonies, that steps must be taken to prevent the accumulation of enormous quantities of land in the hands of individuals through the operation of free transfer, and also that the conditions of tenure must be such that the Government may be able from time to time to obtain its share of the unearned increment in the value of the land—that is the portion of its value which is due to the growth around it of an organised economic and political system.

“Land for farms should be granted to settlers on leasehold tenancies of 99 years at rentals revisable on a basis of 5 per cent. of the unimproved value of the land, subject (except where the land in question at the time of valuation is included in a township) to maxima of 9d. and 2s. 3d. per acre respectively at the 33rd and 66th year, with complete reversion to the Crown at the end of the term on payment of compensation for improvements. Notice of the rent based on the revaluation should be given before the end of the 32nd and 65th years; and if the lessee should not within six months of such notice accept the new rent, his lease should determine at the end of the current period. Six months before the determination of the lease the land should be offered in one or more blocks at the rent fixed by the Board, and at a premium representing the value of the improvements made by the late tenant. The latter sum should be paid over by the new lessee to the outgoing lessee. If no tenant should be found within six months of the determination of the lease, the Commissioner should pay from Government funds the assessed value of the improvements to the late lessee less any amount due from him under the expired lease, and should then be at liberty to offer the land at a reduced rent. A temporary occupation title should be granted in the first instance, and the settler should be on probation for five years, during which he must spend a sum equal to 40 times the amount of his rent on development (*i.e.*, on certain specified improvements), and after which, if he fulfils the conditions, his title should be confirmed on the leasehold tenure described above. If within a period of not less than three years he spends the stipulated sum of money on development, it should be open to him to claim a secure title then. If, on the other hand, the land leased has been unoccupied for any period exceeding nine months, or if at the end of the probationary period the stipulated sum of money has not been expended, the Government should have the power to resume on giving compensation for improvements. The

probationary period should be included in the first term of 33 years. The improvements should be those specified in Schedule A of the report of the Land Board.

“I am assured by banking authorities that such a tenure will be no obstacle to advances for cultivation; but I am advised that, in general, lenders prefer to look in the first place to the forthcoming crops as their security, and next to the improvements. Values, in fact, cannot be created by legislation, but only by industry.”

---

The British Consul at Zanzibar directs attention to the rebates and preference granted to German and French shippers by the Deutsche Ost Afrika and the Messageries Maritimes Companies, and regrets that, with the withdrawal of the British homeward service, British merchants are again left to the mercies of foreign lines. It is certainly a great pity that East Africa should be without a direct service with this country. To some extent this is due to what looks like an understanding between the British India and the South African conference lines, for neither appears to be at liberty to serve the whole of the east coast. The British India tranship at Aden, and any shipper who wishes to avoid this must go to a foreign company. The difficulty in the way of establishing a direct service is partly that the freight obtainable would be hardly sufficient, and partly that the British India would no doubt step in more actively against any such competition. It would probably be necessary to grant a subsidy, and this suggestion always invites objections. The German company are not supposed to have a subsidy, but the German Government pays the canal dues for them—which comes to the same thing.

---

We call attention in another place to the gratifying progress of that much-criticised enterprise, the Uganda Railway. Uganda itself is not suitable for white settlers, and the few who have started small plantations there have suffered both in health and pocket. But the country is populated with a remarkable native race, which is at once easily governed and eager to assimilate the ideas of industrial and intellectual progress. Without any aid from the Government they have produced over 700 tons of cotton in less than two years, and the area of cultivation is rapidly increasing. It is rather hard on Uganda that its neighbour, East Africa, is not only more attractive to white settlers, but possesses the whole of the so-called Uganda Railway. The improved results of this line are mainly due to the traffic from the lake ports, and largely to the exports from Uganda; but the Uganda Treasury only benefits from this indirectly, as it does not participate in the profits earned. The great promise of Uganda, however, is certain to lead to the extension of the railway.

At present a majority of the native population is engaged in doing the work of mere beasts of burden, and the development of the country would be vastly accelerated if these thousands of porters, who are now slowly trudging along the roads with burdens on their heads, could be set free for the cultivation of the soil. This is an economical advantage of railways in such circumstances which should be taken into account. A road does not pay a community directly, and a railway is only an improved road: its advantages are not to be measured merely by the excess of revenue over expenditure.

---

In July the Governor of the Straits Settlements paid a visit to Labuan, Brunei and Sarawak. These places have been stumbling blocks to the editors of the Colonial Office List. Labuan, however, is now safely anchored to the Straits, having been incorporated with them last year; and Brunei, whose internal affairs are still left to the Sultan, has been promoted from the "Appendix" to keep it company. Sarawak, however, remains in the latter list of undigested mouthfuls. Brunei is mostly known for its stamps and cigarettes. Sir John Anderson was presented by the Sultan with a cigarette over two feet long, and was no doubt equal to the occasion. The rest of the party were let off more lightly with fifteen inches. The *Singapore Free Press* observes of the lower orders in Brunei that they all have their peculiarities, and adds, somewhat doubtfully, that some appear to be of use. It is to be hoped that the closer connection with the Straits will help to develop them.

---

The experiences of the few Crown Colonies which have been represented at the Franco-British Exhibition are not calculated to make the others sorry that they have stood out. The collections were excellent, but the Exhibition Authorities first failed to complete the buildings till long after the opening, and then capped this by allowing cheap knick-knacks of Birmingham, or similar origin, to be sold in the Court. The following letter records the opinion of the Commissioner for Fiji on these proceedings:—

" CROWN COLONIES COURT,  
" FRANCO-BRITISH EXHIBITION,  
" 14th July, 1908.

" MY LORD DUKE,

" As Commissioner for the Colony of Fiji to the Franco-British Exhibition, I desire reluctantly to bring to your notice the following facts.

" In 1907 an arrangement was made by cable with the Exhibition Authorities by the Colonial Secretary of Fiji that 800 square feet of space should be reserved for Fiji at the price of 10s. per square foot.

“ In January, 1908, at the request of the Exhibition Authorities I paid through the Crown Agents £400 as arranged.

“ This space has not been allowed by the Exhibition Authorities. In April, when the building was said to be ready for our exhibits, I found only 704 square feet allowed for the Fiji Court.

“ In conjunction with Mr. C. H. Harley Moseley, Commissioner for Southern Nigeria, I protested against this reduction of space, but without effect, and no offer has been received to refund the sum of £48, which I now claim should be returned.

“ All the exhibits from Fiji were in London in March, and should have been in the Crown Colonies Court in April. As the building was not ready at the time promised, the exhibits had to remain on storage at the expense of the Colony I represent.

“ On May 26th, when His Majesty visited the Exhibition, the Crown Colonies building was still unfinished, and any inspection by His Majesty was out of the question. It would almost appear, from the small number of men employed and the irregularity of their employment on the Crown Colonies building, that the claims of similar work at the Exhibition received more favourable consideration.

“ The scaffolding on the exterior was only removed on June 26th.

“ The electric lighting of the interior was first available on June 23rd.

“ On July 13th, owing to rain, the exhibits of Fiji, with those of the other Crown Colonies, suffered from leakage of the roof, and at 12.30 p.m. the commissionaires were still sweeping out water and there were large pools in the passage way.

“ On June 9th, with the other Crown Colony Commissioners, I addressed a letter of protest to Mr. Imre Kiralfy, a copy of which I have the honour to enclose, and to which I have received no reply.

“ I have only shortly referred to matters which have caused an immense amount of trouble, not to say unnecessary annoyance and expense, and which have been the subject of frequent verbal and written complaints to Mr. Collins Levy, in charge of the Colonial Section.

“ In conclusion, I would ask the kindly consideration of your Grace to my claims to compensation, which I now present on behalf of the Colony of Fiji:—

“ 1st.—That space has been paid for which has not been allowed by the authorities.

“ 2nd.—That delay in completing the building for the Crown Colonies has caused expenses for storage of exhibits, &c.

“ 3rd.—That the loss to the Colony is considerable through the building not being finished till some six weeks after the opening day.

“ 4th.—That the condition of the building is very unsatisfactory, the leakage from the roof causes trouble and loss, and the authorities have made no sufficient attempt to complete the inside of the building as ‘resolved,’ according to the original prospectus, ‘by decorations in a harmonious, artistic and tasteful way.’

“ 5th.—That though the Crown Colonies have been charged at the very high rate of 10s. per square foot for space, a number of traders in small wares have been introduced into the Crown Colonies Court.

“ I have, &c.,

“ (Sd.) C. R. SWAYNE,

“ Commissioner, &c.

“ HIS GRACE THE DUKE OF ARGYLL, K.T.,

“ Hon. President of

“ Franco-British Exhibition, London.”

---

It is comforting on the face of it to find, from the Report of the Committee on a National Guarantee for the War Risks of Shipping, that the effect of any probable rise in insurance rates on prices and industry has been exaggerated, but on further examination it will be seen that this is not because there might not be a serious rise in the rates, but because any such rise would be only one, and that not the most important, of the many factors controlling prices in a great naval war. The important fact is that there would probably be a financial panic of unprecedented dimensions, and prices would be regulated chiefly by the ordinary laws of supply and demand, both of which would be affected by the disturbance of trade and scarcity of money. Things would settle down or not in accordance with the course of war. No guarantee, of course, would ensure the safe arrival of ships or afford any relief to a suffering population. Everything would turn on the success of the navy. No doubt there would be a very trying time at the beginning, and great numbers of ships would be laid up, but the higher prices would quickly bring them out again if the seas were fairly safe. When the navy has been distinctly superior to its enemies the volume of British trade has actually increased during war. On the other hand, it may be urged with force that for a time there will be uncertainty and timidity, and that the discontinuance of the usual supplies will cause much injury and suffering. This, however, is an inevitable incident of war, and the Committee consider that the objections to any form of national guarantee outweigh the advantages.

---

Some uneasiness has been caused by a rumour that Fanning Island, the mid-ocean station of the Pacific cable, was likely to be

acquired by some Japanese. The site and requirements of the cable board are fully secured, but the rest of the island is private property, and there has been some rather curious litigation in Fiji over it. It may reasonably be surmised that when a sale is talked of it is not entirely without regard to the Government interests and to the possibility of a Government purchase. It is unlikely, however, that the authorities will rise to the bait, if such it is. The island is too small and sterile to support any considerable number of settlers. To be on the safe side, however, the High Commissioner for the Western Pacific has issued a regulation providing that it shall not be lawful for an alien to hold land in the island, subject to any existing ownership.

---

A Committee was appointed in June to consider "the conditions of tenure, the scale of payment of salaries and pensions, and how far arrangements in the office of the Crown Agents are in accord, or can be brought into harmony with, the principles governing the Civil Service." The Committee consists of Col. J. E. B. Seely, D.S.O., M.P. (Chairman), The Right Hon. Sir F. Mowatt, G.C.B., I.S.O., Sir R. Moor, K.C.M.G., H. J. Gibson, C.B., R. Bailey, M.V.O., I.S.O., Sir Albert Spicer, M.P., and C. A. Harris, C.B., C.M.G. It has made a general survey of the work of the office, with a view to deciding whether changes are desirable or not, and has taken evidence from a number of ex-governors, present officials, and gentlemen interested in the subject. It is to be hoped that with this assistance it will be able to pierce the veil of mystery which, according to some critics, hangs over the institution. The office has grown up in a comparatively short time from a small beginning—there are still recollections of a time when the capital resources are said to have consisted of 6s.—to a staff of 100, and a reserve fund of about £400,000; and it is clearly desirable that its constitutional status and the lines of its organisation should be set out in definite and authoritative manner, suited to its present position. The question seems to be whether it should be conducted on the footing of a commercial house or on that of a government office. Apart from this domestic side of the case, the work of the Committee will be valuable as virtually embracing an enquiry into the methods with which the business is conducted. The Committee will, it is understood, consider its report this month.

---

The *South African Railway Magazine* gives an alluring account of the excursion organised by the C. S. A. R., from Johannesburg to the Victoria Falls and the Matoppo Hills. The cost is under £20. The writer truly remarks that "it is difficult to make some of mankind think," but he contends that the Falls will do it if anything

can. Niagara, compared with them, is, according to an American visitor, "just a bead of perspiration."

---

A new illustrated guide to the Uganda Railway has been prepared and gives a lively description of the joys of "Safari," or camping out in a natural zoo. Messrs. Cook organise a tour from Mombasa over the railway to Lake Victoria Nyanza and thence to Cairo, and the fortunate people who have the time and money have no excuse for not undertaking one of the most fascinating trips that can be imagined.

---

The Royal Horticultural Society's autumn show of Colonial-grown fruit and vegetables will be held on November 26th and 27th next, in the Royal Horticultural Hall, Vincent Square, Westminster, London, when the President and Council hope for a large show of fruits worthy and representative of those British Colonies whose fruits are in season at that time of year, and more especially from the West Indies, Canada, British Columbia and Nova Scotia. During the past few years the November Colonial Show has been highly successful, and a complete justification of the encouragement so long extended by the Society to our Colonial fruit industry.

Ever since its foundation in 1804 the Society has constantly endeavoured to assist the fruit-growing resources of British Colonies, and to foster their interests in every way. It was the R.H.S. which first sent out the original cuttings and grafts from which the majority of the trees now growing in our Empire all over the world are descended. In the early part and middle of last century, the Society propagated wine-grapes and other fruits, such as apples, pears and plums, by tens of thousands for gratuitous distribution in the then young Colonies; and having thus laid the foundation of the material, it now endeavours, by means of exhibitions, to bring the fruits themselves before the public at home, and to indicate the Empire's resourcefulness in fruit and vegetable products, as well as their good qualities, and so to demonstrate the feasibility of the different parts of the Empire mutually to supply not only the home, but their own various markets with an ample supply of fruit and vegetables without the assistance of the foreigner.

The Council, who award the medals of the Society after the recommendations of competent and disinterested Judges, are particularly anxious to encourage fruit growers. Exhibits may be shown either through the agency of the Agents-General in London, or by the shippers, or by the growers themselves. If desired, any produce may be sent direct to the Society, and it will be stored in the cellars at Vincent Square (not cold storage) and staged by the Society's officials, but the Society cannot undertake to re-pack and return any exhibits. No entrance fee or charge for space is made.

## THE FINANCIAL PROBLEM OF AUSTRALIA.

ONE of the most important benefits which can be secured by the federation of States consists in the fact that the joint credit is better for the purpose of borrowing money. Not only is the security consolidated, but the practical advantage is obtained of having one important denomination of stock, which can be firmly established on the market, instead of a number of issues, which perplex the ordinary investor and tend to prevent close prices. In the case of the Australian States, the existing stocks will come to maturity at varying periods, and it should not be impracticable to redeem or convert them, at the proper time, by the issue of stock secured upon the consolidated revenue of the Commonwealth, and bearing the attractive title of "Australian Consols." Assuming that the same security was given, it is morally certain that such consols would command a higher price than State stocks of the equivalent denomination and currency, and that conversion on terms favourable to the Commonwealth would be found to be advantageous, and to be desired by many existing stockholders. The State debts amounted in June, 1907, to about £244,000,000. As Sir John Forrest, when Treasurer of the Commonwealth, put it, "It is not reasonable to suppose that any single State of the Commonwealth can for long be able to either raise, redeem, or convert loans on such favourable terms as the Commonwealth, with its exclusive power of taxation through Customs and Excise, and with the security behind it of the whole of Australia."

If the existing State stocks were simply taken over by the Commonwealth, a very substantial advantage would be thrown away. The opportunity, if used at all, should be used to effect a conversion profitable to the Commonwealth; otherwise the result would be that holders of stock would receive a present of any increase of price caused by the combined security and the greater convenience. The best time for such an operation would be when a considerable amount of State stocks are approaching maturity.

It is, however, by no means universally agreed in Australia that the Commonwealth could borrow money on better terms than the States. Sir J. H. Carruthers, the Premier of New South Wales, said, at the Sydney Conference of 1906 :—

“I have the information from Mr. Coghlan to the effect that, as regards the confidence of the British money-lender in our stock, there would be absolutely no improvement whatever by handing over the control of our stock to the Federal authorities. On the contrary, there would be injury. This proposal is practically taking over the debts, to hand over to a body which has no tangible assets behind it, and only the power of taxation, the controlling of Australian securities. Whether we believe it or not, the advice I have got from Mr. Coghlan, reiterated time after time, is that it is a delusion and a fantasy to imagine that Australian securities would improve in value or in popularity by handing them over to the Commonwealth Government. On the contrary, he says that he believes the securities would diminish in popularity and decrease in value. I have that from Mr. Coghlan in letter after letter.”

This is undeniable on the basis of the present situation, *i.e.*, so long as the States have the solid securities and the Commonwealth has no power to tax a defaulting State. The States have the railway revenues. The Commonwealth, in fact, took over, broadly speaking, the non-remunerative services from the States, but not the remunerative. At the first session of the Australasian Federal Convention the cost of Federation was estimated at £1,550,000 per annum, made up as follows :—

New expenditure in the exercise of the original powers conferred by the Constitution ...	£300,000
Expenditure on services and powers transferred from the States ...	£3,005,400
Less revenue expected from transferred services ...	1,755,400
Net expenditure on transferred services ...	1,250,000
Total estimated cost of Federation ...	<u>£1,550,000</u>

It was clearly necessary, to secure uniformity, that the Commonwealth should collect the Customs duties. But it was never intended that the Commonwealth should retain them for its own purposes. The history of the case has been given with admirable clearness by Mr. T. G. Watson, C.M.G., in a paper printed officially at Melbourne. The feeling was strong from the first that the States should have in their own hands the means of meeting their liabilities. Thus it was put by Sir W. Lyne (New South Wales) in the Melbourne debates :

“I would ask honourable members to place themselves in the

position of a State Treasurer. He would not know without some guarantee what money he would receive from month to month, or from year to year, and yet he would have to forecast his financial position for each succeeding year. It is all very well to say that the Federal Parliament will be framed from the electors of the States as they are now. That is correct in one sense, but only in one sense. It will be made up from the electors of the present States, but under very different conditions. If the Federal Treasurer got into financial difficulties at any time, the first thing he would do would be to throw the responsibility on the State Treasurers by refusing to pay them the amount of money that they should receive. He would, perhaps, be able to carry on, but would do so by placing the States in a very unenviable position. I desire to leave as much as we reasonably can to the Federal Parliament, but we should consider the necessities of the States during the first few years of the Commonwealth. I do not think for one moment that there is any possibility of any of the States repudiating any of their responsibilities or becoming insolvent. Still, some of the States might be placed in very great financial straits if they were left dependent entirely on the Federal Treasurer."

Eventually the matter was fixed by the "Braddon Clause" (s. 87 of the Commonwealth Constitution Act), under which, for ten years after the establishment of the Commonwealth, the Commonwealth can apply not more than one-fourth of the net revenue from Customs and Excise towards its expenditure, and must repay the rest to the States or apply it to the payment of interest on the State debts. The question of the consolidation of the debts was not dealt with.

Till the end of 1910, therefore, the Act regulates the position. After that nothing is provided, and the result is that if nothing is done, the Parliament of the Commonwealth would, after 1910, be free to spend the whole of the revenue from Customs and Excise for Commonwealth purposes, without being responsible for the debts of the States.

The question has, therefore, been further considered at various conferences. The argument that the united credit of Australia would be better than that of individual parts presupposes that the Commonwealth would be able to offer, on the issue of a loan, the assets of the States which form the security for State loans. This practically means that, in addition to its Customs revenue, the right to collect the gross railway revenues should be vested in the Commonwealth, so far as might be necessary for the purpose of paying the interest on loans, or, at any rate, that a general power should be given to raise, by taxation, any sum which might be required.

This was urged by the first Treasurer of the Commonwealth at the Conferences of 1904 and 1905. He argued that if the debts

were taken over the States should give the Commonwealth the right to collect the gross railway revenues; that this was necessary to "satisfy the financiers in Great Britain that the Commonwealth stock is absolutely secure as to principal and interest, and has 'priority of security,'" and that "if the Commonwealth takes the place of the States as borrower it must have the same security."

The proposal, however, met with the strongest objections from all the States and was abandoned. The objections of the States are indicated in the following extract from a speech at the Hobart Conference by the Hon. J. M. Davies, M.L.C., Attorney-General for Victoria:—

"Mr. Davies.—With regard to this proposed security. The Commonwealth Act authorizes the Commonwealth to take over the State loans, subject to certain limitations, and provides what shall happen when those loans are taken over. The Constitution provides that the States as a whole shall indemnify the Commonwealth against them. It also empowers the Treasurer to apply certain payments of the State in settlement of the interest on such loans taken over. It was not contemplated under that Act that any kind of security was to be asked. Our States have been able to borrow money in the past from England, and also in Australia, upon the general State security, without hypothecating any asset whatever towards payment of the interest. It seems to me, and I am only speaking from my individual view in regard to this, that the Commonwealth Government, unlike the English creditor, will not trust the States. The Commonwealth say, "Although you have borrowed money from England without pledging any specific security, before the Commonwealth will trust you it is necessary for you to hypothecate your gross railway revenue to them." If anything can be done to belittle the State as a borrowing power, it is that. I feel very strongly against this hypothecation proposal. If the Commonwealth want to take over the loans, it is surely possible to do so without this stipulation."

After much further discussion, the Melbourne Conference of 1906 decided in favour of a financial system which keeps the Commonwealth and the States apart; that is, which excludes from the consideration of the Commonwealth Parliament the finances of the States as States, and from the States any consideration of the financial position of the Commonwealth. This is the position in the United States. The resolution adopted decided in favour of:—

(a) Giving financial security to the States;

(b) Leaving the Commonwealth and the several States financially independent, each within its sphere.

The final resolution on the subject of the financial relations carried out this principle, and ran as follows:—

“*Resolved*—That during a period of ten years from the 31st December, 1910, and thereafter until the Parliament otherwise provides, the amount to be paid by the Commonwealth to each State shall be on the following basis:—

“1. To pay annually to each State for ten years after 31st December, 1910, a fixed sum equal to the average annual amount of three-fourths of the net revenue from Customs and Excise which that State has contributed during the period from 1st July, 1901, to the 31st December, 1910 (not including the special revenue in the case of Western Australia).

“2. If three-fourths of the total net revenue received by the Commonwealth from Customs and Excise in any year after 31st December, 1910, exceeds the aggregate amount of the annual fixed sum guaranteed to all the States, any such sum in excess to be distributed among the States *per capita*.

“3. Provided that, subject to the foregoing proposals being given effect to, the Commonwealth may impose additional Customs and Excise duties for specific purposes, and may specially appropriate and retain and “ear-mark” the whole of the revenue—

“(a) Derived from any new items of duties on goods not at present subject to any duty, and imposed solely for specific purposes;

“(b) Derived from any additional duties on existing items of duties imposed solely for specific purposes.

If any surplus remains in any year after providing for such specific purposes from the revenue derived from such special appropriations, three-fourths of such surplus to be annually returned to the States *per capita*.”

The effect of this arrangement is that the Commonwealth would be able, after 1910, to arrange its taxation so as to provide funds for the annual contributions to the States and for its own ordinary expenditure, and will also be in a position to impose new duties for specific purposes, *e.g.*, naval defence or old-age pensions. Under the “Braddon clause,” it is obvious that if the Commonwealth required additional revenue from Customs and Excise, it would have to raise four times as much as it required, as three-quarters must be remitted to the States, and this makes it practically impossible for the Commonwealth to embark upon any such schemes until this restriction is removed.

There is no intention, however, of allowing the Commonwealth to reach this position without much further debate. At the Conference held at Melbourne in April–May last, Mr. Deakin submitted a scheme, prepared by Sir W. Lyne, under which the Commonwealth would take over all the debts of the States and replace them at a new maturity by 3 per Cent. Australian Consols. But the Conference would have none of it. The resolution arrived expressed

the policy of safeguarding the independence of the States, running as follows :—

“ Resolved—That this Conference views with apprehension the proposals of the Commonwealth Government embodied in the Memorandum of Sir William Lyne, and is of opinion that they will, if adopted, seriously affect the financial independence and solvency of the States, and further resolves :—

“ 1. That, in view of the fact that upon the State Parliaments devolves the duty of developing the resources of their respective States by means of land settlement, railway construction, irrigation, and other public works, and that they are charged with the responsibility of maintaining adequate education and charity systems, and providing for the administration of justice and other services, the financial obligations connected with which will inevitably increase with the growth of population, no financial scheme can be assented to by the States which does not provide for their receiving—

“ (a) A fixed annual sum ; and

“ (b) A proportionate part of all increases in revenue from Customs and Excise.

“ 2. That, for the purpose of enabling the Federal Government to initiate a general scheme of old-age pensions, the State Governments will be agreeable to accept a smaller proportion of the Customs and Excise revenue than three-fourths, and thus supplement, if necessary, the amount which can be provided under the Commonwealth Surplus Revenue Bill.

“ 3. That, no restriction having been placed by the Constitution upon the borrowing powers of the States, and, further, for the reasons set out in Resolution No. 1, the States should be the sole judges as to the raising of loans, within or without the Commonwealth, for the purpose of carrying on the work of internal development without interference by the Council of Finance, as proposed in the scheme of the Commonwealth Treasurer, or by any external authority.

“ 4. That the gradual assumption by the Commonwealth of the State Debts may eventually lead to economies, but it would be advisable to allow the settlement of details to stand over until the question of the distribution of the net revenue from duties of Customs and Excise has been determined.”

Recently the Federal Parliament has passed a Bill providing for the retention by the Commonwealth of the full one-fourth of the net revenue from Customs and Excise when it is not spent in the year in question. At present, under the “ Braddon ” clause, the one-fourth may be applied to the expenditure of the Commonwealth, but if it is not so applied it must be distributed among the States. The Bill enables the Commonwealth to retain the unspent balance, but it does no more than this, and the statement which has appeared in the

press at home that it provides for the Commonwealth taking more than the quarter is incorrect.

There is no prospect, therefore, at present of the Commonwealth taking over the State debts, and it is clear that there is a strong body of objection to its doing so. The strength of the State sentiment is in fact the real difficulty. The federation of Australia is very far removed from unification.

But the matter is so important that an examination of the business aspect may well be justified. The essential question is whether a material saving could be effected, but before this is considered the ground may be cleared by one or two preliminary observations. The consolidation of the debts and future issues of loans by the Commonwealth need not interfere with the right of any State to borrow at its discretion. It is for each state to decide how much it will spend in the improvement of its territories, and there is no occasion for the Commonwealth to trespass on this sphere. The only advantage sought by the arrangement is to get money cheaper. Nor is it proposed that the debts should be taken over so as to lose their identity. If that were done the more indebted States would gain at the expense of the less indebted. The proposal can only be that the Commonwealth should consolidate the debts as opportunity offers, but each State would remain, as against the Commonwealth, responsible for the interest on its debt charge. This responsibility would have to be made definite by statute.

Coming now to the question of saving, the matter can be tested to a very fair extent by a comparison of Canadian stocks with Australian State stocks. Prosperous as Canada is, the "balance of trade" against her in 1907 was about £20,000,000, whereas in Australia the surplus of exports over imports amounted to a similar sum; and it may reasonably be premised that Australian credit should be as good, or at any rate nearly as good, as Canadian. The comparison, therefore, is a natural one, and has been made at the conferences. It was considered, however, to show that there would not be much difference, if any, between the position of the Commonwealth and that of the States in the London market. One speaker observed:—"For instance, I find that Canadian 3½ per cent. stock, payable in 1934, was, on the 1st January, 1898, according to the *Economist*, at £108 10s. . . . Now take, for the purpose of comparison, a South Australian stock—3½ per cent., payable in 1939. That stock was at £109 11s., as against the Canadian stock at £108 10s., on the 1st January, 1898. So that the difference in five years is covered by the 21s. additional price for South Australian stock. I might also say that Tasmanian 3½ per cent. stock, payable in 1920-40, was at £109 11s., as against the Canadian stock mentioned at £108 10s. on the same date. The same thing is observable throughout the whole scale of the Colonial stocks. So

that honorable members who think that the premiums will be realized are imagining that something will take place which the existing comparison between the Canadian and our own Australian stocks show will probably not be realized, at any rate at the beginning of Federation."

At the recent Melbourne Conference the same view was emphatically expressed by Mr. Waddell. "New South Wales," he said, "is in as good a position to borrow in London as Canada is. Our credit is as good. If we take the  $3\frac{1}{2}$  per cent. Canadian stock, and compare it with ours, we find our stock holds as good a position as theirs. Even British consols have in some cases not returned more, or as much, interest to the investor as ours, showing that ours are in a better position." He added that there was no great difference between Canadian Dominion and Provincial loans, and urged this as showing that the like case would obtain in Australia.

These comparisons, however, are fallacious. The current price of a stock is largely ruled by the date on which the borrower can redeem. It is obvious that if it is open to the borrower to redeem at par at once or shortly, no one will buy the stock at more than a very small fraction over the par price. Thus, the  $3\frac{1}{2}$  per cent. Canadian stock referred to is redeemable, not, as stated, in 1934, but at any time from 1909 to 1934, and the possibility of this redemption prevents the price from rising above about  $100\frac{1}{2}$ . On the other hand, the South Australian stock mentioned is not redeemable till 1939, though even so it reaches only 99. But take a case, for fair comparison, where the period of redemption is distant and about the same in both Canada and Australia. The Canadian 3 per cent. stock, redeemable in 1938, stands at a mean price of 95. The New South Wales 3 per cent. stock, redeemable in 1935, stands at  $89\frac{1}{2}$ . Thus the difference is fully 5 in favour of Canada. The error in the comparison of Dominion and Provincial stocks is still greater. Quebec 3 per cent. stock, redeemable in 1937, stands at  $84\frac{1}{2}$ , fully 10 below the Dominion. It is clear that Canada borrows money with an advantage of at least 5 per cent. over the Australian States.

Now, if the Commonwealth were to borrow on the same terms as Canada, this means, putting it broadly, that the saving in interest would be the proportion of, say, £3 10s., payable for £5, or 3s. 6d. This, on the debt of £244,000,000, as it stood in 1907, would come to about £435,000 a year. The whole of those debts mature by 1952, and by that time the annual saving, capitalised at  $3\frac{1}{2}$  per cent., would amount to about £40,284,000.

A scheme has been put forward by the Hon. King O'Malley, under which the Commonwealth would assume the responsibility for that portion of the debt of each State, the interest and sinking fund on which would amount to the three-fourths of the net customs and excise revenue at present returnable to the State. The average net

three-fourths is £6,544,559, and this sum would cover the annual charges for about £174,000,000.

The reason for this limitation is that the Commonwealth could apply the three-fourths to this purpose without further statutory powers. A big start, at any rate, could be made in this way. It is certain that a large number of holders, especially trustees, would come forward and convert, notwithstanding the sacrifice, on the ground of the better security; and the general anticipation would probably be that the Commonwealth stock would appreciate, and the remaining State stocks, if anything, depreciate.

It would be essential to choose a good time, as so much would depend on the first operation. The Commonwealth could hardly, perhaps, expect to leap at one bound into the position of Canada in the market, but it has much to gain.

## CANADIAN NATIONALISM.

SINCE the separation of the Imperial Conference of 1907, the question of the relations to one another of the various self-governing parts of the British Empire has fallen comparatively into the background. There had, perhaps, been rather an excess of discussion upon it, and there has been a not unnatural reaction, which has taken the form of a temporary apathy. There have been other sufficient reasons for a concentration of interest and activity in other directions. Canada, Australia and South Africa have all been faced with special local problems of pressing importance, to say nothing of the United Kingdom, occupied with a session of unprecedented legislative activity. But the question remains one of permanent interest, of which much more has yet to be heard, and any serious contribution towards it deserves a careful examination. Such a contribution has been made by Mr. J. S. Ewart, K.C., in an interesting collection of papers recently published—*The Kingdom of Canada and other Essays* (Toronto: Morang & Co.). They are primarily addressed to the Canadian public, but it may be hoped that they will succeed in finding readers in the United Kingdom and in the other self-governing dominions. Mr. Ewart is anxious to develop by all possible means the growth of a Canadian national sentiment, and he finds that there are two main obstacles which obstruct the attainment of this ideal—divisions within the Dominion which tend to promote provincialism, and Imperialism of a type which tends to reduce Canada to a position of subordination to the United Kingdom, or at any rate to the Empire. Each of these tendencies he is equally concerned to combat. For the existence of internal divisions Mr. Ewart suggests two principal reasons. The first is the dual race origin of the Canadian people, "emphasized as it is by a concurring line of religious difference." The second arises from the facts of geography. "We are all east and west of one another. Common lines of longitude are almost unknown. Add to this fact that interposed, here and there, are long stretches of water, of mountain and of waste land, and the force of this second reason becomes very palpable and, unfortunately, most potent." To an Englishman, the assertion that Canadians are deficient in national sentiment will probably come as a surprise. The speeches of Canadian

statesmen, the writings of Canadian authors, the conversation of Canadians who come "home"—a word which Mr. Ewart tells us is fast ceasing to be applied to the United Kingdom—seem to afford strong evidence that such a sentiment is now vigorously alive, and is growing irresistibly. But the question is one of which a Canadian is the best judge; and in any case, when you are preaching salvation, you must assume that your audience is satisfactorily unregenerate. We are not so much concerned here with the existence of internal causes of division in Canada, as with the effect on Canadian sentiment of the relations between Canada and the other parts of the Empire. "*L'Impérialisme voilà l'ennemi*" is Mr. Ewart's watchword. "How can Canadians love the British Empire, which they have not seen, when they do not love their own country, which they have seen? Is Ontario to have more sympathy with New South Wales than with Nova Scotia, or Quebec more affection for British Guiana than for British Columbia?" It would be easy, by a selection of quotations removed from their context, to represent Mr. Ewart as frankly hostile to the British connection in any shape or form. He will have nothing to do with "links of Empire." Imperial Federation was a mischievous chimæra, fortunately now moribund. Mr. Chamberlain's proposals involved an insidious attack upon "Colonial" independence. (We use the adjective with a sense of guilt, but there is no adjectival form of "dominion.") The maintenance of the legislative powers of the Parliament of the United Kingdom is an offensive anachronism. The jurisdiction of the Privy Council in Colonial causes is an impertinent piece of interference, defended by hollow and insincere arguments. The proposals generally associated with the name of Mr. Deakin are, happily, dead and buried. But this summary list of opinions expressed by Mr. Ewart does him less than justice. His view of the proper relationship of the different parts of the Empire is open to criticism and provocative of controversy. But it is consistent, intelligible and sincere; and it is wholly untainted with "disloyalty," or with any desire for separation. His cry is, "We must have a Canadian sentiment first. It is a pre-requisite of all Imperialism;" and in discussing the future he makes a shrewd remark. "It seems to be taken for granted that there are but three alternatives before us— independence, annexation, and stay as we are. I venture to suggest a fourth, namely, to go on as we have been going." Canadian history presents itself to him as a gradual process of evolution in the direction of increased freedom. "Every step has been taken with difficulty, and in the face not only of Downing Street opposition, but, strangely enough, of objection and resistance from many Canadians. Every step has been denounced as involving, or tending toward, a separation from British connection. And yet (mark this) every step has but served to strengthen the tie. Lord Thring says truly that 'the history of imperial union shows that as

the legal ties are slackened the moral ties are tightened.'” This tightening of the moral tie Mr. Ewart himself desires and seeks to promote, a fact which should be borne in mind, to prevent misunderstanding, when his animadversions on the legal ties are considered. Mr. Ewart fulminates against the limitations on the legislative powers of the Canadian Parliament which prevent it from dealing satisfactorily with such questions as copyright, naturalization or the regulation of coasting trade; and against the limitation of her jurisdiction to her own geographical boundaries. (Has he, we wonder, noticed the judgment of the Privy Council in the case of *Attorney-General of Canada v. Cain and Gilhula*, and considered its possible implications?) He resents the necessity of appealing to the Parliament at Westminster if it is desired to amend the constitution of the Dominion, and the power of the Governor-General to refuse assent to a Canadian Act, and of the Secretary of State to notify its disallowance. But as a general rule he is protesting less against the tyranny of Downing Street than against the apathy of Canada. “For the condition of the Canadian constitution Downing Street is not altogether to blame. The British North America Act is very nearly such as Canadians themselves asked that it should be.” “Canada . . . can readily obtain such changes in her constitution as she desires. Should she wish complete independence, it is hers; and should she be content with the mere removal of some of her legislative disabilities, she has but to make the request. If Canada likes subordination—likes to go to London, for example, when she wishes to rearrange provincial subsidies—she may continue it. And if she wants authority to manage her own affairs as she pleases, she may have it.” In dealing with some “badges of servitude,” Mr. Ewart is perhaps not altogether ingenuous. The importance of the power to refuse assent and of the power of disallowance seems to us to be a little exaggerated, and for his most recent example Mr. Ewart has to go back forty years. It would be easy for a constitutional lawyer, as learned and as acute as Mr. Ewart, to adduce many apparent examples of the subjection of British democracy to monarchical or oligarchic powers, which have nevertheless lost all their living reality. It has been remarked of the British constitution that nothing in it is exactly what it seems to be. The King may still refuse assent to any Act of the Parliament of the United Kingdom. The privileges of the House of Commons are “ancient and undoubted,” but in each new Parliament the Speaker “humbly petitions” His Majesty to continue them. The exclusive rights of the Commons in money matters depend only upon a resolution of the Lower House, and there is no law which prevents the House of Lords from infringing them. The final Court of Appeal for the United Kingdom is still a legislative chamber based on the hereditary principle. In all these matters the different connotations

of the words "illegal" and "unconstitutional" must be remembered, and the practice of making war on symbols is not always wiser than that of tilting against windmills. But Mr. Ewart is within his rights in objecting to whatever seems to him to convey an implication of inferiority or subordination. Two other criticisms we venture to offer on Mr. Ewart's arguments. He is occasionally too much inclined to speak in the name of Canada on matters as to which Canadian opinion is not unanimous. For example, he unequivocally condemns the jurisdiction of the Privy Council; yet he himself quotes Sir Wilfrid Laurier's statement, made only last year, that "it has, as a general rule, given very great satisfaction." And he is sometimes too ready to assume that the opinion of Canada is also the opinion of the Dominions, which is by no means always the case. But we are indebted to him for a study of Imperial relations which is all the more stimulating because it often provokes a difference of opinion. We have not space for a detailed study of his views on particular questions. He is anxious for increased treaty-making powers for Canada, and acknowledges, with gratitude, the concessions in this direction made in recent years. He is opposed to contributions for the purposes of Imperial defence, but favours the establishment of local defence forces, naval and military. He is an advocate of Imperial preference, but considers that the fiscal policy of the United Kingdom is a matter for the United Kingdom to determine; and he does not regard Imperial preference as a stepping-stone to either commercial or political union. "Not only as regards commercial questions, but as to all other matters, Canada intends to control her own affairs. Her affection for the United Kingdom is deep and indisputable, but her national status precludes the possibility of submission to any governance but her own." In conclusion, that it may be clearly understood that Mr. Ewart is, in the best sense of the word, a convinced Imperialist, we will quote a passage with which our only quarrel is that it is written in unnecessarily turgid language:—

"The British Empire must assume this grander character, and rise to its higher ideal. Not inferiority, but equality. Not subservience, but equipollence. Not subjection either of Canada to the United Kingdom now, or of the United Kingdom to Canada when their proportionate importance shall be reversed, but absolute and unreserved brotherhood, making with Australia, South Africa, and other great kingdoms 'a galaxy of nations' which, by their example of concord and affection, by their strength and widely extended situation, and by that regard for right conduct which alone can give true glory to a people, may not merely induce the world to tread the paths of peace and goodwill, but may inspire among men nobler sentiments concerning their common humanity and their duty of mutual helpfulness."

## THE OUTLOOK IN SOUTH AFRICA.

THE Convention which is to consider the question of closer union among the South African Colonies is to meet at Durban on October 12th. The task which it will have to face is full of difficulties. There are wide divergences of interest and of policy between the different Colonies in such matters as railway rates and customs duties; there is a demand for local protection which, though for the most part not countenanced by the leading statesmen of South Africa, has yet powerful forces behind it; and there are differences in the electoral system, and still wider ones in the all important matter of native policy, which it will be difficult to reconcile in any compromise satisfactory to all parties. If we assume that some means will be found to overcome these special local difficulties, there still remain to be settled questions of general principle upon which it is certain that contradictory opinions will find earnest and able advocates. If the South African States decide in favour of union, it remains for them to determine whether they will follow the Australian or the Canadian model, whether they will prefer a loosely-knit confederacy of states which surrender only a fraction of their sovereignty, or a strong central government, conceding only a moderate degree of independence to local units. At the present moment the latter policy appears to commend itself to the leading spirits in South Africa. It will be remembered that it was strongly advocated in Lord Selborne's memorandum on federation, in which effective lessons were drawn from the story of Alexander Hamilton's efforts in the cause of federal union in America. The same line is taken by the anonymous authors of "The Government of South Africa," of which three instalments have now appeared, the necessity of leaving no room for a conflict of policy in matters of essential importance being strongly emphasized. But it is when the descent is made from principles to details that the difficulties to be overcome are first realized. Local jealousies and suspicions have been lulled but not eradicated. After eight years of union, the Australian States have not yet succeeded in establishing their federal capital. Will South Africa succeed in settling this

matter, and the many analogous ones without corresponding difficulties?

The most hopeful sign is undoubtedly the fact, of which there is abundant evidence, that there is a general determination among South African statesmen that the efforts now being made shall be crowned with success. The difficulties are fully appreciated and they will not be faced in any spirit of light-hearted optimism. But there is a conviction that they are not insuperable, that they can be, and ought to be, overcome; and it is the spirit which recognizes difficulties and dangers, yet refuses to be deterred by them, which commonly breeds success in political matters, as in other spheres of human endeavour.

If the present movement results in the creation of a United South Africa, it will have made a notable addition to the British Empire. The new union will be in every way worthy to take its place beside the sister federations of Canada and Australia. In one respect it will be unique. Australia has the good fortune to possess a population which is practically homogeneous and of common stock. Canada has its race problem, the juxtaposition of British and French being in many respects analogous to that of British and Dutch in South Africa. But neither Australia nor Canada has had to face a native problem of serious proportions. The remnants of the original populations of those two great continents are too scanty in numbers, and show too feeble powers of adaptation and development to present any serious problems to the dominant race. South Africa will be the first great self-governing federation in the Empire to be faced with the colour question in an acute form. It will undoubtedly be a gain that that question should be handled by a single government, and not, as at present, by four separate governments, whose policies necessarily react on one another, so that mistakes made by one state produce apprehension and irritation among its neighbours. And it seems reasonable to believe that the union of South Africa will have upon the whole a liberalizing effect upon its native policy. There will be less likelihood of measures dictated by local panic or prejudice, and as a general rule a wider horizon tends to a greater breadth of mind in political affairs. Moreover, Cape Colony, which will contribute the largest area of territory and the greatest population to the new union, has been admittedly both more generous and more successful in the treatment of the natives than her sister colonies. Beyond these statements, any prophecy would be rash. But there are signs that the whole question of the relation of the white to the coloured races in South Africa may come to be re-considered. In the Transvaal, since the subsidence of the old controversies which preceded the war, and of the more recent ones connected with the constitution and Chinese labour, there has been a

considerable development of thought upon different aspects of this question. Two reports, those of the Mining Industry Commission and the Indigency Commission, have been published which indicate the growth of a belief that under existing conditions the permanent predominance of the white race is not adequately secured, and the materials of a stable democracy are to some extent wanting. The former of these reports is, perhaps, generally regarded as an expression of extreme views, but the latter appears to have commanded general approval. In any case, the elements of the situation admit of no dispute, and they present a remarkable contrast to the conditions which exist in the other self-governing dominions of the Empire. In Canada, Australia and New Zealand the whole fabric of society rests on a foundation of white labour, and the democratic sentiment of those communities is far more thoroughgoing and ungrudging than that of the United Kingdom in its acceptance of the view that manual labour is an honourable thing, below no man's dignity. The influence of labour on politics, profound if not predominant in Australia and New Zealand, is certainly destined before long to be felt with almost equal strength in Canada. But the South African communities are face to face with the results which invariably follow from the conjunction in society of two races, of which one claims a social and political superiority to the other. The predominant race tends to claim a monopoly of such work as calls for special intellectual faculties, and to refuse all participation in work of a purely or mainly manual character. For the white man in such a community, if he is not a landed proprietor farming his own estate, there are open the professions, trade and commerce, and the supervision of coloured labour; but manual labour itself is not for him. It is true that skilled labour in South Africa is still the sphere of the white man, that the number of such skilled labourers is very considerable, and that, in the Transvaal at any rate, they have already made their influence felt in politics. But it must be remembered that "skilled labour" in South Africa does not necessarily mean exactly the same as it does at home. As the French Consul-General pointed out in an interesting and suggestive report, the element of supervision tends to become more and more important, and the amount of actual work which the skilled man in South Africa performs with his own hands tends constantly to diminish. The maintenance of his superiority to the coloured unskilled worker is a matter of the first importance and he will do nothing to prejudice it. There are no signs of any diminution in South Africa of the determination that the whites shall remain the dominant race, enjoying a definite position of superiority. But it is beginning to be realized that the maintenance of this predominance on the basis of an "aristocracy of occupation" presents serious difficulties. Mr. Creswell

and his colleagues on the Mining Industry Commission point out that the openings for skilled labour or supervision in South Africa are after all limited, and that the opportunities of acquiring skill as a helper which the worker in purely white industrial communities enjoys are denied to the white man in South Africa. The natural source of supply for the skilled labour market is cut off. The Indigency Commissioners recognize the increasing gravity throughout South Africa of the problem of the "mean white." Debarred by circumstances or character from the few recognized "white man's occupations," he has nothing on which he can fall back without losing caste and, by his downfall, impairing the prestige of the white race. Mr. Creswell's remedy is to open the door to the unskilled white labourer by putting a stop to the recruitment of native labour from outside the limits of the Colony. He argues that the mines of the Rand can be worked at a profit with unskilled white labour earning a living wage, and that it is only the liberty which the mine owners enjoy of recruiting cheap coloured labour from foreign territory to an unlimited extent which has prevented the opening of the field of unskilled labour to the white man. The Indigency Commissioners suggest a variety of remedies, almost revolutionary in their character, to prevent the white man falling from his position of superiority into that of the "mean white." Yet, taking South Africa as a whole, it may be doubted whether even the application of all the remedies recommended by both Commissions would go far to solve the problem. When Australia embarked upon her white labour policy, it was a daring and perhaps risky experiment. But it was possible for her to arrange for the actual deportation of the Kanakas from the sugar-farms of Queensland and to cut off the sources of supply. It is possible for the Transvaal to put a stop to recruitment from Portuguese East Africa, but the supply of coloured labour from other sources would still remain considerable. South Africa cannot refuse to her native population the opportunity of earning wages, and so long as the condition of that population remains anything like what it is at present the effect of its competition must prove disastrous to the white workman. It is hardly socially possible for the black and the white man to work side by side at the same task in South Africa. It is hardly economically possible for them to be employed on the same task at wholly different rates of wages. But it is impossible for the white man to subsist on the Kaffir's wages, and so long as the Kaffir is available at such wages it is idle to suppose that the employers will fail to take advantage of his low standard of needs and comforts. It is for the future Parliament of South Africa to face these problems, and if it succeeds in solving them satisfactorily it will have achieved a task in which no other state can yet claim to have been completely successful. They are in some degree analogous

to the problems which have been faced, but hardly solved, by the Southern States of America; but it is a substantial point in favour of South Africa that the inheritance of slavery counts for far less there than in the plantations of the Southern States. A fuller realization of the fact that cheap labour, even when regarded solely from the economic point of view, is never a satisfactory basis for the policy of a country, will go some way to help in the search for a solution. It will render possible the employment of white labour in the lower ranks of industry, without which a permanent white society will never be securely established; and it will also tend to raise the native above the plane of a human labour machine, whose inefficiency is tolerated for the sake of his cheapness.

## SOME RECENT RAILWAY REPORTS.

### Cape.

The gross earnings of the Cape Government Railways in 1907 were £3,690,597, and the expenditure on working, maintenance and pensions, £2,575,214. On these figures the return on the capital invested would amount to about £2 17s. per cent.; and, taking the interest actually paid, viz., £1,114,655, there was a net loss of £60,032.

There was a decrease of earnings in the year of 8·03 per cent., as compared with 1906, but one reason for this is the decline in imported goods owing to greater local production. Purely South African tonnage is now greater than oversea, but as the rates to a large extent were fixed when the tonnage of the latter, which represents the most lucrative traffic, was from two to three times the tonnage of the former, the question of readjustment deserves attention. The increase in local production is, of course, a healthy feature, and one which will eventually benefit the railways, even if it unsettles calculations for the present. A remarkable increase is shown in the carriage of livestock, especially sheep and goats, and there are clear signs that agriculture is advancing.

A railway administration cannot do very much to increase receipts, but expenditure is a different matter and lends itself to criticism. The main lines in the Cape pay well; the numerous branch lines, with one exception, incur a loss. The main lines are, of course, fed by the tributaries, and so long as the whole system pays reasonably it may be argued that it is right to run the feeders even at a loss; but on the present figures it would seem justifiable to reduce the train service, increase the rates on certain commodities, and curtail special privileges—and suggestions to this effect are made by the General Manager. The passenger concessions appear to be numerous and, in some cases, curious, including as they do—

(a) *Delegates to Masonic, Friendly and Temperance Societies, Y.M.C.A., and Land Surveyors' Congresses.*

(b) *Jockeys, race-horse attendants, members of St. John Ambulance Association.*

(c) *Wives and Children of Delegates, Ministers of Religion, and Teachers.*

(d) *Lady shop assistants, art pupils, junior clerks, apprentices, messengers, teachers and students of typewriting institutions.*

(e) *Buyers of S.A. livestock for slaughter purposes.*

(f) *Editors, sub-editors and reporters on transfer.*

It is hardly fair to a railway to be loaded with such burdens; free or special tickets should be at the expense of the departments concerned, but one weakness in the system of State-owned railways is that it lends itself readily to a long list of privileges.

The future of the Cape railways rests chiefly with the domestic trade. The pursuit of foreign trade has, perhaps, been carried too far. Business coming from beyond their own limits is subject to severe competition and fluctuations, and is not to be compared in point of stability with business which proceeds from local developments. Somehow or other, a hankering after foreign business, to the detriment of home interests, is characteristic of many railways. In America this tendency was stopped by the Hepburn Act in 1906. Now, in America, the bulk of the trade was built up by cheap rates for local produce, and in numerous cases a very low rate has been given to encourage some particular industry. This has not been done in South Africa, though the fact that the railways are the property of the State is an additional reason for encouraging local development. This aspect of the matter has been strongly put by Mr. P. Duncan in a lecture published in the *South African Railway Magazine* for July, from which we extract the following:—

“A comparison such as we can obtain of American railway rates with South African, shows very unfavourably against the latter. Outside a few special rates for export, which carry a comparatively small amount of traffic, the lowest ton-mile rate on the Central South African Railways is probably about  $\frac{3}{4}$ d. On the Cape system certain kinds of agricultural produce are carried at  $\frac{1}{2}$ d. per ton-mile. These, however, to all intents and purposes, are the lowest rates. On the through traffic from the coast, the receipts per ton-mile average, on a very rough calculation, from about  $1\frac{1}{2}$ d. to 3d. In the United States, for the year 1903, the average rate over the whole Union, on all railways, per ton-mile, was about  $\frac{3}{4}$ d. This is an average rate over all systems, covering all descriptions of freight. Let us now consider how these exceptionally low rates have been obtained. I do not think it is too much to say that the condition which has

made them possible is complete freedom of action. The following extracts from a writer on American railways will show how adaptable the railways there are to the local conditions which they have to serve:—'The citrus and deciduous fruits and canned goods of California find, through continually lowering rates, a widening market. The sugar beet and sugar industry of Colorado and California could never have been placed upon a paying basis had not the railroads made sacrificial rates in the interests of those industries. When the boll weevil has destroyed the cotton crop in Texas and Louisiana, the railroads have instantly made very low rates on cotton seed to the stricken regions. When there has been over-production of potatoes and other vegetables, apples and other fruits, melons, rice, and other commodities, that must be marketed at once, or perish, the railroads from the growing regions have made rates that have saved the producers from loss. There is not a coalfield in the United States whose operators have not time and again called upon the railroads serving their mines to grant concessions in rates because of changing market conditions. The asphalt industry of Texas and California was built up by the railroads, which successively lowered their rates as prices had to be reduced to meet competition in distant markets. The rates on brick, stone, cement, and other building materials are in a state of continual adjustment from places of production to the scenes of building operations. The trade of the United States with the Orient is being built up by the making of rates to the Pacific coast that allow manufacturers and other producers to ship their merchandise to the trans-Pacific markets.

"Such rates are experimental, and they are invariably relatively low. No company could afford to make them the standard of all its charges, or to put them in if they could not be abandoned should the business fail to develop. No Government body would ever order such experiments, or could justify its order if it did, and no railway would or could afford to make them if a rate-making Commission existed. For such a Commission would surely regard them as the strongest evidence of the reasonableness of similarly low rates on other business, for which no commercial justification could be found."

In Great Britain traders are prohibited by law from giving any preferential benefit to any person, and this means, in practice, that if a special bargain is made with a trader on the basis of quantity, though this might be legal, any one else can summon the company to show cause before the Railway and Canal Commission why the same rate should not be given to him; and the result is that the companies adhere to the mileage basis. The low freights of America would never have been possible under this system. Stereotyped equality no doubt prevents some possible abuses and has the great political advantage of guarding against complaints, but the railway

which has to adopt it loses the advantages of a flexible and adaptable system. One low rate tends to bring others in its return, and it is a striking commentary on the two methods that in recent years the American lines show a reduction in rates of 19 per cent., as against 2 per cent. in the United Kingdom.

A good deal of traffic is lost to the Cape railways by the competition of ox-wagons; some of the railway officials regard this competition as carried to unreasonable lengths, and it has actually been proposed to make things more difficult for the carriers by imposing a license fee on them. It is hardly likely that the public will agree to bring about the "surrender" of the wagon owners by such means. The carriers cannot be blamed for providing a cheap service, nor the traders for taking advantage of it. The only remedy is for the railways to reduce the rates.

### Natal.

The revenue for 1907 was £1,843,148, an increase of '34 per cent. on 1906; the working expenditure was £1,273,611, an increase of 2'99 per cent. There was a continued heavy loss in sea-borne traffic, but an increased coal traffic sprang up and a large export trade in maize commenced. The latter promises to attain big proportions, and we may quote, with reference to what has been written above, the remark that "although, from a railway point of view, the rates charged on this traffic are so low as to be unremunerative, the departure marks a new era in the development of the Colony, which will undoubtedly, as time goes on, prove of the utmost value, both to the railway and to the country as a whole." The report strongly urges that true economy lies in reducing working costs by the maintenance of the highest standards in every section, and in particular recommends (a) the steady improvement of adverse gradients and curves; (b) the maintenance of our permanent way at its highest standard; (c) the improvement of our engine power by the regular annual augmentation of our existing engine stock with up-to-date and heavy locomotives; and (d) the improvement of our rolling stock by a steady further supply of high capacity wagons.

The principal shrinkage in trade was in the through traffic, and is largely attributable to the steady diversion of the Transvaal transit rate to the Delagoa Bay route. The following table shows the percentage of sea-borne trade from the several Ports to the Transvaal during the last four years:—

	Natal.	Cape.	Delagoa Bay.
1904	40·08	16·33	43·59
1905	36·66	11·94	51·40
1906	32·59	13·25	54·16
1907	28·91	13·18	57·91

**Central South African Railways.**

The revenue in 1907 was £4,139,631, as against £4,782,049 in 1906, showing a falling off of £642,418 (13·4 per cent.). The ordinary working expenses were £2,011,154, as against £2,163,571 in 1906, a reduction of £152,417 (7·06 per cent.). The shrinkage in traffic is, of course, due to the depression in trade, but there are signs that in future the development of local industries will save the situation.

“So far as the local traffic is concerned, it is gratifying to be able to again draw attention to a steady increase. Excluding the coal and other mineral traffic (coal alone accounts for 82·3 per cent. of the total local tonnage handled by this Administration, and is referred to separately), the local tonnage is now more than *one-third* of the total traffic carried, and there was an increase under almost every head.”

The Report points out that the progress of internal development is eminently satisfactory. The loss of the profitable long-haul oversea traffic is naturally regretted, but it is well to face the fact that the old figures were due to abnormal circumstances caused by the war and the expenditure of enormous sums on restoring the devastation of the war. Here, as elsewhere, the altered position must be accepted as a permanent factor and taken into account in settling railway rates. It is interesting to notice that dynamite, the monopoly in which played no small part in the negotiations preceding the war, is now manufactured in the Transvaal and soon will cease to be imported. Cement is another article where the local product promises to displace the imported entirely. An excellent step, which it is to be hoped will be widely extended and imitated, has been taken in beginning the establishment of a system of through booking of goods between South Africa and Great Britain. The London and South Western Railway Company have co-operated in the matter.

The spectacle of a railway system which makes a net profit of half its earnings is an uncommon one, and the Central South African Railways are to be heartily congratulated on their profit of over £2,000,000. This result does not prevent the administration from carefully considering every detail, but it justifies the jubilation expressed in the following lines, which we have culled from another source:—

“There’s a thing called a Commission, which has issued a report,  
 In which they make suggestions of every kind and sort;  
 The great thing that they advocate is, ‘Retrench in every part,’  
 And, as they were all railway men, they know just where to start.  
 Now, as the Railway makes a clear two millions every year,  
 The reason for such drastic measures wasn’t very clear.  
 It puzzled us exceedingly, but now the reason’s plain—  
 They’re saving money to rebuild the Shops at Braamfontein!”

### Lagos.

The gross revenue was £139,747, and the working expenses £74,435, producing a net revenue of £65,312. The gross revenue in 1906 was only £84,663, and the improvement in 1907, on the mean mileage, amounted to 36 per cent. The cost of the line in operation in 1907 is about £1,640,000, and after allowing 3½ per cent. on this capital the net revenue of £65,312 yielded a profit of nearly £8,000. The extension of the line to Oshogbo has thus changed the position, converting the previous deficit into a surplus. The cotton business is increasing and promises to be a great support. The extensions now under construction do not pass through palm or rubber-producing country and will not get this lucrative traffic; compensation, however, may be found in the fact that planting will be pushed on with more vigour than where natural products abound. It is pleasant to find that there is a continued and decided improvement in the health of the staff; there were no deaths in the year and only three invalided home.

---

### Gold Coast.

The gross revenue for 1907 was £166,256, a decrease of £4,975, and the expenditure was £77,257, a decrease of £1,519. The mine owners have frequently complained of the high charges of the railway, and fairly numerous reductions were made in 1906, but the result was disappointing as the tonnage of mining machinery and materials fell off considerably. The year was not a prosperous one to the mining industry and it could not be expected that the mining imports would increase, but reductions will only foster traffic when there is reasonable opportunity for it if rates are sufficiently tempting. More cocoa, for instance, would be attracted from the Volta route if the rate were reduced, but machinery would not be affected by any change, unless big enough to cut down working expenses so much as to encourage development. Further reductions on plant came into force on 1st August. The net revenue is equal to 4·84 per cent. on the total expenditure charged to capital account, a decidedly satisfactory result.

---

### Uganda.

The revenue of the Uganda Railway in 1906-7 was £231,375, an excess over expenditure of £68,838. This gratifying figure indicates a general increase of traffic, such as might be expected from the increases of exports and imports in both East Africa and Uganda.

The labour question still continues to present serious difficulties. Until recently, skilled labour, *e.g.*, carpenters, masons, &c., as well as

station masters and signallers, was easily obtainable from India ; within the past year, however, partly on account of the ravages of the plague and partly on account of the increasing demand in India for this class of labour, the available supply has not been sufficient to meet the requirements of the railway.

The year 1907-8 has been disappointing, owing partly to considerable reductions in rates and partly to a drought on the Lake Littoral. The prospects for the current year are good.

It can hardly be doubted that eventually the railway will be extended and the lakes linked up. Surveys are now in progress under Capt. A. G. Stevenson, D.S.O. Some day a connection will be made with the railway from Cairo, and we shall then have occasion to regret that the latter is a British and the Uganda a metre-gauge.

## MARINE INSURANCE.

THE Emperor Claudius did a stroke of underwriting when, to encourage the importation of corn into Rome during a time of scarcity, he undertook to make good the loss which might be sustained by the owner from storms at sea. It does not appear, however, from Roman law or literature that the idea spread to commercial circles. The oldest extant policy is probably one effected in London in 1613, this being on "the good shipp called the Tiger," which is believed to be identical with that referred to by Shakespeare in *Macbeth* and *Twelfth Night*. The phraseology of the middle ages still hangs about the current form of policy, and the principal dangers might still be inferred to be "enemies, pirates, rovers, thieves, letters of mart and countermart." The practical conditions are to be found in a memorandum of glaringly modern origin, which figures as a sort of foot-note.

In a previous issue we referred briefly to the practice of colonial governments in maritime insurance. The subject is dealt with by the authorities almost entirely from the legal point of view, and some notes on practical points may be of interest to those who have not the opportunity of mastering such technical works.

The insurance is, taking the general form, against "perils of the sea." The word "of" is important. The protection does not cover every loss which may happen on the sea. "It is well settled that it is not every loss or damage of which the sea is the immediate cause which is covered by these words. They do not protect, for example, against that natural and inevitable action which results in what may be described as wear and tear. There must be some casualty, something which could not be foreseen as one of the necessary incidents of the adventure. The purpose of the policy is to secure an indemnity against accidents which may happen, not against events which must happen." Thus fire is one of the perils, but not deterioration of goods caused by the voyage, but not attributable to any extraordinary occurrence; thus loss caused by rats or vermin is not covered by the policy.

When an insurance is effected, it may be made to cover all losses, however partial, or only a case of total loss. These insurances are technically known as "with average" and "free of particular average" respectively. This term "average" is rather confusing, as

it is employed in several senses. The origin of its relation to marine insurance is somewhat obscure, but for ordinary purposes it may be taken to denote a loss or a contribution made towards any loss or expense sustained for the general safety of the cargo and ship. "General average," is the contribution so made by all parties towards a loss sustained by one or more for the benefit of all. Thus if some of the cargo is thrown overboard, *i.e.*, "jettisoned," as a sacrifice for the general good, as for instance to lighten the ship when aground, or when salvage has to be paid, the loss must in fairness be borne proportionately by all concerned. This is an ancient Rhodian law. The calculation of the amount due from each party is usually referred to a professional average adjuster, and it is often so enormously detailed as to take many months and cost more than the amount lost. Colonial Governments have not infrequently to pay claims of this kind, but, subject to any express provision in the policy, contributions can be recovered when the goods are covered by insurance.

As soon as it is decided to insure an article, it must be settled whether it is to be insured "with average" or "free of particular average." If the article is of a sort that can be partly damaged by the perils of the sea without being wholly spoiled, it is advisable to insure it "with average," and in that case compensation can be recovered for any degree of damage caused by a peril insured against. If it is either practically undamageable or if injured at all rendered worthless, it is sufficient to insure "free of particular average," in which case compensation is only paid for total loss, or in the event of a general average. The rates of premium in the latter case are naturally rather lower than in the former. Usually in cases of insurances "with average" the underwriter protects himself against any claims which come to less than three per cent. of the value of the consignment. This is to keep off small and irritating claims for trifling matters. The contract, however, may omit this provision, and if the goods insured are of considerable value it is prudent to do so.

Thus "particular average" is the liability which attaches to a policy in respect of partial damage or loss. If, for example, ten casks of cement out of 1,000 are found to be damaged by sea water, this is a particular average loss and is so endorsed on the policy.

Goods are usually insured for the sum which represents the actual outlay of the owner. This should be the Government practice, but commercial firms often add about six per cent. to cover the cost of insurance, out-of-pocket expenses and anticipated profit. The Marine Insurance Act, 1906, provides that any contract of marine insurance by way of gaming or wagering is void, and this precludes any margin of percentage which goes beyond reasonable limits.

Certain classes of goods, such as dangerous acids, which are carried on deck, can only be insured free of particular average, a claim therefore can only be made on the ground of total loss or if the goods are

jettisoned. The same may be said of bulky articles such as underframes which cannot be stowed below. An additional premium is usually charged for covering easily breakage articles, such as glass and iron castings, but a good client is often able to obtain their insurance on ordinary terms. The three per cent. clause is usual in the case of brittle goods.

The assured persons are bound by certain clauses of the policy to protect the interests of the underwriters as far as they can in the event of accident or loss. The only person who can actually do so is frequently the captain, but it is sometimes possible to minimise a loss by mending or repairing injuries. Any expenses incurred in doing so are paid by the underwriters.

The Imperial Government insures nothing, considering that its shoulders are broad enough to take the whole risk. Accordingly, the protectorates which are supported by grants-in-aid do not insure. Nearly all the crown colonies insure on the ground that a serious loss would be very embarrassing, even if it would pay them in the long run not to insure.

The rates charged by the insurance companies are rather higher than those which are often obtainable from the underwriters at Lloyd's, but in the latter case, the assured has usually in any large case when making a claim to satisfy several underwriters who have divided the risk, and to pay one per cent. to the broker for collection.

Marine insurance rates are now very low, and there is good reason to believe that underwriters generally have not had a flourishing time. Still, on the whole, as is somewhat naively expressed in an old Colonial Office despatch, "the underwriter must necessarily charge a premium more than equivalent to the risk which he runs, else he would have no profit. But what is gain to him must, of course, be a loss to the colony." It may be suggested that a means of avoiding the loss, and, at the same time, obtaining security for the value of consignments, would be for the colonies, or some of them, to establish a common fund and organisation of their own. No capital need be provided in the first instance, as it would be possible to underwrite the liability for large consignments until the profits on the small transactions yielded a sufficient fund to meet all risks. We believe that, in time, the fund would become large enough to meet all claims from accruing interest, so that no rates would have to be charged.

Maritime colonies are particularly interested in the insurance of steamers, tugs and other craft. It may be of interest, therefore, to explain the general principles which govern the insurance of vessels.

The first step is to ascertain, for the information of the underwriter, the respective values of hull and machinery, and of any stores, such as coal, &c., which may be on board. The amounts should be sufficiently large to secure indemnity to the Government in the event of the total loss of the ship, plus an allowance to cover the cost of

insurance and incidental expenses. The next proceeding is to determine the degree of protection to be secured by the policy, and on this point the Government will have to be guided by local conditions and the risks involved. Broadly speaking, vessels are usually covered (1) against total loss or constructive total loss only, with full collision clause and warranties for the payment of salvage charges, and of general average losses, or (2) under a full protection policy. In the former case claims can be made when the vessel is irretrievably lost or is so damaged by a peril insured against that the cost of repairing the damage would exceed the value of the ship when repaired. Salvage charges and general average and collision losses are also recoverable under this policy. On the other hand, the full protection policy is intended to indemnify the assured against all perils of the sea and the liabilities under Ch. 60 of the Merchants Shipping Act, 1894, and usually contains special clauses covering the following risks:—

Collision (with strange or sister ship).

Capture, seizure and detention.

Negligence of master, engineers, &c., and bursting of boilers.

Deviation.

General average.

Loss of life, personal injury and damage to fixed objects.

Claims under Workmen's Compensation Act, 1906.

The rates of premium for full protection are naturally considerably higher than those for the simpler form of policy, but it is open to the Government to omit some of the special clauses if the circumstances do not appear to render them necessary. It is desirable, however, that the collision clause should be included in every policy of this kind, as the damages payable under the Merchants Shipping Act by a shipowner whose vessel has been at fault are heavy, amounting in the case of damage with loss of life to £15, and in the event of damage or loss only, to £8 for each ton of the vessel's tonnage. Warranties for the payment of salvage charges and general average losses should also be inserted in all policies, on account of the danger of heavy losses.

It is customary to insure vessels for a period of twelve calendar months, the underwriter agreeing to make a return of premium for any period during which the vessel may be laid up or the insurance cancelled. As a vessel might at the close of her time policy be at sea and there might be reason to fear that she was lost, a clause has been devised known as the "continuation clause," which provides that in such circumstances the ship shall be held covered to her port of destination at a *pro rata* monthly premium, provided due notice be given to the underwriter. It is laid down in the Finance Act, 1901, that such a margin of time may extend to the date of arrival at destination and for a reasonable time thereafter, not exceeding

30 days. Under the provisions of the Workmen's Compensation Act, 1906, owners of vessels having a domicile in the United Kingdom are responsible for injury arising out of their employment to masters and crews, and if the vessel is being sent out from this country by an Agent of the Colony, it might be held that the Colonial Government comes within the jurisdiction. When such a vessel is insured it would be expedient, therefore, to cover this liability which may under certain conditions entail a weekly allowance for injury, or in case of death, a payment down of from £150 to £300. When this Act first came into force underwriters charged an additional premium for the risk, but in the case of larger insurances, no extra charge is now made.

Vessels purchased or built for Colonial Governments in the United Kingdom are as a rule insured for the outward voyage, the premium varying with the time of year. Barges and small craft are carried on deck at special rates of freight and insurance, or at ordinary rates if taken out in sections and stowed below. When a dredger or vessel able to proceed to her destination under her own steam is supplied, it is sometimes found expedient to entrust the contractor with the navigation. In such cases, the contractor has to effect insurance at Lloyd's or with an approved company, and to produce evidence that he has done so.

The shipowner is practically in the position of a common carrier and subject to claims for negligence. A bill of lading, however, is a document of portentous length, and appears at first sight to secure the shipowners against every possible contingency. Liability for negligence is excluded in almost every case that will be thought of. Thus it is usual to provide that the shipowner shall not be liable at all for fragile goods, and only to the extent of £2 per cubic foot for valuable goods. In a recent case (*Baxter's Leather Co. v. W. India R.M.S.P. Co.*) it was held that the latter condition was not unreasonable, and was therefore binding.

Mention of marine insurance would not be complete without reference to the Society of Lloyd's. Lloyd's may be compared in its corporate capacity with the Committee of the Stock Exchange, but, whereas the Committee lays down definite rules of a disciplinary character, Lloyd's assumes no jurisdiction over its members, and leaves them at liberty to carry on business in their own way. On the other hand, the reputation of Lloyd's is so high and so loyally upheld by its members that cases of default are, if possible, prevented by private combination amongst them for the liquidation of the liabilities. The largeness of the risks and the uncertainty of the business lead to the formation of syndicates of underwriters. A large amount of liquid capital is necessary, and a weak point in the system is that a policy-holder has no knowledge as to what capital is held by the underwriters, or how it is being employed.

## PROSPECTS OF RUBBER CULTIVATION.

UNTIL recently the price of rubber was constantly on the up-grade, and plantation schemes always looked tempting. The old field of supply along the upper Amazon had been so much used up that comparatively little accessible forest was left, and vast as the untouched districts are, the cost of collection and transportation rose to nearly 2s. per pound, which is considerably more than the cost on a properly conducted plantation in Ceylon or the Straits. It is no wonder, therefore, that rubber plantations multiplied and became a prominent feature on the Stock Exchange. In the latter half of last year, however, the demand for rubber fell off greatly, and the price went down from 5s. 6d. to 3s. 6d. The all-important question is, of course, whether it will go down or go up. So far as the supply is concerned, the main question is whether the wild Amazon rubber will come more into the market. The output of this yield is still far and away the greatest: in 1905-6 it amounted to 41,000 tons out of the world's supply of 68,000: and growers have some natural apprehension that, notwithstanding the remoteness and present inaccessibility of unexplored fields, new means of transport may greatly increase the output and so bring down the price. But there are no signs of any movement of the kind, and on the whole it seems very unlikely that any extraordinary augmentation will take place in this quarter. Next to Brazil comes the Congo State, with about 4,500 tons, and, though the exportation has been steady for some years, it is known that a large part of the territory is now exhausted, and the supply must fall off until the plantations mature. The increase of plantations in our own possessions is too small a matter to affect prices for some time to come. It does not seem probable, therefore, that any serious fluctuation will be caused by the nature of the supply. The future depends on the demand, and it is clear now that there has been a certain amount of overproduction in the industries using rubber, followed by a period of depression, which accounts for the fall in price. At present the price is rising, and in the long run it is much

more likely to go up than down. Twenty years ago, when Brazil was the only, but an amply sufficient, field of supply the price kept fairly steady between 2s. 6d. and 2s. 10d.; the extraordinary developments in the industrial uses of rubber sent up the price, and though set-backs will occur occasionally, as recently from a falling-off in the motor-car business, the tendency of the demand is bound to be upwards.

The effect of the ever-growing demands of civilisation for tropical products may be illustrated by the fact that some 15 years ago the price of cocoa-nuts in the East was 13 dollars per 1,000; it is now 40 dollars.

On the subject of the cost of plantations, an interesting report by Mr. N. C. McLeod, Deputy Conservator of Forests in Southern Nigeria, based on a visit made to the Federated Malay States, has been laid before the Legislative Council of Southern Nigeria. Mr. McLeod states that rubber is being grown in the Federated Malay States on land previously under some other crop or in fresh clearings. In the former case the planter merely puts down his stumps or seedlings at any interval he fancies between rows of coffee, cocoa or sugar cane, and, as the rubber trees grow older, gradually removes the original crops, thus affording more growing space to the rubber. The Para tree in the Federated Malay States is propagated by seed from trees at least eight or ten years old. Large quantities of seed are sent abroad which are obtained from trees of younger age, but the planter in the Peninsula prefers seeds from mature trees for his own use.

Mr. McLeod thinks that rubber plantations in Southern Nigeria would be very profitable. His calculation is as follows:—

“ In the Malay Peninsula the average wage of a coolie is 27 cents per diem, which is equivalent in English money to 7½d., or about the same rate at which labourers by the month are paid in Southern Nigeria, so that figures given by Mr. Arden (pages 84–86, Johnson’s book on Para) for opening up and maintaining a plantation in the Federated Malay States may be taken as a very fair guide.

“ In the Federated Malay States, Para trees became productive in five years, but I propose to allow seven years in the case of Southern Nigeria.

“ Cost of opening up 500 acres and maintaining till plantation is productive:—

“ First year	... ..	\$25,275
“ For next six years at \$9,900	... ..	\$59,400
“ Total		\$84,675 or £9,878 15s.

“ Allowing compound interest at 4 per cent. on expenditure from the first year to the end of the seventh, would bring the total up to

£12,694. If the trees are planted 20 ft. by 20 ft., *i.e.*, 108 to the acre, and the average yield per tree be taken as  $1\frac{1}{2}$  lbs. per annum (6 months tapping), the yield would be (500 by 108 by  $1\frac{1}{2}$  lbs.)—

“ Selling price at 2s. 6d. per lb.

$$\text{“} = \frac{500 \text{ by } 108 \text{ by } 1\frac{1}{2}}{8} = \text{£}10,125.$$

“ If plantation expenses, cost of manufacture of rubber and freight to Europe be put down at £2,125 per annum (a very high figure), a handsome profit of £8,000 would result.”

This calculation is pretty much in accord with the usual estimate of £20–30 as the cost of bringing a rubber estate to the productive stage per acre. In the Federated Malay States it is generally found that one coolie is required for two acres while the trees are growing, and one to each acre when they are producing. Labour is the principal item, and the cost and scarcity of labour is likely to prevent cultivation in Rhodesia and the Transvaal. In West Africa there is a great field, but the climatic conditions are unsuited to the private settler, and the work will be left to the native growers and to companies and syndicates which can acquire large areas and organise industry. The treatment is often slovenly, and the impurities found in West African rubber affect the price unfavourably.

The figures taken by Mr. McLeod in the above calculation seem to be on the safe side. He gives 108 trees to the acre, but 120 can easily be grown; and a yield of  $1\frac{1}{2}$  lbs. per annum per tree, whereas 2 lbs. are frequently obtained from a mature tree. The other crops which can be obtained while the rubber trees are growing, such as cassava, tapioca or ground-nuts, may also be taken into account.

## THE FINANCES OF THE LEEWARD ISLANDS.

IN the issue of this Journal for October, 1907, a brief reference was made to the improvement that had recently taken place in the financial position of the Colony of the Leeward Islands. The affairs of this group have a more than local interest, as showing how a depressed and harassed industry can be supported by energetic effort and judicious government assistance.

The improvement has been continued, we are glad to learn, during the past financial year, and the prospects of the five presidencies of which the Colony is composed are better than they were at any time during the last three decades. The total revenue of the Colony for 1907-08 was the highest on record, and amounted to £151,520, exceeding the revenue for 1906-07 by £13,366. Of the five presidencies, Antigua leads the way with a revenue of £50,619, closely followed by St. Christopher and Nevis, with a revenue of £49,336. Next comes Dominica with a revenue of £38,998, over £5,000 more than in 1906-07; then follows Montserrat with a revenue of £10,232; and lastly come the Virgin Islands with a revenue of £2,335, little enough to meet the requirements of the numerous islands comprised within that presidency, but £285 in excess of the expenditure for last year. Both Dominica and Montserrat have set up fresh records, and, so far as can be ascertained, the two islands were never in a more prosperous condition than at the present time. The total expenditure of the five presidencies in 1907-08 was £134,273, leaving a handsome balance of £17,247 in favour of revenue. In contributing to this balance, which was £9,088 in excess of the balance for 1906-07, Dominica comes first with a surplus of £8,378, Antigua next with £3,652 (this being the first time for sixteen years that its revenue has exceeded its expenditure), St. Christopher and Nevis next with £3,215, then Montserrat with £1,717, and lastly the Virgin Islands with £285. On the 31st March

last the total assets of the five presidencies of the Colony exceeded the liabilities by £38,485, and, judging from the returns of revenue and expenditure for the first four months of the year 1908-09, it would seem that the surplus of assets will be increased by the 31st March of next year.

The principal sources of the wealth of the Colony are: in Antigua and St. Kitts-Nevis, the sugar and cotton industries; in Dominica, the lime and cocoa industries; in Montserrat, the lime and cotton industries; and in the Virgin Islands, cattle, cotton and shipbuilding industries. The cotton industry in the Virgin Islands has been fostered carefully by the Government, and the Agricultural Department purchases at fixed rates the seed cotton which is brought to the Government cotton ginney at Tortola, and undertakes, at its own risk and charges, the ginning, baling and shipment for sale of the cotton. An attempt is being made, which, in course of time, is likely to prove successful, to foster on similar lines the lime industry, and it is only by the adoption of this paternal policy that there is a reasonable prospect of the Virgin Islands attaining gradually to a moderate condition of prosperity, seeing that there are no capitalists or large proprietors in the islands who can lead the way in industrial or commercial enterprises. Of the five presidencies of the Colony, Dominica appears to be the only one in which any considerable increase in the annual revenue may be expected from year to year. A revenue of £50,000 a year each should, with care, suffice for the reasonable requirements of Antigua and St. Kitts-Nevis, and allow of further additions being made to surplus funds. It is not likely that, as a general rule, a revenue of £50,000 will be much exceeded in either presidency, and, if there should be any excess, it will be a question for the Government to consider whether the heavy import duties now in force should not be reduced in those two presidencies.

There is one dark feature in the present satisfactory condition of the finances of the Leeward Islands, and that is the amount of a long-standing public debt, which, after deducting sinking funds, amounts to £208,599, with charges for interest and sinking funds for 1908-09 of £14,398. This is a large sum for so comparatively small a Colony to have to pay, and it is unfortunate that Antigua, whose present debt is £95,511, or nearly twice as much as its revenue for 1907-08, has the least to show for its debt, the interest on, and the sinking funds for, which amount this year to £6,874.

It is a notable fact that what may be called the revival of prosperity in the Leeward Islands should have come just ten years after the establishment, thanks to the initiative of Mr. Chamberlain, of the Imperial Department of Agriculture. From its inception in 1898 the Department has been admirably organised and worked by Sir D. Morris and his able assistants, and to it the Colony of the

Leeward Islands is indebted, to no small extent, for the changes that have taken place in its position and prospects.

In 1903 an enterprise was taken in hand which has contributed largely to the improved position of the sugar industry. A company undertook, with the help of £15,000 lent by the Government, to erect a central sugar factory capable of making not less than 30 tons of 96 degrees grey crystals sugar per day, or 3,000 tons in the season, and arrangements were made with the planters and peasants to be supplied with sufficient cane. The enterprise has been a financial success, and has, we believe, given satisfaction to all parties.

## BUSINESS NOTES.

### Recent Improvements in the Working of Telephone Trunk Lines.

The ear is a marvellous organ which in some way that is little understood is an exquisite analyser of sonorous vibration and interprets speech amid the turmoil of considerable disturbances. But in long distance speaking over wires there are many factors which create difficulties, and to make the best of the system a certain amount of "telephonic education" both for the voice and the ear is necessary. Inventors are perpetually at work to make the task easier by reducing resistance, radiation and leakage. The first object is to prevent waste of energy; the second to direct the energy into a proper channel to maintain the amplitude and form of the waves. One expedient is by tuning—the circuit is broken up into a series of sections in which the energy flows in virtually simultaneous steps instead of being prolonged and damped down as it would be in a long submarine cable.

The "Pupin" coils are devised with this object, and very satisfactory results have been obtained in the United States from them, inserted in telephone trunk lines.

These coils are "inductive" and their function is to counterbalance the capacity effects which are inherent in long double lines of electrical circuits, and which interfere seriously with the transmission of speech over the circuit.

Broadly speaking, the effect of these coils is to more than double the length of line of any definite size of copper conductor over which speed is satisfactory. For instance, a conductor weighing 150 pounds per mile is, with the insertion of one Pupin coil every eight miles, equal in all telephonic respects to a conductor weighing 400 pounds per mile without coils.

Between New York and Chicago—a distance of about 1,000 miles—175-pound copper conductors are used with these coils inserted every eight miles, and the speaking is found to be quite as perfect as that over a 435-pound conductor circuit without coils.

At the present price of copper, £75 to £80 per ton of wire, a 1,000-mile two-wire line with 150-pound conductors and 125 coils, would cost between £13,000 and £14,000 excluding labour and poles, whereas 400-pound conductors would cost from £26,500 to £28,500.

For any well insulated metallic circuits with conductors, each weighing more than 100 pounds per mile, and for any distance above 200 miles, the one size of coil, placed at the same distance apart (namely every eight miles) has an equally good effect in improving the quality of speech. We are given to understand that these coils can be obtained for a price not exceeding £25 each, but probably somewhat less.

In the United States there are 25,000 miles of overhead lines equipped with Pupin coils, and over 100,000 coils have been supplied for underground lines, in which they are placed  $1\frac{1}{2}$ –2 miles apart.

---

### Motor-cars.

Complaints are made of spares being packed for export without waterproof lining in the cases, and without greasing or packing the articles in oiled papers. The result in such cases is that rust badly seizes the parts; thus pistons arrive with the rings rusted tightly on them. A little attention to this matter would make a great deal of difference in the reputation of a firm in the colonies, many of which are now importing motor-cars on a great and rapidly increasing scale.

It is found in hot climates that spring-controlled-valve type carburetters give too rich a mixture if set for easy starting, and are somewhat irregular in action, while owing to the heating arrangement sometimes embodied, they become excessively hot in running. The simple float type has proved superior for local conditions.

Great trouble is sometimes caused by failures of petrol and oil supply pipes, owing to the joints being soldered only instead of brazed.

The Ceylon Government are contemplating an extensive use of motor-cars for the use of inspecting officers and others. It is believed that this will effect a saving in transport. An Albion car has been run at a cost of 43 cents per mile (allowing 10 per cent. for depreciation), the distance covered being 9,460 miles; and on this basis travelling would cost only about half the present amount.

The questions of supply were referred to the Mechanical Transport Committee of the War Office, which recommended the 16 h.p. Albion for the larger car, and the 10-12 h.p. Humber for the smaller.

The Southern Nigeria and Uganda Governments have Albion cars fitted with the Cottrell carburetter, and cars run with paraffin fourteen miles to the gallon.

## Cotton-gin.

The new "Universal" cotton-gin may prove a great boon to the colonies which are now producing cotton. It is designed to remove the seed from the cotton in such a way as not to damage either the staple or the seed. Very little power is required to drive it. The present machines have a knife or saw, and the seed and fibre are inevitably cut and damaged. The "Universal" simply combs the seed from the fibre, and the cotton turned out has been valued at from one-eighth to one quarter of a penny per pound more than that gained by the old machines. We have received the following report on it by Professor T. W. Fox, Professor of Textiles, Municipal School of Technology, Manchester:—

"I have recently carefully examined, at the St. Ann's Iron Works of Messrs. Musgrave & Co., Limited, of Belfast, the 'Universal Fibre Gin,' and I proceed to report upon the condition and capabilities of that machine.

"Since my first inspection of this gin, as far as the mechanical features are concerned, it was not then so perfect as it is now. The ginning branch of the cotton industry has remained essentially unchanged. There is the same pressing demand for a gin which will clean without injuring the fibres, and judging from the slight changes which have been made during recent years, it would appear that the present types have reached their highest development. But if the gin is to assume its legitimate position in the industry, namely, to furnish the spinner with a sound staple and cease to convert into waste large quantities of a valuable commercial article, changes as radical as those which have been made in spinning, preparing and weaving machinery are necessary.

"Ginners have been subjected to much adverse criticism for continuing to use obsolete machinery, but it is not entirely their fault, for they can only select from available types, such gin as will be most economical and most adapted to their needs. Still, there is too great a tendency on their part to work for quantity rather than quality of output, partly because injury done to the fibre at this stage only remotely affects them.

"The 'Universal Fibre Gin' is the result of efforts to raise ginning to the level of other sections of the cotton industry.

"It is a machine in which the strong features of the 'McCarthy Gin' are combined with others of an entirely novel character, and the combination has, in my opinion, produced the most efficient gin upon the market.

"The essential difference between the 'Universal Fibre Gin' and the 'McCarthy Gin' consists in the method of constructing the ginning roller and in the use of a vibrating comb instead of a vibrating knife. There are also many minor differences which tell greatly in favour of the 'Universal Fibre Gin.'

“Great attention has been given upon the general design of the machine. The bearings are long and rigid, and, except at the combs, provision is made outside the framework for lubricating all moving parts. There is no risk of one being thrown into the cotton. All adjustments necessary for different staples can be made simply and accurately. Belts from a bottom shaft convey motion to all parts of the machine. Fire risks are reduced to a minimum. A damaged comb can be readily replaced. In my opinion the machine as a whole is efficient and not liable to get out of order. It treats short and long fibres with equal ease, by reason of the closeness of the bite and the firm grip of the roller. It cleans the fibres better than other gins because it rejects much foreign matter that other gins allow to pass. It is not so liable to bruise, cut, strain or stain the fibres as other gins.”

---

#### A British-built Fire Boat.

On June 12th a new seagoing fire and salvage boat, built by Messrs. Merryweather & Sons, of London, for the Genoa Harbour Board, underwent its official trials on the Thames. A trip was made from Greenwich to Tilbury, where the pumping capabilities of the vessel were demonstrated. There are two monitors on deck, which can be moved in any direction, either laterally or vertically, so as to send a jet in the required quarter, and as evidence of what the pumps are capable it may be mentioned that a powerful 3-in. diameter jet was cast to a height of over 200 ft. With both monitors in action two jets, each 2½-in. diameter, were then brought into play, and afterwards, with the aid of flexible hose and branch pipes, as many as 12 jets were discharged simultaneously. The propelling and pumping tests were in every way satisfactory, and the vessel travelled over the measured mile at Long Reach at 10 knots an hour (one knot in excess of the contract speed). All present, including the representative of the Genoa Harbour Board, as well as representatives of various foreign embassies and navies, evinced the utmost interest in the proceedings. The vessel is called the “San Giorgio,” and is 70 ft. long with 16-ft. beam, and draws 5 ft. of water. It is propelled by two double cylinder compound engines driving twin screws, and the fire engines are of the double cylinder “Greenwich” pattern, with a total pumping capacity of over a quarter of a million gallons per hour. For fire extinguishing the pumps take water through the side of the vessel, but for salvage purposes the suction is taken through two deck connections with 6-in. pipes. Two Merryweather quick steam raising boilers supply the steam, and by means of an oil fired header a low pressure of steam can always be maintained in one of the boilers, thus effecting a considerable saving of time in raising steam

for starting the vessel. A great feature of this boat is that the boilers, engines and machinery are all in duplicate, so that the vessel can be practically relied upon as being always in fit condition for service, as in the event of any part of the installation requiring attention or adjustment the corresponding section can be at once utilised.

---

### Inks.

Where transport is difficult, liquid ink is often wasted by leakage, and it may be better to import ink powders. No doubt the ink produced from powder is never quite so good as the fluid ink, but the quantities ordered from the colonies are increasing, and evidently the article is found in some places convenient and satisfactory. It is sold in packets making one pint, and the price is from 1s. 9d. to 2s. 4d. per dozen packets, according to colour and quality.

---

### Steel Rails.

Trouble both with corrugations on the head of the rail and with excessive wear is common, and has been materially increased in this country since the introduction of electric traction. On the Metropolitan Railway it has recently been reduced by the use of high silicon rails made by the Sandberg process, which in parts where the traffic is very heavy has been found to give an extra life of over 100 per cent. These high silicon rails have also been tried on the Great Northern Railway and on the South Eastern and Chatham Railway. Their price is about 10s. per ton above the ordinary market price of rails.

---

### Mahogany.

The July number of the *Journal of the Royal Society of Arts* contains an article on mahogany, which prophesies that in the near future it will be found that the value of mahogany will be seriously enhanced. It is to be hoped, in the interests of West Africa and British Honduras, that this will be the case. In the former place, however, the business, though it has grown to gigantic proportions in recent years, is affected by labour troubles, as the natives find that work in the mines and other undertakings is more profitable and permanent. The following remarks on the virtues of mahogany are of interest to producers and buyers:—

“To the connoisseur mahogany possesses a beauty of appearance when of fine colour and richly figured, but extreme colour becomes a blemish, especially if the texture is not good. Another important and almost unique feature is that this wood with age mellows in appearance and attains a bloom of colour not evident when newly wrought. Possibly, with the exception of oak, it is the only wood possessing this trait. Rosewood and Padouk, when made up

and newly polished, have a charming appearance, but with age the colour fades, and the wood assumes a listless or dead appearance. Whether to place figure in mahogany before its colour is a point upon which experts may differ, but either in themselves make a log valuable; but, whilst nature is prolific, it is seldom that the combination of figure, colour and texture is found in one log. Where these three factors are blended they form a beauty much to be admired, and give a value to a log ranging from 2s. 6d. to 30s. per foot, whilst the cargo average may only be from 4d. to 6d. It will be understood that where logs realise the high prices stated they are used in veneer form, whilst the cheaper wood is used in the solid.

“Plain mahogany has a utility peculiarly its own, and its uses are almost illimitable; for ordinary furniture and for painting and enamelling it is without a compeer.

“*Size.*—Whilst the uses of many fancy woods are limited by their small sizes, mahogany stands out as a wood giving either extreme length or width, or both combined; hence for signs, fascia boards, counter-tops and panels for railway carriages it is unrivalled. Sometimes it is of hard texture, and in other cases of a mellow nature, making it suitable for carriage panels. Then mahogany, even when figured, does not possess that alternate hardness and softness of grain characteristic of many woods, which makes it so difficult to obtain an even surface on them in highly-finished work. Some woods, whose initial cost may be low priced, yet in their manipulation, after all the care possible has been spent upon them, show a ridgy face and lack a fine even surface, owing to their absorbent nature and uneven fibre; they will not compare in beauty even with an ordinary grade of mahogany.

“*Warping and Twisting.*—The great desideratum in high-class woodwork, if the cost of the labour is to be justified, is to use a wood which when wrought will stand—that is, neither warp, twist or shrink. Many fancy woods, even when reasonably seasoned, have these failings, but in mahogany they are absent in a marked degree; it can also be readily seasoned.

“*The Cost.*—Of all the furniture woods available, if we except the few specially-figured logs, the average cost of mahogany is lower than that of many of its rivals, it is also less wasteful in conversion.”

---

A self-docking floating dock, constructed by Messrs. Swan, Hunter and Wigham Richardson, was sent in tow for Lagos on August 8th. It will be able to raise a vessel of 400 tons displacement within an hour. The price of the dock, delivered in Lagos, was £12,350, and £490 was paid for galvanising the bottom, sides and end.

**Atoxyl (for Sleeping Sickness).**

This is a protected name and cannot be used by other manufacturers than Messrs. Greef, of Germany. The drug is, however, a well-known chemical composition, and can be made in England. "Atoxyl" has in some cases been attended with loss of sight by the patient. Other preparations, known collectively as atoxyl-derivatives, are coming into use, and it is claimed for them that they are equally efficacious, and do not produce symptoms of poisoning. "Soamin" is sold by Messrs. Burroughs & Wellcome at 4s. per ounce, as against 7s. 6½d., the price of "Atoxyl."

---

**Windmills.**

The following practical letter is extracted from the *Cape Agricultural Journal*.

"SIR,—Since the importance of irrigation by means of windmills very largely affects the South African farmer, and since the subject of windmills is frequently dealt with in your Journal, I venture to bring to the notice of farmers, through this medium, a few facts, concerning windmills in particular, which are sure to prove of considerable value to many unacquainted with the possibilities of windmills.

"Many look upon windmills as mere playthings, only suitable for pumping sufficient water for domestic purposes or small flower gardens. This impression arose from the large number of failures seen everywhere. These failures, in turn, are due to (1) An inferior mill incapable of doing its work when nature provides variable winds and working only in a particular wind velocity for which it was built. (2) An inferior mill incapable of resisting safely the variable stresses to which it is subject, even when not working, and hence necessitating continual repairs. (3) An inferior mill incapable of taking care of the pump, which it has to operate in high winds, thereby pulling or jarring the pump cylinder valves or rods to pieces, necessitating continual pump repairs. (4) An inferior mill incapable of taking the maximum energy from the wind and converting it to useful pumping work, thereby causing heavy loss of work done during any given period. (5) Inferior engineering and erection of windmill plants. In quite a large number of cases, windmills have been sold with pumps and erected where the pump is entirely out of proportion to the mill which has to drive it. In quite many cases, too, the persons responsible for the engineering of a windmill plant for a given locality have shown a marvellous lack of knowledge of wind velocities obtaining at that locality.

"Given a thoroughly good and reliable windmill and expert windmill-engineering skill to plan out and erect the plant, there is now no doubt left that the windmill is a most satisfactory motor for

driving pumps for irrigation purposes. A good windmill, correctly installed, will pump enough water—under average conditions—to properly irrigate from 3 to 8 morgen of cultivated land. When we consider that this amount of water is raised for the price of lubricating oil only, and that this lubrication is only attended to once in every six weeks, we see at once the great advantages of using good windmills and making sure that they are absolutely correctly installed by responsible and reputable firms.

“ Without desiring to give any one firm or windmill a cheap advertisement, but merely for the benefit of the farmer, who may be in need of reliable pumping plant, these figures are given to show the average cost of maintenance of a first-class windmill, well engineered at erection, and since running continuously in all winds :—

“ Mill. ‘ Samson,’ erected in January, 1907, at the Government Farm, Potochefstroom, by Messrs. Malcomess & Co., Ltd. The ‘ Samson ’ was erected to replace another windmill which was erected on the same place by another firm in March, 1904. Since the erection of the ‘ Samson ’ in January last, it has been left open to work in all winds, and was never shut off once, except when oiling it. During the nine months its cost of maintenance was as follows :—

			s.	d.
To $\frac{1}{2}$ gallon lubricating oil	...	...	2	9
To repairs and spare parts	...	...		nil.
Total	...	...	<u>2</u>	<u>9</u>

The old mill, which first stood on the same place, showed the following figures for its cost of maintenance :—

March, 1904, to December, 1905, repairs	...	£19	9	0	
December, 1905, to November, 1906, repairs			8	12	0
Total for 32 months	...	<u>£28</u>	<u>1</u>	<u>0</u>	

Expenses in maintenance per month, 17s. 6 $\frac{1}{2}$ d.

Hence this mill costs more than six times as much to maintain for one month as the ‘ Samson ’ cost to maintain for nine months.

“ Besides this ‘ Samson ’ mill belonging to the Government, we have here in this neighbourhood at least eight other ‘ Samson ’ windmills, none of which costs more to maintain at the most from 8s. to 10s. per annum, and these mills are all running continuously and have been for the past two years.

“ There are several good windmills on the market, but it is safe to conclude that the would-be purchaser of a windmill will not be induced to buy a windmill unsuitable for his requirements if he uses ordinary care and the experience of those who have bought windmills, when selecting a mill.

"I have stated above that under average conditions from 3 to 8 morgen can be well irrigated by a windmill. This applies to the smaller plants operating over small boreholes. There are many 'Samson' windmill plants to-day irrigating very successfully as many as 20 morgen of land. In such cases the water is usually drawn from rivers, open wells or fountains.

"Another point which very often gives rise to doubt when the farmer contemplates irrigating lands by means of windmills, refers more to the supply than to the windmill. Briefly stated it is this: 'Which plan will answer better, one or two large and deep boreholes, with one or two large windmills erected over them, or several small boreholes with a small windmill erected over each?' Practical experience as well as theory at once reply that small 6-in. boreholes, sunk to moderate depths, with small windmills over them, not only cost less to instal and to maintain, but yield in proportion much more water than larger plants. A 9-in. borehole sunk in these parts cost £3 per foot to drill. It was drilled 1,100 ft. deep, and thus cost £3,300. At 100 ft. down water was struck which rose 20 ft. The supply was tested up to 5,000 gallons per hour. A windmill was erected and the pump placed 400 ft. down. The windmill pumps from 4,800 to 6,000 gallons per hour, according to the wind, but cannot reduce the water level in the borehole below 80 ft. from the surface. This windmill cost approximately £500 to instal. Hence for, say, 6,000 gallons per hour the initial cost was £3,800. Now if 5 boreholes, each 6 ins. diameter and 100 ft. deep, had been drilled instead, and over each a small windmill erected costing approximately £70 each, the total cost of boreholes and windmills would have been £850, and the quantity of water pumped would have been, under the same conditions, from 7,500 to 9,000 gallons per hour.

"The farmer must make sure to build a good reservoir—preferably of cement—in which to pump the water. To store the water before use is more than half the battle won."

---

The Tanjong Pagar Dook Board in the latter half of 1907 made a profit of \$864,968, and has accumulated a reserve fund of \$254,848, notwithstanding the charging of certain works of a capital nature to revenue. During the six months 1,270 vessels used the wharves and 136 were dry docked. The Board is to be congratulated on these satisfactory works. The work done is of enormous importance to commerce, and the Board itself is an interesting example of a body constituted by Government, but consisting mostly of unofficial members, and practically left without interference. On the 15th October the Board accepted the tender of Messrs. John

Aird & Co. for the construction of a wet dock and the reconstruction of the main wharf, all in accordance with the conditions and specification of the Consulting Engineers dated June, 1907, at a cost of £998,700, the time of completion being five years. Since that date a number of the engineers' and contractors' staff have arrived in the Colony and work has commenced. The area of the wet dock is  $24\frac{1}{2}$  acres, and provides 3,837 ft. of quay wall, also 1,900 ft. of pitched slope; the depth of water at L.W.O.S.T. being 30 ft. The main wharf reconstruction covers a total length of wharf of  $4,575\frac{1}{2}$  ft., of which 3,144 ft. will be in concrete block-work wall and  $1,431\frac{1}{2}$  ft. wrought-iron cylinder construction, with a minimum depth alongside at L.W.O.S.T. of 33 ft.

---

The German Government are arranging for an International Commission to unify the international regulations for testing petroleum oil and products and facilitating the transport. The British Government have been invited to send representatives. Unification will do away with much uncertainty and confusion.

---

We have been requested to state that an international exhibition of industries and labour will be held in Turin in April-October, 1911, the fiftieth anniversary of the proclamation of the Kingdom of Italy. There will be a simultaneous exhibition at Rome of a historical, archæological and artistic character, and there is no doubt that the occasion will vastly swell the number of visitors to these cities. Exhibitors are particularly requested to send articles with a stamp of novelty and progress.

## COLONIAL STAMPS.

A POINT of some interest to Colonies which issue stamps printed by the steel plate process has arisen since our last issue. It appears that owing to the numerous wettings undergone by these stamps, as explained on page 66 of our issue for June, 1907, so much distortion takes place that it is impossible to bind them into stamp books without an excessive spoilage. Besides this, all the plates used for this class of stamp have hitherto been made so as to print continuously, *i.e.*, not in panes of 60 stamps with a margin between the panes.

This will be more clearly understood if we explain the way in which the books are made. For this purpose we will suppose that each book is to contain eighteen 1d. and twelve  $\frac{1}{2}$ d. stamps, and that the stamps are printed by the surface process. Three sheets of 1d. stamps and two of  $\frac{1}{2}$ d. stamps, interleaved with waxed paper, are laid one on the top of the other, and at the top and bottom a sheet of stiff paper covers. A machine like a sewing machine "runs" the edges vertically once and the central "gutter" between the panes twice with wire. Then the whole is cut vertically between the two central sewings and horizontally below every second stamp. Each page thus contains six stamps, but, of course, half the books open with the hinge to the right of the opener instead of to the left. The alternative to this inconvenience is to have the card at the top and bottom printed with certain columns upside down, but the result of this is even worse than the awkward opening, as the stamps themselves will appear upside down when the book is opened.

The only way to obviate these difficulties is that adopted by the Imperial Government, *i.e.*, the purchase of stamp printing plates which print the fourth, fifth, sixth, tenth, eleventh and twelfth columns of stamps upside down, but the expense of this is considerable, and even if it is adopted the watermark of the above columns will be upside down.

The price usually charged to the public for a book such as that described above is  $\frac{1}{2}$ d., but unless at least 5,000 books are required at a time they cannot be placed in the Colonies under that price.

The proposal of the Commonwealth of Australia to have an uniform issue of Australian stamps has not passed without a strong protest from New South Wales. The following extracts show the grounds of the objection, and the reply. It will be seen that the new issue has not been decided on:—

“SYDNEY,

“27th November, 1907.

“SIR,

“I have the honour to state that I am advised that the Board recently appointed by the Commonwealth Government ‘to consider and report on the best methods to be adopted to ensure a suitable issue of postage stamps that will be available for immediate use during the bookkeeping period, and thereafter for use as an issue for the Commonwealth without distinction as to States’ have reported in favour of (1) an uniform issue throughout the Commonwealth; (2) printing in one office; and (3) steel plates.

“Further, it has been announced in the press that Sir William Lyne has decided to have the postage stamps printed at one central office in Melbourne.

“In view of this announcement—and as it has not been contradicted it is assumed to be true—I wish, on behalf of the State of New South Wales, to protest strongly against such a proposal being adopted.

“Such a course will not be in the best interests economically of the Commonwealth, and its adoption will have the effect of ignoring the just claims of this State to consideration. Indeed, I make bold to say that the whole history of the proceedings in connexion with the appointment of this Committee evidences a want of consideration for this State.

“Now that the report has come to hand, which contains a proposal to use steel plate printing, Mr. Gullick, the State Government Printer, points out that the modern Power Plate Press for the printing of postage stamps on the lines suggested by the Board has been in use in the Government Printing Office, Sydney, for the past nine years, and in no other office in Australia, and although a sum of £2,000 would supplement the plant of this State to an extent sufficient to enable it to turn out the entire postal issue of Australia, the Board has recommended the Commonwealth to enter into an expenditure which is probably under-estimated at £30,000.

“The effect upon this State will probably be to render useless expensive plant which has been in operation for some years past, to throw out of employment a large number of men, to increase the cost to the taxpayer generally, and cause the transfer of the work from a responsible officer who has proved himself eminently fitted for these duties, to some other person whose qualifications cannot be higher, but will very probably be lower.

“Mr. W. Hull, the substitute for Mr. Bassett Hull, is of opinion that the purchases by stamp collectors will amount to a very large sum which will go largely to reduce the increased cost if the work was carried out in Melbourne. Other philatelists in this State, however, are of a different opinion, and state that Mr. Hull’s figures are very largely over-estimated.

“For the reasons above mentioned, and in view of the fact that this State has in no way been consulted officially from first to last with regard to this matter, I would ask that the matter shall be re-opened, or at all events not finally determined until the views of this State and the capabilities of the Government Printing Office in Sydney are made known to your Government in detail.

“I have, &c.,

“(Sgd.) C. G. WADE.

“The Honorable the Prime Minister of the  
“Commonwealth of Australia,  
“Melbourne.”

“MELBOURNE,

“7th February, 1908.

“Sir,

“In acknowledging the receipt of your letter of the 9th January, 1908, relative to your protest against any proposal to concentrate in Melbourne the printing of stamps for the various States of the Commonwealth, I have the honour, at the instance of my colleague, the Treasurer, to inform you that the report of the Stamp Printing Committee has not yet been considered by this Government, and that, even should it be decided to adopt the Steel Engraving process, it will be a considerable time—say two years—before the necessary designs would be approved, dies cut, &c. In the meantime there is no intention of making any fresh departure so far as your State is concerned.

“I have, &c.,

“(Sgd.) ALFRED DEAKIN.

“The Honorable the Premier of  
“New South Wales,  
“Sydney”

---

In our last issue we stated that the new  $\frac{1}{4}$ d. CAYMAN ISLANDS stamps and postcards were for internal postage within Grand Cayman. We have since been informed that, though it was originally intended to confine them to local circulation, it has been found necessary, through lack of  $\frac{1}{4}$ d. stamps, to allow them to be used for foreign postage. A further supply of both stamps and postcards of the farthing value is now in hand.

TRINIDAD has decided to complete the adoption of the new colour scheme by using the colours appropriated to the 4d., 6d. and 1s. values.

ST. VINCENT will issue stamps of the values of 6d. and 1s., of the design already seen in the lower values. It is intended to continue to use King's Head stamps for the 2s. and 5s. values, but all the above four values will conform to the new colour scheme.

THE STRAITS SETTLEMENTS will adopt the new colour scheme for all values except the 3 cents stamp. New plates are in hand for the \$25 and \$100 values. These stamps will be of large size, and will show the King's Head printed from the new large key-plate. The colours of these two values have not yet been decided on.

Other Colonies which have decided to adopt the new colour scheme without any alteration of design are NORTHERN NIGERIA and FIJI.

Of the impending changes mentioned in previous issues the following have appeared during the past quarter:—

BRUNEI.—1, 2, 3, 4, 5 and 8 cents.

NATAL.—2s., 5s. and £1 postage stamps; and 6d., 1s., 2s., 2s. 6d., 5s., 10s., £1, £1 10s., £5, £10 and £20 Revenue stamps.

CAYMAN ISLANDS.—6d. stamp, "Postage and Revenue."

SIERRA LEONE.—6d., 1s., 2s. and 5s.

The following will appear before our next issue:—

NORTHERN NIGERIA.— $\frac{1}{2}$ d. and 1d.

BRITISH HONDURAS.—2 and 5 cents.

ORANGE RIVER COLONY.—1s. postage stamps have been supplied for the first time on multiple watermarked paper.

MAURITIUS.—An entirely new issue of stamps has been arranged. As stated in our October, 1907, issue several corrections have been made in the Arms of the Colony. The following stamps will be printed from the new "Arms" Keyplate, the existing set of duty plates being used with it:—1, 2, 3, 4, 6, 8 and 15 cents. The following values will be printed from the old Universal King's Head Keyplate:—5, 12, 25 and 50 cents, R. 1, Rs. 2.50 and Rs. 5.

The colours of the above stamps will be those appropriated in the new Colour Scheme to the following values respectively:—Less than  $\frac{1}{2}$ d.,  $\frac{1}{2}$ d.,  $\frac{1}{2}$ d., between  $\frac{1}{2}$ d. and 1d., 1d.,  $1\frac{1}{2}$ d. and  $2\frac{1}{2}$ d. for the Arms series, and between  $\frac{1}{2}$ d. and 1d., 2d., 4d., 8d., 1s., 2s. 6d. and 5s. for the King's Head series.

The 4 cents stamp will be sage green with carmine label and the 5 cents stamp grey with carmine label. A supply of 2, 3, 4, 6 and 15 cents stamps will be sent to the Colony towards the end of the current year.

As we have frequently referred, and shall frequently refer in the future, to the new colour scheme, it may be useful if we give below the official descriptions of the colours used. The names are not intended as an accurate description of the shades of colour but will be sufficient to distinguish one from another.

Value.	Duty or Border.	Head.	Colour of Paper.
Under ½d.	Black	Black	White
½d.	Brown	Brown	White
¾d.	Green	Green	White
1d.	Red	Red	White
1½d.	Orange	Orange	White
2d.	Grey	Grey	White
2½d.	Blue	Blue	White
3d.	Purple	Purple	Yellow
4d.	Red	Black	Yellow
5d.	Sage Green	Purple	White
6d.	Purple	Purple	White
7½d.	Yellow	Purple	White
8d.	Black	Purple	White
10d.	Red	Purple	White
1s. 0d.	Black	Black	Green
1s. 6d.	Blue	Green	White
2s. 0d.	Blue	Purple	Blue
2s. 6d.	Red	Black	Blue
3s. 0d.	Violet	Green	White
4s. 0d.	Red	Black	White

£1	Black	Purple	Red
£5	Yellow	Green	White
£10	Blue	Purple	White
£25	Red	Green	White

## REVIEWS AND NOTICES.

**The Cradle of the Deep, an Account of a Voyage to the West Indies.**—By SIR FREDERICK TREVES, Bart., G.C.V.O., C.B., LL.D. (*Smith, Elder & Co.* 12s. net.)

It is refreshing to find from this book that the great surgeon is blessed, amongst other gifts, with the heart of a schoolboy. The hero of the work is Drake, and the story is largely that of the buccaneering vendetta against Spain. Sir Frederick Treves describes the scenery and the manners of the islands with a vivid touch, but he regularly gets back to the pirates, and loves to conjure up old scenes, where the outlass and the brandy keg figure large. "The captain is enthroned on a stout sea chest. He is an execrable-looking villain. One of his eyes has been gouged from its socket, while the lid of the other is made to droop by reason of a sabre cut, which has left a pink streak across his temple. He is dressed in a green satin coat, with voluminous skirts, &c., &c." Then comes a fight, picturesquely described with imaginative details, and the Spanish galleon is captured by the filibusters, the captain crying, "Jesus bless us, are these devils or what are they?"

In the same vein pictures are drawn of the life on land during this merry period. At Port Royal "slaves trundling casks along the cobbled road would be brought to a stop by a hatless mariner lying full length in the path, with no sign of life in him beyond an occasional babble of unintelligible speech that issued from his baggy lips. Now and then a string of purple-faced revellers would lurch by arm-in-arm, rolling to and fro like linked beacons in a choppy sea, bellowing as they went the refrain of a ballad learnt ten years ago in England. In a by-lane might be seen a Jew haggling with a sister over the price of a crucifix, and in a dark corner, near by, the lank corpse of a man who had died of yellow fever." On the whole the extinction of romance seems not to have been without considerable compensation, but at a safe distance an adventurous and reckless epoch has a special fascination for a generation which is dogged at every footstep by a prosaic law.

The reader must not expect to find in these pages any dealing with current political or commercial subjects—the passing traveller is not obsessed by the federation of the group or the prospects of sugar. But the aspect of things is described with an extraordinary clearness. The account of the Kingston earthquake, “a record of ten seconds,” is a blend of the minuteness of Defoe and the word colour of Hearn.

The medley of races and manners is throughout well illustrated. We extract a story from the description of Montserrat, where the first settlers were Irish and the brogue is still preserved. An Irishman fresh from Donegal arrives at Montserrat, and leaning over the steamer's rail addresses himself to a coal-black nigger who has come alongside with provisions.

“Say, Cuffee, phwat's the chance for a lad ashore?”

“Good, yer honour, if ye're not afraid of worruk. But me name's not Cuffee, an', plase ye, it's Pat Mulvaney.”

“Mulvaney? And do yez mean to say ye're Oirish?”

“Oi do.”

“The saints dayfind us. An' how long have yez been out here?”

“A matter uv tin year or so.”

“Tin year. An' yez black as me hat! Save me sowl, I tuk yez for a naygur.”

---

**The Canadian Annual Review of Public Affairs, 1907.**—By J. CASTELL HOPKINS, F.S.S. (Toronto: The Annual Review Publishing Company. Cloth, 12s. 6d. ; morocco, 16s. 8d.)

Every country has its year-book in some shape, but we doubt whether any possesses so clear and readable a compendium of current history as this *Canadian Review*. All the material facts and statistics are given, but they are made vivid by being incorporated in lively descriptions of the controversies and discussions, in parliament and the press, which relate to them; each question is turned round and examined in the light of different opinions, and the reader easily gathers not merely the “what,” but—as is the object in scientific instruction—the “why.” Every subject of the year is handled—the financial stringency with which the U.S. troubles affected Canada, railway enterprises and problems, agricultural and mining conditions, the relations of capital and labour, the varied aspects of immigration, foreign relations, and the work of the federal and provincial legislatures. The work is interesting at every point. As an example of the treatment of subjects, we quote the following from “Problems of Immigration—English and Foreign.”

“In the present condition of Canada the problems of immigration and settlement have to do with race, language, character, local labour

conditions and local prejudices. Certain general difficulties came very much to the front in 1907—some of a surface character and merely irritating; others of a deeper kind and more serious. Amongst them was the coming of nearly 100,000 Englishmen marked by all the characteristics of their nation and with faults, in some cases, which met very sharply certain prejudices and ignorances which Canadians occasionally possess and vigorously express. Many of the Englishmen came expecting too much, believing all the promises of immigration agents and steamship solicitors, naturally ignorant of conditions in a country of vast expanses and infinite variety of climate and interests, hopeful very often of more sympathy and kindly or brotherly treatment than was accorded, ignorant of the hostility of Labour unions to an influx of possible competition, naturally unacquainted with customs and social ways in a country where everything was different from their own surroundings at home and where the people were Americans in personal character and habits although 'English' in allegiance and political sentiment. Some of them were undoubtedly black-sheep and too lazy to really work; others could not stand the hardships of a winter which even Canadians-born found a little trying; adjustment of points of view to new surroundings was not always instantaneous and should not have been generally expected; the financial stringency came suddenly and for a time stranded thousands of the newcomers.

"Canadians, on the other hand, were not as sympathetic as they might have been; prejudices bred, in part, from American influences which always under-rate, where they do not despise or detest, the Englishman, had an effect of frequently preventing his employment and more often in giving a cold or unpleasant tone to the reception of the immigrant; in the West the "remittance man" had created an unfavourable field for the new arrival, while the wealthier United States settler, usually owning his farm and possessed of money and goods, looked down upon the poorer Englishman who yet came from a wealthy and powerful country and who felt, not unnaturally, that in a vague way his people were the real rulers of the land he had come to and were certainly paying for its defence and international protection. The average Canadian keenly resented this latter attitude, forgot the limitations of an island-bred man of narrow personal opportunities, and expected him to be more familiar with the peculiar developments of new social and political conditions in Canada than was the Canadian himself with the centuries-old British system. Hence the friction which marked this great influx of immigrants from the Mother-land and filled a part of the press with mutual recriminations at a time when good-feeling and the helpful hand should have been everywhere dominant. The truth seems to be that the average Englishman expected to find in Canada—as Mr. C. F. Hamilton put it in an able article in the *National Review*, of

September—another England, differing in details but in the main similar and he found, instead, a divergent and diverse nationality more like that of the United States than the United Kingdom. There was ground also for complaint against farmers who hired their men for summer work, paid low wages and got rid of them as soon as the winter came; who sneered, too often, at their ignorance of the new ways of a new country and made too little allowance for the infinite difference between the easy-going life of an English farm-hand and the strenuous work of a Canadian farm. Out of these conditions and from the exceptionally low character of some of the immigrants came such a terrible crime as that of Gowland at Killarney, Man., in May, and that committed at Melbourne, Que., early in July. At a meeting in Toronto on November 14th, Brigadier Howell, of the Salvation Army, went so far as to say that something should be done immediately to protect immigrants from being 'ill-treated by farmers.' As to the alleged English lack of adaptability and Canadian prejudice in the matter the *Victoria Colonist* of November 29th dealt very well with the subject as follows:—

“The Englishman who comes to Canada is handicapped to a certain extent by his training and his traditions. When he goes to the United States he realises that he is in a foreign country, and of all the people in the world none can adjust themselves to conditions existing in a foreign country like Englishmen can. But in Canada they are different; they do not seem to feel under an obligation to adapt their ideas to their new surroundings. They are ready to recognise that there is an American way of doing things, and a French way and a German way, and any number of other ways of doing things, and which they drop into with a facility which makes them the best of all colonizers. They have not yet learned that there is a Canadian way, but they are finding it out, and bye and bye they will fall in with it with the greatest facility. On the other hand the Canadian is a little inclined to think his way the best, and he is not always as considerate as he might be in his way of putting it. He is not exactly bumptious, but he has had a hard fight to make his country what it is, and possibly the result has been to make him just a trifle too cocksure of himself. However this may be, we do not think anyone will deny that he is an exceedingly impatient person, and has not yet learned how to wait for anything. Rarely has the Canadian been trained in a groove, whereas nearly every Englishman has been.’

“The subject was much discussed in Sons of England lodges and in meetings of St. George's Societies during the year, and the consensus of opinion in these organizations was that Englishmen made the best settlers, but that there should be careful selection in the immigrants sent out, and that they should be prepared to go to

work on the farms when they reached Canada. In Toronto, on March 27th, the British Welcome League was formed at a public meeting, with Mr. Albert Chamberlain as President, and did good work during the succeeding year in looking after and helping thousands of immigrants who poured into the city, passed through, went to work locally, or found themselves unable to get work. Varied evidence was supplied to this organization and the press throughout the country as to deception in the kind of work available, the amount of wages, and conditions generally, which many of these men had encountered in the promises of emigration agents and bureaus in England. There was much fraud of this kind perpetrated, and Mr. Mackenzie King's visit to London in this connection was well advised. In December, 1907, stringent orders were given emigration agents, etc., in England to check emigration until February of all who did not have a little money in hand.

. . . . .

"The movement of United States settlers into the West was, on the surface, an easy problem. Usually well-to-do, frequently experienced farmers, often Canadians by birth, they came in an increasing stream of 26,388 in 1902, 45,229 in 1904, and 56,690 in 1907. With them they brought goods and effects which the Customs authorities valued at about \$5,000,000 annually, but which were probably worth \$10,000,000 or more. Most of these immigrants were permanent settlers and farmers, and the bulk of them came from the neighbouring Western States, although there was a proportion from all the agricultural portions of the Republic. The Dominion Government had for some time kept Immigration Agents at all the principal points in these States, and through them distributed a constant stream of literature and information throughout the country.

"In the distribution of this great army of incoming people—nearly a million in five years—friction was bound to occur between the old and the new, as it does occur in every line of life and development. Problems were certain to evolve, and not the least of them was the coming of the Japanese and the Hindu.\* The former became an international issue and is dealt with separately; the latter was small in dimensions but big in talk and pregnant with Eastern possibilities. Only 2,413 of these East Indians were officially stated to have come in during the year, and yet British Columbia made a vehement and pressing public issue of the matter, while, curiously enough, 14,000 Galicians, 2,000 Bukowinians, 1,500 Hungarians, 2,500 Bulgarians, 1,500 Chinese, 1,200 Greeks, 6,200 Russian Jews, 13,000 Italians, 1,400 Finns, 2,200 Swedes and many other racial

---

\* NOTE.—The commencement of this difficulty is dealt with in the 1906 volume of this work.

types of equally distinct and divergent kinds were coming into Canada without question and with hardly a reference in the press."

The history of the agitation against Indian immigration is given lucidly and impartially.

---

### South African Agriculture.

The report of the Cape Department of Agriculture is particularly important when the last hope for a way out of the present depression lies with agriculture. There is a great opening for more skilful and energetic work, and the report indicates in plain terms some present shortcomings. The cows are largely of inferior quality, the yield of milk being deplorably low. As good beef can be grown in the colony as anywhere, but the farmer has to learn how to handle it. "Our conception seems to be that an ox, to qualify for the butcher, must spend a long probationary period at the yoke, and then we wonder why people should perpetually grumble at the quality of our beef. While recognising the necessity for the use of the ox-wagon in many parts of the county, I fail to see why such a large proportion of cattle should have to undergo this training before being slaughtered. I fear it will remain so until the purchasers of slaughter stock begin to differentiate in price very materially between a young animal, which has been more or less continuously fed, and one which is so old as to make it impossible to give us good carcasses. Speaking broadly, I should say that three-year-old beef should be worth to the consumer at least 25 per cent. more than the bulk of the commodity now put on the market, and so far as I am aware there is no difference made in the price paid for the two qualities at the present time. If the question of export should arise at any time, this is the first matter that must be attended to. As we have learned by bitter experience in other branches during the last two years, there is one way of making and retaining a world market, and that is by supplying only the best quality procurable."

The colony imported in 1907 £132,000 worth of bacon and ham, every ounce of which could be produced in the country and at a profit. The bill for breadstuffs was over a million sterling, and a large proportion of this should have been paid locally. What is wanted is more energetic preparation of the land and rotation of crops and "closer settlement."

The hopelessness of the "poor whites" is a painful feature which is brought out with unusual plainness in the following passage:—

"In the course of my work the urgency of the problem of the growing indigent white population has repeatedly been brought home to me. The fatuous content and the inherent unreliability of this class renders difficult the task of improving their condition. Philanthropic bodies such as the Church use drastic coercive measures

with good effect, but Government in all its varied guises they seem to regard as an institution for their support and fair game at all times. In irrigation schemes, in forest management, in land settlement and in relief works of an agricultural character, it would seem best to leave the confirmed poor white to the public charity. The State may then concentrate its endeavours upon those who, though not yet destitute, are tending towards this degraded state and who have still some farming aptitude, independence and energy left, but who lack sufficient means to embark unassisted on the risks of a farming venture. Prevention in this case is as worthy as cure, and rather more likely to be successful."

---

**Trout Fishing in the Cape Colony.**—By D. W. MANNING, F.R.G.S.  
(*Argus Printing and Publishing Co., Cape Town*).

Trout acclimatization in Cape Colony has not only been accomplished, but has met with such extensive success as to add greatly to the attractions to travellers. Mr. Manning, of the Cape Civil Service, disavows the embellishments of the experienced journalist, but he draws alluring pictures of scenery and sport. The practical information which an angler requires is also fully given. The following description of the scene of the original stock conveys a vivid idea of the surroundings:—

"Nestling among trees and framed in a setting of smooth grass, the hatcheries at Jonker's Hoek are in themselves a perfect picture, the quiet waters mirroring the overshadowing landscape.

"Far away from the human hive no sound is heard save the hum of the dragon fly, the soft cooing of the ring dove, or the 'flop' of a frog as it rejoins its brethren in the cool deep waters after a siesta in the warm, glad sun.

"Until, as if by a magician's wand, the scene is changed. The water boils with the upward leap of golden speckled trout, as the fish, in their haste to secure a share of food, project themselves in the air, descending with a mighty tumult to renew the leap again and again, until all is done and the waters once more resume their normal aspect of placid calm.

"Away down beneath in the valley, below the green-leaved vineyard with its clustering branches of already purpling grapes, is the Eerste River, its surface hidden by dense foliage. The grateful shade of the oak trees on either bank provides a tempting refuge from the noon-day sun for the shrill-cried pheasant.

"In the glen beyond, up past the wooden bridge that spans the river, the water winds its way through marshy lands, where pink *watsonias* grow in bewildering confusion, the river sparkling like a thousand gems as it falls in a succession of cascades.

"The stream is fed by numerous springs and rivulets, having their origin in the oft snow-capped peaks of the distant mountains. The mother grijsbok will bring their young down the slopes as the sun declines, and with them graze on the short sweet herbage on the edges of the waters, while the brown-winged partridges dust themselves in the wagon road leading to the isolated and now forsaken thatch-roofed house high up the valley.

"Past the site for the artificial weir, the intake whence the life-giving fluid is drawn for the increasing population of the town of Stellenbosch, through bush and rock-bound steep, the headwaters of the main stream are reached, a deep dark basin far back in the side of the hill, where its moss and fern-cased sides glisten in the dim light with the spray from waters poured through a narrow opening high above. The roaring torrent and death-like stillness give rise to an eerie feeling as one rests on the clean-cut rock at the entrance to the cavern, after the toilsome, though surpassingly enjoyable, clamber along the mountain path.

"It was into this same pool at the foot of the waterfall that the first trout fry, hatched at Jonker's Hoek, were liberated, whence they have spread far down the river, through Stellenbosch itself, past homestead and farm, to find an outlet in the sea in False Bay, where, unless driven helter-skelter back by the bitter taste of the tidal waters, they became an easy prey to the shoals of 'geelbek' and other denizens of the deep, or are caught by 'trekkers' from the Muizenberg beach.

"But it is usually only the brown trout that venture thus to their strength in the ocean's current. The silvery loch levens love best to remain in the sweeter waters. Ensnaring themselves in some favoured, root-entangled spot, they exercise dominion over the smaller fry, and levy toll alike on frog and crab in the daylight hours and the gay-tailed firefly as it 'dips,' 'dips' to the water's surface in the midnight watches; until, at length, of great girth and exceedingly magnificent, the trout fall a prey to their lust of food and find themselves, though not without a mighty struggle 'gainst skill and patience, closely encircled within the clinging meshes of the angler's landing net, only to be released when safely borne to the clean-washed shingle or shining sand at the side of the stream.

"Truly from small beginnings do great things come. The trout fry, placed with such fostering care in the pool below the waterfall, were few in number, but they were the original stock from which the rivers and streams of the Cape of Good Hope and the adjoining Colonies of Natal, Orangia and Transvaal have drawn their supplies, reaching even as far as distant Salisbury in Rhodes' land.

"How far the hopes of those responsible for their introduction have been justified, we have endeavoured to set down in these pages—not, however, with the embellishments of the experienced journalist,

but soberly, and, with strict regard to facts, clearly stated and gleaned from authoritative sources or actual experiences."

---

We have received from the Liverpool School of Tropical Medicine, Vol. II., No. 3, of "Annals of Tropical Medicine and Parasitology." This number contains further articles upon different questions connected with Trypanosomiasis, or Sleeping Sickness, as well as papers on Cirrhosis of the Liver, on Dengue Fever, and on new species of *Culex*, collected during the anti-malaria campaign in Mauritius in 1908.

We have received copies of the undernamed pamphlets, which have been prepared and printed in Northern Nigeria.

"A Short Vocabulary of the Fulani Language," compiled by Captain E. A. Brackenbury, B.A., Assistant Resident.

"Gbari Grammar Notes and Vocabulary," by the Rev. W. P. Low, Church Missionary Society.

"Vocabulary of Okpoto Language," by Captain F. W. W. Byng-Hall, Assistant Resident.

"Vocabulary of Jukon Language," by W. K. Fraser, Assistant Resident.

These little works form the first steps towards the study of the vast body of unknown languages extending throughout the Northern Nigerian Protectorate. Up to the present Hausa is practically the only language which has received attention; now, officials and missionaries are beginning to turn their attention to other tongues, an effort in which they will receive every encouragement from this Administration. The present output is somewhat slight, but this is only to be expected of first beginnings, and it represents much patient work by the authors.

By the publication of such efforts the first step is taken towards something more solid, and encouragement is afforded to others. The Governor confidently hopes that these little works may be steadily enlarged and added to in number, until, in course of time, a respectable *corpus linguarium* may be attained. It is to be hoped that the interest will be enlisted of scientific philologists to aid the amateur efforts.

## LETTER TO THE EDITORS.

## LETTER II.

## The Future of the West Indies.

5th September, 1908.

SIR,

Some encouragement is given to write to you again by the kindly notice of a letter written and published in your July, 1908, issue on the above subject, and by the indications apparent throughout the West Indies and amongst West Indians in other parts of the Empire of a trend of thought towards seeking some form of closer association by which objects such as were therein mentioned—common to the interests of all—may be secured.

Those who have studied questions of the nature of those under consideration, know that the Constitutions, as devised by and for the Dominion of Canada and the Commonwealth of Australia are those which appeal to British people, as leaving that freedom to British subjects which is so necessary for them, and if it be within the practical politics of the near future to consolidate the West Indies, and perhaps include the Bahamas, British Guiana and Honduras, it would seem that the gradual and spontaneous evolution of the Australian Commonwealth would be a guide to each of the several communities. Step by step that evolution might be studied and followed as far as could be with great advantage and progressive despatch, and the success following actual working and experience would invite absolute confidence.

The Constitution named would be found to be the most suited to the means of unification of the West Indies as preserving and securing to them all their present rights and liberties in respect of self-taxation and domestic legislation. There can be no remodelling of forms of Government which does not preserve these Constitutional rights unimpaired, and it was subject to this *sine*

*quâ non* that the Australian Commonwealth was accomplished by impulse from within. What was done by the Commonwealth can be done by the West Indies, as to any student it is apparent that every West Indian Community has been well trained in legislative work, and the rights of self-taxation and Government—the bed-rock of Constitutional progress—have been well exercised by the several legislatures. Public-spirited and fearless, but factionless, discussion seems to have characterised these Communities, and if some inner impulse towards development should arise, the dawn of a new era in those rising Colonies will be looked for with hopefulness.

Should, therefore, public opinion in the West Indies gain ground in favour of Consolidation of common interests, a convention of delegates elected by each separate legislature might assemble in London for the purpose of discussing and formulating a Constitutional arrangement which might then be submitted to each of the separate Governments and Legislatures, and on adoption by them come into operation by an Act of the Imperial Parliament, and in this manner the West Indies would follow the course and procedure of the Commonwealth of Australia.

In conclusion it might be well to recommend, to those desirous of studying Canadian and Australian Constitutions, the perusal of an address on "Federal Constitutions within the Empire," delivered in May, 1900, by the Rt. Honourable R. B. Haldane, K.C., M.P., at the Royal Colonial Institute, and published in a book entitled *Education and Empire* by John Murray, London.

I am, Sir,

Your obedient Servant,

JOSEPH RIPPON.

## RECENT TRANSFERS AND PROMOTIONS MADE BY THE SECRETARY OF STATE.

- Mr. G. S. PODEVIN (retrenched from the South African Constabulary),  
Assistant District Commissioner, Southern Nigeria.
- Mr. J. P. AULD, A.M.I.C.E. (Provincial Engineer, Southern  
Nigeria), Superintendent of Public Works, British Honduras.
- Mr. A. VAN W. LUCIE-SMITH (Senior Puisne Judge, British Guiana),  
Chief Justice of Trinidad and Tobago.
- Mr. E. A. SPEED (Attorney-General, Southern Nigeria), Chief  
Justice, Northern Nigeria.
- Mr. E. T. PACKARD (Attorney-General, Sierra Leone), Puisne Judge,  
Southern Nigeria.
- Mr. S. J. HOOD (Provincial Collector of Customs, Southern Nigeria),  
Comptroller of Customs, Gold Coast.
- Captain C. E. RICE (late Adjutant of Volunteers, Transvaal),  
Assistant District Commissioner, Southern Nigeria.
- Mr. K. M. LESLIE (late of the Gold Coast Survey), Assistant Com-  
missioner of Police, Southern Nigeria.
- Mr. W. J. O'HARA (retrenched from the Department of Posts and  
Telegraphs, Transvaal), Postmaster, Nyasaland.
- Mr. D. F. WILBRAHAM (Master of Supreme Court, Sierra Leone),  
Attorney-General, Sierra Leone.

- Mr. F. A. VAN DER MEULEN** (Assistant District Commissioner, Sierra Leone), Solicitor-General, Sierra Leone.
- Mr. M. H. BROWN** (retrenched from the South African Constabulary), Assistant District Commissioner, Southern Nigeria.
- Mr. C. F. H. HENRY** (retrenched from the South African Constabulary), Assistant District Commissioner, Uganda.
- Mr. H. F. WRIGHT** (retrenched from the South African Constabulary), Assistant District Commissioner, Uganda.
- Mr. S. T. HARRISON, C.M.G.** (late Treasurer of Northern Nigeria), Comptroller of Customs, Barbados.
- Mr. M. J. BERKELEY** (Stipendiary Magistrate, Trinidad), Puisne Judge, British Guiana.
- Mr. A. HUDSON** (Protectorate and Circuit Judge, Sierra Leone), Attorney-General, Gold Coast.
- Mr. T. D. MAXWELL** (Commissioner of Lands, Southern Nigeria), Crown Prosecutor, Southern Nigeria.
- Mr. K. J. BEATTY** (late Assistant Resident Magistrate, Transvaal), Master of Supreme Court, Sierra Leone.
- Major G. C. DE RINZY** (Chief County Inspector of Police, British Guiana), Inspector-General of Police, British Guiana.
- Dr. G. THORNTON** (late Medical Superintendent, Pretoria Hospital), Medical Superintendent, General Hospital, Colombo.
- Mr. H. E. GOODSHIP** (Assistant Accountant, Railway Department, Sierra Leone), Assistant Chief Accountant, Uganda Railway.
- Mr. G. C. KEIGHLEY** (retrenched from the South African Constabulary), District Superintendent of Police, Northern Nigeria.
- Mr. G. W. GIBBS** (retrenched from the Transvaal Civil Service), Statistician and Accountant, Marine Department, Northern Nigeria.
- Mr. A. R. PENNINGTON** (Puisne Judge, Gold Coast), Attorney-General, Southern Nigeria.
- Major W. N. BOLTON** (late Resident Magistrate, Transvaal), Commissioner of Kyrenia, Cyprus.

**Captain H. M. TUFNELL** (King's African Rifles), Assistant District Commissioner, Uganda.

**Mr. M. J. DE LA P. BERESFORD** (2nd Clerk, Governor's Office, Grenada), Assistant in Secretariat, Northern Nigeria.

**Mr. T. STONE** (retrenched from the South African Constabulary), District Superintendent of Police, Northern Nigeria.

**Mr. H. M. OSBORNE** (retrenched from the South African Constabulary), District Superintendent of Police, Northern Nigeria.

## OFFICIALS ON LEAVE OF ABSENCE IN THIS COUNTRY WITH DATE OF EXPIRATION OF LEAVE.

—

This List is compiled from the Leave Certificates sent to the Crown Agents for the Colonies. The Editors will be glad to receive notice of any other cases of Colonial Officials on Long Leave.

THE  
COLONIAL OFFICE  
JOURNAL.

---

---

VOL. II.

JANUARY, 1909.

No. 3.

---

---

[*This Journal, though published with the approval of the Secretary of State for the Colonies, is not official, and the Secretary of State is in no way responsible for the opinions expressed in it.*]

---

---

EDITORIAL NOTES.

THE resignation of the Marquess of Ripon brings to an end a remarkably long and varied official career. He has been in Parliament fifty-six years and in office twenty-four; he has sat in thirteen Parliaments and held nine Ministerial appointments. He was, appropriately enough, born in Downing Street. His father, Lord Goderich, was then Premier, though he held the position for only seven months and without ever meeting Parliament. Lord Ripon was Secretary of State for the Colonies for about three years, from 1892 to 1895. He will carry with him in his retirement the regard and esteem of all his old subordinates, who will not readily forget either his kindness of heart or his sound judgment.

---

The Canadian elections have resulted in Sir Wilfrid Laurier being once more returned to power. His majority is reduced, but not seriously impaired, and the result is admittedly a severe disappointment to the Opposition, and to some extent a surprise to Sir Wilfrid's own supporters, who had anticipated a victory, but not such a substantial one. Sir Wilfrid has now secured the confidence of the electors at four successive general elections, and this circumstance must no doubt be attributed in great measure to the commanding

personality of one who is generally regarded as the first statesman in the British Dominions beyond the Seas. But the prolonged tenure of office by a single party is a far commoner feature in the political life of the Dominions than in that of the United Kingdom, and the Liberals under Sir Wilfrid Laurier's leadership have not yet equalled the record set up by the Conservatives under Sir John Macdonald. No such permanence of tenure has characterised the political history of the Commonwealth, where the development of the "three-party system" has inevitably rendered the conditions extremely unstable, but in New Zealand Mr. Seddon enjoyed a continuance of power which led many to compare his position to that of a monarch, and there is as yet no indication that the position of his successor, Sir Joseph Ward, has been seriously shaken, though the recent elections have diminished his majority; the seventh successive victory of one party at a general election is probably an event without parallel. A curious feature of Canadian politics is the tendency of bye-elections to turn in favour of the party in office, a tendency the exact opposite of that with which we are familiar in the United Kingdom. The feeling of the electors appears to be that a supporter of the Government is more likely to be in a position to secure favours or concessions for the constituency which he represents, whereas in the United Kingdom the Government of the day is saddled with responsibility for every misfortune and every disappointed expectation since their term of office began.

---

The General Election in Newfoundland has resulted in the creation of an extraordinary situation. The Government and the Opposition have each obtained eighteen seats in the lower House, and it remains to be seen with what degree of success party government can be carried on under such conditions. Additional piquancy was lent to the situation by the fact that the Minister of Fisheries was elected by a "small but compact" majority of one. There was a recount, but it only served to increase the majority to three, so that the two parties were left in an exact equality. In these circumstances the responsibilities of the Governor are increased to an embarrassing extent, and Sir William Macgregor deserves every sympathy in a situation in which he will necessarily be exposed to criticism from all sides. In ordinary circumstances the Governor of a responsibly governed Colony is practically immune from criticism so long as he follows the advice of his ministers. But when the position of ministers is in the highest degree precarious, he is placed in the position of a trustee for the electors of the Colony, and must to some extent rely on his individual judgment as to what is the real "will of the people." It is difficult for those outside the Colony to draw any particular moral from the result of the elections. The

manifestoes of the respective leaders were not wanting in vigour, but they did not disclose any broad divergences in policy. But it would seem clear that Sir Robert Bond's policy in the matter of the fishery question has not commended itself to the electors most directly interested, the Government having sustained serious losses in those constituencies which are controlled by the votes of the fishermen. The Government charged the Opposition with being favourably disposed to a scheme of federation with Canada, but the charge was strenuously repudiated. Federation, it is clear, is still very unpopular in Newfoundland, and, though the disinterested observer is apt to look at the map and pronounce it to be "natural" or "inevitable," there is no indication at present that it is coming appreciably nearer. Canada would welcome it and the Home Government would regard it as a convenient change, but it is a matter for Newfoundland to decide. If "Closer Union" comes about in South Africa, Newfoundland will be by far the smallest self-governing community constituting a separate unit in the British Empire.

---

After an adverse vote in the Lower House Mr. Deakin has tendered his resignation of the Premiership of the Commonwealth, and for the second time a Labour Government comes into power. Throughout the period during which Mr. Deakin's Government has held office his immediate supporters have constituted the smallest of the three Parliamentary parties, and have depended for their continued existence upon the support of the Labour Party. Mr. Fisher's Government will be similarly dependent on Mr. Deakin's support, so that no very substantial change in the policy of the Commonwealth Government need be expected, though it may be doubted whether Mr. Deakin's defence proposals will be carried out in their entirety. The most difficult question to be faced is that of the "New Protection" policy which the decisions of the Supreme Court, upon which we have commented on previous occasions, have declared to be *ultra vires*. The Labour Party is committed to this policy even more completely than Mr. Deakin, and they will doubtless adhere to the determination to seek an amendment of the Constitution so as to bring the matters in question within the jurisdiction of the Commonwealth Parliament. But at the present moment there will be a stout resistance, in which many who sympathise with the general policy of the Labour Party will join, to any proposal for the further limitation of the powers of the States, and there seem likely to be stormy times ahead in Australian politics.

---

Mr. Deakin made a great impression in this country when he attended the Imperial Conference last year, and his resignation from

office will be regretted as removing from the list of statesmen in power in the Over-sea Dominions one of the most striking personalities known to the British public. But it may be expected that his disappearance will only be temporary, and that he will still be reckoned with as a potent force in inter-Imperial relations. Mr. Reid's resignation of the leadership of the Opposition in the Commonwealth Parliament constitutes another serious loss to Australian politics.

---

The Closer Union Convention of the South African Colonies has been sitting at Durban and Capetown with closed doors, and very little information has been allowed to transpire as to the progress of the discussions. It is stated that even the delegates are not permitted to take copies of the resolutions passed out of the conference room, and the "special correspondents" have been reduced to supplying their newspapers with personal sketches of the delegates and accounts of the occasional festivities. But the mere fact that the deliberations have been prolonged is in itself a hopeful sign, and a general impression prevails that the members of the Convention have made more progress with their difficult task than even the most optimistic could have expected. There can be no doubt that the close co-operation of the representatives of different Colonies and opposing political parties will do much to promote the growth of a feeling of common South African patriotism. If the Convention brings its labours to a successful issue, it will then be necessary to procure the acceptance of the new constitution by the Parliaments of the different Colonies, and at this stage sectional interests are bound to make themselves strongly felt. Finally, the Imperial Parliament will no doubt be invited to pass a Constitution Act for South Africa. When Mr. Chamberlain introduced the Australian Constitution Act in the House of Commons he described it, in words which will be long remembered, as "a model of legislative competence." We believe that South Africa will show that it can lay claim to equal powers of constructive statesmanship, and the best of all trainings for the working of a constitution is the making of it.

---

The Report of a Queensland Royal Commission on the Pearl Shell and Beche de Mer fisheries is of considerable interest as an example of a somewhat extreme application of the "White Australia" policy. The Commissioners find that the industry is almost entirely in the hands of Japanese, and that in purchasing supplies and provisions they deal almost exclusively with their own countrymen. "It is the natural and laudable aspiration of Australians to conserve their country and their industries for men of their own race. At a time when the nations of the East are awaking and are looking

around for openings for the settlement of their surplus millions, it behoves Australians, with their vast territory and their handful of people, three-fourths of whom are situated in the south-eastern corner of the continent, to see to it that no Asiatic power is allowed to obtain a foothold on their shores . . . The patient industry, the uncomplaining endurance of hardships, and the generally law-abiding character of these Asiatic sojourners in our midst are admitted. In many respects they are not undesirable residents; but in no country in the world outside the British Dominions is any primary industry allowed to be monopolised by a race of aliens." The remedies proposed certainly deserve to be called heroic. No vessels are to be licensed unless built within the Commonwealth and by British subjects. A Training School of Instruction for White Divers is to be established, and within five years of its establishment the employment of alien divers is to cease entirely. It is hoped that the wages of white divers may be brought up to a total of £180 a year. "As aboriginals of the mainland, of Torres Strait, and of Papua have proved themselves suitable for tenders and crews, and as they have certain natural rights in the Northern Fisheries of Queensland, their employment in those capacities be continued." We are at present without information as to whether any steps have been taken to carry the recommendations of the Commissioners into effect.

---

A Select Committee of the Cape House of Assembly has presented a report on the question of Imported Contract Labour, the brevity of which is in amusing contrast with the enormous bulk of the similar reports which have emanated from the Transvaal. The principal reason for this is to be found in the fact that the Committee limited their investigation to the question of importing skilled labour under contract. They recommend that the importation should be prohibited "when such labour is available in the Colony." They admit that there may be some difficulty in determining the question of fact, and after dismissing a proposal that the duty should be entrusted to the Government Labour Bureau, they suggest "that the decision should rest with some body upon which employers and employes might be represented, such as a Wages Board." They state that they have had before them "evidence to show that importations of skilled labour at a lower wage than that usually paid in this country have taken place, and they regard this as inflicting hardship upon the people in the country, and often upon those imported." They state also that in consequence of the depression there is an abundant supply of labour of all kinds available. This circumstance really deprives the question of actuality at the moment. South Africa is, unfortunately, not at the present time a favourable field for emigration for any class

of white labour, and there is therefore little likelihood of the Committee's recommendations provoking much criticism in any quarter. But it must be recognised that the policy which they embody might lead to trouble in a period of expanding industrial activity. In such circumstances a policy of "South Africa for the South Africans" may commend itself locally as a means of retaining for the inhabitants the advantages of a run of prosperity with its usual concomitant of high wages. But an exclusive policy of this kind generally proves to be ill-advised in the long run, as some of the Australian States are beginning to realise, and it is to be hoped that when the emigration and immigration statistics of South Africa begin again, as they no doubt will sooner or later, to show a "balance inwards," the people of the country will welcome the circumstance as evidence of expanding prosperity, and not make of it an excuse for a narrow policy of exclusion.

---

Mr. J. Henniker Heaton's proposal for "penny-a-word" telegrams must cause some parts of the Empire, which are blessed with rates of 5s. to 7s. a word, to think furiously. His main ideas are to increase the land lines, so as to rely as little as possible on expensive cables, and to acquire a cable to Canada. The first is cosmopolitan in character, and it is not unreasonable to believe that international agreements for reduced through rates might be arrived at. At present Turkey, some people may be surprised to learn, sets the example. Whether we shall ever get down to 1d. is another matter, but it is a good thing to have an ideal and a battle-cry. The second idea is more strictly Imperial, and has been taken up vigorously by Mr. Lemieux. The question is, of course, mainly one of finance. Mr. Deakin is reported by telegram to have said that communications through the Pacific cable are greatly crippled by the excessive charges imposed by a combination controlling Atlantic cables. The Atlantic companies, however, give the Pacific cable a reduced rate, so that the charge from the United Kingdom to Vancouver is 1s., and under present circumstances it does not appear that any considerable reduction in this charge could be made by using wireless telegraphy, even if it were sufficiently reliable. Australia itself charges the Pacific messages with an inland rate of 5d. a word. Thus, even if the Pacific cable charged nothing, the out-payments amount to 1s. 5d. a word. The movement for a reduction of Australian rates is principally on behalf of press messages, and all classes are interested in the cheapening of these, and there would therefore be considerable justification for a special concession for this purpose. But the proposal for a Government Atlantic cable opens up the questions of interference with private enterprise and the subsidising of a part of the public.

The Earl of Rosebery in a recent speech has referred to "what used to be called the colonies" as the "Outer Britains." We are doubtful whether the latter term will commend itself overseas. It is no doubt the case that the settlements which have outgrown the original idea are now something more than colonies in the ordinary sense and do not care to be described by that name. But no one is concerned to dispute that all the possessions of Great Britain abroad are historically colonies, and in any reference to general political relations the name must be used. The consideration which has recently been urged and carried into effect is that a distinction for administrative purposes should be made between the colonies which are self-governing and those which are not. This is a division into species, but it does not affect the genus. The word colony as a general one remains, and nothing can be invented to displace it. The colonies, great or small, have their own character, are not new or outer Britains, and do not want to be described as such.

---

His Lordship proceeded, in his characteristically suggestive manner, to express an opinion that that State is most fortunate which achieves its own development by the character of its own citizens, and by their individual efforts, as little as possible supported and guided by legislation. But the keynote of most modern legislation is not an endeavour to develop resources or to increase wealth. It is rather a moral consideration—the desire to extirpate ignorance, vice, crime and disease. The experience is general that for these objects collective action is absolutely necessary. It is not enough to have an individual here and there on a high level in these matters; what is wanted is to bring up the general community to this level, and this can only be done by law. A new law in such matters reflects the general sentiment of the nation, but it sets up for uniform obedience a higher standard than that generally followed. Only by this process of picking out the best and applying it all round has mankind won a difficult way up from barbarism. At the present day the moral force which is shaping legislation is markedly strong, both in this country and the colonies. In the end, national greatness must depend on the character of the individual man and the individual woman, but if the weaknesses of human nature are not curbed by social efforts that character will not reach the highest possible level.

---

The depression of trade which is affecting the United Kingdom and many of the colonies is the inevitable result of a period of expansion. The supplies and demands of the world are so intricate that it is impossible to keep anything like an even balance between them. Even the experts in particular articles cannot foretell, except

in a very qualified and tentative way, what the relation between the two forces is going to be in the immediate future. The movements in silver, for instance, great as they are at times, defy prediction. The whole financial machine moves in mysterious ways. No one prophesied, or could have prophesied, at the beginning of this year that there would be a plethora in the money market in the autumn. This phenomenon was no doubt due to the fact that when trade is flat capital is hoarded instead of being employed in business. The explanation of such fluctuations is generally quite simple, after the event.

---

An interesting discussion has taken place between the Cape Government and the fruit exporters as to the modes in which this industry should be assisted. Opinion was divided on the question whether the Government should inspect and brand fruit. There is an increasing tendency for Colonial Governments to do work of this character, and the consumption is certainly greatly helped by the official certificate. It is urged, on the other hand, that the course is an interference with the rights of shippers, and this view found expression at the Cape conference. When there is considerable uniformity in the product, so that a fairly definite standard can be fixed and generally attained, there is great advantage in a system of Government supervision; when this is not the case, the control which is virtually granted would become troublesome and perhaps unfair. In short, the necessary condition is standardisation. In the case of fruit, it is easy to see whether the fruit is bad or decidedly below an understood standard. In South Australia, New Zealand and elsewhere a Government inspector has full power to forbid the export of bad fruit, and this keeps up the quality and the reputation of supplies. If there is no check of this kind, obviously a single consignment may do a vast amount of harm to the industry, for the buyer will be chary of running the risk a second time, and so the careful producer suffers. We think the fruit industry of the Cape, which is still in the experimental stage so far as export is concerned, would benefit greatly by a similar provision. There is a great business obtainable if the quality is kept up and the packing and seasons properly studied.

---

There was a time not long ago, it appears, when brandy was sold in Cape Colony at 2d. a bottle. In those Elysian days, a speaker at the Agricultural Union observed, the farmer could now and then afford to give his hands a glass, "he could not do that now, so that the farm hands went to the village for their drink and generally finished by being looked up." Apparently the Arcadian brandy has been displaced by "injurious spirituous compounds at present being

secretly manufactured and consumed in the country." Possibly the 2d. product erred on the side of being too innocent for the general taste. Whatever the reason, the wine industry of the colony is in a bad way. It is a great pity, as some two millions and a-half sterling are invested in it, and it employs much more labour than ostrich farming and such other substitutes. The only remedy is to improve the quality. Practically there is no export market, and until one is created there is little prospect of success.

---

Large areas in the Transvaal are suitable for tobacco growing, and a committee has considered how the industry can be promoted. The dark African types of leaf fetch only about 3d. per lb., but a bright leaf of the Virginian type brings 2s., and one Company has offered to buy a million pounds of this leaf whenever it is offered. The Transvaal farmers, however, have practically made no efforts to grow the best varieties. Tobacco growing is an intensive form of agriculture, requiring a great deal of labour and care, and the usual methods now employed are only good enough for local consumption, and not the best of that. Central warehouses and scientific instruction are recommended by the committee.

---

A good deal of work has been quietly done in the scheme for the preparation of illustrated lectures on the Empire. The first idea was to give colonial children, by means of "visual instruction," a clear understanding of the character of the United Kingdom. Various sets of lectures and lantern slides were prepared for this purpose by Mr. H. J. Mackinder. The compilation gives the journey from the colony to London, London, the scenery of the United Kingdom, historic centres, country life, the great towns, and the defences. The cost of these lectures was defrayed by the colonies. To provide for the lectures on the colonies for use in this country, a private subscription was set on foot, and, at the instance of H.R.H. the Princess of Wales, Lady Dudley and a committee of ladies secured nearly £4,000. Under these good auspices the work has proceeded in a satisfactory manner. Mr. A. H. Fisher, a member of the Painter-Etcher Society, has been commissioned to visit India and the Colonies for the purpose of obtaining sketches and photographs suitable for lantern slides. He has visited India, Ceylon, Somaliland, Aden and Cyprus, and in July commenced a second tour to take in Canada, the Straits, Borneo, Hongkong and Wei-Hai-Wei.

---

Much discussion has recently taken place in India with regard to the hoarded wealth of the natives. In a calculation made in 1884, the value of the gold and silver imported into India between that date

and the middle of the 16th century was put at some £800,000,000 ; but the process began many centuries before the latter period. It is proposed that some means should be adopted to educate the native mind up to the point of appreciating the blessings of investments. The process can only be a gradual one, for the habit of hoarding is primeval and can only be eradicated by a long course of experience in modern dealings. The same thing is observed in West Africa. There the silver pieces of British currency to a great extent silently disappear into the interior and never come back. This is a very profitable phenomenon for the British Treasury, which makes a profit of about 50 per cent. on the coinage. In this country the coins would be exchangeable for their face value in gold, and the Treasury, which is responsible for supplying the gold, is naturally entitled to the profit on the silver, or, as it is called, the seignorage. If, however, the silver disappears from sight, the Treasury takes its 50 per cent. and incurs no real liability. It has been proposed that the Treasury should pay over this or some of the profit to the colonies to which the coins are exported, but one difficulty is that no one can prove that the silver will not be returned for exchange, and in the meantime the Treasury is always theoretically liable. That department remains, therefore, entrenched in its position. When the silver coins are "token," *i.e.*, marked and meant for some local currency alone, the Treasury has no liability, and the profit on the coinage should go to the colonies in which it is legal currency.

---

The Australian Commonwealth Government have, it is understood, decided to take over the coinage of silver and bronze coins. This work has hitherto been done by the Imperial Government. The average supply during the last ten years has been £111,859 in silver, and £61,342 in bronze. These coins will gradually be withdrawn by the Imperial Government, but probably about half the issue has been already drained away from Australia. The future coinage will be local and, therefore, more or less confined to Australia, and the Commonwealth Government would take the profit on the seignorage and the responsibility. It is proposed to do the coining at one of the branches of the Royal Mint in Australia by arrangement with the Imperial authorities. In connection with this matter the question of manufacturing small arms ammunition in Australia has been considered. It is obviously desirable that Australia should be able to supply herself with this material, and the work of making discs for coinage and cups for cartridges is similar, for in both cases alloys have to be made by melting and mixing the proper metals in due proportions, and these alloys have to be cast and subjected to annealing and rolling operations before the strips are punched out into the required form. The "Mint" at Birmingham does both classes of work.

Bronze coin is unpopular with the African native on account of its colour. Something brighter is essential.

In 1905 it was arranged to coin for local currency in Northern Nigeria a nickel bronze penny, equal in value to one-twelfth of a shilling, of the size of the British bronze penny, and an aluminium coin, equal in value to one-tenth of a penny, of the size of the farthing. The coins were to be perforated so that they could be strung together, and this practically necessitated the omission of the King's head, but for this there are precedents in the last and previous reigns. Moreover coins are better liked by Mohammedans if no pictures of men or animals appear on them. Two interlacing triangles, called "Solomon's Seal," were adopted as the device.

But it was found before any coins were issued that the nickel bronze tarnished quickly, and, it was evident, would be unpopular on that account. The coin also was heavy—as heavy, notwithstanding the perforation, as the British penny. The tarnishing was greater than has been found to be the case in the West Indies, but there the climate is not saturated with moisture. Moreover, the West African native does not wear trousers or use pockets, and the coins, therefore, are not kept bright by constant rubbing. The proportion of nickel to copper was accordingly increased (25 per cent. to 75 per cent.).

The aluminium coins were found to corrode quickly. The "tenths," as they were called, were extremely popular at first, but became dull and dirty in a few weeks, and the natives lost confidence in them. In some cases it was clear that this was due to contact with acids, probably contained in exudations from the human body. The loin cloth of the native is in fact more trying than any subjection to plain heat and moisture. The metal also appeared to be rather soft. It was necessary to resort to a nickel alloy similar to that of the nickel bronze penny. The drawback to this course is that this material is dearer than aluminium.

---

The West Indies will part with Sir Daniel Morris, K.C.M.G., with sincere regret. His colonial services began in 1877 in Ceylon, where, after investigating the coffee disease, he recommended the cultivation of tea, now, as everyone knows, carried on on an enormous scale. He was transferred to Jamaica in 1879, and paid visits to other members of the group and to St. Helena. In 1898 he was appointed to be the first head of the Imperial Department of Agriculture for the West Indies. He has worked indefatigably in that position and has shown the invaluable gift of inspiring others. The Department has now, it is hoped, become a permanent element in West Indian administration. It has won generous recognition even from those who were at first disposed to level against it the criticism which the "practical man" is so fond of levelling at the

“scientific expert.” The revival of cotton growing has been largely due to Sir Daniel Morris, but his activity has extended to a great number of other products. The Colonial Office will, we understand, continue to take advantage of Sir Daniel’s unrivalled knowledge and experience of tropical agriculture.

---

The Trinidad Dock and Engineering Company may reasonably expect to acquire a considerable business in time, but the process is slow and, in the meantime, the fixed charges are heavy. The Company is now in such a position that the Colonial Government may have to consider the question of taking over the undertaking. Under the contract the Government has power to do this by paying the amount spent out of capital, less depreciation and any subsidy paid; this amount, assuming that there is no depreciation, is £88,100. The fixed London charges amount to £8,330 a year, made up chiefly of the debenture interest at 5 per cent., the redemption policy and insurance. This is a heavy load to struggle against, and the small vessels which have hitherto used the dock are far from supplying the business required. It is true that the past year has been a very unfavourable one, and that a much greater tonnage may be hoped for in future.

---

The extensions of the British Empire are occasionally embarrassing from a topographical point of view. The New Zealand Government approved a proposal to open a post-office in King Edward VII. Land, and a notice was issued that a suitable surcharged stamp will be used. The lynx-eyed stamp collector was, of course, at once on the track, but the General Post-office at Wellington informed applicants that the stamps could only be obtained at the King Edward VII. Land Post-office. As the map failed to disclose the whereabouts of this territory, the information was not of much use; but a further official letter stated that “the Post-office at King Edward VII. Land is in the South Polar regions, and if you address a communication to the Postmaster it will be despatched in the mail to that office by the first opportunity, which will probably be about a year hence. Registered letters are accepted for transmission to King Edward VII. Land.” Presumably the Nimrod expedition to the South Pole was at the bottom of this somewhat mysterious response. The gravity preserved by the Wellington Post-office in this matter is admirable.

---

The report of the Fiji Customs Commission, recently published, is an interesting study of the considerations which affect questions of taxation in a mixed community. The object is simply fiscal, and the main point is to secure fairness of distribution between the

different classes, but particular regard has to be paid to the importance of not imposing heavy burdens, which tend to check the development of industries. Increases of the taxes on certain food-stuffs are recommended, and it is pointed out that, while there are general objections to such taxes, it is essential in such a country as Fiji to impose them if a fair distribution is to be realised, as the industries are practically in the hands of a small proportion of the residents. All machinery imported by the sugar manufacturers is admitted duty free.

---

The Ceylon Government are contemplating a number of undertakings which will necessitate a loan for the equivalent of Rs. 51,552,800. Many of the purposes were discussed under Sir Henry Blake, and recent services which have been decided upon as requiring loan funds are the drainage of Colombo, survey, Colombo Lake development, irrigation, and motor traction.

---

A famine is a very rare occurrence in any part of the Colonial Empire, and in a tropical country there is seldom any real excuse for one. There was, however, a severe one in March-June this year in Usoga (Uganda), caused by a drought in 1907, the improvidence of the inhabitants in relying entirely on bananas, and depredations of crops by wild pig. Early in March men were collecting roots from the jungles and swamps, and women and children were said to be dying in large numbers. On March 20th 400 deaths from starvation were reported. Food was sent by the Government for the men working for it, but, strange to relate, the greatest difficulty was experienced in getting men to come in. Natives refused to have food sent to their families, and when employed at a wage of Rs. 3 per month they almost invariably deserted. The officials were at their wits' end to help people who did so little for themselves, and showed no appreciation for anything done for them.

---

In April some 24 tons of food were shipped from Kisumu to Jinja, but a new difficulty arose owing to a report to the effect that the Government was only distributing food with a view to seizing all the goats and live stock by way of compensation. Also, it was found that the natives often ate their grain raw, in which state it did more harm than good. In May the Secretary of State granted £3,000 to meet the requirements, and 37 distributing centres were established, with a kitchen at each. On May 18th it was reported that the deaths amounted to nearly 4,000, and that 70 per cent. of the population were starving and the remainder in want. On May 26th the Secretary of State sanctioned an expenditure of £8,000 on relief,

and offered assistance in supply of food or by opening a relief fund, but this increase proved unnecessary. May was the worst month, and in it 565 tons of food were shipped to Jinja. The rains continued, and at the end of June the earliest crops—chiefly sweet potatoes—could be depended on. The total deaths came to 6,000 to 7,000. By the end of June the famine was practically over. Transport was one of the chief difficulties; the people absolutely refused to help themselves or their starving brethren by carrying food, and the men preferred to be at home and starve rather than come for food to a distributing centre where they might be caught and sent to bring more food. The gross expenditure on the famine amounted to £13,700, but it is expected that the sale of accumulated rice will bring it down to £9,000. It is intended to recover the whole amount from the people next year, probably by a double hut tax or a poll tax of two rupees.

A redeeming feature in the story of the famine is to be found in the whole-hearted manner in which the Roman Catholic and Church of England missionary organisations co-operated with one another and with the Government in the task of relieving distress.

---

The palm nut of the tropics is familiar to the younger public at home as the monkey nut, and the exhibits at the Franco-British Exhibition will have made it well known to the public which has not ventured to make its acquaintance as an edible. It should, therefore, be realised that the collection is no easy matter. The work is laborious and not without danger, especially as snakes are fond of the thick foliage at the top of the trees, and from their position enjoy a tactical advantage over the climber. It rarely happens that more than two bunches of ripe fruit are found on one palm tree, and when these have been cut each fruit (about the size of a small plum) has to be separated by a outlass from the strong husk in which it is embedded. A considerable time, therefore, is required for a native to get 80 lbs. (a heavy carrier's load) of severed ripe fruit ready for transport; generally it is nearly three days.

---

The geographical character of many of the British possessions eminently fits them for the position of distributing centres, and it is important that everything should be done to increase their value in this respect. The prime considerations are that every facility should be given for export, and that transshipment of cargoes should be made as simple and easy and cheap as possible. Ships are tempted to come in if a drawback on ship's stores is allowed, but a minimum tonnage should be prescribed to entitle ships to this privilege. In some cases drawbacks are not fully allowed unless the goods are in

their original packages; but this is not altogether reasonable and leads to trouble. It should, however, be required that the goods are in the same condition as when imported, and a limit of time should be fixed. The clerical requirements should be simplified as much as possible, and the transhipment charges clearly fixed by an inclusive tonnage charge. At the same time there is a limit to the freedom which should be allowed. In Malta steamers are allowed to begin discharging without notice, and the importer makes no formal entry. The revenue cannot be properly protected in this way. A detailed and instructive report by Mr. R. H. McCarthy, C.M.G., on the working of the Customs Department of Malta, has recently been published, and would be serviceable to any Government which has occasion to consider its customs arrangements.

---

Paragraphs have appeared in various papers that the little fish in Barbados known as "millions" destroy mosquitoes, and some colonies have asked for supplies. A reference has been made to the Zoological Society, who have kindly furnished the following report:—

"(1) The small fish known in Barbados as 'millions' (*Gerardinus pæciloides*) appear to be very hardy, and will live in quantities of fresh water from half a gallon upwards. They also multiply rapidly. Their food is any kind of small water flea, or larvæ. We have had some in a tank at the Gardens for several months, where they live upon a species of minute crustacean, which happens to be abundant in some of the tanks in our reptile house.

"(2) It is certainly the case that they eat greedily the larvæ of mosquitoes, and some persons at least are of the opinion that the freedom of Barbados from malaria is due to the presence of these small fish, which are abundant in the island, and which are kept in various ponds and tanks in private houses. I understand that the mosquitoes, which are the carriers of the malaria organism, almost invariably frequent any small pools or tanks near houses, and no doubt these fish, if kept in such tanks, would aid in keeping down the mosquitoes, although I am by no means convinced that this method would be as effective as the well-known method of keeping a film of paraffin, or some other oily material, on the surface of the tanks. On the other hand, it seems to me extremely improbable that the presence of 'millions' can be an effective agent in the reported freedom from malaria in Barbados, because in other islands, which are not free from malaria, different species of the same genus, but with similar habits, are abundant.

"(3) It would be easy for anyone going out to Mauritius, and who is prepared to take a little trouble, to take with him two or three hundred of these fish, which are from a quarter of an inch to half an inch in length, as they could be fed on small fragments of shredded

meat. I have every hope that our stock at the Gardens will live for some time, and I shall be glad to present to any agent of the Government of Mauritius a number of living specimens, and give him advice as to looking after them on the way out.

"I may add that some time ago we sent in this way a collection of specimens to Uganda, but I have not yet heard with what result."

We may observe that the example of Barbados is hardly conclusive, as the anopheles mosquito is not found there. A consignment of "millions" has been sent to Ceylon.

---

Lloyd's Annual Report for 1907-8 mentions that there is an increasing demand for steamers built for the carriage of oil in bulk. Probably this mode of shipment will in time almost entirely displace the expensive shipment in drums. The progress of the marine turbine is shown by the fact that the tonnage of these steamers was nearly double what it was in the previous year. There is a rapid increase in the number of yachts, &c., fitted with oil or petrol engines. Refrigerating appliances also show a large development.

---

A long-standing difficulty has been arranged, without much attention being attracted, by the arrangements under which the French and German Governments have practically assimilated their freeboard regulations to ours. This will enable the loadline certificates issued by both countries to be mutually recognised. The matter is specially noteworthy at the present time, when the Imperial Government is representing to Australia the importance of having approximately uniform standards. The correspondence (published in Cd. 4,355) has largely gone on questions of the power to legislate, but there can be no doubt from a practical point of view of the convenience of uniformity, however it is secured.

---

The functions of the Government Auditor are a matter of general interest to the Colonies, and a point which has arisen in Ceylon may be mentioned. It was proposed that in certain cases the Treasurer's recommendations for expenditure should, on their way to the Colonial Secretary, go through the Colonial Auditor, "to see if they are in strict order;" the object being to avoid mistakes from the outset, as, if the expenditure would not be proper, the Auditor would say so at the inception, and not when it had been approved by the Governor. The Secretary of State, however, did not agree. He observed that "the essential principle to be

kept strictly in mind is that it should never be possible for a public officer, when an account is being audited, to allege that the Colonial Auditor had already approved, or at any rate acquiesced in, a given payment. The system of sending papers to the Colonial Secretary through the Audit Office should not be adopted, since under it the Colonial Auditor will be liable, however wrongly, to be regarded as approving of anything which he does not definitely question, even though it was not one of the points on which his opinion was asked by the Government. If the Governor or the Colonial Secretary requires the opinion of the Colonial Auditor on the interpretation of a regulation, he should refer that definite question to the Auditor, and as far as possible keep the interpretation of the rule apart from the particular instance on which the inquiry arose."

---

As Colonial Governments from time to time enquire about authoritative publications dealing with customs tariffs and the classification of imports, a list of such papers may be useful.

(1) The Import and Export Lists of the United Kingdom, with appendices.

(2) "List of Countries, Ports and Shipping Places throughout the World" (Customs Department).

(3) Parliamentary Papers, Cd. 3,859, 1907, Foreign Import Duties; and Cd. 3,708, 1907, Colonial Import Duties.

(4) "Bulletin International des Douanes," issued by the International Customs Tariff Bureau and printed by Hayes, 112 Rue de Louvain, Brussels.

(5) The "Imperial Tariff," published by Eyre & Spottiswoode.

(6) The "Shipping World Year-Book," published by the Shipping World, Limited, Effingham Street, W.C.

---

The Colonies which participated in the Franco-British Exhibition came in for an abundant award of honours. This is satisfactory, and no doubt the prizes were well earned. But the system of judging does not seem quite proof against mistakes. We learn from the "West India Committee Circular" that in one case a bottle labelled "Cassava Farine" was awarded the grand prize for arrow-root. Subsequently it was found that the bottle contained neither the one nor the other, but merely powdered lime.

---

The G. P. O. annually gives instances of the way in which its patience and ingenuity are tried by the public, but it is hardly pressed so near to the verge of endurance as a New Zealand postmaster seems to have been when he posted up the following

notice :—"As all postmasters are expert linguists, the addresses may be written in Chinese or Hebrew. Persons are not compelled to lick their own postage stamps and envelopes ; the postmaster will do this for them. Persons are earnestly requested not to send post cards with money orders attached, as large sums are lost in that way. It is particularly requested that lovers writing to each other will please confine their gushing rhapsodies to the inside of the envelope. When watches are sent through the post, the sender should put a notice on the outside ; the postmaster will then wind them up and keep them in going order."

---

On the 9th of December the Earl of Crewe presented Sir W. Baillie-Hamilton, on his retirement after a service of forty-four years in the Colonial Office, with a three-quarter length portrait painted by Mr. W. E. Miller, and three large silver cups with covers, copies of originals of the period of George II. The testimonial was the gift of members of the Corona Club, which has owed its origin and much of its success to Sir W. Baillie-Hamilton. Sir C. Clementi Smith opened the proceedings, and both he and the Secretary of State warmly recognised the value of the achievement. The Colonial Office will miss the presence of an officer who has steadfastly striven to maintain the dignity and increase the popularity of the department.

## AFTER THE BOER WAR.

THE Boer war is rapidly becoming ancient history. It is being blotted out of view by the constitutional settlement. It cannot by any means be claimed that everyone is satisfied, but it is clear at any rate that equilibrium has replaced instability. The grant of responsible government closed the dissensions which led to the war. Other questions succeed, but the matters which figured in the correspondence between President Kruger and H.M. Government are fast being relegated to oblivion.

Economically, however, substantial effects remain. War and the causes of war pass away, but no treaty of peace restores the waste. That the loss has to be made up is obvious, but few people can realise, until they have had an object lesson, how great and lasting the loss is.

The waste is, of course, greatest in the country which is the scene of operations. Not only is capital used up and labour diverted, but there are the ravages of destruction. In the Boer war these were exceptionally severe. The Transvaal Repatriation Department was constituted to deal with them. They found that at the declaration of peace on the 31st May, 1902, the whole of the country away from the railway lines had been cleared of everything, and was more like a wilderness than a country which should have been supporting some two hundred thousand people. All the farmhouses had been laid waste, many of the smaller towns had been destroyed, and scarcely a homestead remained intact. The system of "drives" which had been organised by Lord Kitchener had denuded the country of all live stock and supplies. In short, the Transvaal had been stripped of everything which was necessary to enable the country population to return to their homes and resume their occupations. Added to this, the stocks of supplies and merchandise in the hands of merchants and others in the large centres and smaller towns along the railway lines were so limited as to be of very little service in feeding or in any way equipping the large numbers of people whom the declaration of peace threw on the hands of the Government. In

consequence, nearly everything required for repatriating and restarting the country people had to be imported into the country. Added to the above-mentioned fact, the railways, which had been working at very high pressure during three years of war under conditions which prevented the maintenance of their permanent way and rolling stock at a proper working standard, were being strained to their utmost capacity in taking troops, which were being returned to England, to the seaports, in bringing up army supplies, in replenishing their own stocks of repairing and constructing material, and in bringing forward supplies for merchants and importers who had placed very large orders for supplies of every kind, so that it was only with the greatest difficulty and delay that the supplies required for repatriation purposes were brought forward.

Under the terms of settlement the Imperial Government provided £3,000,000 for the purpose of "assisting the restoration of the people to their homes and supplying those who, owing to war losses, are unable to provide for themselves with food, shelter and the necessary amount of seed, stock, implements, &c., indispensable to the resumption of their normal occupations." The work was taken in hand promptly, too promptly in fact for a proper consideration of the subject; but as the position was critical, there was no time for a philosophical survey of the case. The three millions were spent, and much more. The three millions went in free issues of money and supplies, and without any deduction for working costs; but, in addition, £5,481,753 was expended, of which £583,758 represented free issues, and the rest advances or supplies which were to be repaid.

The difficulty is now, as might naturally be expected, to get back the advances. There is, we might say, of course, a class which does not intend to repay till it is obliged and which clamours for the total remission of the debt. The matter is put plainly by a recent Committee. "Throughout the country there is a class of the farming community who in the past received assistance from the State—a class which constantly clamours for help, and, when given to it, invariably looks upon it as a free gift, because it comes from the State. This view of State assistance has now become conviction in their minds, and it will be difficult to remove it. This class consist of those of whom it has been said they took all they could get on credit from the Repatriation Department, openly expressing the opinion that they would never be called upon for payment. The energetic and advanced farmers of the country feel strongly on the matter, and many of them are withholding payment in order to see whether the class indicated are going to receive special treatment, which, if they do, they consider should apply equally to all. The thriftless class, it has been stated, possessed little or no stock before the war, but, in order to meet the requirements of the

Department and secure an issue of cattle, instances are known where small plots of farm lands were leased to give the applicants for assistance an appearance of financial stability. There seems to be no doubt that the sureties were aware of what was taking place, and they divided with the principal debtors the stock obtained. Thus we have the hard-working farmers making every endeavour to discharge their liabilities, but waiting to see whether Government will treat the thriftless agitator with the same leniency he is said to have received in the past at the expense of the State Treasury."

Government assistance of this kind is, in fact, to a great extent demoralising. The task was too big to be conducted with a scrupulous regard to the merits of each case. A great population had to be re-established, and no doubt some got too much and others too little. The crop failures of recent years have greatly increased the trouble. The Committee observe that in the agricultural districts a spirit of despondency and desperation is taking hold of the people at the prospect of being called upon to meet liabilities which they cannot provide for owing to financial distress caused by the failure of crops for three successive seasons. The grant of a period of years within which to meet liabilities would remove this feeling and be gratefully received by the deserving class. At the same time the Government will have to face many losses, which are sure to arise through insolvencies, death and emigration of both principals and sureties. Another danger which partly defeats the object State aid is meant to confer, and which has to be faced, is the seizure of the farmer's stock, goods and chattels by other creditors. These creditors are traders, who readily give credit so long as the farmer has a few tangible assets which can be seized and turned into cash sufficient to cover his liability to them with interest. The effect of the action of this class of trader is that many of those who have been assisted by the Government are gradually being pauperised and thrown back upon the State, and the money expended upon them can be looked upon as practically waste. As to whether or not the special circumstances under which the relief was given out of State funds would justify the Government even now to introduce legislation to protect debtors from this class of trader for a reasonable period of years is a matter upon which the Committee did not feel called upon to express an opinion.

Apart from these considerations, there are specific allegations that in some cases unreasonable prices were put on the things supplied. On the whole, it would seem that rations, seeds, building materials and farm implements were fair in price and quality. But, unfortunately, this is not clear in the case of horses and cattle. These were mostly supplied by the military authorities, and it is asserted that excessive prices had been given for them, and that many of them were in bad condition. No doubt the huge and

sudden demand sent up prices, and it cannot be shown that there was a market value at the time below that paid. The Committee are disposed to think that it would have been better to wait for better terms. "It is admitted that if the Civil Government had refused the military stock and purchased elsewhere, it would have delayed the work of repatriation for a few months, but the advantages to the Civil Government would have been apparent from the start. The extra cost of keeping people in camps already established would have been comparatively small, better animals would have been obtained, and the loss of time would not have been of great moment, as, after all, the month of September would have been a better month to repatriate people than the middle of winter. Against this it may be said that the clamouring of the people to get home did not admit of any delay. Your Committee are aware that the position was one of great difficulty, but the conditions of surrender clearly state that repatriation would be carried out 'as soon as conditions permit,' and it is felt, however trying it might have been for the ex-burghers, that the matter could have been satisfactorily explained to them by their own leaders. The result must, of course, remain a matter of conjecture, but it is fair to assume that the same amount of casualties would have occurred through disease, &c., and the sum of £641,000 for death of animals, which is exclusive of losses upon sales of surplus animals, and the amount recovered through raising prices would not have been a charge upon the guaranteed loan falling upon the Colony to-day."

This is reasoning in the cool of the evening, but at the time the urgency of the position seemed the predominant consideration. It is easy to see what complaints would have arisen, on the spot and in this country, if the authorities had kept the people in the camps in the hope that the prices of horses and cattle would go down. Commercial speculation is rather out of place in such a situation.

It is necessary, however, to recognise the fact that many of the animals were bad, and many people lost all their stock. There was undoubtedly much severe suffering, and many debts remain where the receiver got no benefit. Some leniency is called for, and the Committee recommend some remissions of the charges for stock and extension of time for repayments. The cost to the Transvaal would be £350,000.

## EARLY COLONIAL HISTORY.\*

THE early history of the British Settlements in America is a subject which the English reader cannot easily pursue with entire disinterestedness. His sentiments are inevitably coloured by a feeling of regret at the great catastrophe which cut off from the British Empire the most prosperous and populous Colonies which it has ever succeeded in establishing, and set up a second Anglo-Saxon nation in the New World. He does not always pause to reflect what revolutionary changes in English political, commercial and social life must have been brought about had the connection with the American Colonies never been interrupted. Australian and Canadian statesmen of to-day look forward to a time when the white population of the Commonwealth and the Dominion will exceed that of the British Isles. It is an expectation destined, in all probability, to be realized, and with its realization there must come about a fundamental change in Imperial relationships. But the time is still far distant, and it is not unreasonable to believe that our political institutions will show an adaptability and elasticity sufficient to fit them for new circumstances. But the development of the United States has been so rapid and so immense that it is hardly conceivable that any change in the mould of our constitution could have enabled the connection with the United Kingdom to be maintained. Nevertheless, even the inevitable may furnish a just ground for regret; and the grievous mistakes admittedly made by our eighteenth century statesmen, their alternation of recklessness and apathy, their short-sightedness and lack of imagination, as well as the downright incapacity which marked so much of their policy and administration, justify sentiments of a stronger nature than regret. But there was at one time a tendency to express far too general a condemnation of the early Colonial policy of Great Britain, and to represent the whole Colonial system as the outcome of selfishness and commercial

\* *The Origin of the British Colonial System, 1578-1660.* By G. L. Beer.—The Macmillan Company.

greed. By the irony of circumstances it has fallen largely to American historians to destroy this fable, to show that the case for the mother country is far stronger than used to be supposed, and to prove that the Colonies were not solely animated by the motives of manly independence and resistance to oppression. In the present volume, Mr. Beer does not approach the period of acute controversy; his sketch of the development of the Colonial system is only carried up to the year 1660; but the story is already brought up to the point at which the main features of what became a more or less permanent Colonial policy are clearly discernible, and it is possible to form an opinion as to the merits and defects of that policy as a whole. There is an excellent analysis of the motives which inspired the foundation of the early settlements. The spirit of adventure and discovery counted for something; religious motives, especially important in the case of New England, perhaps for more; while there were also present those vague desires for an expansion of territory and a spread of British jurisdiction, which lie at the root of all Imperialist sentiment in all ages. But the really operative motives were economic. The idea that the Colonies would furnish valuable new markets for British manufactures, an idea familiar to us as an argument in favour of a "forward policy" in more recent times, was of comparatively late growth. In the first instance it was mainly as sources of supply that they were valued. England was to be relieved of the necessity of purchasing the commodities she required from her foreign competitors, and thereby the "drain of bullion," which the primitive economists of the seventeenth century dreaded, was to be avoided. There were hopes, constantly renewed and as constantly disappointed, that the precious metals would be discovered in the North American Colonies, which would thus become a counterpoise to the Spanish possessions. They were to supply the naval stores for which England was to a large extent dependent on the Baltic powers. They were to serve as a half-way house to the Far East, the trade with which was almost monopolized at first by Portugal, and subsequently by Holland. They were to furnish fresh fishing grounds in which England might hope to be independent of Dutch competition, which she had combated with small success in nearer waters. It was only in the expectation of tangible advantages such as these that the colonizing movement had been countenanced by the home authorities. "In permitting its subjects to settle America," says Mr. Beer, "the English Government assumed onerous obligations, in return for which it naturally expected that some compensating advantages would accrue to the mother country." For many years the history of the Colonies was largely one of disappointed hopes. The commercial "adventurers" who founded the colonizing companies expended large sums and received only meagre returns. The Government found that the

supplies on which it had counted were not forthcoming. The shorter route to the East proved to be a delusion. And there is another aspect of colonization which Mr. Beer sets forth with great lucidity. Unless the parent State has a larger population than she needs, the loss of citizens entailed by colonization is a serious matter, "If . . . the State has no surplus population, and is called upon to protect the dependency, then the mother country must, in her own interest, seek some means of deriving from the Colony compensating advantages, such as exclusive privileges in trade. Otherwise the parent State would be in a stronger position without the burdensome responsibilities arising from the possession of dependencies." Since the industrial revolution, Great Britain has had a rapidly expanding population, and a considerable overflow into other lands has been inevitable. That those other lands should be British and not foreign has been a clear advantage. But "prior to the completion of the industrial revolution diametrically opposite conditions prevailed. During the two centuries reaching back from that time to about the Restoration in 1660, England had no surplus population. During this long period emigration from England to America, although it was of slight dimensions, was viewed with great alarm. The prolonged duel with France emphasized the comparative smallness of England's population, even adding thereto that of Scotland and Ireland. Thus in 1670, a well-known economic and political writer, Roger Coke, said that 'Ireland and our Plantations do, in proportion to England, more exhaust it of men than the West Indies do Spain'; and that, while Spain gained new subjects in her Colonies, 'we, in our Plantations, wholly people them from ourselves.' Coke maintained that England's existing military inferiority to France was due to this emigration, and he pointed out that before the era of colonization, England had usually been successful in her wars against France and Scotland. Finally he said that 'Ireland and our Plantations rob us of all the growing youth and industry of the nation, whereby it becomes weak and feeble, and the strength, as well as trade, becomes decayed and diminished.'" Mr. Beer goes on to point out that, during the first half of the seventeenth century, there was a widespread impression that England was over-populated, and great use was made of this as an argument in favour of colonization. The language used sometimes recalls that of Mr. Rider Haggard or General Booth. A pamphlet of 1630, in favour of colonizing Massachusetts, represented that it was a great pity this land should remain "altogether unoccupied, when so many honest men and their families in old England, through the populousness thereof, do make very hard shift to live one by the other." Sometimes more cynical views were expressed. The Spanish Ambassador in 1614 wrote to his Government that though the Virginian Settlement had turned out

an expensive failure, the Government would not allow it to be abandoned, because "it was well to preserve that place, altho' it be good for nothing more than to kill people, and to afford an outlet to them from here; since in this Kingdom here they grow and multiply so as to be innumerable." But Mr. Beer finds that there was no real over-population, tested by the productive capacity of the country, during this period. There was a considerable increase in prosperity from the middle of the sixteenth century, which was attended by an increase in the complexity of social and industrial conditions, one feature of which was an increased inequality in the distribution of wealth and the establishment of pauperism as a permanent feature in English life. We have no doubt that Mr. Beer's view on this matter is correct; but we think that the supposed existence of a surplus population—that is, a population in excess of the productive capacity of the land—at the present time may be similarly explained. However that may be, it is clear that during the early years of colonization, the expatriation of a certain number of Englishmen was of no direct benefit to the mother country, and that, taking the narrow point of view of Imperial book-keeping, the Colonies were only valuable if the expenses and risks in which they involved the parent State were counterbalanced by solid commercial advantages. As Mr. Beer shows, and as we have indicated above, it was long before such advantages were realized. Looking at the other side of the account, we find that the advantages which the Colonies themselves derived from the Imperial connection were very real and substantial. It was only the certainty that English protection would be extended to them which prevented them from succumbing to the forces of France, Holland and Spain. They enjoyed a very large measure of local independence, the Imperial Government in many instances having not even a single resident official to represent it. And if they were compelled to export the bulk of their produce to the home market, they benefitted there at the expense of the English consumer by preferential duties, which, in some cases, conferred a practical monopoly, and by the actual prohibition of the cultivation of tobacco in England. Moreover, the restrictions imposed on their trade sometimes did little more than give legal sanction to limitations imposed by the force of circumstances. The title of England to her settlements was disputed by many rivals, and produce exported to those rivals would have suffered immediate confiscation. The English ports, too, were already important *entrepôts*, and it was at once more profitable and more convenient to send goods there than elsewhere. Mr. Beer illustrates his treatment of all these matters by a copious use of original authorities, and he shows great skill in maintaining the interest and lucidity of his narrative when dealing with masses of intricate detail. The history of tobacco, which figures largely in his pages, is diversified by much piquancy and humour. There is a

curious parallel between the seventeenth century attitude towards tobacco and the twentieth century attitude towards opium. King James's picturesque "counter blaste" is sufficiently well-known, but the intensity and wide prevalence of the disapproval of tobacco at this period is perhaps hardly so well realized. In Russia, the use of tobacco was prohibited by law. In India, the Mogul Emperor Jahángir wrote a treatise against it. In Massachusetts and New Plymouth smoking in public was punishable by a fine. In Connecticut "confirmed smokers" were specially registered as confirmed opium smokers are supposed to be in China to-day, and other persons were only allowed to use tobacco on the strength of a medical certificate. The development of tobacco planting in Virginia and Bermuda was a standing anxiety and annoyance to the proprietary companies of those Colonies, as well as to the home Government. Charles I. was much troubled that Virginia produced no substantial commodity, and was "wholly built upon smoke, tobacco being the only means it hath produced." The Privy Council reminded the West Indies, Bermuda and Virginia, that tobacco notoriously enervated "both body and courage." The Providence Island Company prohibited the cultivation of "that scurvy weed." The objection to tobacco was strengthened by economic considerations, its violent fluctuations in price being productive of distress in the plantations and despair among merchants at home. Nevertheless, the importance of the crop became so great that the history of the fiscal and trade relations between England and her Colonies in the seventeenth century is to a large extent a history of tobacco.

Mr. Beer's volume is mainly devoted to the economic side of Colonial policy. He gives a sketch of the growth of the administrative system, which, in its full development, was closely akin to that which survives in Bermuda to-day, but he is little concerned with the details of the internal history of the Colonies. The later volumes, which are to bring the story down to the outbreak of those differences which led directly to the war of independence, will be awaited with interest.

## RACE CHARACTERISTICS IN MAURITIUS.

SOME critics, in the endeavour to keep the Imperial spirit within just bounds, are fond of pointing out the comparative smallness, in size or population, as the case may be, of some of our possessions. Thus, the white population of Natal will be airily compared with that of the town of Leicester. These arithmetical considerations are sound and instructive, but they do not detract from the special interest which is to be found in the history of a place which has had a separate existence and an individual career. Thus, Mauritius has an area rather less than that of the county of Surrey. The history of Surrey is practically merged in that of England, and its towns and fields have few special associations except for the archæologist. Mauritius, on the other hand, has in the past played a prominent part in the politics of the world and the destinies of nations. To-day she shows, with extraordinary force and distinctness for so small a place, the different qualities of the European, African and Asiatic races.

The first occupiers were the Dutch, who failed, and the first French settlers, under the French East India Company, did little better. France recognised the importance of Port Louis as a strategic base for naval operations, especially the capture of foreign trade, and eventually, on the bankruptcy of the Company, took over the administration—at an enormous cost, as usual on such occasions. It became, under the Napoleonic régime, a valuable unit in the wide-cast military scheme. “In the long struggle,” says Colonel Malleon, “with England which had followed the Revolution, the Isle of France had inflicted upon the English trade a ‘damage which might be computed by millions,’ whilst she herself had remained uninjured,—for eighteen years indeed—unthreatened. She had proved herself to be that which the Emperor had declared that Cherbourg should become,—‘an eye to see and an arm to strike.’ Protected for long, partly by the storms of the ocean, partly by the daring spirit of her children, partly by the timid counsels of the British Government, she had been, for the privateers who preyed upon the commercial marine of the East India Company, at once a harbour of refuge and a secure base of operation. She had been the terror of British merchants, the spectre which haunted the counting-house, the one

black spot in the clear blue of the Indian Ocean. The relief which was felt by the merchants of Calcutta was expressed in an address presented by them to Lord Minto, in which they offered their 'sincere congratulations on the capture of the only remaining French colony in the East, which has for so many years past been the source of devastation to the commerce of India, to a magnitude almost exceeding belief.'"

Under the British dominion Mauritius has rendered signal services in time of war. She promptly despatched troops to India in 1857 at the time of the Mutiny, to South Africa in 1879 on the occasion of the Zulu War, and again in 1900 during the Boer War.

The population is a peculiar mixture. Out of a total of about 373,000 there are some 5,000 of pure European descent. Almost all these are French. This element retains in a marked manner the most charming characteristics of *la vieille France*. It is extraordinary how tenaciously this small and detached community has preserved, not only its racial characteristics, but also the manners and culture of its country of origin. They faithfully represent at the present day the great French race which in the middle ages civilised Europe. We may well be proud to know that under our flag is conserved so characteristic a section of old times in the island of the romance of "Paul et Virginie."

The earliest imported labourers were those brought by the Dutch from Madagascar and Batavia, of mixed but mainly African origin. This element increased rapidly and proved exceedingly unmanageable. More Africans were introduced by the French in the slavery days. But all efforts to force or induce the Africans to do agricultural work have substantially failed. The case is one of those that go to show that the African in tropical countries is averse to steady work. He has other views of life, as was pointed out by a correspondent in a previous number, and the trait seems ineradicable except under very favourable circumstances.

For African labour, therefore, Mauritius has substituted Asiatic. Here we have a totally different element. In 1830 there were about 858 Indians and Chinese; now the Indians number 261,000, or 69.9 per cent. of the whole population. They are industrious and frugal, and have gradually acquired a vast number of small holdings, representing one-third of the whole cultivated area of the island; the process is growing every year. In addition they have secured almost the whole of the hawking and carrying trade. This development has been greatly assisted by the fact that from economic causes the trade of Mauritius has been diverted mainly from Europe to India.

The Chinese number about 3,500, of whom only 58 are women. Sir Charles Bruce, in a very vivid and suggestive address delivered before the Scottish Geographical Society and printed in their

magazine for January, made the following observations on their character and practices:—

“The Chinese are a peculiar people, and occupy a peculiar position in Mauritius, as elsewhere. They have served a useful purpose, and have always loyally submitted themselves to the regulations and wishes of the Government. But they have acquired a monopoly of the retail provision trade by methods which I have always regretted. They have made this branch of trade subsidiary to the retail liquor trade, of which they have also acquired a monopoly, and the profits of the liquor trade enable them to undercut competition in the provision trade. If the profits of the retail liquor trade were transferred from the Chinese to the Government for public purposes, it is probable that the Chinese immigration would cease, and the legitimate profits of the retail provision trade would be restored to the general community. I made a proposal in this sense before I left Mauritius, but I fear it has not met with encouragement. The Chinese perfectly understand that Mauritius affords a very limited area for their transactions, and that if they increased and multiplied, competition among themselves would reduce the small margin of profit with which they are satisfied, below a living wage. With rare exceptions, therefore, they never bring their womankind with them, and have no intention whatever of becoming permanent residents. They work ‘for all they are worth,’ to enable them to return home as soon as possible with what is to them a sufficient fortune. By arrangement among themselves—an arrangement with which the Government has nothing to do—about 10 per cent. repatriate themselves every year, and make room for others. This will explain the small percentage of females in the census return.”

This quiet, voluntary, but absolutely solid organisation is characteristic of the race. It is quite natural to find the Chinese acquiring the possession of trade for which deliberate planning and concerted action are required. They show the quality of diplomacy, not to say intrigue, in the handling of commerce. But they are and remain always aliens. Their intention is invariably to return home when they have amassed sufficient property. There is no sign here that the much-talked-of exodus from China is a matter to be reckoned with.

It may be asked how it is that with these diverse elements, containing as they do much ability and industry, Mauritius is in some financial stress. An extraordinary series of disasters in recent years—hurricane, fire and plague—goes far to account for the fact. The depreciation of sugar, the staple industry, has, of course, been a great blow. About 95 per cent. of the exports consist of this product. The public debt of the Colony, however, is small, and great efforts will no doubt be made to tide over the present period of depression.

## THE ONE FATHOM BANK FERRO-CONCRETE LIGHTHOUSE, STRAITS SETTLEMENTS.

By Colonel the Honourable ALEXANDER MURRAY, V.D., M.I.C.E., F.R.C.I., Colonial Engineer, and Surveyor-General, Straits Settlements.

TRAVELLERS in ocean-going ships have been accustomed for 30 years and more to notice in the Straits of Malacca, in about latitude N.  $2^{\circ} 53'$  and longitude E.  $101^{\circ}$ , an iron Screw Pile Lighthouse on the One Fathom Bank. This structure served its purpose in warning mariners of the hidden dangers of sand banks and reefs in the vicinity, but the necessity being felt for a lighthouse of greater range to cover the more distant shoals it was decided by the Government of the Straits Settlements to erect on this exposed site a Ferro-Concrete Lighthouse, the first, it is believed, of its class constructed in the open sea in comparatively deep water (20 feet) on a sand bank subject to tidal erosion, and about 15 miles from the nearest land on the Malayan Coast. During the monsoons the strong tidal currents running over the One Fathom Bank at the ascertained rate of from 3 to 4 knots per hour cause an erosion of the sand bank to a depth of 12 feet, rendering the question of foundations one of special difficulty and expense. The range of the tide is as much as 14 feet.

The focal plane of the old Screw Pile Light was 55 feet above high water of ordinary spring tides. The focal plane of the Ferro-Concrete Light is 92 feet 6 inches above H.W.O.S.T.

The light is a Second Order Occulting White Light of 4 flashes in rapid succession at intervals of 15 seconds, with a range of 15 miles. Since the light has come into operation it has been reported that on dark nights the reflections of the flashes against the sky are clearly visible at a distance of 40 miles. The light, supplied from the works of Messrs. Chance Brothers of Birmingham, is of the

second order with an intensity of 64,000 candles, and of much greater illuminating power than the old first order light. The new light was brought into operation on January 12th, 1908.

The design for this special class of structure was prepared by Mr. O. P. Thomas, a ferro-concrete expert, and at that time agent in Singapore for the Colonial Ferro-Concrete Syndicate, Limited, and submitted to the author, who, after causing some alterations and additions in order to secure greater strength and rigidity, recommended the execution of the work.

The lighthouse site being in an exceedingly exposed position the full effects of the monsoon storms, or "*Sumatras*" as they are locally named, were experienced. This made all the submarine work of an exceptionally tedious, risky and difficult nature, the waves during the fiercest blasts rising to a height of 8 feet.

In July, 1904, several timber piles for the temporary staging were swept away by heavy seas in a severe monsoon storm. Bad weather continuing, the erection of the staging was postponed to January, 1905.

In October, 1904, the whole of the ferro-concrete piles (17) were completed. In June, 1905, a short stoppage of operations resulted from collapse of a part of the temporary platform, through a flaw in the heart of one of the main beams. Owing to adverse weather conditions, the extreme difficulty in inducing native labour to remain on the work, and the lack of sufficient reserve capital to push operations forward energetically, the contractor, Mr. O. P. Thomas, threw up his contract. In September following Messrs. Riley, Hargreaves and Company, engineers and contractors, Singapore, undertook to complete the work. In January, 1906, close upon midnight, the temporary quarters and workshed caught fire, which was at once extinguished. During this month the timber staging suffered damage from storms and heavy driving seas necessitating repairs, and in the following month during a heavy storm the contractors' tender, "*Bangkok*," dragged her anchor and drifted just clear of the staging. In July following the sinking and testing of the ferro-concrete piles was completed. Another severe storm was experienced, jeopardising the safety of the central iron cylinder, which was in position preparatory to sinking. The loosened lashings were made secure after considerable risk to life and limb. In September the sinking and filling of the central cylinder was completed. In July, 1907, during the prevalence of a severe storm the flagstaff of the old Screw Pile Lighthouse was struck by lightning, and in November following the worst storm during the whole period was experienced, during which the temporary quarters and workshed were destroyed. As the ample accommodation in the new lighthouse was now available it was made use of until the completion of work at the end of December, 1907.

The timber for the temporary staging was procured from the forest on the Malay Peninsula, and at one end of the platform of the staging an "attap" shed of jungle timber and palm leaf covering was erected for the occupation of the resident engineer, workmen, workshop, store, office, &c. The contractor's agent lived on board the s.s. "Bangkok," the tug launch employed on the work.

The ferro-concrete foundation piles, seventeen in number, were constructed on Pulo Gedong, a small island close to the Malayan coast and fifteen miles from the site of the new lighthouse. These are of steel rods laced together with steel wire, and of granite, metal, cement and sand. The concrete was in the proportion of 1 of Portland cement to  $2\frac{1}{2}$  parts of granite broken to pass at all angles through a  $\frac{3}{4}$ -inch ring and  $1\frac{1}{2}$  parts of sand.

For the sake of lightness and facility of transport to site the piles were built hollow, each 50 feet 6 inches long—nine of these were 2 feet square and eight 18 inches square.

These were floated out to site attached to rafts constructed of barrels, and heaved into a vertical position preparatory to sinking.

The sinking to the necessary depth was secured by two water jets, actuated by a steam pump, playing at opposite sides at the foot of the pile. The piles were sunk to an average depth of about 15 feet into the sand bank in from three to four hours.

In view of the periodic erosion of the sand bank, resulting from the strong tidal currents, added to the comparative ease with which it was found the piles could be sunk through the sand by the above procedure, it was decided to lengthen one of the piles by  $14\frac{1}{2}$  feet to ascertain to what further depth it was possible to sink them.

This pile was sunk to a further depth of 13 ft., making a total depth of 26 feet 8 inches, into the sand until a hard sub-stratum was reached.

Similarly, the remaining sixteen ferro-concrete piles were lengthened 13 feet, and sunk to an average depth of 26 feet 9 inches. The usual set tests were then applied with satisfactory results.

The foundation piles were arranged in octagonal form, the centre pile being a 5-foot diameter cylinder filled with concrete, an inner ring of 18-inch square piles (introduced into the design at the instance of the author) at a radius of 9 feet 9 inches, and an outer ring of 2-foot square piles at a radius of 20 feet.

The heads of the piles were connected by radial and ring beams at a level of 4 feet below H.W.O.S.T., the ends of the radial beams being clamped to the centre pile and bracketed to the piles by angle irons.

From each pile a ferro-concrete column was carried up to the level of the first floor, 21 feet above the main bracing.

Intermediate between the main bracing and first floor a ferro-concrete bracing was fixed of radial beams, strengthened by steel bars and shearing bars fitted between the tension bars.

The first floor is supported by ferro-concrete radial beams and by the inner and outer ring beams. The gallery, 5 feet wide, is carried on a continuation of the radial beams in the form of a cantilever.

The ferro-concrete floor is 5 inches thick, finished with a rendering of cement mortar.

The gallery is reached from sea level by a teak-wood ladder in two flights, the lower flight being hinged to a platform made of ferro-concrete and supported on one of the ferro-concrete columns.

The lower end of the upper flight is fastened to the concrete platform, and the upper end to the continuation of the main radial beam giving access to the gallery through a "well" protected by a wrought-iron grating.

From the first to the third floor, the intervals between the outer ring standards are walled in with ferro-concrete.

On the first floor two store houses are provided for oil, lamp stores, &c. The internal party walls radiate at a distance of 6 feet from centre of building. Two ferro-concrete water tanks store 1,000 gallons each, the water being collected on the third floor, which is graded to a gully at the head of the down pipe leading to the tanks below. Special provision was made for the rain water collected in the first few minutes to run to waste, ensuring as far as possible clean water for drinking and culinary purposes. Accommodation is provided on the first floor for kitchen, dining-room, bathroom and closet. The entrance from the gallery is through an archway.

The second floor is reached by a teak-wood staircase, continued to the third floor, and protected by a ferro-concrete hood over the "well" giving access to the third floor.

On the second floor sleeping quarters are provided for the lighthouse staff, also an office and visitors' room.

The third floor projects 4 feet beyond the lower floors, giving a width of 44 feet, with a curb round the outer edge. This floor serves as the rainfall catchment area for water supply. The floor is moulded to an average thickness of  $4\frac{1}{2}$  inches.

At a radius of 24 feet from the centre, eight raking columns of reinforced concrete rise to a height of 30 feet to the level of the service floor. The radius at the top of these columns is 9 feet 3 inches.

The central column is 2 feet in diameter, and carried to the top of the building. It is moulded hollow above the third floor, to form a weight tube. An opening in the side is provided for convenience in placing or removing the weights.

THE LIGHTHOUSE COMPLETED.

Between the third and service floors two sets of reinforced concrete bracings tie the raking columns to each other and to the centre column. The service floor is reached by three flights of ladder steps, with a suitable platform at each bracing level. The floor is moulded 4 inches thick, and carried by eight radial beams. These overhang the raking columns, and support the gallery.

The heads of the raking columns and the outer ends of the radial beams are tied together by reinforced beams. Eight radial beams support the floor at the top level, and on this floor the cast-iron base of the lantern, 12 feet in diameter, is bolted by suitable hold-down bolts.

The total weight of the completed structure is about 1,000 tons, and the total cost \$246,900, or, at 2s. 4d. to the dollar, £28,805.

The work was supervised by the Public Works Department, under the general direction of the author. Mr. John Craig, of the Public Works Department, was the Engineer resident on the works, and Captain Walker the Contractor's Agent. Much credit is due to these two officers for the successful completion of the work, notwithstanding the difficulties referred to.

It is satisfactory to note that during storms the vibration at lantern level is barely appreciable compared to similar movement on the old Screw Pile Light.

A. MURRAY, Col.

## BUSINESS NOTES.

### Automatic Telephones.

This system does away entirely with the telephone operator. Mr. Llewellyn Preece, during a recent visit to Paris, inspected the Lorimer Automatic Telephone Exchange which is erected there for inspection purposes; the result enabled him to report favourably on this system, in the working of which all conversations are secret.

In its details and construction the system appears to be far superior to any other automatic system. Owing to the fact that practically all movements in the Exchange are mechanically made and electrically controlled, connections between the calling subscriber and the subscriber called are rapidly but firmly carried out, and, assuming that the called subscriber is disengaged, any call can be put through in about eight seconds.

Exchanges are constructed on a "Sectional" system, each section containing all the controlling apparatus for 100 subscribers, and being as a rule so arranged that 10 per cent. of the subscribers can be connected at one time. It is found that the average percentage of lines simultaneously engaged in America is 7 per cent. for ordinary Exchanges. If desired, however, the section can be so arranged that 15 per cent. of the subscribers can be connected at one time.

The sectional boards are constructed in five divisions, each one of which can be used for one connection; that is, each may be looked upon as replacing one "cord" circuit of an ordinary Exchange. Each division contains five connectors identical in construction though varied in the internal connections. One connector, the "primary," deals with the calling subscriber; the second connector with the intercommunications in the division selected; the third is required if the Exchange contains more than one section, *i.e.*, if there are more than 100 subscribers; the fourth connector, termed the "secondary," deals with the called subscriber; and the fifth transmits the signals from the calling subscriber through the primary connector to the called subscriber through the secondary connector.

Besides these divisions—which may be called the “cord” divisions—each section has one control division which has four connectors. The first receives the subscribers initial call; the second picks out the nearest disengaged “cord” division on the same section; the third controls the order of calling, should more than one subscriber make a call at the same moment; the fourth transfers the call from the control division to the “cord” division picked out by the second controller or connector. Three of these are of special design, but the fourth is identical in construction with the connectors used in the five other divisions, so that on a section of 100 subscribers there are only four forms of construction, and out of 29, 25 are identical.

The mechanical movements are worked by a small motor requiring  $\frac{1}{10}$ th H.-P. for two sections, and of increasing size as the sections are multiplied. The motor drives a series of shafts by worm or spur gearing, which connect to gearing on each connector when electro-magnets are actuated, but only under such circumstances. One of the control division connectors is constantly rotating, except when a call is received, then it stops until the call is handed on to one of the five connecting divisions. All electrical control is done either by these electro-magnets, which hold or release the gears, or by relays, the armatures of which can make one or other of the two contacts.

The motor is driven by an accumulator of six cells, which also supplies all current required for the electrical controlling connections.

The system is entirely a central battery one, and the subscribers' instruments are quite simple.

Each subscriber's instrument contains—besides the usual transmitter and receiver—a set of small levers which are adjusted by the subscriber when making a call. One lever is for the unit of called subscriber's number, one for the 10, one for the 100, and one for the 1,000 (if necessary), and another can be added for the Exchange if more than one is in use. There is, further, a handle to which the subscriber gives a half turn on making a call, and within the apparatus is a contact maker which automatically transmits the necessary signals to the Exchange as soon as the instrument is connected to its primary connector in one of the “cord” divisions in the sections.

The subscriber has to set his levers to the correct number, give the handle a half turn, then wait until he hears a buzz (which means he is through) and press a button which rings the bell in the called subscriber's instrument. On finishing a conversation and returning the receiver to its hook, the Exchange automatically returns all apparatus to the normal position, and each subscriber is immediately free to make other calls.

This system should be kept in order without much skilled labour, as all moving contacts are well covered up and are positive

rubbing contacts. All connections are well within view, and should a connector break down it is an easy matter to take the whole division out and replace with a new one. Further, whilst the division is being replaced, the remaining four continue the work undisturbed.

At Peterboro, Ont., in Canada, one exchange of 500 subscribers has been working continuously for the last four years and giving satisfaction. Two others—one for 1,200 subscribers, the other 500—are also being erected in Canada.

The French Government are having an exchange for 300 subscribers now erected in Lyons (which will be at work within a week or so), and another for forty subscribers is in hand for Rome.

At present all apparatus is made in America, but the French company, which controls all European patents, are starting a factory in Paris to deal with work on this side of the Atlantic.

The cost of a section for 100 subscribers would be at present about £200-£250, but, when the French factory is working, this figure will be reduced. The subscriber's instrument at present costs from 20s. to 30s. and this figure will also be reduced.

The Lorimer Company are prepared to send out an expert to erect the apparatus and give full instructions how to maintain and superintend the working of the same.

---

### The Sydney (N.S.W.) Fire Brigade and Motor Fire Apparatus.

The adoption of motor fire apparatus is on the ascendant in all parts of the world, and no city has realised its advantages to a greater extent than Sydney. Superintendent Webb, the chief officer of the fire brigade, already has three motor appliances in service, viz., a petrol driven fire engine, a petrol motor chemical engine, and a petrol motor salvage van. These three machines, which were all constructed by Messrs. Merryweather & Sons, of London, are just being supplemented by a fourth from the same firm. The new appliance, which has just been shipped from London, can travel at the rate of twenty to thirty miles an hour, and on reaching the scene of action, by the simple movement of a lever, the power of the motor can at once be transferred from the road wheels to the fire pump, which delivers 300 gallons per minute. Melbourne also possesses an engine of the same design, but of larger size, whilst, in the old country, Glasgow has three, and two are in course of construction for the London Fire Brigade. At a fire which occurred near Glasgow a few months back, one of these engines travelled a distance of sixteen miles in thirty-four minutes.

**Rees Roturdo Pump.**

The motor-driven Rees Roturdo pump which worked the cascade at the Franco-British Exhibition is so designed that it will adjust itself to any conditions of working without it being necessary to alter the speed.

The ordinary centrifugal pump must be run at practically a fixed speed, corresponding to the head and volume for which it has been designed. In places where the conditions of the supply of water are variable the self-regulating quality is very valuable.

---

**Blue Oil.**

Blue oil, officially known as "oil mineral preserving wood," has been found satisfactory in official trials, and it is believed that it will form an efficient protection for hard woods against the attacks of white ants. It can either be applied with a brush, in which case three coats should be sufficient, or the articles can be dipped in a tank of the oil, the surplus oil being allowed to drain off and the articles allowed to dry before a second dipping. The penetration of the oil below the surface of the wood varies with the wood, the temperature and time of immersion. As a guide to what may be expected, hard English oak dipped twice, and remaining immersed each time for about half-an-hour, showed an oil penetration of about  $\frac{1}{4}$  in. The oil can be obtained for 6d. a gallon in quantities.

---

**Osram Lamps.**

It is claimed for these tungsten lamps that they are 70 per cent. more efficient than the carbon filament lamps, and this is borne out by a report of the Faraday House Testing Institute. But the resistance of tungsten to the passage of electricity is so low that it is not proposed, it appears, to introduce high voltage lamps of lower c.p. than 50, and in an installation of 200-volt 16 c.p. lamps there would be no saving by substituting 50 c.p. osram lamps. If, however, the current is an alternating one, transformers can be used to bring the voltage down to 25 volts, and then the 10 and 16 c.p. lamps can be used. The Civil Service Stores in Queen Victoria Street have adopted this plan, reducing their voltage and installing 4,000 25-volt lamps.

---

**Small Printing Machine.**

Enquiries are sometimes received for the price of a small printing machine suitable for light work, such as printing signatures on a number of documents. The platen machine "Excelsior" has been recommended for this purpose; the inside chase measurement is  $7\frac{1}{2}$  ins. by  $10\frac{1}{4}$  ins.; the price, for treadle, £21 15s.; treadle and power, £23 10s.

**Vaseline.**

This article is largely imported by the Colonies, but it does not seem to be generally known that it is not an ordinary name of a product, but a registered trade name for an article made by the Chesebrough Manufacturing Company and supplied by them only. If supplied as Paraffin Molle, P.B., with a similar melting point, the cost is much less.

---

**Fire Extinguisher.**

An enormous number of the "Underwriters" fire-extinguishers have been sold in the United States, and the apparatus is remarkably simple. There are no stop-cocks, valves or levers; it is only necessary to turn the machine upside down, and a stream of fire-quenching liquid 40 to 50 ft. long is poured out. Most extinguishers contain a glass bottle, which is broken in some way or other, and so allows the sulphuric acid to mix with the bicarbonate of soda solution and generate carbonic acid gas. This sets up an enormous pressure, and serious accidents have naturally happened. The "Underwriters" have a self-feeding stopper, which distributes the acid gradually. A good point is that the rubber tube is always kept straight, and thus takes longer to perish.

---

**Oxy-Acetylene Process.**

This method of repairing cracks in boiler plates (which are not in torsion) has been used considerably on the Continent, and is now being adopted by many firms in the United Kingdom. It is claimed that the process effects a saving of time and money and is more effective.

---

**Removal of Tree Stumps by Dynamite.**

This is an effective means of clearance, and often the most economical. A hole should be made with a crowbar or borer just under the stump in a slanting direction till the end of the trunk is reached; if the soil is dry, throw in a little water to soften it. A sufficient number of cartridges should be pressed, one at a time, into the borehole by means of a wooden rammer—and take care that it is wooden. Prepare a detonator by cutting the safety fuse in an oblique direction, so as to expose as large a surface as possible of the powder core, inserting it in the detonator and fixing it with nippers. The detonator should then be inserted to two-thirds of its length in the last cartridge, which is gently pushed home till it touches the next one. The remaining space in the borehole should be filled up with earth, or clay if available, each handful being gently pressed down with a rammer. Apply a light to the safety fuse until the powder

ignites, and then (it is hardly necessary to add) retire to a safe distance.

If the ground is light and loose, it is better to bore the stump, preferably in the strongest part.

Boulders can be broken up by this means, the charge being placed under the stone and in close contact with it.

Safety fuse burns at the rate of about ninety seconds per yard. There are a great many varieties, and different countries show a predilection for special kinds; in any case, the important points for the operator are to keep the fuse dry and cut it down just before using.

The detonator is really a large percussion cap charged with fulminate of mercury, which detonates the dynamite in the cartridge. Detonation is conversion into gas with such suddenness as to be practically instantaneous.

---

### Concrete Reservoirs.

Some failures make it desirable to point out that concrete reservoirs with walls from 2 to 4 ft. thick will not hold water, which will quickly flow through at all points. The reservoir must be plastered internally with a non-porous lining of some sort, such as  $\frac{3}{4}$  of an inch of sand and cement plastering, and over this a layer of pure cement plastering  $\frac{1}{4}$  of an inch thick. The concrete is only to give sufficient strength and immobility to the whole. The angles formed by the walls and the floor should be filleted, and in these places the plaster should be much thicker. This renders damage less likely when the reservoir is being cleaned.

---

### Suction Gas Plant.

A vaporiser of a suction gas plant is apt to crack unless the casting is strong. The inner pipe is exposed to a very high temperature, due to the gas in the inside, with warm air and vapour on the outside, and the shell to a much lower temperature, due to the cold air outside and warm air and vapour inside. This means a great difference of expansion between the inner pipe and the outer shell; they are one and the same casting, and therefore something must give, unless the casting is strong enough to bear the abnormal strain.

---

### Stoneware and Iron Pipes.

These pipes are so brittle in transport that a large number of breakages occurs, but the cost of protecting them in a really efficient manner would be too great to be justified. Such packing in the case of stoneware might amount to 50 per cent. of the value, and

the breakages do not come to this, though cases have occurred where they have reached 10 per cent., and stoneware junction pipes are liable to a still greater rate. But stoneware traps, which are very fragile, might be packed in strong crates and protected. Iron pipes suffer more than stoneware, but the heavy losses which often occur are due to careless and rough handling. The ordinary labourer does not understand how brittle cast iron is, and intelligent supervision at the lighters and the wagons is necessary.

---

### Timber.

No little difficulty is experienced from the fact that much of the beauty of a piece of wood may be accidental, and the observer may be misled into thinking that it is general. Figure in timber is in some cases "inherent"; the transverse section shows a number of fine lines, known as "medullary rays," radiating from the pith to the circumference. But the most beautiful specimens of figure are accidental. They come from any cause which makes the fibre irregular, such as capsun on one side, abrasions, sudden variations of temperature. Each species of tree, however, is apt to develop similar accidental figure.

One of the most beautiful of the accidental effects is where alternative streaks, suggesting light and shade, run with the grain the length of the log. This is called "roe," and if it is vivid and varied it gives a great value to the wood. "Mottle" is the mark which suggests something raised on the surface. In all cases expert knowledge is required for cutting in the proper way and obtaining the best results. (*Journal of the Royal Society of Arts.*)

---

### Artesian Wells.

It is only possible to make these wells when there is a permeable or water-bearing stratum below an impermeable one. The former may be sand, gravel, shale or some such material capable of holding and storing water, *i.e.*, of the order of sedimentary or aqueous rocks, as distinguished from the igneous or intrusive rocks, such as granite, laterite or gneiss. Thus, if clay is found over granite, it is hopeless to look for water between. Another requisite is that the permeable stratum shall outcrop on the surface at an altitude above the site of the proposed boring.

---

### Furniture.

"Dryad" furniture, about which an enquiry has been received, is made of natural pulp cane unbleached, and this material is said to be very suitable for the tropics, provided galvanised or non-rusting nails are used. America and Germany export a large quantity of

such furniture, and the manufacture has been begun in this country. Insects do not attack cane as they do other woods.

---

### Accra Water Supply.

A scheme for a water supply for Accra has been prepared by Messrs. Middleton, Hunter and Duff. The dam would consist of a concrete wall 10 feet thick, built in a trench excavated in the sub-soil of the river bed. It is proposed that this trench be formed with steel piles driven on each side, similar to those which have lately been successfully used in connection with the construction of the new water works at Singapore, and which, in a different form, were used at Hodbarrow, on the coast of Cumberland. It was found at Hodbarrow that when the piles were driven down about 25 feet below the surface there was very little leakage of water underneath them, as the ground was firmly consolidated by the weight of the earth upon it. It is believed, therefore, that, by constructing the trench in this manner, pumping during the sinking of the trench and the building of the dam will not be excessive. The concrete wall will be carried up to the level of 32 feet above datum, and will be supported above ground by rubble backing having an easy slope, covered with concrete blocks 2 feet thick. The top of the embankment will be about 10 feet above the surface of the ground at its southern end, increasing to 16 feet at about the centre of its length. The construction adopted will permit the highest floods to flow over the top of the dam without injuring the work. At the north end of the dam it is proposed to provide four large "Stoney" sluices, each 26 feet high by 20 feet wide, which will serve the double purpose of allowing the main body of the floods to pass through their openings, and of preventing the silting up of the reservoir by the detritus brought down by the river.

The sluices will be constructed so that two men will be able to work them whatever may be the height of water in the reservoir. They are, moreover, designed of sufficient height to enable the capacity of the reservoir to be doubled by increasing the height of the dam by 4 feet, making the total height 36 feet above datum, which can at any time be done at a very small cost. The increased water storage thus obtained would enable additional turbines with an electrical plant to be installed at the dam site, which would provide for the lighting of the European quarters in Accra.

The estimated cost of the work is £190,450, including turbines for pumping and a light railway along the line of the main to the dam site for transport of materials. The capacity of the reservoir would be 1,500,000 gallons, and on the assumption that 500,000 gallons were supplied daily the cost is estimated at 1.68 shillings per 1,000 gallons.

The charge of the Rand Water Board to Johannesburg is 8s. per 1,000 gallons, and at Bloemfontein it is 5s. 6d. Accra would, therefore, fare well by comparison with these figures. The capacity could be doubled at a small expense, and power provided for an electric light installation.

---

### **Dredger for Lagos.**

A pump hopper dredger has been ordered from Messrs. Simons and Co., Renfrew, at a cost of £86,065 for the vessel delivered at Lagos. The hydraulic machinery will be supplied by Sir W. Arrol and Co., who supplied it for the dredger "Egerton," in which its working has been satisfactory. The speed is 10 knots; length on deck, 291 feet; depth, 18 feet 9 inches; net capacity of hopper well, to about the level of main deck, not less than 36,000 cubic feet.

"Cedervall's" protection boxes will be fitted on the outer end of the propeller shaft; it is claimed that these provide a very efficient means of excluding sandy water from the stern tube, and would considerably mitigate, if not altogether avoid, the trouble usually experienced with vessels working in water heavily charged with sand.

---

### **Tanjong Pagar Dock New Extension Works (Messrs. John Aird & Co.'s Contract).**

The main wharf is being reconstructed, and a dredger had in October bottomed up 150 feet of the foundation for the blockwork wall at the eastern end. A drilling barge put down 90 holes in a month, about 8 feet deep and 10 feet apart each way. Five pounds of gelignite are used for blasting in each hole, with the result that the shale appeared to be thoroughly broken up. Very little concussion was felt when these charges were exploded, but special precautions were taken to ensure the safety of the shipping during these operations. About 2,260 men are employed on the works.

---

### **Priestman Dredger.**

A road has been constructed through the swamp at Belize by the aid of a Priestman dredger, which cut its way from a lagoon to the sea. The soil which it removed in making a channel for itself was used to form the roadbed, and proved of firmer material than had been expected. The channel at the side reduced the level of the water in the swamp and drains some land.

### Road Tracer.

Mr. C. V. Bellamy, Director of Public Works, Southern Nigeria, has devised a new road-tracing instrument, which is being brought out by Messrs. Stanley & Co. It determines the grade of roads by measuring the angle between the axis of a sighting tube and a heavy pendulum, which always swings into a vertical position. An arc of a circle is adopted for the vernier, and the movement of the zero mark on the vernier from the index on the pendulum measures the inclination of the line of sight from the horizontal. The details are carefully designed, and if intelligently used the instrument is expected to give results nearly as accurately as the level or theodolite.

---

### Imports and Exports.

The Trade Records Committee (Ed. 4,345 and 4,346) recommend that importers should be required to declare upon their entries the place from which the goods were first consigned to the United Kingdom, as well as the place of shipment, and exporters to declare on their specifications the places of final destination so far as they know them. At present, under the Customs Declaration Act of 1876, all imports are attributed solely to the place where they were put on board, and this, of course, gives an altogether wrong idea of the real trade. We do not want to know the stages of the journey, but where the goods are made or consumed. Traders would like to learn the ultimate destination of their goods so that they can as far as possible deal directly with the real customers. The manufacturer, however, who sells to a merchant at Hamburg or Rotterdam does not know where the goods are going, and the merchant takes care not to tell him, and this will always be a difficulty which is hardly recognised in the report. On the other hand, the obligation to state the original place of imported goods will undoubtedly go far to show the commercial world where their real competitors are, and this will put them on enquiry.

---

### Cotton Growing.

The Commercial Intelligence Officer of Southern Nigeria in reporting on the trade of the country writes:—

“Cotton is already grown for local use in most of the districts which will be served by the railway now in course of construction, and it is cultivated so cheaply that in the north I bought seed cotton at a price which would permit of its being landed at Liverpool at 3½d. per lb., after allowing for the cost of ginning and rail and steamer freights, &c. Even on the borders of Southern Nigeria, pure coarse country cloths, made from cotton, grown, ginned, spun and woven locally, can be bought at a price which works out at only

10d. per lb. in the cloth. To anyone who has travelled through the country beyond the palm belt, and has given attention to the extraordinary low prices at which locally-grown produce and native manufactures are sold, there can be no doubt as to Nigeria having the handicap in its favour so far as labour values amongst the natives themselves are concerned.

"In the Lagos Province we have in the fifth year shipped a crop of 9,000 bales of 400 lbs., and it must not be forgotten that this has been produced in a country where there are strong competing industries which will not apply to anything like the same extent beyond Ikerun, and that only hoes and manual labour have so far been used on the farms, no draught animals being employed. In the open country which the railway is now entering, cattle and donkeys can live and thrive, and from the condition of the majority of the farms I saw in the north I consider ploughing will be feasible.

"The important points to be considered with a view to properly developing the cotton industry are, to my mind:—

"(a) The maintenance of staple buying rates.

"(b) Careful selection of seed, giving particular attention to the improvement of indigenous varieties.

"(c) Suitable rotation of crops bringing in something which can be exported—ground nuts for example.

"(d) Introduction of ploughs and other labour-saving implements, and

"(e) The presence on the spot of the merchants whose assorted goods will induce the natives to work."

There is a good deal in the last point. No doubt the goods must be varied to suit local tastes. In one village cloth may be esteemed, and beads scorned; in the next village it may be the other way about.

---

### Motor-Cars.

The death of a chauffeur was reported in the F.M.S., but the report was, as Mark Twain put it, "greatly exaggerated." The incident, however, serves to show what some motor cars can do:—

"The man was not a driver, only a cleaner. He was told by the driver of another car not to attempt it, but presumably, seeing the other cars leaving, thought he would do so too. On arriving near the Rest-House, where the other cars were drawn up along the side of the road, he could not stop and, to avoid a collision with the Resident-General's car, turned the car into the ditch. The other occupants jumped off, but the driver went over with the car, which turned over in the drain, pinning him under it. Mr. Claud Severn and Captain Gay were snipe-shooting close by, and the former ran up and got the driver out, his head being just above mud and water

level, and sent him to the hospital. Later, the Assistant Surgeon reported that he had come round. He had a slight concussion, a cut on one hand from the broken glass and a badly bruised leg. The ditch was about five feet long and 18 wide, with almost a vertical side, down which the car went. The hood, splash-board and glass screen were wrecked, and the car coated inside and out with Krian mud. Mr. Severn and Captain Gay worked like Trojans, and with ropes and about 100 men got the car on to the road again. After tiffin Mr. Spooner set to work and with assistance succeeded in getting a cough out of the engine, which he could not turn at first, as everything was choked with filth. However, ultimately he got the engine to go, and, having had the cushions, &c., cleaned, took the car for a turn in the village. Mr. Spooner then went after the party, which had gone off previously in the other cars, and later drove H. E. Sir John Anderson back to Bagan Serai without a hitch, the car going splendidly. The car was the 24 h. p. Albion Railway Inspection Car, and it speaks wonders for its capabilities that after such an experience it should be in working order again within an hour or two."

---

#### Touring Exhibition.

An exhibition will be held at Olympia next year under the name of the World's Touring, Sport, Pastime and Travel Exhibition. A low rate for space is promised, and none of the bazaar element will be admitted. British Colonies can have a special rate of 3s. per square foot. It is suggested that Colonies should have cinematograph displays, as these are popular with the crowd and give a real idea of the countries; the cost of running one (if films are supplied) is £80 a month.

## RAILWAY NOTES.

## Uganda.

The Uganda Railway in 1907-8 did not do quite so well as in the previous year, the profit being £64,713, as against £76,763, but the climatic conditions were unfavourable, and a steady improvement may confidently be looked for, though it may not be considerable this year, as there has been a scarcity. The management is hoping for an increase of exports from the East Africa Highlands. At present, hardly anything is exported in large quantities, except potatoes, and the railway wants something more substantial and less perishable. Mr. Currie rests his hopes on wool, and urges concessions to encourage the importation of good stocks of sheep. No doubt the question of the immediate future will be the construction of feeder roads. The traffic area is confined mostly to a narrow belt, extending only a few miles on each side of the railway, and it would be no difficult matter to pick out several points at which tramways or motors could be enabled to run with great advantage to the line. The most striking feature at present is the vigour of the Lake trade; the steamers earned a dividend of 10½ per cent. The "up" traffic on the railway is more than double the "down," building materials showing largely (17,000 tons); and a development of exports would be convenient to balance matters.

A party of Boers, numbering 260, and their families, recently arrived (by steamer) and made for the Highlands. Many more are expected, and we may very soon see a Boer province in East Africa. The land selected at Wasin Ginsho is very good, and suitable for cattle and sheep, and the Boers are said to be very pleased with their prospects.

---

"We may all live to see the commercial interests of Uganda valued in millions" (Governor's speech, 26th September). The

development is going on so well, that the case for a really Ugandan railway is strengthening rapidly. Lake traffic is the most remunerative, and the example of the Victoria Lake points to the prospect of a paying traffic from the Albert Lake. "Moreover," Mr. Currie observes, "such a railway would form an important link in our East to West through communication between the Indian Ocean and the Atlantic, which, as a commercial undertaking, has immense possibilities, infinitely more so than the much talked of Cape to Cairo Railway." The British public will perhaps not be easily shaken from its belief that the latter is the ideal project, and the sanctity of great names has been given to it; but on a mere business survey of the character and population of the lands to be traversed and the probable business, Mr. Currie is no doubt right.

---

### Nigeria.

The line from Lagos is making good progress, and is expected to reach Jebba on the Niger by the beginning of the year, thus bringing this point two days' journey from Lagos. A bridge from the Northern Nigerian side to Jebba Island is being constructed; it will be 900 feet long. On the other side of Jebba Island, however, communication will for the present be made with the Southern Nigerian side by a steam ferry, which is now being constructed, but eventually a bridge will be put up. The other line from the Niger to Kano has been the scene of an extraordinary effort in getting the material up to where it was wanted during the flood season. It is not too much to say that the success achieved realised the best expectations. 150 miles of earthworks were completed in less than a year. 7,000 natives are employed. It is expected that the rails will reach the junction of the Southern and Northern system at She by June; the line from She, *via* Zungeru, to Jebba (100 miles) will then be taken in hand simultaneously with the extension of the main line from She to Kano, a distance of 230 miles. Kano should be reached early in 1911, 400 miles from Baro.

---

With this work may be compared the construction under contract of the German line from Morogoro to Tabora. The contractors undertake to have 700 kilometres of railway in working order by 1st July, 1914. They began working in July last, and are employing about 6,000 men; up to the end of September 121,000 cubic metres of earthwork had been excavated.

---

It has been no light task to get the material required this year for the Northern Nigeria Railway up to Baro. Eight steamers belonging

to Messrs. Elder, Dempster & Co. were chartered by the Niger Company and employed from 19th July to 16th October in the transport of railway material, during the high-water season, from Burutu to Lokoja and Baro. Each vessel was about 250 feet long, with a deadweight capacity of from 1,000 to 1,200 tons, on a draught of 10 to 11·6 feet. The first vessel to leave Burutu was the "Bassa," which unfortunately came to grief on 22nd July on a well-known rock two miles below Lokoja. She settled down in 14 feet of water, and during high water she was covered all but her funnel and masts; it is expected that the cargo will be recovered in January-March. Other vessels followed and reached Lokoja safely; three vessels tried to get to Baro, the depth of water at crossings being 11·6 to 12 feet, but they stuck on sand banks and had to be lightened by barges, which the Government fortunately possessed, and which were taken up by branch steamers. The first steamer to get through without mishap left Lokoja on 10th August and reached Baro on the following day; afterwards the river rose very rapidly and there were no more groundings; on 15th October there were 22 feet on crossings. The river had a phenomenal rise, the highest for sixteen years. The total tonnage landed at Baro was estimated at 18,976 tons.

Messrs. Elder, Dempster & Co. conducted the shipping arrangements to Burutu with unfailing energy and success.

---

Sir P. Girouard proposes that the Niger should be deepened to 5 feet all the way to Lokoja, and a dredger for this purpose is being constructed.

---

It might pay Northern Nigeria to acquire barges and tugs of its own and take delivery of the railway material at Burutu. The boats will always be useful, as the Baro-Kano Railway should have its own connection with the sea-board.

---

The Commercial Intelligence Officer of Southern Nigeria observes as follows on the prospects of the railway to Kano:—  
"Looking to the more distant future when—within five years, it is hoped—Lagos will be in communication with Kano by rail, an enormous field in the Upper Zaria and Kano Provinces will be accessible to our merchants. From the Ilorin Province up to Zaria town the population on the railway route is very scanty, but beyond there is a dense population—more than that of the whole of the Western Province of Southern Nigeria—and a very large business indeed may, in the course of a few years from the opening of the line, be reasonably expected from the northern section of the

railway. Superficially it may be thought that the Kano trade will be done *via* Baro and the Niger, and I agree in thinking that cheap produce—shea-nuts, ground-nuts, salt, &c.—will probably be worked by river, but I believe that the bulk of the trade in Manchester and other European goods will pass through Lagos, and that it is not improbable that a large proportion of down freights in the way of raw cotton will also come this way, for it must be remembered that the cotton crops are gathered at a time when the Niger is not in flood. At the same time, I think the Lagos produce merchants following the line will later on need to give consideration to the idea of having forwarding depôts at Baro to deal with coarse produce and salt. It will be remembered that the important trade centre of Bida lies between Baro and the junction of the Lagos Railway with the Baro-Kano line.

---

The improvement of the Lagos bar is rendered a more urgent matter by the Nigerian railway undertakings. Not only is the ocean freight high under the present conditions, but the transshipment at Forcados doubles the period between shipment and delivery, and constant and extensive damage is caused to goods from rough handling and exposure. Owing to the heavy seas which prevail from the west the sands at the harbour mouth are in constant motion, and the shelter which would be afforded by the western mole seems essential for the fixing of any deep-water channel which may be formed through the bar. This shelter would also be necessary for the protection of the eastern mole and of vessels entering the harbour during stormy weather. The eastern mole is in progress, and if anticipations are realised, about 5,300 feet in length should be completed towards the middle of 1910. Expenditure has recently been approved for the works preliminary to the commencement of the western mole, leaving the extent of the work and the amount to be spent to be decided later. In the meantime the policy is to anticipate and assist by dredging the deepening that may be expected from the construction of the moles.

The improvement of the bar leads to the question of increased wharfage accommodation. It might possibly have been better in the beginning to have fixed the terminus of the railway on the mainland, but it seems too late in the day to consider that now; the increase of business, on the other hand, will render Iddo Island too small for the terminus, and probably new wharfage accommodation will have to be provided at Marina and the railway brought across the lagoon to Lagos Island. A length of 1,400 feet could be provided for the wharves from the south-eastern extremity of the customs wharf, and a width of 15 feet between the front of the sheds and the face of the quay, allowing three lines of railway. A great

increase of trade to Lagos is sure to spring up, and the question of wharfage and handling facilities cannot be taken in hand too soon.

---

### Gold Coast.

The receipts for the six months ended 30th June last were £80,634, and the expenditure £40,964. There has been a heavy decline of imported cement, coal, cotton goods and timber, which shows that the mining companies have not been very active, but it is hoped that this falling off will be rectified before the end of the financial half-year. On the other hand, it is a promising sign that substantial increases occurred in mining machinery and materials.

---

It is proposed to reconstruct No. 1 Jetty step by step, driving the piles to a lower level and about 52 feet seaward of their present position. At present the jetty is too high to be convenient. A portion of the jetty at its inner end would be cut off by the formation of a customs quay, and the length so cut off would be added to the outer end, so that little new pile material will be required. To avoid the trouble that has arisen from the rotting of the deal under the rails, it is proposed to use bearing-plates bedded on pieces of Callender's bitumen sheeting, making a watertight joint with the planks. The work would be a great improvement.

---

The contract for the construction of the Accra-Akwapim Railway has been let to Mr. W. M. Murphy, of Dublin, whose record leaves little room for doubt as to the satisfactory execution of the work. The price for the construction, not including materials, is £165,614, and this appears to be a reasonable figure. There will be other expenses, including the materials, the cost of the land—which will probably be about £16,000—the survey already made, and the rolling stock and equipment. Five tenders were received.

---

### Gold Coast Mines.

The Gold Coast Government have agreed to construct and work for 20 years a branch railway from Tarkwa on the Sekondi Railway to the Prestea mines on the Ancobra River. If ever during the 20 years the net receipts fall short of 3½ per cent. per annum on the capital expended (this not to be put above £125,000), the Prestea Blook A, Limited, contract to pay the difference to the Government. The Union of London Bank agree to advance £125,000 to the Colonial Government, as required, against Government certificates for the amount, the intention being that the certificates shall represent

allotment of inscribed stock if a loan is raised. The construction has been commenced. A further agreement provides for the laying of a branch from a point near the Ancobra to Broomassie, on a similar undertaking, the capital in this case being put at £10,000.

Under this arrangement the Company gets the money on cheap terms, *i.e.*, those of the Government's credit, and the Government is indemnified to the extent of the sum named. It is probable, however, that the expenditure will exceed the original estimate, principally because the price of labour at Tarkwa has risen considerably.

---

### Sierra Leone.

This railway was the first Government enterprise of the kind in West Africa, and was watched with special interest on that account. The profit in 1907 was £14,909, as against £10,624 in 1906. This is equivalent to  $1\frac{1}{2}$  per cent. on the capital cost, but the customs receipts have been enormously increased. The line was described as follows by Mr. J. T. Alldridge to the Royal Colonial Institute on 24th November:—

“The line runs from Freetown to Baiima—220 miles—traversing country nearly due east. The greater part of the Protectorate, especially in a northerly and westerly direction, is not affected by it and remains practically *in statu quo* in regard to overland transport. This railway, the first, and as yet the only one, in the Colony, was only open to its terminus at Baiima in 1905, but it has already effected the most remarkable transformations even in the remote parts of the Protectorate. It would be quite impossible for me to describe the really extraordinary changes produced by this up-to-date Government railway; even now, although I have travelled by it several times, I cannot yet realise that I am being cheaply and safely carried over the very ground that it formerly took me three or more weeks of discomfort, peril, and expense to cover—a distance of 220 miles, that I can now do in a couple of days. The railway has completed the pacification of the Hinterland. It has penetrated the remote fastnesses of the chiefs who used to be constantly at war in regions they considered inaccessible to the white man. It has brought these regions, with their illimitable natural wealth, into touch with European markets, and it has afforded new fields for trading operations to numbers of Sierra Leoneans, and so, to a certain extent, has relieved the congested state of Freetown commerce. Around the stations along the line branch trading factories have been opened by the large European firms, and consequently the revenue of the Colony has increased at a very remarkable rate. Some idea of what this Government railway has already accomplished in the way of improving the exportations of the two principal articles of produce—palm kernels and palm oil—may be gathered from the fact

that whereas, in 1903, only five years ago, the exports of kernels from Freetown are scheduled as being 8,199 tons, they had risen last year to 20,431 tons; while palm oil had risen in the same period from 35,104 to 157,823 gallons; this marvellous increase being mainly attributable to the advantages of the railway communication. When we consider the extraordinary amount of manual labour that is involved in expressing the oil, and the enormous time that is occupied in breaking the shells of the nuts, one by one by hand, it is difficult to understand how the men, women, and children, who do the work, are able to get such large quantities together; but great as these quantities are, they undoubtedly might, and probably in time will be, hugely exceeded when science steps in and relieves the people of such tedious labour by substituting modern machinery for the primitive methods now in vogue."

Other people have not been slow to realise that the palm forests, scientifically treated, would well repay capital, and proposals have been put forward for concessions. It is necessary, however, to take care that the terms of any grant will not interfere unduly with the development of the whole territory.

---

### British Honduras.

The Stann Creek line had been laid to 12½ miles in October, and the first section was formally opened on the 17th. No little trouble was caused by the regrowth of bush which had been cleared, and, in view of similar difficulties elsewhere, it is interesting to note that a weed-killer was found which effectually destroyed the roots.

The line crosses the river at the end of the first section, some 9½ miles from the pier, and shortly vessels drawing 24 feet will be able to come alongside the pier. It is to be hoped that liners will be ordered to do this, but as there is some doubt, mooring buoys will be provided.

We congratulate the Colony on the acquirement of a substantial line, which will certainly largely help on development. British Honduras is progressive, and a good case may before long be made out for a larger railway scheme. We should very much like to see it linked up with the cable system, but internal communication and transport are the first considerations.

---

In the construction of the new Canadian transcontinental line from Moncton, N.B., to Prince Rupert, B.C., during 1907, over 22,000 men and 6,000 animals were employed, and the expenditure on labour and material was about \$12,000,000.

**Johore State.**

This line, which has a special interest as having been built by the F.M.S. Government in a territory which is not technically under British protection, is  $120\frac{1}{2}$  miles in length. Construction was commenced at the end of 1904, and at the end of 1907 6,792,128 cubic yards of earthwork had been executed out of an estimated total of 9,053,818, and the permanent way was laid for 86 miles; the sum spent to that date was \$7,780,798.

A train ran through successfully on 6th September, at an average speed of 20 miles, and it is understood that the work throughout has been highly satisfactory. It is anticipated that the enterprise will be completed within the estimated expenditure.

**Railway Gradients and Curves.**

In every railway construction scheme the question arises of the extent of curves and gradients which can be allowed. The increased cost of transport which is caused by sharp curves and steep gradients has to be set against the saving in construction. In a recent Colonial experiment it was found that, whereas 545 tons could be hauled on a 1 in 150 incline, it had to be reduced to 403 on 1 in 100, to 334 on 1 in 80, and 212 on 1 in 50.

The influence of curves on the hauling operations is shown as follows:—

Radius of Curves.	Load in Tons.	Percentage of Increase.
5 chains ... ..	814 ... ..	—
10 „ ... ..	1,062 ... ..	30·4
15 „ ... ..	1,178 ... ..	44·7
20 „ ... ..	1,246 ... ..	53·0
30 „ ... ..	1,320 ... ..	62·1
50 „ ... ..	1,387 ... ..	70·4

It will be seen that the resistance is proportionately much greater between 5 and 20 chains, the reason being that as a curve decreases in radius, the frictional resistance increases in a very much greater proportion.

It is usual on railways constructed with sharp curves to ease the grading proportionately to the additional resistance due to curvature, so as to avoid having the two impediments simultaneously. But it is impossible by this means to neutralize the evil results of excessive curvature. Not only is the cost of haulage great, but the wear and tear of rolling stock is excessive. If possible, the minimum curve allowed should be 15 chains, with a minimum length of 4 or 5 chains of straight road between curves.

**Stagger Jointing.**

This method, which consists in breaking or alternating the jointing, so that each joint is opposite the centre of the corresponding rail, instead of both joints being even or opposite to one another, has been adopted in relaying part of the Federated Malay States Railway. The running has been found smoother and less noisy, and it is believed that the cost of maintenance will be less.

---

**Steel Rails.**

A certain "waviness" is sometimes noticed in rails, which does not follow any regular system. It does not occur at definite distances, such as might be expected if the section was too weak to support the load between the sleepers. Generally speaking, there is a drop at the ends of the rails, and this points to either imperfect straightening of the rails after rolling, or to unequal contraction when cooling.

## MEDICAL NOTES.

**Report on the Prevention of Malaria in Mauritius.**—By MAJOR  
DR. R. ROSS, C.B., F.R.S. (*Waterlow & Sons.*)

This full and lucid report gives in most interesting style the story of the discovery of the cause of malaria, and deals exhaustively with measures of prevention. The fever is, it appears, probably caused by a little poison which escapes from the parasites when they produce spores; this poison may be eliminated from the patient's system in from six to forty hours, and the fever then leaves him temporarily; but by this time another generation of parasites may be approaching maturity and may cause another attack in the same way. Besides fever, the parasites often produce anæmia and enlargement of the spleen. These parasites are never found in water, earth or air, but only in other animals, and it is a curious problem how they originated; probably, Dr. Ross suggests, they were originally free living animals, which by the gradual evolution of ages acquired the power of living in other animals. The anophelines can be distinguished from their less dangerous relatives by the fact that when the insect is at rest on a wall the tail projects outwardly, whereas with the culex it hangs downwards.

The continual increase and decrease of parasites, which result in successive relapses and recoveries, is due to the varying resistance of the corpuscles of the blood. Anything which weakens the resistance—fatigue, heat, chill, dissipation or other illness—tends to encourage the parasites and to precipitate a relapse. It is therefore necessary to keep the patient under observation for a considerable time—three months are recommended in temperate climates and four in the tropics.

The disease did not establish itself in Mauritius till 1866. In 1901 it had ravaged the coast and lower parts of the island so fearfully that "the wealthier residents had been driven out of these regions . . . everywhere the villages became more and more

deserted. Even the patient Indians sought the upper regions. . . . The population of Port Louis, which had always suffered most of all, began to fall. Even the houses were removed, and everywhere one sees the ruined basements, overgrown gardens, deserted fountains and mouldy gateways of the more prosperous past, now surrounded only by the poorest huts of Indians. It is the classical position of a great endemic epidemic. Plagues and cholera visit a country and vanish, but malaria and dysentery remain." In a similar way there is every reason to believe that ancient Athens and Rome were attacked; not war, nor famine, but the mosquito depopulated the shrines of classical civilisation.

The only effective and, in the long run, the least expensive and troublesome way of overcoming the evil is by draining the swamps and clearing the watercourses. Dr. Ross deals at length with the questions of cost and procedure, and his treatment of the subject will be valuable to every colony which is afflicted with this plague. He estimates the cost of the measures proposed for Mauritius at £9,000 a year.

---

The Committee on Ankylostomiasis, which has been sitting at the Colonial Office, has presented the following report:—

"The Committee, having considered the reports received from the several Colonies, recognize that the loss of labour caused by the prevalence of ankylostomiasis is very serious, and affects prejudicially not only the employers of labour but the community at large. Not only is there loss of life, direct and indirect, but also through the invaliding of labourers the charges for hospital and pauper expenditure are largely increased. This loss is, in the Committee's opinion, largely avoidable. Experience has shown that certain simple, well-understood and inexpensive measures can be adopted, which, if properly carried out, will reduce the evil effects of ankylostomiasis to a negligible quantity.

"The Committee think that the Colonial authorities have been inclined to exaggerate the difficulties of dealing with this question. They have argued that the complete eradication of ankylostomiasis is impracticable, and that the cost of preventive measures is prohibitive; and they have been content, with a few commendable exceptions, to do nothing in the matter.

"It cannot be too clearly understood, however, that provided that reasonable precautions are taken to prevent the constant re-infection of the labourers, the presence of a small number of ankylostomes, even in a large proportion of the population, may have no appreciable effect. Moreover, no elaborate sanitary appliances are necessary to guard against re-infection on a large scale. For example, latrine accommodation on estates is sufficiently subserved

by a hole or trench cut in the ground, provided that the contents are covered with earth from time to time. If it is assured that this accommodation will be used by the majority of the labourers, the fact that isolated cases of fouling the soil cannot be prevented is not of material importance. The main point is to guard against the fouling of the soil in places where, from the condition of the soil and the presence of numbers of labourers, it is clear that danger is to be apprehended.

" In these circumstances, the Committee think that no hardship can be involved in compelling estate owners, local bodies, and private persons to take such reasonable precautions as experience has shown will minimize the constant drain on the resources of the community which the existing state of affairs involves.

" The Committee therefore recommend, for the consideration of the Secretary of State, that :—

" (1) Wherever necessary, laws should be enacted enforcing the provision on estates, and elsewhere where numbers of labourers are collected, of simple, inexpensive, but efficient latrines, in places appropriate both as regards the convenience of the labourers and the health of the public.

" (2) A penalty should be imposed on persons found avoidably defæcating in any place where contamination of the soil or water would be likely to cause risk of infection.

" (3) Each Colony should be divided into convenient districts, in each of which should be appointed an Inspector responsible to the local authority, medical officer, or some other authority, who should be charged with the enforcement of sanitary regulations.

" (4) \*An Inspector-General should be appointed by the Secretary of State, his salary being divided amongst the Colonies concerned, whose duty it would be to supervise the measures taken for the eradication of ankylostomiasis and to distribute advice and information. This appointment to be purely temporary, in the first instance at any rate.

" (5) In all schools object lessons on ankylostomiasis should, as far as possible, be given. Leaflets containing simple information on the subject should be distributed periodically. The Committee consider that the pamphlet prepared by Dr. Nicholls, of the Leeward Islands, would form a suitable model.

" (6) While the treatment for ankylostomiasis of the whole population is clearly impracticable, arrangements should be made for the distribution from convenient centres, such as schools, post offices, district nurse stations, &c., of anthelmintics at cost

---

\* Mr. Grindle reserved his opinion on this recommendation, partly on the score of expense, and partly on constitutional grounds.

price, with simple directions for use. For this purpose beta-naphthol is the most suitable drug; thymol and other toric anthelmintics being only used under medical supervision.

---

The British Guiana Society for the Prevention and Treatment of Tuberculosis has issued its first report, covering a period of eighteen months (January, 1907, to June, 1908). Disappointment is expressed with the poor response to the appeal made for contributions, which has had the effect of seriously restricting the work of the Society, and emphasis is laid on the serious prevalence of the disease, especially in Georgetown.

“ When the pages of the Registrar-General's Report are turned over, it is apparent to the most casual observer that year after year in regular succession 250 to 300 deaths are chronicled from phthisis alone. Were these deaths either from plague or yellow fever, not even the seething unrest of the last few months in this Colony would give any adequate idea of the outbreak of indignation against the supposed neglect of this or that authority. Yet the calm acceptance, by all who know, of a constant drain of 250 to 300 lives yearly from Georgetown, by a preventable disease, is difficult to imagine, were such not before our eyes. Neither yellow fever, plague, small-pox nor cholera has claimed so numerous victims as has tuberculosis.”

The founders of the Society have been faced with the difficulties resulting from the attitude of leaving everything to the Government, which is characteristic of the Crown Colonies, and perhaps especially of the West Indies, and the Report comments on this with some bitterness :—

“ It is a deeply-rooted impression amongst many that the question of tuberculosis in this Colony is one to be dealt with by the Government, financed by the Government, and organised by the Government. It should be recognised, however, that to throw the initiative and responsibility of all but most intimate private affairs on the Government or Municipality is an advanced condition of Socialistic Communism, at present repudiated by all English-speaking races, and represents the very antithesis of personal freedom; one must hesitate to regard such a feeling as characteristic of a young and rejuvenating Colony such as British Guiana is; one prefers to regard that opinion as merely a convenient formula with which to cloak repudiation of any interest in the spread or decrease of tuberculosis.”

It has not yet been found possible to establish a model dispensary, as had been hoped, but a cottage dispensary was opened in January, 1908, and in the first six months was attended by 514 patients, but of these not more than 91 were actually suffering from tuberculosis, the objects of the dispensary not having been clearly understood by the public at first. It is to be hoped that the public spirit of those resident in or connected with the Colony will result in a more adequate provision of funds in future years.

The Trinidad Medical Report for 1907-8 contains particulars with regard to the occurrence of cases of yellow fever and plague in the Colony. Fortunately, neither of these diseases became widely prevalent, and the plague cases—the first recorded in the island—were only two in number. Of yellow fever the Surgeon-General writes as follows:—

“ My predecessor recorded an outbreak of yellow fever in Port-of-Spain at the close of the last financial year, 5 cases being reported between the 31st January and the 31st March, 1907. The disease continued to recur at intervals in this financial year until the 20th August, when the 33rd case—the 38th of the series—was recorded and proved fatal on the 22nd August; the incubation period of 18 days having elapsed on the 9th September without any fresh case occurring meanwhile, it was a source of pleasure to be able to mark my official entrance into the Colony that day by the issue of clean bills of health. But the intermission was short lived; another case appeared in San Fernando on the 1st November, and 8 further cases at intervals up to the 1st March, the financial year closing with 47 cases in all from the first appearance of the disease fourteen months earlier.

“ Of the total number of 47 cases, 39 occurred in Port-of-Spain, the remaining 8 being in outlying districts as far distant and separate as San Fernando, Gran Couva and Santa Cruz; in two cases reported in St. Joseph and Santa Cruz there existed a reasonable possibility of the disease having been contracted in Port-of-Spain, but careful inquiry failed to discover any connecting link between Port-of-Spain and the other outlying cases, while, although in perhaps 8 cases close together in Port-of-Spain infection might have been more or less directly conveyed—the other 31 cases were scattered about the town at widely separated places, and intervals of time, and offered only theoretical explanations of the source of infection.

“ Fatal results attended 28 cases out of the 47 recorded—25 in Port-of-Spain and 3 in country districts, yielding a gross percentage mortality rate of 59·57 and rates of 64·1 and 37·5 for town and country respectively—a rather striking disparity when there are considered the advantages usually associated with treatment in

hospital as compared with treatment in private residences in country districts.

“The West Indies, where yellow fever is known to have prevailed during the last 250 years, is universally accepted as one of its endemic areas—if not, as Manson suggests, its actual source of geographical distribution; as Trinidad affords all the local conditions recognised as favourable to the production and dissemination of the disease, it becomes difficult with any degree of probability to exclude this Colony from liability to occasional outbreaks of yellow fever, apart altogether from direct and fresh importation of the infective material. In so far as the recent series of cases here did not present any recognised trace of imported infection (although such a possibility of origin should not be altogether excluded), and because the cases themselves in many instances were devoid of any apparent or discoverable connection, there is, I think, some colour for the other explanation of its source, and if this view be admitted as even a possibility, we may congratulate ourselves that the previous history of epidemic incidence here points to intervals of twelve or thirteen years between its recurrence, while at the same time we should persevere relentlessly with the destruction of the infection-carrying mosquito.”

The following is the passage in the Report relating to bubonic plague:—

“The statistical returns from the Colonial Hospital for the year under review present for the first time records of two fatal cases of bubonic plague; this occurrence marks the beginning of an era in the public health history of the Colony fraught with a new danger, the ultimate issue of which it is impossible to forecast with any accuracy, and brings this country within the list of 52 that since 1894–95 have become infected by plague in its pandemic progress.

“It does not appear to have been possible to discover the origin of the infection in these two cases, which occurred in the persons of two native children, aged 8 and 9 years, residing at 63 Duke Street, Port-of-Spain; they were admitted to the Colonial Hospital on the 3rd June, 1907, and both died there within two days, the clinical, post mortem and bacteriological examinations yielding distinct evidences of the presence of bubonic plague.

“Measures directed against the spread of infection were put into effect, and on the 22nd August, 1907, regulations were passed by the Governor in Executive Council, endowing the Sanitary Authorities with wide powers to cope more efficiently with existing conditions and with any extension of the disease that might ensue. No further development of human plague was recorded here up to the close of the financial year.”

Dr. A. E. How, of the West African Medical Staff, has written a report on an investigation which he conducted into cerebro-spinal fever in the Northern Territories of the Gold Coast in 1908. The report is published by the Gold Coast Government. The obscurity which still surrounds the causes and treatment of this disease renders the collation of scientific experience in different parts of the world of especial importance.

---

A report on Veterinary Bacteriological Work in the East Africa Protectorate during 1907-8 by H. G. Simpson, F.R.C.V.S., has been published in the Miscellaneous Series of Colonial Reports (No. 53. Price 1d.).

---

The first number of the Bulletin of the Sleeping Sickness Bureau, of which Dr. A. G. Bagshawe, of the Uganda Medical Staff, is Director, contains an elaborate article on the Chemo-Therapy of Trypanosomiasis. The second number opens with an article on the Diagnosis of Human Trypanosomiasis. The Bureau has also issued a Quarterly Report on the Progress of Segregation Camps and Medical Treatment of Sleeping Sickness in Uganda (December, 1907-February, 1908).

---

**Studies from Institute for Medical Research, Federated Malay States.**—Volume 3. (*Kelly & Walsh*, Singapore; *J. & A. Churchill*. 10s.)

It is pointed out that there is a curious contrast between Malaya and Central and East Africa, as none of the anopheles mosquitos in the one country are found in the other. In Malaya they are more easily dealt with. There are detailed notes on the culicidæ of Malaya and on various tropical diseases.

---

Reported cures of leprosy by Deycke's leprosy preparation (Nastin) in America and New Zealand have caused enquiries. A lecture on the subject by Professor Deycke, who is Director of the Imperial Medical School at Constantinople, was published in the *British Medical Journal* of 4th April, 1908. He has accepted an offer from the British Guiana Government to take charge of a leper hospital, and has also been invited to visit India. The extract is not a culture, but a fatty extract of streptothrise, cultivated from leprotic tissues dissolved in benzoyl chloride. This benzoyl-nastin solution is put up in ampoules containing each from 0.0005 to 0.002 nastin in sterilised olive oil, and one such dose is injected hypodermically once a week. It is said that in favourable cases the lesions disappear after some weeks or months. The material is prepared by Kalle and Co., and can be obtained in London.

## REVIEWS AND NOTICES.

**My African Journey.**—By the RIGHT HON. WINSTON SPENCER CHURCHILL. (*Hodder and Stoughton.* 5s. net.)

This account of one of the most interesting of our possessions will be widely read and appreciated, not merely on account of the name and position of the writer, but for its fascinating style and practical suggestions. The scenery, the life and the sport of the countries traversed are vividly described. Mr. Churchill returned from the tour deeply impressed with the possibilities of East Africa and Uganda, especially Uganda, and with the importance of providing in time against any land system or want of system which would tend to check the coming of the small farmer. Whether English families would thrive in the highlands remains to be seen, but in any case there is no doubt that an immense production will take place in these territories. The principal lesson of the journey is the need for a prolongation of the Uganda Railway, and this idea will, we believe, prove before long to be economically sound.

---

**The Far East Revisited.**—By A. GORTON ANGIER, with a Preface by SIR ROBERT HART, G.C.M.G. (*Witherby & Co.* 10s. 6d. net.)

Sir Robert Hart remarks in the preface that "the East is up and awake, and the foundations are being laid for a fuller share in the work of the world, and for more intimate relations with all that concerns international intercourse and the influence one nation can exert on all others." At such a time of rapid change affecting moral and material forces, a statement of facts and impressions by an intelligent and experienced observer is welcome, and the editor of the *London and China Express* clearly brings to the task the habit of close examination and impartial judgment. China and Japan occupy the greater part of his space, but the notices of the Straits Settlements, the Federated Malay States, North Borneo and Hong Kong are full of information and graphically written, and we can

vouch for the up-to-date character of the particulars. It is indeed a rare thing to find, in the flood of works of travel, a volume which combines so much fullness and accuracy of detail with pictorial effect.

Mr. Angier's impression of Singapore was that it was not then in its happiest mood. "Something seemed to be now clogging the machine. People wore a more restless air, instead of exhibiting that calm contentment which has been the dominating feature of the Singapore I had known for nearly thirty years." But he does not doubt that the trade which has been diverted from her will be ultimately more than made up in other directions. It is true that some neighbouring ports have increased their business at Singapore's expense, and at present the place is affected by a world-wide depression; but the position is unrivalled, and as an emporium for the Far East its importance is as great as ever. Some comparatively local trade has been lost, but the development of the great countries of the Far East will more than make up for this. It may also be observed that much of Singapore's loss of business represents what the Federated Malay States have gained. Much business now goes direct to Port Swettenham which recently went to Singapore. However, the Tanjong Pagar Dock Board, which while created by Government rather prides itself on freedom from conventional Government methods, is doing really well, and the harbour improvements now in progress will vastly increase Singapore's advantages. In the meantime, it must be admitted that the diversion of trade is a serious matter for Singapore. It is no doubt partly due to unavoidable causes, such as the development of other ports and the conveniences of direct transport; but local opinion, which is not likely to be wide of the mark, puts it down largely to the Shipping Conference. In the annual report for 1907 it is remarked that "undoubtedly one effect of these Shipping Conferences has been to eliminate all chance of any sailing vessel obtaining cargo in the colony for the United Kingdom or Continent of Europe, and the same prohibition has, in effect, been placed upon the economically-run 'tramp' steamers, British mainly, which used to participate largely in the important over-seas carrying trade of this colony."

Mr. Angier dilates eloquently on the prosperity of the Federated Malay States. He suggests, indeed, that the revenues would admit of greater enterprise, and that "it is unnecessary to keep quite so tight a grasp on the purse strings when there are ways and means in which it may be profitably expended in developing the country. It has become the rule to keep them tightly closed, and one is constrained to wonder whether this policy is deliberately pursued in consequence of the financial necessities of the Colony of the Straits Settlements." It does not appear to us, however, that there is any definite ground for this suggestion. Mr. Angier freely recognises

the varied improvements which are being made, and it must be remembered that they are all paid for from surplus revenue. The States took up a large portion of the Straits loan, and in that way helped Singapore, but the investment was a good one.

The account of Hong Kong comprises a full and excellent statement of the public works, accomplished and in progress, and of the Chinese environs.

Mr. Angier makes some interesting observations on the silver currency, and expresses regret that the value of the Straits dollar was not fixed at 2s. 0½d., instead of 2s. 4d. Perhaps it would have been better if the figure had been put lower, but silver is constantly fluctuating, and no one can foresee its course; if it is necessary to value it in terms of gold, the administration can only take its value at the time. This was done, and silver rose higher still afterwards; since then it has come down heavily, but wisdom after the event is useless. The plain fact is that such countries as India and the Straits are in the difficult position of not having a gold standard, but of being compelled to maintain a fixed ratio as if they had. The Straits rate of 2s. 4d. is not statutory or in any way legally binding on the Colonial Government; but it is, of course, very desirable to maintain a fixed rate, and, in order to do this, the Government receives silver for gold at that rate, or a small fraction less. This is done either by issuing gold locally or by giving bills on London. The lowest price touched in 1907 for the telegraphic transfers was 2s. 3¼d., so that the rate may be said to have been well maintained. It may be argued, as Mr. Angier suggests, that it would be better to adopt a gold standard at once, and so do away with the somewhat cumbersome machinery for artificially regulating the rate; but the answer to this is that the operation is too vast, in view of the enormous mass of silver in the cast and the increasing demands for gold. At any rate, India would have to show the way.

---

**The Fijians—a Study of the Decay of Customs.**—By BASIL THOMSON. (*William Heinemann.* 10s. net.)

Mr. Thomson, who is a son of the former Archbishop of York, forsook several years ago the amenities of the Colonial service in favour of the Commissioners of Prisons, but he has since, in several productions, shown that Fiji and the South Seas retain a strong hold upon him, and he has now brought out a work which deals in a really masterly way with Fijian customs and the effect of European civilisation upon them. He begins with the observation that the present population of the world is believed to be about fifteen hundred millions, of which seven hundred millions are nominally progressive and eight hundred millions are stagnant under the law of custom. But no race now exists which has not to

some extent been touched by the influence of civilisation; the old isolation is everywhere vanishing, and with it the old laws of custom are being driven out. Eventually civilisation will become, more or less, universal, and the result will inevitably be that special racial or local characteristics will be lost in an ever increasing uniformity. At the present time the feeling of race distinction is very strong, often amounting, in cases of colour, to antipathy; but Mr. Thomson argues forcibly that this sentiment is neither primitive nor ancient. He considers that it dates only from the time of slavery in the West Indian colonies; "and yet the Romans, the Spaniards, and the Portuguese, who were the greatest slave-owners in the world, never held marriage with coloured people in contempt." Throughout Europe itself there has been a vast mingling of races in old times. Mr. Thomson prophesies that in tropical countries the line of caste will soon cease to be the colour line, and that their wealth will create a new aristocracy recruited from men of every shade of colour. Perhaps he does not fully recognise the strength of the obstacles which at present lie in the way. As the feeling is at present admittedly strong, the argument that it is not primitive or ancient tends to show that it is the result of modern conditions, and is likely to have a long lease of life. It is, in fact, not diminishing, but increasing. The analogy of the ancient, or middle, ages is not really strong, as in them there was not the marked disparity of social ideas and practices which now distinguish civilised from uncivilised nations. But as this disparity diminishes—a sure result, however slow—no doubt race hatred will die down, and intermingling will occur more and more freely. Many will contemplate such a prospect with repugnance, but when it is considered how many millions of coloured men are British subjects, it is obvious that a great levelling up of their social position will enormously increase in future ages the strength of the British Empire.

The customs of the Fijians are set out by Mr. Thomson in considerable detail, and the statement is everywhere combined by shrewd comment. The Fijians show themselves slow to change, and their apathy and indolence seem almost proof against European influence. They are, therefore, a very favourable subject from the point of view of the law of custom. Still a change is taking place, and with the gradual alteration of communal institutions it will grow in force. We hope to recur to the subject in our next number.

---

**From the Niger to the Nile.**—By LIEUT. BOYD ALEXANDER.  
(2 Vols. *Edward Arnold.*)

Lake Chad has in recent years been the object of political activities from Great Britain, France and Germany. It "has for years been the goal that has called forth the efforts of rival men and rival nations in the race of exploration, and round the subject of

this water desert, a history could be written of the ambition of man, of their strength and their weakness, of heroism, of honour, of failure and success." Most remarkable, perhaps, was the triple expedition which France organised in 1898, from north, south and west; of this, one branch started from Senegal, and the story of the leaders, Voulet and Chanoine, who seem to have become desperate and mad, and were eventually shot by their own soldiers, is one of the most regrettable in the history of African exploration. The lake itself does not possess the grandeur expected from an African lake. It is mostly shallow, muddy and reedy, the breeding place of myriad flies and rats. So flat is the country that the water, at the bidding of the wind, will advance as much as two miles, and recede again. But its vastness and light give it a peculiar charm, to which Lieut. Boyd Alexander often pays tribute, and it is the link of a river system from the Niger to the Nile. It is a curious fact that the fish in it are identical with those of the Nile. Its waters have been described as salt, but the taste is probably that of potash, of which the writer observes that, as an addition to water, it "makes it more palatable, and I always noticed on drinking it, after coming in from a long day's tramping, that its effects seemed more stimulating than other water." This peculiarity has been noticed even in this country.

Lieut. Boyd Alexander found that the lake is really in two distinct parts. He travelled onwards over the Shari-Ubangui watershed, and so to Gondokoro. His experience of the Congo State was that the Congo tribes, as a whole, are happier since the Belgians' occupation. The volumes, which are admirably printed and illustrated, are studded with passages interesting to the sportsman and the naturalist. They are a record of a well-planned and well executed journey, which, however, was saddened by the deaths of Capt. G. B. Gosling and Capt. Claud Alexander. We trust that his new expedition to the Kamerun will be a fortunate one.

---

**Through Southern Mexico.**—Being an account of the travels of a Naturalist, by HANS GADOW. (*Witherby & Co.*, 18s. net.)

The conditions of life in different tropical countries are so similar that the scientific examination of one place is valuable to all. This well-written and well-illustrated volume is filled with interesting descriptions of familiar fauna and flora, given with the skill and fullness of the trained naturalist, and also gives a vivid account of the ways of the inhabitants. A familiar case is set out as follows:— "The banana is now a barren fruit; it contains no seeds, or, at least, they have degenerated into tiny vestiges of seeds, which are attached to the grey central string which runs lengthwise through the fruit; consequently the plant can only be reproduced by suckers. This is a very remarkable thing. The striking-looking flower, delicately

mauve or pink, is there, with stamens and pistils complete, but the fruit is barren. There are still some species in the tropics of Asia which reproduce themselves by seeds, but the best edible kind, the *Musa Paradisiaca*, has never been known to do this, and, what is more, all knowledge of its original home is lost—hence its specific name. It has been from time immemorial propagated by roots only, and has, consequently, lost the sexual mode of reproduction." This result is, no doubt, indicative of the extremely ancient cultivation of this plant. Long selection has led to softer and, ultimately, seedless varieties.

As an example of the studies of animal life, we may quote the following account of leaf-cutting ants:—

"In such forests our eyes are sure to be attracted by a procession of apparently migrating pieces of fresh green leaves, all neatly cut out and walking in an upright position, as each is held in the jaws of an ant. Let us follow this stream to its source. It comes down from the stem of an orange or lime tree in our host's most cherished plantation. Thousands of ants are sitting upon the leaves, each holding on to the edge and scissoring out with its jaws a piece of the leaf, the cut forming part of a neat circle. This is allowed to drop, to be carried away by the other ants which are waiting below; or else the cutting ant jerks the load, which is many times larger and heavier than itself, on to its back and climbs down. Within a few hours that tree may be stripped of all its green, only the ribs of the leaves being left, and it will probably die unless the attack was made during the sprouting season, but in any case that year's prospect of a harvest is gone. Now let us follow the procession along its well-beaten track, where nothing is allowed to grow, because of the millions of little feet which have trampled over it. It leads over many obstacles in a straight line for hundreds of yards until we come to a slight rise of ground in the forest, where we sink half up to the knee into a blackish-brown, smeary compost of rotten, ill-smelling vegetable matter. The mound may be a foot or two in height, and may measure several yards across. What we see is only the used-up or spent manure, the remains of the millions of bits of leaves which had been taken into the cavities in the ground, there to be further chewed into pulp, and then allowed to ferment in the countless passages and chambers of the mound, which is honey-combed in every direction. In the fermenting mass grows a fungus in profusion, and this forms the sole food of the ants and their larvæ. We have, in fact, walked into a huge, scientifically-constructed mushroom bed—a farm for the cultivation of mushrooms, and the nursery of the independent state of some species of *Eciton* ants. That the whole thing is in good working order is soon impressed upon us by the territorial army, the garrison of soldiers who are swarming out to attack, whilst the workers rush about in the well-

known style of disturbed ants. . . . Trees are liable to be visited by the attacks of leaf-cutting ants—especially introduced trees, which are quite unprepared for such conditions, while native trees have had time to hit upon some defensive plan. The best way of fighting ants is to get other ants to fight them. Lucky are the trees which possess such inducements to attract the mercenary ants, either by means of honey and other food, or by offering them shelter. Thrice lucky are the plants which can combine such attractions. Some acacias have managed it. Their twigs grow pairs of bull's horns, hollow spikes, modified stipules; ants bite a hole into the base and live in these fortresses; and on the tips of the pinnate leaflets is a little gland or other modification, full of honey, or a proteid, or some other stuff which is good to eat and can be spared by the plant. And these little bodies are beloved by the ants, which, thus receiving board and lodging, are content to stay, to garrison and to defend furiously the hospitable tree against any aggressor. The system answers well. How it has come about, whether by teleology or by natural means, is another question, the answer to which must depend upon personal inclination. There is no arguing in such matters."

---

**King Edward's Ring: a West African yarn of adventure more or less true.**—By PEREGRINE ATBUSH. (*East Anglian Daily Times*, Ipswich. 1s.)

The ring is a mysterious curio of the kind beloved of fiction of the Anstey and Haggard schools, but it serves as a means of introducing no small amount of lively description of the natives' customs on the West Coast. The *nom de plume* clearly conceals a writer who has had large opportunities of mixing freely with the natives and of studying their ways. Anyone who takes an interest in such matters will get in this little book an ample return for his shilling.

---

**Nature Teaching, based upon the general principles of Agriculture, for the use of schools.**—By FRANCIS WATTS, C.M.G., D.Sc. (*Imperial Department of Agriculture for the West Indies*. Price 2s.)

This is a second edition, enlarged and illustrated, of a work originally issued in 1901 by the Imperial Department of Agriculture for the West Indies, and written by Dr. Francis Watts, the well-known Superintendent of Agriculture in the Leeward Islands. Dr. Watts has received assistance in the preparation of the work from various officers of the Imperial Department, and Sir Daniel Morris contributes a preface. The book may be regarded as an admirable example of one side of the work which has been carried out by the Department since its establishment ten years ago. The

West Indies at that time suffered from the want of any means of centralizing and co-ordinating the agricultural work, both practical and scientific—and it must be remembered that in the sphere of agriculture, no less than that of industry, scientific research is in itself directly practical—which was being done in the different Colonies. Since that time, the scope and variety of such work has, mainly through the agency of the Department, been immensely increased. It has from the first been recognised that the work of agricultural development ought not to be limited to giving advice and assistance to planters, and discovering improved methods of cultivation and of dealing with disease and insect pests. In all these directions the Department has been active. But it may safely be said that none of its activities has been more valuable than that which has taken the direction of educational effort. It is now fully recognised that education of a purely literary or scholastic type is thoroughly unsuitable for a community ultimately dependent for its prosperity upon success in agriculture; and the study of agriculture has become a regular part of the curriculum of all West Indian schools, while special agricultural schools have been established in most of the Colonies. Doctor Watts' volume is designed for the use of teachers and of the older pupils who have received oral instruction in the subject which it covers. It deals, in a series of nine chapters, with the seed, the root, the stem, the leaf, the soil, plant food and manures, flowers and fruits, weeds and insects; and in every chapter the theoretical section is followed by instructions for practical work, including experiments which may easily be carried out. Doctor Watts writes in a simple and interesting style, and the book is notably free from that excess of technicalities which makes so many text-books on botany and kindred subjects abhorrent to the pupil. We are glad of the evidence of success given by the appearance of a second edition, and we hope that the volume may enjoy a wide circulation.

---

**The Geology of the Goldfields of British Guiana.**—By J. B. HARRISON, C.M.G. (*Dulau & Co.* 5s.)

This work gives the results of reconnaissances which went on from 1897 to 1905. The descriptions are based mainly on the rocks exposed in the channels of the river. The reason for this is that in such a country rocks in other places are covered by heavy forest growths, but during dry seasons the beds of the rivers become exposed over large areas, and their corners give excellent natural sections along which the structure of the district can be studied, especially at the rapids and cataracts.

Gold was not systematically searched for in British Guiana till about 1886, and the companies first in the field were unsuccessful, largely because mills were installed and crushing operations began

before a sufficient supply of gold-bearing quartz was found—a frequent error in the history of gold mining companies, which begin with capital and are anxious to start work as quickly as possible. In 1903, however, a very large auriferous reef was discovered on the Puruni River, and the land was purchased by an American syndicate. The prospects of this mine are very promising. A German company commenced working in 1903 with satisfactory results. In 1906, a syndicate located 2,000 acres on the Mazaruni River for diamonds, and there has been a rush to the district. By March, 1907, there had been found 731,240 diamonds, weighing 49,590 carats.

Mr. Harrison sets out with much detail and in clear style the physical features of the Colony, the petrography of the rocks, and the geology of the different districts. The Mining Ordinance is given.

There is undoubtedly an immense field here for future enterprise. The goldfields are extraordinarily extensive, and only a small part has yet been touched. The country is favourable for hydraulic mining and dredging.

A geological map is issued to accompany the work (5s. unmounted, 7s. 6d. mounted).

---

**The Surveys of British Africa, Ceylon and the Federated Malay States.—THIRD ANNUAL REPORT OF THE COLONIAL SURVEY COMMITTEE. (Price 1s. 10d.)**

This Report contains accounts of the surveys of the following territories:—Anglo-Egyptian Sudan, British East Africa Protectorate, Gambia, Gold Coast, Northern Nigeria, Nyasaland, Rhodesia, Sierra Leone, South Africa (General), Cape Colony, Orange River Colony, Southern Nigeria, Uganda, Ceylon and the Federated Malay States. The progress which has been made in the delimitation of British frontiers in Africa is shown in tabular form, and it is mentioned that three Boundary Commissions have been at work during the past year, viz., the Niger-Chad Commission (Anglo-French), the Uganda-Congo Commission (Anglo-Belgian), and the Yola-Cross River Commission (Anglo-German). An announcement of some interest is made with regard to the vexed question of the spelling of African place names:—

“The Secretary of State has approved of the following rules for the spelling of place names in British Tropical Africa:—

“(a) Established forms of spelling of well-known places are to be retained, *e.g.*, Coomassie, Accra.

“(b) The spelling of other place names is to be in accordance with the rules of the Royal Geographical Society. (Briefly, in this system, the consonants are as in English and the vowels as in Italian.)

“(c) The Director of Surveys in each Colony or Protectorate (or where there is no Director of Surveys, the Intelligence Officer), is responsible for the correctness of the spelling of the place names on field sheets sent home for reproduction. He will ascertain the true pronunciation from Commissioners and Residents.

“In any case in which it is doubtful whether a name should be dealt with under (a) or (b) he will refer the question to the Governor for decision.”

---

### Scenery Preservation in New Zealand.

A report presented to the New Zealand Parliament gives an interesting account of a side of Government work which many persons would be glad to see more extensively imitated in the United Kingdom. Under two Acts, passed in 1903 and 1906, the Lands Department had, up to March 31st, 1907, acquired 25,801 acres, which were reserved “for scenic purposes,” and to this total an addition of 8,130 acres was made during 1907-8, the total area reserved thus amounting to 33,931 of private or native land specially acquired, exclusive of about 100,000 acres of Crown land similarly reserved under the Land Act. It is stated in the report that “although much still remains to be done throughout New Zealand to preserve the most attractive and frequented beauty-spots which would otherwise be in danger of destruction, yet there is no fear that this country, which is so richly endowed with picturesque scenery, will fail to retain uninjured the greater part of what visitors praise so highly.” The report is accompanied by a series of beautiful photographs which indicate how well worth preserving the natural scenery of New Zealand is. The Dominion recognises that it is an obligation of Government to promote the amenities as well as the utilities of national life; and it would be gratifying if the British Government would accept a fuller responsibility for work of the kind, which is at present being performed, with sadly inadequate resources, by the “National Trust.”

---

### The Micmac Indians of Newfoundland.

The Colonial Office has published a report by the Governor of Newfoundland, Sir William MacGregor, on a visit which he recently paid to the settlement of the Micmac Indians at Bay d'Espoia on the south coast of the island. This little community consists of twenty-three families, or 131 persons in all. They occupy a Reservation which was laid out for them in 1872 by the Colonial Government, but they have never fulfilled the conditions under which their occupation licenses might have been converted into grants in fee, and their present condition and prospects are described

as far from bright. "Game, their principal food, is manifestly becoming more difficult to procure; their trapping lands are being encroached upon by Europeans; they are not seamen; they are not fishermen; and they do not understand agriculture." These Indians are a branch of the Algonquin Indians who inhabited Maine, New Brunswick and Nova Scotia. They first came over to Newfoundland exactly a hundred years ago, and, largely owing to their possession of fire-arms, they seem to have been mainly instrumental in crushing out of existence the unfortunate Beothuk Indians, whose only weapons were bows and arrows. This indigenous race is now entirely extinct. Sir William MacGregor states that he has not heard of any person in Newfoundland in whose veins flows Beothuk blood. The Micmacs, on the other hand, have a considerable admixture of European blood. The Governor remarks that they require special attention and treatment at the hands of the administration. It would not be difficult to find a location for them which would be more suitable, so far as cultivation is concerned, and equally good for hunting and trapping. They appear to be a fairly healthy community; they have their own church (Roman Catholic) and school, where good work is being done under discouraging conditions; and they select their own chief without regard to hereditary principles.

---

#### The Journal of the Society of Comparative Legislation.

New Series., No. XIX. (August, 1908; John Murray.)

This number contains an important judgment of the Supreme Court of Ceylon on *nudum pactum* in Roman-Dutch Law, an interesting article on the Market in African Law and Custom, a contribution by Professor Harrison Moore, of Melbourne University, on the Legal Relations of the States of the Empire, and a Gold Coast Judgment on the Status of Native Courts.

---

The Quarterly Bulletin of Miscellaneous Information issued by the Botanical Department of Trinidad (October), contains a very interesting collection of notes from various sources on agricultural and sanitary matters. A lecture is quoted, in which great praise was given to the high grade fats now made from the cotton plant, and, if mankind can be persuaded that vegetable fats are richer, purer and healthier than animal fats, a vast extension of the uses of cotton plants may be looked for. The cakes of the ancients were always made with vegetable oil, but animal fats have come in since simply because they are cheap.

## COLONIAL STAMPS.

IN our last issue we gave the colours appropriated to stamps of all existing values in the proposed colour scheme. We may further explain that, although the colours of stamps printed from the old Universal King's Head Keyplate would agree exactly with the list given, they would be found reversed in the case of the 8d., 10d., 1s. 6d., 4s. and 8s. stamps printed from the new Universal King's Head Keyplate; *e.g.*, the 8d. stamp printed from the old keyplate would show the head and the words postage and revenue in purple, and the name of the Colony and the value in red, but the 8d. stamp printed from the new keyplate would show the head in red and the border in purple. It is also necessary to add that, although stamps bearing designs other than that of the King's head would be printed in the colours given in our last issue, it does not follow that the constant portion of each design will be in the colour given for the King's head, as this colour may be allowed to the border of the stamp.

---

A further point of interest in connection with stamp books arises out of the price paid by the public for them. It is often considered that 2s. 6½d. or 2s. 7d. is an awkward sum to charge, and it has been suggested that instead of this the charge should be 2s. 6d., but that the books should be one or two stamps short. It will probably be clear, on reference to our last number, that the labour of removing the stamps after the books are bound would be very great, apart from the difficulty of auditing a large number of single stamps. There are only two ways in which this difficulty can be overcome. That adopted by the Imperial Government is somewhat expensive, and would only be justified by a very large demand for stamp books. A special stamp printing plate has been made which prints a cross in place of the first stamp and every seventh subsequent stamp on a sheet. In making up the sheets of stamps preparatory to binding

one such sheet is put at the bottom of each batch, so that in each book the first stamp on the last page is a dummy. The other alternative is to print the stamps as usual but overprint a corresponding stamp to that described above with some such words as "Not for use." This method was tried by the Government of Natal, but did not give satisfaction, and the uneven charge was substituted for it.

---

We understand that the Imperial Government has decided to admit approved advertisements on the interleaves of stamp books. If this were done in the case of such articles in the Colonies, it would very likely be possible to sell them without a premium, the loss being in all probability more than made up by the proceeds of the advertisements. The stamp books would certainly be in largely-increased demand, and this would in turn be reflected by their increased value as an advertising medium.

---

ST. VINCENT has ordered a supply of 2s. and 5s. postage and revenue stamps to be printed from the Universal King's Head Key-plate in the colours allocated to their values in the list given in our last issue. The new 6d. and 1s. stamps were despatched at the end of November.

A NEW 1d. stamp plate is in hand embodying certain small improvements which will be found in the 6d. and 1s. stamps referred to above.

STRAITS SETTLEMENTS.—The colours chosen for the \$25 and \$100 values are blue and purple on blue paper for the former and red and black on blue paper for the latter. It has been decided to issue a new large-sized stamp value \$500, the colour of which will be yellow and purple on white paper. No order has yet been received for stamps of either of the above values.

TRANSVAAL.—The new 2½d. stamps, referred to in our issue for October, 1907, have been supplied; also some 2s. 6d. postage stamps printed on multiple watermark paper.

GOLD COAST has decided to adopt the new colour scheme, and 6d. stamps have been supplied in accordance with it.

LEEWARD ISLANDS and VIRGIN ISLANDS have decided to adopt the new colour scheme.

---

Messrs. Whitfield, King & Co.'s new catalogue states that the total number of stamps issued to date, as included in the catalogue, is 22,382, of which 6,849 belong to the British Empire and 15,533 to the rest of the world.

## LETTER TO THE EDITORS.

## LETTER III.

**The Future of the West Indies.**

24th November, 1908.

SIRS,

A reference to Letters I. and II. on the above subject will show that the lines laid down by the Commonwealth of Australia in the formation of their Constitution have been closely followed, and from current information it may be gathered that the Australian methods have guided the preliminary propaganda for the formation of a Constitution for a United South Africa, which resulted in the Convocation of the National Convention recently held at Durban and Cape Town. The meeting place was in the Colony, instead of, as suggested for the West Indies, in London. But it must be recognised that the several Colonies in South Africa already have, and are exercising in their respective Governments, the powers required by the West Indies as a whole.

The verdict of the authors of the work entitled *The Government of South Africa* is, that in the proposed Union reposes South Africa's only hope of fully realising her destiny. The unsparing efforts of a small band of enthusiasts, each an expert in his own domain, who for eighteen months have been engaged as an Unofficial Committee of Enquiry, and with the cognizance and assistance of the various Governments, in accumulating, sifting, classifying, and condensing an intricate mass of facts, figures and general information regarding the present Government of South Africa, have brought about and made possible the meeting of the South African Convention. In the case of the West Indies, if some similar method were followed, they would prepare the way for a Convention in London of delegates elected by each separate Legislature in the

West Indies. If such a band of workers for the West Indies could be formed and then dissolved when the Council meets, the most legitimate expectations of success might be entertained.

The Convention of the delegates of the various Colonies of South Africa shows that the fact of different nationalities with divergent opinions and interests, and the existence of the most complex questions, forms no bar to the policy of a Union. On the contrary, it has been proved that delegates so various as de Villiers, Merriman, Sauer, Malan, Beck, Jameson, Smartt, Stanford, Maasdorp, Van Heerden, Walton and Jagger for the Cape Colony; Botha, Smuts, Schalk Burger, De la Rey, Farrar, Fitzpatrick, Hull and Lindsay for the Transvaal; Fischer, Steyn, Hertzog, de Wet and Brown for the Orange River Colony; Moir, Greene, Smythe, Morcom and Hyslop for Natal; and, lastly, Milton and Mitchell for Rhodesia, can meet in a Convention and decide questions long the source of continuous conflict.

The West Indian question is not one so different as to be beyond the power of a like settlement, provided that the Colonial spirit exists, with the customary British way of adapting and strengthening the potential resources of the part of the world in which our countrymen find themselves placed.

As regards Jamaica, the formation last August of the Kingston Citizen's Association has some bearing on the question now discussed. The objects of this Association are (*inter alia*) "to create and keep alive public interest in public affairs." Similar associations already exist in other West Indian Islands. All of these might be subservient to the formation of a suitable Sub-Committee charged to collect data, &c. In conclusion, it would seem from the example of what has been done in Canada and Australia, and is about to be done in South Africa, that the West Indies might, without loss of independence, re-arrange their legislative and executive powers so as to make that independence within the Empire more effective than now in promoting objects of common interest to the West Indies as a whole.

I am, Sirs,

Your obedient Servant,

JOSEPH RIPPON.

## BALLADE OF RED TAPE.

"HUMANI NIHIL ALIENUM."

Old England has gathered her thrones together  
From the shores of the south to the land of the snow.  
Her sailors on guard, come wind, come weather ;  
Her soldiers ready to meet the foe,  
Their hearts for the shock of battle aglow ;  
And her civil servant plying his beat  
From home to the office. The Colonies trow  
It is all red tape in Downing Street.

He sits with his quill of the grey goose feather  
By an inkpot ; to train his thoughts to flow  
His freeborn soul to a desk they tether,  
Whilst messengers entering in dumb show  
Deposit the bundles, row on row,  
For this dull-eyed hermit in his retreat.  
Away from the field and the flowers that blow,  
It is all red tape in Downing Street.

In his youth his footsteps trod the heather,  
As he sang with the lark till the sun was low ;  
He flew the kite and he chased the leather.  
To-day he remembers the long ago,  
And smiles as his pen glides to and fro  
With its wise old scratch on the folio sheet.  
Says the World, but it doesn't exactly know,  
" It is all red tape in Downing Street."

## ENVOI.

Clerk, if you find the office slow,  
If the press with a gibe your labours greet,  
Forget not the days of your boyhood, though  
It is all red tape in Downing Street.

## RECENT TRANSFERS AND PROMOTIONS MADE BY THE SECRETARY OF STATE.

- Mr. H. B. WALCOTT (Treasurer and Collector of Customs, British Honduras), Collector of Customs, Trinidad.
- Mr. E. G. ROWDEN (Director of Education, Gold Coast), Director of Education, Southern Nigeria.

---

*[This Journal, though published with the approval of the Secretary of State for the Colonies, is not official, and the Secretary of State is in no way responsible for the opinions expressed in it.]*

---

---

**EDITORIAL NOTES.**

SIR CHARLES LUCAS, the senior Assistant Under Secretary at the Colonial Office, who is in especial charge of the Dominions Department, has been sent on an extended tour to Australia and New Zealand. His mission is an official one, but he has not been charged with the transaction of any special piece of business. The object of his journey is the furtherance of the policy of bringing the Colonial Office into closer touch with the great self-governing dominions, a policy in support of which all parties are agreed, though differences of opinion have shown themselves as to the best means for bringing about the desired end. Sir Charles will bring back with him to the Colonial Office a personal knowledge of Australian conditions acquired on the spot. He will also, it may be hoped, leave behind him in Australia a more complete understanding of the attitude of the Colonial Office, and of His Majesty's Government, towards the self-governing dominions. Personal intercourse is by far the best means of dispelling misunderstandings, and we feel sure that Sir Charles Lucas's journey will result in an improvement of inter-imperial relations. It may be regarded as an adoption, in the spirit, if not in the letter, of the proposal for an interchange of officials which was put forward by Lord Northcote at the banquet given in his honour, and which was very sympathetically received by Lord

Crewe. But while it is to some extent a new departure, we do not think it is generally realized how many members of the staff of the Colonial Office have been afforded opportunities of acquiring personal knowledge of the parts of the Empire with whose affairs they deal. It would appear from the attitude of the press that the general impression prevails that none of them ever leave their native shores, or at any rate that the Colonies remain outside the scope of their wanderings. This is far from being the case. But the volume of work devolving upon the office necessarily restricts the opportunities of detaching its members for prolonged terms of foreign service. Such arrangements have occasionally been facilitated by temporarily attaching officials from the Crown Colony service to the staff of the office, but it is not so easy to arrange for such an exchange in the case of self-governing dominions. But we believe that some means will be found of continuing and renewing from time to time the personal intercourse which Sir Charles Lucas's mission is to initiate.

---

There has been a good deal of openly expressed discontent in Canada at the discussion in the American press of the details of the International Waterways Convention before it had been communicated to the Dominion Parliament. *The Times* discharged a public service by pointing out in a leading article that in this case, at any rate, the villain of the piece was not Downing Street indifference to Colonial interests, but that much overlauded document, the United States Constitution. There never was an international agreement which was more thoroughly the work of a Colonial Government than the Waterways Convention. Mr. Bryce, we know, regards himself as not less the Ambassador of Canada than the Ambassador of Great Britain, and in this instance it is well-known that Mr. Gibbons, the Canadian representative, is primarily responsible for the text of the treaty. But unfortunately, whereas British adhesion to a treaty is complete—save for the necessity of subsequent ratification—when the British plenipotentiary has affixed his signature, American adhesion can only be given after the Senate has signified its approval. The Senate is a deliberative body, and in the course of its debates the details of an agreement which may be hanging in the balance are necessarily fully canvassed. For the suggestion that the Canadian Government was kept in the dark as to the terms of the treaty there is no sort of foundation; on the contrary, the terms were that Government's own handiwork. The Canadian Parliament was kept in the dark because the Canadian Parliament, like the Parliament of the United Kingdom, but unlike the United States Senate, is not invested with any share in the treaty-making power. *The Times* article was little more than an essay in comparative constitutional law. We are sorry that it has been resented in some quarters in Canada as a curtain lecture. The subsequent

publication of the official correspondence has, however, made it clear to everyone that there is no sort of grievance against the Imperial Government. The main source of the trouble is the leakage which inevitably occurs when a diplomatic document is under discussion by a deliberative assembly. The treaty was not published in the United States when it came before the Senate, but information as to its contents soon became public property through the instrumentality of the press, and Canadian newspapers, who are ill-served in the matter of Washington correspondence, acquired most of their information by means of telegrams from London which merely repeated news received from Washington.

General satisfaction will be felt at the successful conclusion of the prolonged negotiations with regard to the Atlantic Fisheries Convention, in which both Canada and Newfoundland are interested, and it may be hoped that the question will be settled by the Hague Tribunal in such a manner as to remove this old cause of friction, not only with the United States, but also between Newfoundland and the Imperial Government. At one time there appeared to be an imminent danger of the prospects of a settlement being wrecked by the complications resulting from the political crisis in Newfoundland, but it was found possible to send Mr. Kent to Washington, and his mission resulted in the introduction of amendments which enabled Sir Robert Bond to accept the treaty.

The report on the Emigrants' Information Office for the year 1908 draws attention to the great decrease in the number of emigrants to Canada, which fell to 81,211, as compared with 151,216 in 1907. This was partly due, no doubt, to the knowledge that the financial crisis of Autumn, 1907, in the United States of America had adversely affected industrial conditions in Canada; but it was largely the outcome of a direct policy of restriction adopted by the Canadian authorities. Upon this subject the report contains the following remarks:—

“ A noticeable feature of the year was the action taken by the Canadian Government to restrict the entry of classes of emigrants whose coming was considered undesirable by enforcing regulations requiring each emigrant to possess a prescribed sum of money on landing and by requiring that emigrants sent out by British charitable societies or by public funds should obtain certificates from the Canadian emigration authorities in London that they are suitable settlers. The effect of the latter requirement was immediately apparent in the marked reduction in the flow of emigration to Canada conducted by emigration societies and public bodies such as the Central (Unemployed) Body for London and Provincial Distress Committees. A further symptom of a new attitude in

Canada towards immigrants was the large increase in the number of families deported during the year under the terms of Sec. 33 of the Canadian Immigration Act of 1907, which provides that any emigrant who, within two years of landing in Canada has become a public charge, or an inmate of a penitentiary, gaol, prison or hospital or other charitable institution, may be deported, together with those dependent on him. The number of cases of deportation to this country increased from 339 in 1907 to 798 in 1908. The attention of the Committee was called to the subject in connection with deportations from Oshawa and Deseronto. They were led by the facts brought to their notice to make suggestions with a view to avoiding the unintentional infliction of hardship in the application of the law."

---

In a review of industrial and labour conditions in Canada during 1908, published in the *Canadian Labour Gazette* for January, it is stated that "the policy of rigid regulation adopted by the Dominion Government with regard to immigration, by curtailing the number of arrivals by over one half, assisted greatly in adjusting the labour market." There is little to be said against the policy of reducing the influx of immigrants at a time of industrial depression, but the policy of deportation is, we think, more open to criticism. A Bill has now been introduced to extend to three years the period after arrival during which an immigrant shall be liable to deportation, and where the sole ground for deportation is distress due to unemployment it appears to us that a real hardship is inflicted. Fluctuations in trade are, unfortunately, of constant, though irregular, recurrence in all commercial and industrial communities, and they necessarily bring with them periodic increases in the percentage of unemployment. But Canada has deliberately encouraged immigration in the past, and may reasonably be asked to accept responsibility, in slack times, for those whose services she has been glad to obtain in times of industrial activity—in other words, for those who are not really undesirable, but only unfortunate.

---

The results of the prolonged deliberations of the South African National Convention at Durban and Capetown have now been published in the form of a draft Bill for the union of the four self-governing Colonies in South Africa. It is a very remarkable document, which affords abundant evidence of the statesmanlike qualities of the delegates who framed it. The claim which has been put forward, that it represents the most perfect constitution yet known to the British Empire, is hardly an exaggerated one. Advantage has been taken of the unrivalled variety of experience in constitutional methods which the British Empire affords, and the recently estab-

lished constitutions of the Transvaal and the Orange River Colony, as well as that of the Australian Commonwealth, have been laid under contribution. The principle of equal electoral districts—from which a limited departure is to be admitted to meet local circumstances—and that of automatic redistribution are borrowed from the former. South Africa will thus, it is to be hoped, be saved from the unfortunate difficulties which attend the question of redistribution in the United Kingdom, where it is still left to the tender mercies of party politics, with the result that reforms admittedly urgent are indefinitely postponed. The question of redistribution has been the cause of acute differences both in Cape Colony and in Natal, and in each case the result of the new provisions should be a gain to the towns at the expense of the country districts. For the present, Natal and the Orange River Colony are to receive a rather larger measure of representation than they are entitled to on a strictly numerical basis, but as the white population grows this inequality will be redressed. The franchise at present existing in the different Colonies is to be preserved, and a special provision is made to safeguard the native franchise in Cape Colony. On the other hand, only persons of pure European descent are to be eligible for election. The adoption of the principle of proportional representation is an unexpected innovation, the results of which will be watched with deep interest all over the Empire.

---

There had been much speculation as to whether South Africa would follow, in regard to the general framework of union, the example of Australia or that of Canada. It turns out that the constitution goes considerably further even than that of Canada in the direction of centralization. In fact, it can be most accurately described as unification accompanied by a large measure of devolution. The provincial governments will only enjoy such jurisdiction as the central legislature allocates to them, and the central legislature may at any time alter the allocation originally made. There is thus no suggestion about the constitution of a treaty only alterable by the consent of the parties. The provincial governments will be carried on by committees elected in accordance with the principle of proportional representation by their local councils, together with an Administrator appointed by the central government. This will give us a system of local administration which appears to be entirely new, and will apparently preclude the possibility of any system of cabinet government in the provinces. A complete reconstruction of the system of local government in the United Kingdom cannot be very far distant, and the advantages of this new South African model will be worth studying in this connection. The new constitution hardly gives any recognition to the federal principle, except in the provisions relating to the Senate, to which each of the

provinces is to send eight members, the number being raised to forty by the addition of eight members nominated by the Governor in Council, of whom four are to have a special knowledge of native affairs. The provisions which are made to meet the possibility of a deadlock between the two houses are taken from the Transvaal and Orange River Colony constitutions, to which they were originally transplanted from the constitution of the Commonwealth. They are, in fact, becoming a part of the regular legislative machinery of the British Empire, though there is as yet no sign of their adoption at home, and though their efficacy has not yet been tested by actual working experience. Among the other provisions of the constitution may be noted with interest the proposed management of the railways by a non-party commission, by which surplus railway revenues will be applied to railway purposes, instead of being paid into the Treasury.

Thus the draft Act differs essentially from the Canadian and Australian models, in that it aims not so much at fixing the form of government once for all as at providing the means of unified government. We see that Mr. Watson, formerly Prime Minister of the Australian Commonwealth, has expressed his conviction that if Australians to-day had the choice over again they would unhesitatingly select a more concentrated constitution.

---

It is inevitable that sooner or later the protectorates of Basutoland, Bechuanaland and Swaziland, which are at present directly administered through the High Commissioner by the Imperial Government, should form part of the United South Africa of the future. The transfer is not to take place immediately, and it would be rash to assume that it must necessarily take place at an early date. But the conditions which are to govern it, when the time comes, are laid down in a Schedule to the Constitution Bill. The natives are guaranteed the enjoyment of their lands, the prohibition of the sale of liquor is to be continued, and the existing Native Councils are to be maintained. Legislation is to be by the Governor in Council, a provision which should afford a valuable guarantee against the evils of misdirected legislation by an imperfectly informed Parliament, which the report of the Natal Native Affairs Commission so strongly emphasized. The Commission, which is to advise as to the conduct of affairs in the territories, will supply the element of permanence in the administration, to which the natives everywhere attach great importance, and which frequent cabinet changes are apt to impair. Perhaps the most satisfactory feature of the scheme is the fact that it indicates that the honourable obligations of the Imperial Government to the inhabitants of the native territories are fully recognized by South African statesmen.

The provision of the new constitution which is most open to criticism on its merits is that relating to the capital. Capetown is to be the seat of the legislature, Pretoria that of the administration, and Bloemfontein that of the judiciary. This arrangement is a compromise in the truest sense of the term, for probably no member of the Convention would claim that it was the most desirable system. It has been adopted because it was the only scheme upon which agreement could be attained, and its adoption is characteristic of the spirit of "give and take," which has marked the whole course of the Convention's proceedings. We notice that there appears to be a laudable determination to make the best of it. Lord Curzon has been brought in to testify to the smooth working of the Indian system of division between Simla and Calcutta, and it is even being urged that the necessity of travelling from Pretoria to Capetown will have a widening effect upon the intelligence and sympathies of permanent officials. We doubt the force of these arguments, and we question whether those who have had experience of the working of Irish administration during the Parliamentary Session—a closer parallel than Lord Curzon's—would endorse them. But considerable practical inconveniences may be, and ought to be, endured, if rival claims, each founded on a substantial basis, cannot otherwise be satisfied and reconciled.

---

The prospects of South African Union becoming an accomplished fact in the immediate future appear to be very favourable. It would be a calamity to South Africa and the Empire if all the ability and strength of purpose which have been at work during the proceedings at Durban and Capetown should prove to have been in vain. At the moment, the one unfavourable symptom seems to be the opposition of Mr. Hofmeyr, who has so often shown himself to be the power behind the throne in Cape Colony. But there has been a substantial readjustment of party divisions in the Cape of late years, and it remains to be seen whether Mr. Hofmeyr will now carry with him so large a section of opinion as he once controlled. There is also undoubtedly strong opposition to the scheme in its present form in Natal, but if the other Colonies approve it, Natal will hardly elect to stand alone. The project will have no serious dangers to encounter in the Imperial Parliament, if it successfully passes through the local legislatures which are on the point of considering it. On the contrary, we believe that it will receive a cordial welcome from members of all parties.

---

It is satisfactory to find that contemporaneously with the proceedings of the South African National Convention, Southern Rhodesia has for the first time been able to balance its revenue and expenditure. Population is being secured, substantial progress is being made in

agriculture and mining, and railway development is in prospect. Every advance of this kind brings Rhodesia nearer to union with the rest of South Africa. The eventual settlement will be largely a matter of bargaining, and the more Rhodesia can bring into the pool the easier will be the arrangement. Colonel Grey, one of the elected members of the Rhodesia Legislative Council, has argued that Rhodesia's union should be with the North—Nyasaland and the other territories administered by Great Britain. It is difficult to believe that this is the destiny of Rhodesia. The northern territories can never be a white man's country in the sense that the southern colonies are; the labour, substantially speaking, will be black, and the method of administration and the economic situation will be moulded accordingly. Rhodesia, socially, politically and economically, must gravitate towards the neighbours which are like herself; she will look to the Cape rather than to Cairo.

---

The paper read before the Royal Colonial Institute by Prof. R. Wallace in January gave the results of a study of Southern Rhodesia by a recognised agricultural authority. Prof. Wallace spoke in vigorous terms of the enormous possibilities of the country for stock raising purposes and of the ready market which is available in this country. Of tillage he took a much less hopeful view. He considered that the good arable land is comparatively small, that the profits are likely to be unsatisfactory, and that the labour is poor and dear. In so vast a country the proportion of good arable land may seem small, but there is a huge quantity of it, and Prof. Wallace's anticipations may be far exceeded. Land is cheap and the attractions considerable, and excellent advice is at the command of young settlers. The time has arrived at last, after much disappointment and depression, when it can be said that Rhodesia is definitely going ahead. The new mining ordinances promulgated by the British South Africa Company have given a much needed impetus to this industry, and will help the farmers by creating a better local market.

---

Agriculture is one of the principal matters which stand to gain by the closer union of British South Africa. The country has not participated in the general advance which has been made in most of the European-inhabited countries during the last half-century. It stands in a backward position, and one result of the lack of care is that diseases of animals and plants have been allowed to spread until, to quote the words of Mr. F. B. Smith, the Transvaal Director of Agriculture, in a recent paper, "a collection of pests has been accumulated that for variety and virulence could scarcely be equalled and certainly not surpassed by any country in the world." The main cause of the trouble is the "easy-going, half-nomadic

half-pastoral life of the farmers" in past times. Whenever difficulties were encountered, they were avoided by trekking north and taking up fresh land. But this process is practically at an end, and farmers must make the best of what they have got. Agriculture is now a complicated art, and demands the best scientific advice. Researches and experiments cannot be conducted to any great extent by farmers themselves; they have neither the means, the time, nor the qualifications. The State must help, but it may easily waste its work. "The relation of the State to agriculture," Mr. Smith observed, "and the best methods of promoting the industry . . . constitute a science in themselves." It is said that probably during the past twenty years more money per head has been devoted to the assistance of farmers in South Africa than in any country in the world. But not only is there little to show for all this expenditure, but in some ways actual harm has been done by discouraging independence and initiative. A central parliament and central department of agriculture would not only undertake the work in a more comprehensive manner, but would stand above individual appeals for financial assistance or exemption from regulations as to contagious diseases of animals and plants. From every point of view collective action by all the colonies is necessary for the protection and education of the farmer. "Contagious diseases pay no respect to arbitrary political boundaries, and . . . it may happen that the laxity of a single colony or territory may endanger, or perhaps ruin, the whole of the others." Cattle disease is continually being introduced from one South African colony into another, and common action is clearly essential on this ground alone.

---

The Boer farmer lives on primitive principles. He grows himself nearly everything that he and his dependants require. He buys very little, and what he does buy is usually by barter. It is said that there are many beginners in the Transvaal whose expenditure in money or barter does not exceed £20 for the whole family; this sum is provided by the sale of some mealies, forage, wool and cattle. The staple food is Boer meal or mealie meal, and occasionally a sheep is killed or a buck shot. Their coffee consists of more roasted mealies than coffee beans, and it is not sweetened. The life is simple indeed, but to an European working man it would be squalid poverty. Natives are usually paid for their labour by the use of land, or in stock and grain, not in money. The produce available for sale is remarkably small. Particulars are given in the *South African Railway Magazine* for October last of a farm of 4,000 morgen which yielded only £70 by sales in a year, and half of this was due to firewood out from the bush. The system produced a strong and remarkably self-reliant race. The man who produces

himself almost everything that he requires is taught to be self-sufficing, and is free from the servility which inevitably attacks some classes in countries where the economic conditions are complex. But there are signs of a coming change. It is fairly clear that by no means the best use is made of the land. The standard of comfort is rising, and, for better or worse, the advantages of the division of labour will assert themselves. Scientific education, co-operation and State help will hasten the development.

There is now actual proof that South Africa can produce cereals at a profit for export. Mealies and oats have been shipped and readily sold at good prices. For the former the climate and soil are excellent. Lucerne has proved invaluable as a fodder during drought, and deserves to be grown much more extensively. There is a general advance in farming prospects, and, though South Africa has been called a hard country for the farmer, if the natural conditions are studied in an enlightened manner, he can achieve success. Agricultural education is greatly wanted, for if ever there was a country in which a knowledge of nature is necessary it is South Africa, and the old European school methods, based on very different circumstances, will surely before long give way to a system which will teach the country boy the marvels of plant growth and the purposes of tillage.

The reason why South Africa imports so much foodstuff, which it is quite capable of producing, is not because there is not enough suitable land, but because labour is bad and transport defective. Much can be done to improve the land, and irrigation works of moderate dimensions, such as have been recommended by the Inter-colonial Irrigation Commission, would be a great boon. But the character of the labour and transport is the great difficulty. It is due to the vastness of the area and the fewness of the inhabitants. The country is not ripe for big schemes. The Kaffir is a very slow worker, and the Commission say that as an agricultural labourer he does not do a tenth of the work of an European labourer. The soil itself requires a good deal of labour, as it is deficient in phosphates and nitrates, and must be well manured. The improvement of the Kaffir as a labourer is a very important condition, and if by education and other influences he can be raised to a higher plane the economic gain will be great.

On the subject of native education, a Select Committee of the Cape House of Assembly, of which Mr. H. E. S. Fremantle was Chairman, has presented an interesting report. Of the general advantages of education to the native, and of his capacity to benefit by it, the Committee entertain no doubts, as the following passage in their report will show:—

"The witnesses are generally agreed that education has the effect of making the native more intelligent, more civilized, and more loyal, and of increasing his wants. It is also widely, though less generally, admitted that education makes the native more moral and more industrious. Your Committee can, however, find no evidence in support of the theory that education has a tendency to induce crime. Your Committee submit that the primary objects of native education must be the development of intelligence, the training of character, and in particular the promotion of industry, and that if these objects are duly kept in view throughout, and nothing is done to force development unnaturally, native education cannot fail to be to the advantage of the whole country.

"Your Committee find that the belief in the inability of the native to develop at a normal rate beyond a certain stage is not supported by facts, and that any definite assertion as to the capacity or limits of the native mind must at present be regarded as a deduction from insufficient evidence."

They advocate the provision of increased funds for educational purposes, and the devotion of greater attention to moral and religious teaching, to instruction in hygiene, and to manual and industrial training; and they suggest that the curriculum for native schools should be discussed at a Conference to be attended by representatives of the various missionary bodies, the Transkeian General Council, the native training institutions, and the Education Department, as well as by leading natives who are interested in educational matters. It appears that there are considerable divergences of opinion on this point. Some authorities favour the institution of a special curriculum for native schools; others fear the results of too marked a separation between Europeans and natives in this matter. On the subject of higher education for natives the Committee's recommendations are substantially in advance of existing practice:—

"There is at present no great demand for the higher education of natives, and no provision is made for such education by the State, which assists normal classes but gives no grants for a high school course for natives . . . . Your Committee consider that the question of the provision of such higher education as may be required is part of the question of the attitude of the State towards the proposed Inter-State College.

"The establishment of a native college has been recommended, partly in order to provide for the higher education of natives, and partly to prevent natives from going out of the country in search of it. The evidence shows that upwards of a hundred South African natives have in recent years gone to colleges in the United States and elsewhere; that there may be some opening for natives with a college education as professional men among their own people and as headmen, and that there is a demand for higher education, but

that it is not large. It also appears that many natives enter the normal course solely because there is no alternative course beyond the elementary standards. Your Committee regard this as undesirable, since the normal course is designed only for training teachers. In view of all the circumstances, they consider that the demand for higher education should not be artificially stimulated, but that when shown to be genuine it should not be refused, and recommend that after Standard V. there should, where necessary, be alternative courses (leading up to secondary, normal and industrial work); that the scale of fees be similar to those of the fees charged in European colleges; that grants for secondary and higher work be made to the native college on terms similar to those on which grants were made to other colleges in the earlier days of higher education in South Africa; that the Government be adequately represented on the governing body of the native college; that the work up to and including the matriculation course be subject to the usual Government inspection; that manual training be an integral part of the college course, and that the university standard of work be strictly maintained."

Some day or other South Africa will be faced with the necessity of a vastly-increased expenditure on the education of her immense native population, but the time is not yet. Even as matters are, Cape Colony is in advance of the rest of the sub-continent in this matter.

---

Mr. Sydney Webb, formerly of the Colonial Office, has mentioned in a recent speech the surprise he felt on finding that the native children in Sierra Leone were taught the names and doings of the Anglo-Saxon Kings of England. It is obvious that any absurdity of this kind is due to the ignorance of the schoolmasters, who, all the world over, are inclined to teach only what they have been taught themselves. Education should be founded on the needs of each country. In a primitive community it should be largely industrial; not so much because the results are practically useful, as because this method opens the native mind most effectually. The European child also, in countries which demand the elementary forces, must be largely stimulated by work in which he will take an active interest.

---

An example of what could be effected, and undoubtedly will be in the future, to improve land, is afforded by the case of the territory known as N'gamiland, in the Bechuanaland Protectorate. "There," it is observed in the last annual report, "a great river, the Okovango, flowing from the north, enters the Protectorate and gradually loses itself in marshes of vast extent. The annual volume of water which the Okovango carries is enormous, and to-day this element, so precious in South Africa, disappears in the middle of the sub-continent as completely as though it were discharged into

the ocean. It is not too much to suppose that in the days to come the flow of the Okovango will be controlled, and that by a system of canals that region, to-day a desolate swamp, and many hundreds of square miles bordering upon it, may become land capable of the highest cultivation. Some day N'gamiland may be known as the Egypt of the South."

---

Much concern has been caused by the action of the South African Union Conference in increasing the freight on ore exported from South Africa to Europe, and introducing the system of rebate in this business. The rates on all ores have been fixed as follows (to London and Hamburg):—

Value up to £20	per ton, 15s., and 10 per cent.
„ £20-£50	„ 20s., „
„ £50-£100	„ 25s., „
Over £100	„ 30s., „

Hitherto an uniform rate has been charged for ores irrespective of their values, and we understand that certain Transvaal exporters of base metals have been charged 15s. per ton on ores of the value of £100 or less per ton. Under the new tariff tin will pay 30s. per ton, plus 10 per cent. primage, which will be refunded to shippers who confine their shipments to the ring.

---

The discovery of an old Jewish coin, believed to date from the last year of the revolt, under a heap of soil at Marianhill, Natal, has excited the speculations of the antiquarians who discuss the locality of Ophir and the sources of King Solomon's gold. That king conquered Elath and Ezion Geber, on the Ælanitic Gulf of the Red Sea, and he and Jehoshaphat used these places as naval centres. But they remained in the possession of the Jews only a short time, and it is not likely that the Jews were adventuring so far afield in the critical time to which the coin belongs. The South African ruins themselves point to a much earlier period. The *Jewish Chronicle* concludes that the coin was dropped in quite recent times, "not necessarily by a Jew, although Jewish expeditions to South Africa for gold did not cease with the age of Solomon!"

---

The Northern Nigeria report for 1907-8 contains a striking summary of the administrative work which has been accomplished in this interesting possession. The territory was taken over by the Crown from the Royal Niger Company in 1900, largely because a political situation had arisen which made it practically necessary for the Home Government to step in and assume directly the responsibilities attaching to the occupation. For a time the territorial question with France was acute, and might easily

have led to grave trouble on the spot. Common sense and moderation on both sides averted the difficulty. The next problem was to deal with natives of very different degrees of advancement and spread over great areas. The general policy, the report observes, has been to support native rule and rulers, their councils and courts, customs and traditions, when not repugnant to our ideals. The Residents are to be administrators in the true sense of the word, not direct rulers. "By their sympathy, patience and knowledge of language and customs, it was hoped not only to utilise existing machinery, but gradually to improve it, and thereby better the condition of the people." The progress may be slow, but the policy is sound, and an interesting feature of it is the special care which is now given to the education of the officers in the practical matters with which they are concerned.

The effective administration has been extended in a remarkable way in the few years which have elapsed since the transfer. In 1900 some 30,000 square miles were controlled; in 1908, 220,000.

The Baro-Kano Railway follows the measures which have been taken to suppress slave raiding and organised robbery. The native Emirs take the greatest personal interest in the works and constantly visit them, and the undertaking has clearly a great educational as well as an economic influence. The line, from about mile 20 to mile 60, passes through a continuous shea-butter belt; the value of this oil is about the same as that of soft palm oil. This product will bring considerable freight to the cars from the outset.

---

The Hongkong Government has published the original Chinese text, with illustrations, together with a translation, introduction and notes by Mr. Cecil Clementi, of the article on the poppy from the "Compendium of Literature and Illustrations, Ancient and Modern." This mighty work, which is in 10,000 books, was published in 1726. Mr. Clementi remarks "since my own set was sunk to the bottom of Hongkong harbour in the typhoon of September, 1906, the only copy existing in this Colony is that recently purchased by the Registrar General's Department." He adds that the British Museum possesses what is probably the only copy in the United Kingdom. Mr. Clementi considers that the article conclusively proves that the poppy and its qualities were well known in China at an early date. As early as the ninth century a writer speaks of the poppy fields of the Ssü-ch'uan province as the characteristic feature of the landscape. Opium is mentioned in the fifteenth century, and before 1578 A.D. it had acquired a popular name in addition to its scientific one. "Nor is there any hint in this article of the names 'foreign medicine' and 'foreign earth' which were subsequently

invented to describe the drug. On the contrary, it seems clear that, though the Arabs first taught the Chinese their knowledge of opium and the way to extract it, yet for several centuries previously *papaver somniferum* had been well known in China. In fact, all that the Chinese learnt from the Arabs was a means of extracting further profit from their already existing poppy fields."

The Blue book is interesting as an example of Government enterprise in the field of research, and also in that of printing. Mr. Clementi, whose attainments as a Chinese scholar are now widely known, was appointed as one of the technical advisers to the British delegates at the recent International Opium Conference at Hongkong.

---

The Federated Malay States, although affected by the general depression in the East, showed a revenue for 1907 exceeding that of the preceding year by \$1,570,270. The progress of rubber is marked by a falling off in the production of both sugar and coffee. The exports of Para rubber nearly doubled in quantity as compared with 1906.

---

The growth of the East Africa Protectorate in the sense of the spread of administrative control is evidenced by the best of proofs—the increase in the sum collected by licenses and taxes. In 1907–8 the hut-tax, which had been cautiously estimated at £3,298, realised £16,228, and will certainly increase more as the paper jurisdiction is converted into actual government. This tax has not caused the trouble in East Africa which it has occasioned in West Africa; in Sierra Leone it had much to do with the memorable outbreak which occurred a few years ago, and the administration was freely criticised for imposing an unpopular tax which invaded the domestic privacy of the native. No doubt where the native is highly suspicious of the tax collector and prone to misunderstand his functions it is politic to tax him in a way which does not suggest interference with his family circumstances. In East Africa fortunately the natives are not so suspicious, and a pleasing sign of their trustfulness is shown by an increasing willingness to come for treatment in the European hospitals.

It is satisfactory to find that the abolition of the legal status of slavery has been carried out without any disturbance. Under the ordinance a master may claim compensation for damages caused by its provisions, and in the first six months 431 applications were received and compensation paid to the amount of £450, a small sum for such a reform.

Sportsmen will be glad to hear that bigger bags of lions have been made than usual, and that there has been a good increase in the numbers of eland, buffalo, giraffe, ostriches, zebra and hartebeest.

Side by side with this plenty, the future of farming with graded stock, both cattle and sheep, is assured over large areas of the Highlands. Evidence of the industrial activity is given by the institution of a quarterly Agricultural Journal.

---

Recently published Blue-book reports afford very welcome evidence of the revival of prosperity in the smaller West Indian islands. The case of the Leeward Islands is especially remarkable. The local revenue of Antigua amounted to £50,620, the largest which has been collected for nineteen years, and exceeded the expenditure by £3,652. This is the first occasion since 1892 when there has been a surplus, and all the Presidencies of the Leeward Islands are now relieved from dependence on the Imperial Grant in Aid of Deficiency of General Revenue. The process of reinstating the finances of these islands has been a gradual one, but it has been practically continuous throughout the ten years which have elapsed since the West India Royal Commission, and the work of administration will in future be less affected than in the past by the thankless but imperative duty of retrenchment. Sugar as well as cotton has contributed to the improved state of affairs in Antigua, and the central factories established some years ago have thoroughly justified their existence. St. Kitts-Nevis has continued to enjoy a fair degree of prosperity, in spite of some adverse circumstances—drought and a severe storm of almost hurricane force—while the trade of Dominica has actually doubled during the past ten years. Montserrat has added fruit-preserving to its other industries, and the new venture has been highly successful, and bids fair to expand. In Grenada the revenue was the highest ever collected, while the value of the Colony's exports reached the unprecedented total of £410,000, almost double the figure of the preceding year, a result largely due to the high price of cocoa. The sorely stricken island of St. Vincent also had a very satisfactory year, cotton cultivation having proved particularly successful. A useful innovation in the Grenada and St. Vincent reports is the inclusion of clearly-printed maps.

---

British Guiana in 1907-8 increased its shipments to Canada, sugar being almost entirely responsible for this result. The United States, which at one time took a very large proportion of the Colony's sugar, are now practically closed, owing to the preferential terms given to Cuba and the Philippines, but Canada has stepped into the breach in a remarkable manner, taking no less than 87·11 per cent. of the whole. These figures, and others of the same kind, explain the great interest which is taken in the West Indies in the question of a commercial arrangement with Canada and the satisfaction which was shown at the Earl of Crewe's announcement,

made at the dinner given to him by the West India Club, that a Royal Commission would be appointed to consider the subject.

---

The Report of the Canadian Board of Trade Commission which recently visited the West Indies contains an interesting note on the export of sugar to the Dominion :—

“Owing to the British Preference tariff, the exports of sugar from British Guiana and the British West India Islands have increased very materially; so much that they supply almost the whole of the raw material used by refiners situated in Eastern Canada. Statistics show that 165,000 tons were imported into Canada from the British West Indies and British Guiana during the year ending June 30th, 1906. In many of the places visited the idea seemed prevalent that growers of sugar in the West Indies were not securing as much benefit as they were entitled to from the working of the British Preference tariff. This question was discussed fully, and it was explained that the principle of this tariff was simply to throw open the Canadian market to British products on more favourable terms than to those of foreign origin, and that it had become a question of supply and demand as to the prices paid by Canadian buyers to West Indian producers. The correctness of this view was generally accepted, it being realized, however, that Canadian buyers must be ready to pay fair prices, as otherwise the West Indies would look to the United Kingdom for their market.”

---

In the British Guiana report for 1907-8 it is pointed out that sugar and its products represent some 73 per cent. of the total export of the colony, and the diminution in the demand is, therefore, a very serious matter. With this may be contrasted the case of Grenada, which, in 1907, had an unprecedented export, due almost entirely to cocoa, the value of which more than doubled; this result is no doubt largely attributable to the provision on all the best plantations of apparatus for drying the leaves by hot air; a machine made in London is said to be the favourite.

---

The Colonial Bank has been authorised to increase its note issue to £600,000. This increase was considered necessary, not from an expectation that the total circulation would reach that figure, but because the Bank is compelled to allot to each branch a maximum amount much in excess of the legitimate necessities of the place, owing to the use made of the notes as a means of remittance from one colony to another—a practice of which the Bank has complained.

---

Lord Crewe has appointed, with the concurrence of Viscount Morley, a strong Committee to consider the question of Indian

immigration into the Crown Colonies and Protectorates. The scope of the Committee's enquiry is not limited to indentured labour, and they will be at liberty to consider whether the introduction of "free immigrants" into any Colony is worthy of encouragement. The way in which such a movement of population affects India is to be taken into account, and the Indian Government has nominated Mr. S. H. Freemantle, of the Indian Civil Service, to represent them on the Committee. Lord Sanderson, for many years Permanent Under Secretary at the Foreign Office, is the chairman of the Committee, which has already begun its sittings.

---

A Royal Commission is also to be appointed to conduct an enquiry into the financial situation in Mauritius, which has for some time been far from satisfactory, and has been the cause of much anxiety, both to the Government and to the planting and commercial community. The appointment of the Commission is the outcome of a direct request from the Legislative Council of the Colony.

---

The Secretary of State has appointed a Committee to ascertain the actual facts with regard to the consumption of spirits by natives in Southern Nigeria. Sir Mackenzie Chalmers is to act as Chairman. The question is one which has been repeatedly raised in Parliament, and there have been acute differences of opinion, both as to the extent of the liquor traffic, and as to its effect on the West African native. The Committee will be able to express a semi-judicial opinion on the facts, and its report will no doubt serve as a safe basis for future policy.

---

Some interesting comparisons as to the cost of growing wheat in different countries were made at a recent discussion before the Royal Society of Arts (February number of the Society's Journal). In England in a representative case the cost of cultivation for wheat was found to be £6 8s. per acre, which sum includes £2 0s. 6d. for rent, rates, taxes, tithe and interest on capital. The yield was 35 bushels per acre. On the other hand, in New South Wales the cost of production, excluding rent and interest, is put by the Agent-General at from 15s. 6d. on large farms with first-class appliances to 27s. on small farms; and the Agent-General for Victoria put it decidedly lower, viz., 11s. to 12s. per acre. In any case it is clear that the Australian figures are extraordinarily low as compared with the English, and, as was observed, "showed that the Australian farmer was a practical man, who was able to get a profit out of an incredibly small return." In Canada the whole cost, including an item for something in the nature of rent, has been estimated at 36s. per acre. The yield per acre in England is very high comparatively, and the explanation for the falling-off in the cultivation must

apparently be sought for in the rent, the methods of cultivation and the quality of the wheat. Roughly speaking, suitable land in the colonies can be got for 50s. to 60s. per acre, whereas in this country it costs, say, £30. The methods of cultivation and harvesting are often primitive. The wheat generally grown is of rather poor quality, but, although this is a real difficulty for which climate is largely answerable, a much superior wheat has recently been produced.

---

The international grain market is a sort of pool, into which exporting countries put their surplus produce, and the international value of this grain, plus the cost of carriage, settles the value in the importing country. Competition is wide and the margin for profit small; three halfpence per quarter, it is said, is enough to decide the destination of any wheat from the pool. Thus, if any country imposes any tax or duty on wheat it is the buyer who pays it. On the other hand, the grower whose grain is not subject to the tax will get an extra price, over and above the international value, equal to the amount of the preference, and this advantage will be comparatively greater where the cost of working per acre is low. Thus, if a duty, say 2s. a quarter, were imposed in this country on foreign but not on colonial wheat, the English wheat grower would at present gain 8s. per acre, the Canadian 4s. 6d. and the Australian 2s. 4d., and, having regard to the small margins of profit per acre in the colonies, it follows that the effect would be greater there than here.

---

The report of the committee of enquiry into the organization of the Crown Agents' office has been presented to Parliament, and will no doubt lead to considerable changes. It establishes clearly the principle that the office is a government office, and the staff government officials. The constitutional genesis and character of the office make any other view untenable, but the principle has been somewhat obscured by the long-continued practice of leaving the Crown Agents to make their own domestic arrangements. In future, appointments to the general staff will be made through the Civil Service Commissioners, and a definite classification and rates of pay will be introduced. The practical recognition of the principle will no doubt affect those branches of the business which have hitherto been conducted on the lines of mercantile agencies. If the Crown Agents can concentrate into their own hands various processes which are now carried on outside, they would be in a better position to deal with complaints of every kind, and the acceptance of a fuller responsibility would greatly help the settlement of questions. The recommendations of the Committee are all in this direction, and efforts will no doubt be made to give effect to the general spirit of the report in a thorough and consistent fashion.

## THE CESSION OF MALTA.

THE way in which Malta passed into the hands of the English illustrates a fairly frequent feature of British policy. England at the beginning of the nineteenth century was certainly not hankering after Malta. In 1801 she refused an offer of the sovereignty. But she was resolved not to let France have it. Napoleon was equally resolved to have it. He declared that he would rather see England in possession of the Faubourg St. Antoine than of Malta. "Peace or war depends on Malta," he said in 1802 to the British Ambassador. Over this question war began in 1803 and went on till 1814, during which period England added to her national debt £421,000,000 and lost some 300,000 men. In the opinion of Nelson himself, Malta was of no use whatever to Great Britain. In December, 1802, he wrote to the Rt. Hon. Henry Addington: "It must never belong to France; England does not want it;" and in January, 1804, to Captain Fremantle, "as to Malta, it is a perfectly useless place for Great Britain, and as a naval port to refit in. I would much sooner undertake to answer for the Toulon fleet from St. Helena than from Malta; I never dare venture to carry the fleet there." But in the hands of the French it constituted a serious menace to the British navy. It was then one of the best fortified strongholds in the world, practically impregnable. Neutral, it would not have mattered; as a counter in the game, it was of the utmost value. Later on, when Malta had been acquired by England, its value was better appreciated. In 1803 Nelson, after for the first time entering Valletta, wrote to Mr. Addington, "I consider Malta as a most important outwork to India, that it will ever give us great influence in the Levant, and, indeed, all the southern parts of Italy. In this view, I hope we shall never give it up."

In 1798, the year of Aboukir Bay, the French were in possession of Malta, but they had only just obtained it. Up to that year, from the time when the Emperor Charles V. granted the island to the

Order of St. John, subject to the shadowy suzerainty of the Kingdom of Sicily, Malta was virtually an independent state. In 1798, the Knights, who were mostly Frenchmen, aided by a Maltese party which was infected with the glamour of the French revolution and the fame of the great Napoleon, handed the island over to the French. Whether the gift was a lawful one or the occupation effective enough to constitute sovereignty are fine questions which it is hardly worth while to pursue; it is enough to say that certain judicial decisions have decided them in the negative. In any case the occupation was quickly disputed.

On the 28th August, 1798, news reached Valletta of the destruction of the French fleet at Aboukir Bay, and five days after the Maltese rose in rebellion, to shake off the "tyrannical despotism of the French." They notified the King of the Two Sicilies, whom they acknowledged as their sovereign, but it does not appear that they received any promise or support. Simultaneously they sent to Nelson for help, and help was at once sent. Nelson himself arrived on the 24th of October. The Maltese in the meantime had borne themselves manfully, completely blockading the French in Valletta and the three adjacent cities, but they were grievously hampered by want of weapons and food. The whole country rose, armed mostly with agricultural implements; they lost a great number of lives during the blockade, and the nobility mortgaged lands to procure corn from Sicily. The blockade went on for two years, and finally the French, reduced to extremities, surrendered to the British. By the Treaty of Amiens, 1802, Great Britain was to evacuate Malta, but she refused to do so until France fulfilled her obligations under this treaty. War was renewed, and, on the downfall of Napoleon, under the Treaty of Paris, 1814, England, while surrendering her conquests in the East and West Indies, regained Malta "in full property and sovereignty."

There is little question about the facts, but much warmth has been shown in discussing their constitutional aspect. Is it correct to say, as has been said, that England acquired Malta by conquest? The question is vastly important from the point of view of Maltese national pride, and the deep interest still taken in it is shown by the long series of letters and articles which has this year been issued from the *Daily Malta Chronicle* Office, under the title of *The Sovereignty of Malta and the Nature of its Title*, by Mr. A. Bartolo.

The Colonial Commissioners of 1830 seemed to lend some support to the theory of acquisition by conquest by reporting that "these islands came into our possession by capitulation in 1800." But the remark will not bear analysis. The capitulation did not in fact and did not profess to do this. It was an agreement of a purely military character, marking the evacuation of a fortress by the French. It did not and could not imply that the French had any

power to cede Malta. *Nemo dat qui non habet*. Clearly neither the Maltese nor the English admitted that the French were the sovereign power. The claim, if there was one, was disputed by war, and the Maltese and the English were allies.

Nor could England have acquired the sovereignty of Malta by the Treaty of Paris alone. The engagement was between Great Britain, France, Austria, Russia and Prussia: Malta was not a party to it. The only effect of the treaty in this matter was to show that France renounced any pretensions in favour of Great Britain. The actual cession came from Malta itself, and was merely confirmed by the treaty. The offer was not formally accepted till 1813, but the acceptance, when given, was on the footing of the terms specified in the original proposal.

Mr. Bartolo's articles show considerable controversial vigour, and his object in vindicating the courage and independent spirit of the Maltese throughout the great war is one with which we entirely sympathise. But we do not think that he or any one need have any apprehension that the part played by Malta is misjudged in this country. All recent official utterances have done full justice to the real character of the original compact.

## TROPICAL HOUSES.

EVERY style of bungalow that has been built on the West Coast of Africa for occupation by Government officials has been adversely criticised, and with the view of collecting the information and experience of tropical countries, reports have been obtained from various quarters as to what is considered the best style of building in such places.

The suggestions that have been made in the correspondence received are extremely varied, and probably there is no recommendation made by one contributor which does not run counter to the opinion of someone else. Representations are made that it is a waste of money to raise bungalows much above the ground, and that it is most important to do so; that wide verandahs are necessary, and that they are superfluous; that galvanised corrugated steel is almost the best material for roofing, and that it should never be employed; that all houses should be made mosquito-proof, and that this makes houses unendurable. Probably most of the divergence of opinion is referable to differences in local conditions and the habits of the writers. Condemnation of particular materials may also be due to some imperfect use of them.

The first thing to consider is the question of coolness, and the treatment of this point turns largely on the climatic circumstances. If, for instance, the nights are cool, the building should be designed so that the occupants can live in a natural breeze, and materials, such as wood for walls and shingles for roofs, which rapidly cool down after sunset, are more suitable than masonry, which absorbs heat in the day and gives it out all night. If, on the other hand, the nights are hot, the object is to cool the hot air and use punkahs to make a breeze.

But, of course, white ants, wherever they exist, attack every piece of wood, and innumerable insects find convenient homes in the joists. Bricks are more durable and cleaner, and though they cost usually about 10 per cent. more than steel framing and timber, the

upkeep is less and the life much longer. In such countries as West Africa masonry walls are clearly the best. Frequently the question is not so much what is the best material as what is available locally, and the prevalence of wood and iron houses is due to the fact that they can be put up quickly and cheaply. The construction of strong but thin and light slabs of reinforced concrete will probably cause this material to be largely employed in future. But thick masonry walls keep out the heat well, and cannot be surpassed in localities where the materials are available. Where there are white ants masonry in lime or cement mortars should be used.

Corrugated steel (formerly corrugated iron) is the most prevalent material for roofing. Whenever it is so used it is essential that there should be a good air space between it and the ceiling. Ventilators should not be placed in the ceiling, but in the upper part of the walls; they should also be provided in the steel roof to let out the hot air which accumulates above the ceiling. In Australia double corrugated steel, with an air space between, is used with satisfactory results. Slates and tiles keep out the heat better than iron, but are breakable and expensive to transport. Eternit slates and uralite have been put on the market as a substitute, and appear to contain a large amount of asbestos; they are in use in Lagos.

There is a "refrigerating" composition which can be used in metal or tile roofs, and in a recent trial by a Colonial Government it was found that the temperature of roofs so treated during the full heat of the sun did not rise above blood heat, and the roofs were always cool to the touch when other roofs were too hot to touch. Where there are no white ants, matting over the ceiling, with a mud plaster over it, makes a cool roof.

In India some experiments have been made of reinforced concrete roofs. At Cawnpore a reinforced roof 6 ins. thick was placed over a 5-in. jack arch roof, with an air space between: on 1st May the temperature in this room was found to be 90°, as compared with 105° in a building with only a single jack arch roof.

There is a good deal of difference of opinion whether the bungalow should be well raised above the ground or not. But in cases where it is necessary to keep it open so as to cool it by the breeze, and there is dry, dusty soil about, it is absolutely necessary to raise the floor well above the ground. It is as well to raise them some eight feet, so that a man can get in to keep the space clean, or otherwise the space must be enclosed, and thus there is a temptation to use it as a store-room, in which case it is likely to become a nuisance.

There is a strong body of evidence in favour of making houses mosquito proof by the use of gauze, but it must be admitted that in a hot and damp climate there is a great temptation sometimes to

let the breeze in. It is said that not one European in twenty in West Africa will live in a mosquito-proofed room. It is generally believed that fever can be avoided by living in a mosquito-proof house from sunset to sunrise, but it is not often possible to do this, and as a matter of fact the anopheles does sometimes bite during the day time, especially in shaded spots. The best remedy, therefore, against malarial fever is the destruction of mosquito-breeding grounds near houses, and gauze netting is only necessary till this has been done. The best way is to put the gauze round the verandahs and to have porches where entrances into the house are required. *The Panama Canal Record* says that "the wire should be No. 18 mesh of bronze or brass. The presence of 1 per cent. of iron in the brass alloy has been found, in many instances, to result in the corrosion and destruction of the screening."

In the West Indies verandahs are generally dispensed with on account of the hurricanes, but in West Africa they are necessary and are largely used as part of the house. The extent to which they are used depends on the climate. If one is only required to shelter the walls a narrow one suffices, but if it can be used to sit or sleep on for a great part of the year it should be 10 ft. wide or more.

In any case, for the sake of airiness, the sleeping room should contain as little furniture as possible; a dressing room and a store-room should be provided.

It is generally considered that rooms in which punkahs are to be hung should not be less than 11 ft. high.

Where there is a cooling breeze the building should be faced so that the wind may blow through it; where this is not the case, the best plan is to make the length of the house run east and west, and the front and back north and south, as then when the sun is low it strikes as little of the house as possible.

The direct sunlight is too powerful to be admitted with comfort, and it is desirable, therefore, to arrange for the lighting to be independent of the openings into the verandah. It can be admitted through clerestory windows below the verandah roof, or if above, screened from the sun. The ceiling and upper parts of the walls should be whitewashed so as to increase the light, and this can be done without detriment to the appearance if the whitewashed surface is treated as a deep frieze.

## THE MODERN HARBOUR.

### DEPTH.

SHIPS are continually increasing in size, and the increase would be greater if it were not checked by the limits to the depth of channels. Everywhere, therefore, efforts are being made to increase this depth, and harbours which take no part in the movement are sure to lose business.

From materials recently collected it appears that for the North Atlantic trade New York and Liverpool are preparing for a depth of 40 ft. at low water; Halifax has naturally deep water; Southampton, St. Johns (New Brunswick), Baltimore, Boston, New Orleans, Portsmouth (New Hampshire), and the Panama Canal have now, either at present or are providing for, a depth of 35 ft. at low water. At the French ports provision is being made at the Transatlantic Quay at Boulogne for 38 ft.; at Brest, for 36 ft.; and at the Naval Port of Toulon, for 34 ft. 9 ins. Cherbourg and Marseilles have considerable natural depths. The depth of the New Commercial Harbour at Dover is to be 38 ft. at low water. The navigation of the St. Lawrence is to be forthwith deepened to 30 ft. as far as Montreal, but it is confidently hoped that they can eventually obtain a depth of 35 ft. The depth which has been fixed for the navigations at Philadelphia and at Pensacola in Florida is, however, only 30 ft. at low water.

Mexico has fixed the minimum depth to which its ports are to be constructed at 32 ft. 9 ins., a depth which has also been chosen by Valencia, in Spain, for the new works at Genoa, for the North Sea Canal to Amsterdam, whilst Cuxhaven, in Germany, Cadiz, in Spain, and Bizerta, in Tunis, now have that depth at low water.

The ports of Copenhagen, Esquimaux, Galveston, Montevideo, Newcastle-on-Tyne, Odessa, Plymouth (England), Revel, St. John's (Newfoundland), Santiago de Cuba, Vancouver (B.C.), Vladivostok, Yokohama and London have now either 30 ft., or have works in hand to obtain that depth at low water.

Capetown and Colombo have depths of 34 ft., but Fremantle, the first port of call in Australia of many steamers trading to

Melbourne, has only an available depth of 32 ft. Wellington (New Zealand) has a depth of 42 ft. in its channel and 34 ft. in its deep-water berths. Sydney Harbour is stated to have a depth of 36 ft. at the entrance, whilst the entrance to Melbourne through the Port Phillip Heads is nominally 37 ft.

The depth of the Suez Canal is at present 29 ft. 6 ins., but it is intended to provide eventually for 36 ft.; whilst the depth to be provided in the works of the Panama Canal is to be 35 ft.

Whilst there is no governing limit to the draught of vessels trading between Australia and Great Britain by the long sea or Cape routes, the dimensions of the larger number of the vessels trading to Melbourne will be ruled by the draughts permitted through the Suez and Panama Canals. From the evidence taken some years ago by a Commission appointed by the directorate of the Suez Canal, it appeared that the pilots responsible for the navigation and the captains of the largest steamers navigated through the Canal required a depth of not less than 3 ft. under the keel of the steamers to ensure safe navigation by a prompt obedience of the vessel to the helm; but Mr. W. Ferguson, in his report on the Port of Melbourne, considers it probable that on the completion of the large extension of waterway, both in width and depth, that have been completed and are now in progress in the canal, a less amount of clearance would now be demanded.

"It is true," he observes, "that the regulations of the Manchester Ship Canal permit a draught of only 6 ins. less than the minimum depth over the sills of the docks, and a draught of only 15 ins. less than the depths in other parts of the canal; it is clear that such a small margin is quite exceptional, and, though permissible in the sheltered land-locked water of the Manchester Canal, is quite inadmissible in open exposed channels. So far as I have been able to ascertain, the depths permitted in other navigations leave a clearance varying from 1 ft. 6 ins. to 3 ft. 3 ins. As the Suez Canal is to be deepened to 34 ft. 6 ins. coincidentally with a large increase in its sectional area, I think that it is only reasonable to anticipate that before many years have elapsed we may have vessels passing through both the Suez and Panama Canals drawing 32 ft. to 32 ft. 6 ins."

The general result is that a first-class port should be able to admit at low water vessels drawing 32 ft. 6 ins., and for this purpose a depth is required in the berths and sheltered waters of 35 ft., and more wherever in a navigable channel there is the possibility of a scend.

#### SANITARY CONDITIONS.

It frequently happens that under the wharves a foreshore or bank, in some cases quite dry at high water, in other cases partly

uncovered by the falling tide, has been permitted to remain. The timber sheet piling at the back of the wharves is possibly not closely driven, with the result that the combination provides an ideal habitation for the wharf rat. The garbage and filth from the watercourses and from the vessels using the river floats in and lies upon the banks, and is added to by the sweepings from the wharf and sheds, with the result that a most insanitary and unsatisfactory combination exists. In some places if the rats once became diseased there would be a great risk of trouble.

To prevent such a result the wharves, and also the stores, should be built of reinforced concrete, and the foreshores cleared away as much as possible.

#### HARBOUR WALLS.

The walls should be at least 10 ft. above water level, so as to save unnecessary hoisting; goods can then be wheeled on trucks in and out of the ship or head carried on gangways. With a low wall this is impossible and much time is lost.

The usual width in modern docks between the quay walls and the sheds is 36 ft. This allows for two lines of railway and one line for travelling cranes.

#### SHEDS.

The roof should be strong enough to allow the use of hydraulic or electric jiggers. These are serviceable in stacking cases or in loading. It is desirable to have closed sheds to prevent pilfering, but volatile liquids, green hides and other goods which might affect food products should be excluded. A shed is intended for the first reception and customs examination of goods, and not for storage, and to prevent congestion and delay removal should be required within the shortest reasonable time. It may be convenient, however, to provide an upper floor for the storage of goods which are not very heavy, with an outside gallery.

#### GEAR.

The essentials to be considered in connection with a heavy crane are that it shall either be capable of being taken to the side of the vessel, as in floating cranes, or that the largest vessel can be brought alongside it at a place where the crane has command of a good road and of a railway siding. The berth for the large crane should be such that when either a small or a large vessel is in possession no interference exists with any other berth.

On the gallery on the dock side a rail can be laid flush with the covering of the upper floor and gallery, which would probably be asphalt. This rail would serve to carry the wheels of the landward end of a one-legged gantry, whose seaward end would be carried on wheels running on a rail laid parallel. This gantry would be

movable by hand gear to suit the varying position of the hatchways of the vessels, and would carry on it either an hydraulic or an electric crane or a traverser gear. The advantages of a traverser gear over a crane is that the load is shifted along the shortest route, the diameter of the circle, in place of, as in a rotating crane, being swung round on its circumference. The traverser also has this convenience : that, where the spacing of the hatches of the vessel permit it to be brought in a line with permanent traverser paths fixed in the building, the slings of cargo can be run direct from the vessel's side into the upper floor in place of being deposited on the gallery, to be either picked up again by the internal traverser in the shed, or to have the slings broken down and the component packages trucked by hand into the store. The traversers would be either worked with a traveller, driven electrically, and carrying a man or boy with it, or by means of ropes or other mechanical or electrical arrangement. The best method to be adopted requires careful study, but in order to obtain quick despatch for vessels and cheap handling of the goods when landed, it is necessary that mechanical appliances should be adopted, and that the gear provided by the vessel itself should be supplemented by shore appliances capable of moving loads of moderate weight between the vessel and the wharf, or railway trucks standing on the wharf and the downstairs doors of the stores, or on to the gallery of the upper floor.

Expensive equipment, however, should only be provided where mail steamers call or other large vessels whose time is of much value. An ordinary steamer can handle its own cargo.

On the 17th of December, Colombo harbour contained forty-one ocean-going steamers, including the American fleet of sixteen battleships and four auxiliaries. On the departure of the fleet, sixteen battleships and two auxiliaries were taken out, and a mail steamer taken in, in one hour thirteen minutes—a remarkable performance. The American despatch vessel, the first American vessel to use the graving dock, was docked, cleaned, painted and undocked in twenty-four hours. The occasion shows what may have to be done in an up-to-date port.

## REVIEWS AND NOTICES.

**The Cambridge Modern History.** Vol. XI. (*Cambridge University Press.*)

THE Cambridge Modern History, which is the joint work of a number of writers based upon a plan conceived by the late Lord Acton, has now reached its eleventh volume, and is brought down very nearly to contemporary events. The general title of the new volume is "The Growth of Nationalities," and the period covered is in most cases the years 1840 to 1870, a few chapters covering the longer period from 1815 to 1870. In a volume which endeavours to deal with the whole of the civilized world it has naturally not been found possible to devote a very large amount of space to the British Colonies, and the chapter of 48 pages which deals with them makes no attempt at a detailed narrative of events. It consists of four short essays. The first, "The New Colonial Policy, 1840-1870," is the work of Mr. H. W. V. Temperley. Mr. Stuart Reid deals with "The Federation of Canada," Mr. Archibald Colquhoun with "The English and Dutch in South Africa, 1815-1870," and Mr. J. D. Rogers with "The Development of Australasia" during the same period. It is somewhat unfortunate that no account is given of the development of the Crown Colonies beyond references to Hong Kong in Sir Ernest Satow's chapter on the Far East, and a bare mention of Singapore in the chapter on India. Even an event which reacted so powerfully upon home politics and opinion as the Jamaican rebellion of 1865 escapes all reference. It is possible that some of the gaps may be filled up in a later volume, the divisions of the work being based upon subject classifications and not upon strict chronological order. Of the four essays above-mentioned the most satisfactory is that of Mr. H. W. V. Temperley, which gives a clear, if necessarily somewhat sketchy, account of the development in English opinion which led to the concession of steadily increasing powers of self-government to the component parts of the Empire. He rightly gives the credit for the original inspiration of this new policy to Lord Durham's historic report on Canada. Mr. Reid and Mr. Colquhoun supply

interesting, if rather colourless, narratives of Canadian and South African history, but Mr. Rogers's account of the development of Australasia tends to become a mere catalogue of occurrences, and we doubt whether any reader will rise from its perusal with a clear and orderly conception of the subject in his mind. We have noted a certain number of inaccuracies which should be removed if a second edition is published. British Bechuanaland became a part of Cape Colony in 1895, not in 1885. The reference to "the principle that the Home Government had a right to be treated as the most favoured nation in all commercial treaties which the Colonies might make" seems to imply the enjoyment at an early period of a full treaty-making power which the self-governing dominions do not even now possess; and Mr. Rogers seems to suppose that the main obstacle to the grant of preference by Australia to the United Kingdom before 1895 lay in the terms of the Australian constitutions, and not, as was actually the case, in British treaty obligations to foreign powers. The Governor-General of Canada does not "hold office for five years." The term of his appointment is not limited by his commission, and the full normal period is six years. The Canadian Senate consists of 87 members, not 83. In the account of the Canadian provinces, which professes to be brought up to date, the creation in 1905 of the Provinces of Saskatchewan and Alberta is overlooked. The statement that the Cape franchise "remains the most liberal in South Africa" is not true, in so far as the white population is concerned, since the establishment of the Transvaal and Orange River Colony constitutions on a basis of manhood suffrage. The account of the position of Basutoland appears to imply that the annexation to Cape Colony in 1871 is still in force, the Disannexation Act of 1883 being apparently forgotten. It will be noticed that the majority of these errors occur in connection with events of later date than the period specially dealt with by the authors, and they may perhaps be ascribed to an omission to verify facts which are only the subject of chance reference. There is a convenient bibliography of the principal works relating to Colonial affairs in the period dealt with.

---

**The Fijians.**—By BASIL THOMSON (second notice).

The name of Mr. Basil Thomson is already well known to all who are interested in the Pacific Islands, their history and their inhabitants; and also, we hope to many who have no particular interest in that part of the world. To anyone who wishes to combine a certain amount of instruction with a very large amount of amusement, we can confidently recommend *The Diversions of a Prime Minister* or *The Indiscretions of Lady Azenath*. Mr. Thomson's present work displays all the qualities which made

those books so full of delight—great knowledge of and sympathy with the native mind, a pure and graceful style, and a sense of humour which never fails to charm and refresh. Quite apart from any other merits it is “better reading” than ninety-nine out of a hundred novels.

But if we are not mistaken it is not primarily its literary merits by which the author himself would wish it to be judged. It is a solid contribution to knowledge; in it there is a great deal for the ethnologist and the student of comparative religion, something for the historian, something even for Schools of Tropical Medicine. The mere titles of some of the chapters will make the anthropologist lick his scientific lips:—“Cannibalism,” “The Marriage System” (wherein the reader will find an extraordinarily interesting discussion of the question of consanguineous marriages), “Customs at Birth,” “Traits of Character.” The long chapter on religion contains the pathetic and grotesque myth of the spirit-path, by which departed souls travel through toil and danger to their resting-place at Nakauvandra—a myth which often recalls famous parallels in Homer and Virgil. The chapter entitled “The Age of History” tells of “old, unhappy, far-off things and battles long ago,” of the rise and fall of empires, of heroism and treachery, Charles Savage and Naulivou, Ratu Mara and Thakombau—all to be succeeded by the unromantic rule of the white man.

Yet the history of Fiji, during the thirty-five years since its cession to the British Crown, is in one way peculiarly interesting; for it raises in an acute form a question of the highest moment to the philosopher, and not only to him, but to all who are concerned in the work of governing non-white races. What Mr. Thomson tells us of the Fijian under British rule is, in substance, the same as many competent observers tell us of other coloured races—that in making life in tropical countries more secure for the native inhabitants, we have also made it less worth living. “Wheresoever in the world a people has passed under the sway of England, their lives, in becoming more abundant, have ceased to satisfy their ideals. We have broken in upon the secular calm of ancient civilizations, and over minds which once reposed in a passive and incurious contentment we have cast the spell of our own unsatisfied longings. The savage whom we tame unlearns his simple delight in Nature, and gains access only to our coarser and viler pleasures in its stead.” Every thoughtful mind must recognise that in these words, written by one who was certainly not a “Little Englander,” there is an uncomfortable measure of truth. Mr. Thomson’s book, we fear, will do little to dispel such misgivings; for Fiji, with all its peace and prosperity, remains still an unsolved problem. The natives make a most practical, though unconscious, protest against the white man’s government—they will not live and

multiply under it. The native population does not decrease as fast as it did; in one recent year it even remained stationary. But the views of those who know it best can be judged from a recently published despatch of the present Governor, in which he referred to the time when, by the dying out of the natives, the Crown will become *ultimus heres* of their lands.

What then, apart from purely selfish interests, commercial and strategic, is England's justification for imposing on the Fijian a government which only too literally "bores him to death"? This is the great question of principle raised by Mr. Thomson's book—to give it a definite answer (if one is possible) did not, unfortunately, lie within the scope of his work. It is absurd to discuss it within the brief space of a review; but perhaps it may be suggested that we have ultimately to admit, in this case as in others, an example of a kind of moral selfishness which is nearly inseparable from a strongly marked character. Certain things are repugnant to the white man, and, therefore, oblivious of the fact that other races may not share his repugnance, he will not suffer them to exist anywhere where he has the power to stamp them out. If we search our own hearts, we must in the last resort admit that it is for our own comfort, and not (as we usually imagine) for the comfort of our weaker brethren, that, consciously or unconsciously, we destroy their own poor tabernacle of custom, and set up in its place the temple of Western civilization.

But it would need a volume adequately to discuss these questions. We can only hope that Mr. Thomson may find time to write it. It would equally need a volume to deal with each of the other fascinating problems which peer out of the pages of his book. To go no further than the introduction, his views on the "colour question" in general, and the future amalgamation of white and coloured races, positively clamour for debate. In spite of his authority, and the reasons he urges for his opinion, we cannot believe that any such great amalgamation is conceivable without some extraordinary change in human conditions and character. The whole tendency of modern life seems to us against it; for the more clearly white and coloured races have come to know each other and themselves, the more steadily have they drawn apart in the one essential particular of intermarriage. We do not say that the barrier between them is primarily a physical one; for it does not exist, or is at least far lower, in the case of the Japanese—the one non-European race which has triumphantly adopted more than the trappings of Western civilization. But we believe that for an indefinite time to come the physical distinction will in the main correspond to a sharp distinction in intellect and character which will separate the races far more effectually than causes purely material.

These rather wandering remarks on two of the wider questions raised by Mr. Thomson's book at least serve the purpose of showing

the interest of the problems with which it deals. It is quite unnecessary, we feel certain, to describe its contents in detail; for everyone who can obtain it will hasten to read it for himself. We need only repeat that, though it is the work of an official, it is as full of information as a blue-book ought to be, and as full of entertainment as a blue-book is generally destitute of that quality. When the reader finishes it, his only regret will be that it is but one volume, and his first hope that its author has not exhausted the materials which he collected in his note-books and his memory during his residence on the other side of the world.

---

**My Experiences of Cyprus.**—By BASIL STEWART. (Revised Edition: *George Routledge & Sons, Ltd.*)

The British possessions have been acquired in a straightforward way by actual settlement or by force of arms, with one exception. In 1878, on terms which few people have ever understood, and for a political consideration which no one now wishes to remember, we "occupied" Cyprus by leave of Turkey. There had been no previous discussions or enquiries which led up to this step. We had no interests in Cyprus, nor the slightest knowledge about it. The act was entirely diplomatic in character, and was clearly designed with a view to theatrical effect. This effect it undoubtedly had. At home it was received with vociferous enthusiasm; abroad it was keenly resented. In fact, however, there was little occasion for either applause or suspicion. No deep design underlay the act. Perhaps its importance was magnified by the glamour of the classical and scriptural associations of the island. And, no doubt, the ancient reputation of Cyprus held out possibilities of development which would be worthy of the British Crown and heighten our prestige throughout the Mediterranean. There were not wanting writers who prophesied that Great Britain would use the opportunity of showing how superior her methods were to those of Turkey, politically and economically. After some thirty years of occupation a much more modest tone would now be taken. Nothing would be said of increased prestige. It is realised that Cyprus is, on the whole, far from being a healthy place. If it had valuable mines and forests in old times, the mines have been exhausted and the forests destroyed. But, principally, it has been realised that the financial bargain made with Turkey was a bad one. It is impossible to pay away out of the country the full "tribute" taken by Turkey (some £93,000) and at the same time to have the slightest chance of a surplus for developing the resources of the island. The "tribute" was obviously the most that could be extracted, and, in fact, was vastly more, and it was certain that British methods of administra-

tion, however more laudable in principle, would cost more money. The result has been an annual grant in aid from the Imperial Parliament, carefully framed to meet the precise deficit. That deficit has until quite lately been kept down to the lowest possible figure by rigid economy and avoidance of enterprise. No colonial estimates have ever been so minutely scrutinised and restricted as those of Cyprus. Other grants in aid will, it is hoped, be reproductive; there was no chance of this in the case of Cyprus. In these circumstances the only means of doing some substantial work of improvement was for the Imperial Government to arrange for a special grant, covering at least three years, which would enable some work to be undertaken. This was frequently proposed, but was never done till 1907, when Parliament was asked to vote £50,000 for three years, and the railway was undertaken.

Mr. Basil Stewart knows the island well, and describes its beauties with spirit and its antiquities with care. His book is not the less instructive because it has not the generally laudatory character common in works of travel. Cyprus, he says, is "without doubt the most unhealthy place in the Mediterranean." He does not see that anyone benefits from the occupation. The great commercial difficulty is that there are five ports, and that their claims stand in the way of creating one principal port. Probably in the future this question will be settled by the growth of the trade with Egypt.

---

**A History of the United States and its People.**—By E. M. AVERY.  
(16 vols. *The Burrows Brothers Company, Cleveland.*)

This sumptuous work appeals at once to the eye with its wealth of illustration. Old portraits, documents, maps and plans are reproduced with extraordinary fullness, and certainly at every point stimulate the interest of the reader in the story told. No other country, we imagine, would support a work dealing so lavishly and minutely, for popular use, with the records of its past. The history itself is correspondingly painstaking. The style is admirably clear and the matter full. The second volume deals with the early period of the British Colonies, and a striking feature of it is the fair-mindedness of the author, and the allowances which he makes, in common with some other recent American historians, for errors and follies which it is easy to criticise from a modern standpoint, but which were natural enough at the time and common to all countries. Mr. Avery's views on these matters by no means interfere with his doing justice to the spirit of American institutions. The history of the United States, in fact, gains greatly by the rejection of intellectual and ethical standards which belong to later periods. Told, as Mr. Avery tells them, in close relation with the living ideas

of the times, the various stories of the early settlements are full of human interest to readers of any nationality.

We append two characteristic extracts:—

“Here it need only be said that, whether the regnant power was Stuart, parliament, or protector, the underlying notion was that the true purpose of English colonies was to foster the trade of the mother country. The home government was building up a British empire of which the English colonies in America were a part. Imperial control was one of the legitimate and essential functions of such an empire. In the strengthening of the imperial system English statesmen doubtless made mistakes. Some of the specific rights conveyed by charters granted by the king in council were disregarded, and Englishmen who had settled beyond the seas were sometimes forced to wonder if it had been forgotten that they were flesh of the flesh and bone of the bone of those who remained at home. But Americans of our generation who studiously ponder upon the errors of their fathers in the decade following 1865 will, perhaps, not insist that all unwisdom is born of ill will. The navigation acts were directed against the naval supremacy of Holland rather than the prosperity of English colonies, but the attempt to wrest the carrying trade from the Dutch involved no little injury to Englishmen beyond the Atlantic. It was more difficult for those who then suffered than it is for us to see that these ordinances were not framed in a spirit of conscious hostility to the colonies. The passage of the suffering has not always brought the cleared vision.”

“The migrations from the Old World to the New differed largely from those that had changed the character of European society, in that they were individual rather than tribal. Having been led across the ocean by their common love of liberty, Catholic and Protestant, Churchman and Puritan alike, they left old political forms in the old places and applied their cherished principles in a way and to an extent peculiar to themselves. Students have devoted much time and learning to tracing the germs of some of our institutions back into the depths of ancient German forests, but the truth still stands that the ideas and institutions that characterize the nation are essentially peculiar to the nation. Some of the separate principles were undoubtedly transplanted, as were the religion, language and manners of the immigrants; but from the new soil they grew with new strength and new significance and developed into a political entity different from anything that the world had before known. In the words of Professor Frederick J. Turner, ‘the wilderness has been the melting pot and the mould for American institutions.’ In the New World these Old World ideas developed along two lines—the line of local self-government and the line of union. Of these, one led to the town and state; the other led up to the nation.

The idea of local self-government was historic when Raleigh planted and Brewster prayed. As has been pointed out by many, it was a leading principle of the primeval polity of the Goths; but in the England of King James and Queen Elizabeth this idea was a tradition rather than a living political force. The crown had undermined the ancient freedom of the hundreds, burghs, counties and shires, and deprived the people of the power of local government. But while the seventeenth century was still young, Englishmen out of England were governing themselves, testing their own decisions, and correcting their own judgments. Plymouth had her covenant, Massachusetts and Connecticut their town-meetings and Virginia her house of burgesses. Old germs had brought new fruits that were essentially original and that fairly may be called American. The natural product thus evolved was a cluster of distinct and essentially free communities. The idea of joining these communities for common defence and general welfare grew so naturally under the then existing conditions that the resultant notion of a republic may with equal propriety be called American. This blending of these two lines of polity, union and local self-government, was first realized in the New England confederacy."

**Unemployment: a Problem of Industry.**—By W. H. BEVERIDGE.  
(*Longman's*. 7s. 6d. net.)

Mr. Beveridge's book on Unemployment is by far the most valuable work which has yet appeared on what is admittedly the principal social and economic problem of to-day. He analyses, in a lucid and instructive manner, the facts with regard to seasonal and cyclical fluctuations of trade and their effects on the demand for labour. But the lesson of outstanding importance which he draws from his consideration of the modern conditions of industry is, that Unemployment is not an occasional and temporary feature of modern industry, but a constant and permanent one; that its importance is due to the existence of a vast number of persons casually employed or permanently under-employed; and that the supply of the under-employed is artificially kept up and maintained by the hopelessly unsystematic methods of recruiting labour, which are still largely in vogue. Instead of having one "labour market" in each industry, we have one for each employer, and reserves of labour have to be maintained which would be unnecessary were proper means of information and interchange established, and which preclude the possibility of any regularity of employment in the industries which maintain them. We cannot deal fully here with a book which succeeds in presenting a closely-reasoned argument, with abundant statistical illustration, in an admirable literary form. But the author has been the first to expose the roots of the evil of Unemployment,

and so prepare the way for a constructive policy, and his book should be read by all who are interested in social and economic questions.

---

**Report on the Work of the Imperial Institute, 1906 and 1907.**—(Cd. 3729-48 : 4d.)

Since the management of the Institute was transferred to the Colonial Office in 1907, new collections have been added to the exhibition galleries and a considerable increase of work has taken place. The work done by the Scientific and Technical Department is recorded in considerable detail in these pages, and the record testifies to the unremitting energy of Professor W. R. Dunstan and his staff, which now consists of twenty-eight members, all technically qualified. The report contains detailed notes on the minerals and products of the colonies. It will interest rubber planters to read that "In connection with the present extensive planting of the Para rubber tree (*Hevea brasiliensis*), the fact that the abundant seeds of this tree can be utilised as the source of a valuable oil may become a matter of commercial importance in the near future, when the seeds will be available in quantities far in excess of those required for planting. The investigations conducted in the department have proved that this oil, which resembles linseed oil, will probably command about the same price as the latter commodity, whilst the residue of the seeds from which the oil has been expressed may prove to be serviceable locally as a feeding stuff for cattle. It is, therefore, possible that a valuable subsidiary industry may arise in connection with rubber planting."

---

**L'Agronome Tropicale : organe Mensuel de la Société d'études d'Agriculture Tropicale (Bruzelles).**

This new publication begins with an interesting summary and comparison of the efforts which are being made simultaneously in England, Germany and France, *à battre en brèche le monopole cotonnier des États-Unis*. The movement proceeds from the same considerations in all the three countries. The United States produce 65 per cent. of the world's total, and 75 per cent. of the cotton used in the European factories. This marked preponderance has led to abuses which are widely felt. The American speculators have not failed to take advantage of it, and the sharp and unexpected fluctuations of price which their operations have brought about have caused Europe serious losses. The situation has been aggravated recently by combinations of the growers, with the result that the price has been raised to a point double the cost of production.

England absorbs nearly half the American crop, Germany about one-quarter, and France about one-eighth. In each country a powerful propagandist association has been founded to encourage the

production of cotton in its own colonies, and in this way Europe is banded together to secure independence from the American groups of growers and dealers. It cannot be said that the United States are, so far, materially affected, but the results attained in a few years are substantial. Everywhere some apathy on the part of spinners has been encountered, but much tenacity has been shown in the work of overcoming this indifference. The operations of the associations are summed up. The greatest effort made by England is in Egypt, and the great strides made in that country are referred to as an admirable result of the British occupation. The German association was founded before the English, and received in 1908 Government subsidies of 110,000 marks and 90,000 contributed by industrial bodies. The French budget reaches 175,000 francs.

The number reviews various recent agricultural publications, British and foreign.

---

**Travel and Exploration.**—(A monthly illustrated magazine, 1s. net. *Witherby & Co.*)

This magazine is well got up and will appeal to the large class of readers who are interested in exploration for sport or science. The first number (January) contains among other articles an interesting sketch of British New Guinea and an account of tropical Peru. The latter country is, no doubt, destined to share in the general advance which South America is making, and its enormous resources will then come into play in the world's commerce. Mention is made of a projected expedition, which, no doubt, would be of the first importance, into the interior of Dutch New Guinea; the scheme is due to the initiative of Mr. W. R. Ogilvie-Grant of the Natural History Museum. The February number contains an article by Mr. F. C. Selous on "Hunting in Central Africa."

The great hunter deploras the fact that the rapid spread of civilization throughout Africa has "naturally exercised a disastrous influence on the game in many parts of its once limitless hunting-grounds. The chief charm, the great distinction of Africa, has always been the vast wealth and variety of the animal life, which once lent so much of interest and beauty to an otherwise dreary, sun-scorched wilderness. In many parts of the country the game is gone, and for evermore the land will remain as dull and colourless as a flower-bed in winter."

These sentiments will appeal to the sporting mind, but to the ordinary farmer and trader the "beauty and interest" of the lion and elephant are not so apparent. The process is inevitable everywhere, and most Europeans are thankful that it was finished up in their part of the globe by their ancestors. For those who are still searching for such pastime the article gives good advice on outfit.

If they want a better "flower-bed" than Central Africa supplies, we may mention that in the Federated Malay States an ample supply of ferocious beasts may be guaranteed. In 1907 we notice that 61 tigers and 1,112 crocodiles were destroyed as "noxious animals," on the prosaic principle of giving reward in money at the police stations.

---

**The Royal Navy List and Naval Recorder** (No. 125 : January, 1909. *Witherby & Co.* 10s., post free).

The special feature of this work is the record of services of officers. Material as well as men has its place in this respect, as the services of ships are also individually recorded. A bibliography of naval literature makes its first appearance and will no doubt be appreciated.

---

A book on the Falls of Niagara, issued by the Canadian Department of Mines, excellently written and illustrated, abounds in geological interest. The age of the Falls is put at the respectable figure of 39,000 years. The full diversion of the water under the present active franchise will reach 40 per cent. of the low water discharge.

---

A handbook for use in Nyasaland has been written by Mr. H. R. Wallis (*The Resident's Handbook*), which sums up in a very convenient way, under subject headings in alphabetical order, the provisions of the ordinances and the standing rules and regulations. An officer will immediately find in this little book a summary of the action required in any administrative function and a reference to the regulations affecting it. The volume is interleaved and would well serve as a model for such handbooks.

## BUSINESS NOTES.

### Shipment to the Federated Malay States.

We have had occasion to refer to the fact that some of the shipping business which used to go to Singapore has been diverted to the Federated Malay States. During the last few years the arrangements for the conveyance of railway and other stores to the States have undergone considerable alteration. Prior to 1905 all goods for the Native States were shipped to Singapore and forwarded thence to the port of destination by coasting steamers or lighters. In 1905 the shipments of rolling stock, etc., for the Kuala-Lumpur-Gemas end of the railway became heavy, and after prolonged negotiations a few shipowners were induced to allow their vessels, as a tentative measure, to proceed direct to Port Swettenham. Experience showed that the accommodation at the port for ocean-going steamers and the landing facilities were satisfactory, and shortly afterwards all the lines in the Conference consented to call when sufficient inducement offered. Since that date a regular direct service has been carried on, and during 1908 some 30,000 tons of cargo were landed for the Governments of Selangor, the Negri Sembilan and for the railway. By this arrangement the Federal Government saves the expense of transshipment at Singapore and the freight and insurance on coasting steamer and lighter shipments to destination.

It has also been found possible to arrange for direct shipments to Johore Bahrn, at the Johore end of the railway, but only where full cargoes are concerned. The s.s. "Den of Airlie," which took out supplies of permanent way material in 1906, was the first ocean-going steamer to call at this port, but discharge was carried out without a hitch.

---

### Lagos Harbour Works.

An estimate of the cost of dredging and training walls on the bar and of the harbour works amounts to nearly £1,500,000. It has

been urged that the wharfage and warehouse accommodation provided for is inadequate for the large increase of trade expected, and that some £2,800,000 will be required. It is proposed that the dredging of the bar and harbour should be carried ultimately to 30 ft. Three schemes have been put forward and each appears to have its body of supporters. The comparison is largely a question of cost, and steps are being taken to obtain an approximate estimate for each scheme. The engineering problem is similar to that which presented itself at Durban.

The draught of the bar has been raised by dredging to 13 ft., the highest on record; in February, 1907, it was only 9 ft. The 13 ft., however, is not a constant quantity.

---

### Colombo Harbour.

The history of the recent schemes for the improvement of Colombo Harbour is given in a Ceylon paper (No. 57 of 1908). The south-west breakwater, which was commenced in 1873 and completed in 1885 at a cost of over £700,000, is being extended for 2,000 ft., under a scheme proposed by Captain Legge, and it is anticipated that this arm will shut out the whole of the sea passing through the southern entrance during the south-west monsoon. The estimated cost is £440,000, and the completion is to be in 1913, but it is now believed that protection will be secured by a rather shorter length and in 1911. It has been proposed to increase the accommodation by the construction of steamer jetties, but the estimated cost (£700,000) for two jetties, of solid blockwork, 1,230 ft. long and 200 ft. wide, is considered too heavy to admit of the adoption of the scheme for the present.

---

### Nyasaland Tobacco.

The export of tobacco from Nyasaland increased largely last year, and this was due principally to the establishment at Blantyre of a factory by the "Imperial Tobacco Syndicate" (of Great Britain). This company sent an expert to the Protectorate to report on the local prospects of tobacco, and his report was so entirely favourable that they decided to go to a considerable expense in the hope of encouraging the cultivation of good grades, which they proposed to purchase and cure on the spot. Their factory was completed last June, and they were busy during the rest of the season in dealing with the crop. It is understood that they are quite satisfied with the quality of Nyasaland tobacco and look forward to a great increase in its growth. They are encouraging the planters to extend the industry by offering good prices, averaging about 3d. to 5d. per lb., according to quality, and spot cash is paid.

### Alcohol for Motor Cars and Boats.

1907 was the first year of the operation of the free alcohol law in America, and 4,242,001 proof gallons were completely denatured and 2,063,302 gallons specially denatured. This result shows that there is at once a great demand for the product, and now that it is procurable at a low price its uses will be greatly extended. A gallon of alcohol can be produced from three gallons of molasses, and as the value of molasses to planters is often nominal the production would open up an easy way to increased profits. The difficulty is usually that of excise; the alcohol must be made impossible for drinking purposes and issued under supervision. The following statement as to denaturing has been received from the Board of Customs:—

“Wood naphtha, if sufficiently impure, is eminently suitable for denaturing ordinary alcohol as it not only renders the latter nauseous to the taste, but the two cannot be separated by any practical method; its presence can also be readily detected even when in small proportions.

“Wood naphtha has not the offensive odour of pyridinum, neither does it affect appreciably the industrial value of ordinary alcohol in the numerous manufacturing processes in which the latter is used.

“As a further precaution against the passing into consumption of spirit mixed with wood naphtha in the case of small quantities sold, three-eighths of one per cent. of mineral naphtha is added.” Printed regulations have been issued as to the conditions under which the issue of such alcohol is permitted in this country.

On the other side the extended use of alcohol will enormously facilitate the exploitation of difficult territories, where unaided human labour is of little avail against the difficulties of nature. “It is no good,” Mr. Winston Churchill writes in *My African Journey*, “trying to lay hold of Tropical Africa with naked fingers. Civilization must be armed with machinery if she is to subdue these wild regions to her authority. Iron roads, not jogging porters; tireless engines, not weary men; cheap power, not cheap labour; steam and skill, not sweat and fumbling; there lies the only way to tame the jungle—more jungles than one.”

---

### Alcohol versus Petrol.

The substitution of alcohol for motor cars would be greatly in the interest of sugar, in the manufacture of which it is one of the principal by-products, and in the countries which produce sugar it is reasonable to expect that this use will eventually be made of it. Alcohol can also be produced from the sweet potato. The difficulty is that of excise and this is probably capable of solution. But there

are no mechanical impediments, though slight adaptations of the usual mechanism would be necessary. Alcohol requires no air for combustion, and therefore none need be supplied at the carburetter. The valve springs would have to be adjusted so as to admit a freer supply to the engine. The substitution would be good for the consumer as well as for the producer as the price would be about half that of petrol.

---

### Paper from Megass.

The October number of the *Bulletin of Miscellaneous Information*, Trinidad Botanical Department, records that various samples of wrapping and white paper have been produced, prepared mainly from megass. It is believed for every ton of sugar a ton of megass is available, and if the attempts to make satisfactory paper succeed—and this should be quite feasible with some lines—an important subsidiary industry will be established in aid of cane growing.

Cane can also be utilised to yield wax, when cane juice in the process of clarification is treated with sulphurous acid and lime. The wax is valued at 1s. 6d. per pound.

---

### Cylindrical Boilers and Wood Fuel.

Complaints occur that on lake or river steamers the backs of the combustion chambers of the boilers bulge and the stay heads burn off. This is attributed chiefly to want of circulation in the boilers, but probably this is not the principal cause. Every fuel develops its maximum temperature at a certain well-defined point in its course through the boiler, and the best fuel is that which develops this maximum temperature immediately after entering the tubes on its return journey to the smoke-box, the horizontal surface of the tubes being far more efficient than the vertical surfaces of the combustion chamber. With wood or quick-flaming coal the highest temperature is obtained sooner, and it is likely in this case that it occurs just after egress from the furnace, the flame impinging directly upon the plates opposite. This would be intensified by the constant opening of the furnace door, which is necessary when firing with wood.

This trouble can be greatly reduced by building a supplementary brick bridge between the combustion chamber and the back of the furnace.

Circulation can be improved by the use of circulators ("Hotchkiss").

### Electric Light.

Suction gas plants are giving satisfaction in most cases, but their success depends largely on the supply of a suitable anthracite coal and the maintenance of a fairly constant output. The standard oil engines give general satisfaction and the capital cost is somewhat less.

The new metallic filament lamps take much less energy than the carbon lamps, and therefore a smaller plant would be sufficient. No doubt they will soon be exported, but at present the filaments are brittle and liable to be damaged in transit, and the cost is high.

---

### Acetylene Gas Lighting.

This gas is excellent for laboratory, optical and photographic purposes. It can also be used in bunsen burners for purposes of chemical analysis and in a blow-pipe for glass working. The Incants system has been installed and found successful in the Gordon Laboratories, Khartoum. The cost of an installation for about 18 lights is from £25 to £30, and the annual cost of carbide £10 to £15.

---

### Charcoal as Fuel.

The Director of Irrigation of Cape Colony in his report for 1907 foreshadows the use of charcoal for suction gas plants when he says, at page 33: "It has been satisfactorily demonstrated by actual practice in this country that such plants can be successfully and economically run on charcoal burnt by farmers on their own farms from Mimosa, Kameeldoorn, Guarrie and other woods. Where this can be done the fuel costs are absurdly low." There being an abundance of wood available, it was determined to run the suction gas plant with charcoal, and this has now been done with complete success. The following details with regard to the process employed for making the charcoal and experiments in connection with it may prove of interest:—The wood is cut into lengths of 18 ins., and logs of over 6 ins. diameter are split lengthwise. A central chimney 1 ft. square is built of crossed sticks 6 ft. high, and round this chimney the wood is packed on end in four tiers, making a hemispherical heap 12 ft. diameter and 6 ft. high. The heap is then covered with wet clay all except the chimney at the top, and into this some glowing coals are thrown. As soon as the wood is well alight, the chimney is closed and a ring of holes about 1 in. diameter is made with a crowbar, about 3 ft. from the top. As carbonisation proceeds, the top of the heap caves in and must at once be thickly covered with sand, and other holes made lower down, so that in about 36 hours the process is complete. This is simply the ancient way of making charcoal in heaps.

A number of such heaps were all ignited on the same day and afterwards exposed to exactly the same conditions, and it was with this charcoal that the following experiments were made:—The different kinds of wood were carbonised in separate heaps. All the charcoal worked excellently in the producer; good gas could be got in four minutes with fire previously lighted, or in 15 minutes starting all cold. The gas is colourless, odourless and tasteless, thus requiring a little more care than with anthracite to avoid its poisonous effects when inhaled, but from its being practically free from sulphuretted hydrogen and tar it has less deleterious effects on the engine than even good town gas. The clinker is brittle and friable, causing no trouble in the boshes or on the firebars of the producer, so that much poking is not necessary, and once in 12 hours is quite often enough to open fire door for removal of clinker. In short, good gas can be maintained with less trouble than with anthracite, in spite of the more frequent filling of the hopper, owing to the greater bulk of charcoal.

Among the different kinds of charcoal tried was that made from willow wood, and it was found to possess certain useful properties.

---

### Light Buoys.

The lighting of channels is so important to the colonies that the new departure in the adoption of acetylene buoys will be watched with much interest. The International Marine Signal Company of Ottawa and London introduced an automatic acetylene gas buoy, which has been tried at New Brighton by the Mersey Docks and Harbour Board. After six months, during which no attention whatever was given to the buoy, it was found that the burners were as clear as when the light was first started, and the flashing had worked perfectly in all kinds of weather. The light in this case is 340 candle power, and the smallest lantern made is 140. The usual power of an oil-gas buoy is only 26. A world-wide demand is springing up and, to give one instance of progressive spirit, Korea has ordered six buoys.

---

### Purification of Water.

Water can be largely purified by aeration and filtration, but a substantial proportion of organic matter often remains. A more powerful process is necessary for waters containing organic matter of vegetable origin relatively resistant to oxidation. One of the processes which has proved itself effective in the treatment of this class of water is that dependent on the use of iron, commonly known as the Anderson process, but a very thorough treatment with iron is necessary to oxidise the organic matter. By working at a temperature

above the ordinary an excellent purification can be effected. The process is to treat the water with steel turnings, decant and aerate; the iron oxide is then separated through an ordinary paper filter. With works designed for the thorough application of the iron treatment there should be no difficulty in preparing an unexceptionably good supply.

---

### Concrete Barges.

No such barges are at present made in this country, but they are used in Italy and elsewhere and have proved cheap and efficient for small floating docks, floating bridges and pontoons. They are built with a steel framework covered with expanded metal, the concrete being worked over this and covering the metal entirely. The surface is finished smooth and offers slight resistance to towing. As the metal work is entirely embedded in the concrete the cost of upkeep is small, and the structure is found to resist ordinary shocks fairly well. The weight compared with that of the ordinary steel barge of heavy construction is about 30 per cent. more. The cost in Italy is about the same as that of ordinary heavy barges in this country. Repairs would not be seriously difficult.

---

Mr. Roosevelt has ordered the patent pump filter, made by Messrs. Doulton & Co., for use in his forthcoming East African tour.

---

### Photography.

*Travel and Exploration* discusses the various causes which prevent the ordinary amateur from obtaining sharp and clear pictures, even with an expensive apparatus. The recommendations are, shortly, (1) test the accuracy of the focussing scale, and for moving objects use the Reflex type of camera; (2) clean the lenses frequently; (3) see that the lens is not of too short focal length—it should usually be twice the diagonal of the plate to be covered; (4) use a large stop, so as to get "atmosphere"; (5) use well-backed plates; (6) use an actinometer to ensure that the exposure is correct; (7) usually the developer is much too strong.

## RAILWAY NOTES.

### HOW RAILWAYS DO NOT PAY.

A report issued by the Board of Trade shows that the railway shareholder is gradually losing dividends on his capital more and more. The railway returns reveal no little waste which one would think might be avoided by better management. A goods wagon it appears is in motion, on the average, for  $52\frac{1}{2}$  minutes in the 24 hours; in this time it travels  $17\frac{3}{8}$  miles and carries 2 tons. Thus  $3\frac{1}{2}$  per cent. of time is taken up by travelling at the sedate speed of 20 miles an hour, and the remaining  $96\frac{1}{2}$  per cent. is represented by loading, unloading and (more particularly) idleness. Two tons represent one-fifth of a load, so that apparently as often as not the wagon travels empty. The waste is probably due to the absence of proper system in loading, unloading and clearing goods, and this is a matter deserving the close attention of all railway managers.

No British railway, however, has "gone under" during the past year, and this is much more than can be said of the United States, where no fewer than twenty-three railroads went into receivers' hands, the aggregate mileage being 8,000 and the capital about £126,000,000.

### NIGERIAN RAILWAYS.

The decision of the Government to construct the Baro-Kano Railway, and to extend the Lagos-Ibadan line to a junction with it near the latitude of Zungeru, and the steps which are being taken to carry the work to a rapid completion suggest the consideration of the general principles on which such works should be executed and administered. The subject has been discussed by the railway authorities with clearness and force, and some observations which have been made may be reproduced. It has been owing to the absence of adequate restrictions and safeguards that in Australia, South Africa and some other British possessions, some Government railways have become a continuous burden on the taxpayer, and extraordinary measures have had to be taken to secure more satisfactory results. In times of prosperity railway deficits may

perhaps be met without much hardship from general revenue, but in normal years the "indirect advantages" are but a poor consolation. Indeed, in adversity, the burden may prove so great that the whole financial stability of the colony may be endangered and great retrenchments have to be made in useful expenditure. Such a condition of affairs exists in the Cape to-day, where the annual deficit amounts to some £300,000. This deplorable position is traceable chiefly to (1) the construction of unprofitable branch lines, (2) the provision of railway facilities at rival ports, (3) inadequate rates, chiefly for local produce, (4) concessionary fares to various privileged bodies or persons. In Natal the lines are just paying their way, but this is largely the result of good fortune rather than the verification of expectations, for had not the development of the Natal coalfields taken place, a factor which could not have been foreseen, the railways would be working at a loss. In Rhodesia it appears that the deficit in 1907 was about a quarter of a million sterling.

The financial progress of the Lagos railway (*i.e.*, from Iddo to Oshogbo, 186 miles) has been satisfactory. This line passes through a region where the palm kernel flourishes, and there was good reason to anticipate that it would more than pay its way. This anticipation has been fully realised. But the zone of the palm tree ends some twenty miles north of Oshogbo, and there can be no doubt that the country through which the extension beyond passes is much less rich than that served by the original section. Yet, with all its advantages, the Lagos-Ibadan line suffered for years annual deficits amounting to such considerable sums as to hamper the resources of the old colony of Lagos. This was largely due to the low rates at first charged, which barely covered working expenses and did not represent the value of the service given. These rates have since, generally speaking, been more than doubled, and the trade can very well bear the increase. The financial resources of Southern Nigeria are, it is true, large when compared with those of the colony of Lagos, but the railways for which it has assumed responsibility are seven times the length of the original line. The moral is that the rates should be fixed in accordance with the principle laid down by Mr. T. R. Price, the General Manager of the Central South African Railways, in an annexure to his report for 1906, that "In cases of districts where the financial working results are unfavourable and the rate of freights substantially higher and facilities of transport less, the charging of higher rates of fares and freights is authorised until the revenue exceeds the expenditure, including cost of working, depreciation, interest on capital and other charges."

The position in Southern Nigeria is complicated by the fact that there will be two lines which will compete with one another. At Baro, situated as it is on the banks of the Niger, the waterway of

the Niger is connected with one of the lines, to the detriment of the other. It is clear that the two systems must be worked in co-operation. There is ample promise for the future, but for the first years the situation will be a trying one. As soon as construction is completed the interest on some five millions of capital will have to be met, and later on, no doubt, large expenditure will be necessary on renewals and rolling stock.

---

The progress on the extension of the Lagos railway cannot be considered satisfactory. The work was started more than a year ago, and the earthworks on the short length of thirteen miles to the south of the Niger were not completed at the end of 1908. This is attributed chiefly to the inadequate labour supply.

---

#### **Federated Malay States.**

The profits for 1907 were at the rate of 3·60 per cent. The proportion of working expenses to gross receipts was 70·34 per cent. 6,772,340 passengers were carried—a striking figure. The year witnessed the introduction of coal as fuel for the engines in the Northern Division; bakan firewood continues to be used in the Southern Division. 122,533 passengers were carried by the motor service, which yielded a profit of 4·83 per cent.

With the completion of the Johore State Railway, railway communication is established between Prai on the mainland, opposite to Penang, and Singapore Docks, the only interruption in this distance of 493 miles being the Johore Straits, about three-quarters of a mile in width, which will be crossed by a wagon ferry.

---

#### **Nyasaland.**

The Shiré Highlands Railway has been working for some months. The bridge over the Shiré river at Chiromo has been completed, and trains now pass in one day from Port Herald to Blantyre, a distance of 113 miles. The line was of great benefit during the last dry season, and without its help it is doubtful whether the large crop of cotton, tobacco and coffee could have been moved out of the country, as the condition of the Lower Shiré river makes navigation above Port Herald practically impossible.

---

#### **British Guiana.**

An interesting correspondence has taken place on the subject of a proposed railway in British Guiana to the Brazilian frontier. Col. J. W. Link put forward a scheme for the construction of such a railway, the length of which would be about 200 miles. The

maximum cost was estimated at £8,000 per mile, so that the cost of construction would be about £1,600,000. Col. Link asked that the Colonial Government should guarantee  $3\frac{1}{2}$  per cent. on this sum during construction and for ten years afterwards, and also for a grant of ten square miles, in alternate blocks on each side of the line of one mile in frontage, for every mile of railway. Thus the Colonial Government would pay during some thirteen years the sum of £668,500, a distinctly large proportion of the capital sum considering that the company would remain in full possession of the line and of some 2,000 square miles, or 1,280,000 acres. The Colonial Government would receive shares of a face value equivalent to the sums paid over, but whether these would be valuable would, of course, depend upon circumstances. As to the financial prospects of the undertaking there is rather a singular absence of information. Apparently no attempt was made to estimate the traffic or receipts which might be obtained. The proposer himself remarked that the line would be built "into practically unknown country with virtually unknown and undeveloped resources." He attached great importance to the through traffic from Brazil, but it is evident that Brazil would not be disposed to favour diversion of trade from her own territories to British Guiana. There is no reason to suppose that a railway in Brazil to meet the British Guiana line is projected or would be allowed. The scheme, therefore, it has been decided, has no basis, and is not entitled to consideration. It attracted, however, a good deal of favourable notice in the colony, and the Government was freely condemned for not promptly supporting it. There is a good deal of human nature in this, as a scheme which would undoubtedly be one of public improvement naturally commands much sympathy, and it is pleasant to look at the rosy side of things, especially when the undertaking implies the spending of a large sum of money to the benefit of the present generation.

---

### The Benguella-Katanga Trans-African Railway.

The Tanganyika Concessions are situated in the Belgian Province of Katanga, on the plateau between the sources of the Congo and the Zambesi, and the railway will run to them from Lobito Bay, a fine harbour near Benguella in Angola on the West Coast. The Portuguese Government granted a concession for a railway, carrying a width of 70 miles of land on either side. No great distance from the starting point a gorge had to be negotiated,  $1\frac{1}{2}$  miles long, with an ascent of 400 ft., and here the rack principle was adopted, as on the Delagoa Bay-Pretoria line; the system is the Riggenback, largely used in Switzerland, and the gradient is about 1 in 16. The work was pushed on with despatch for a time, but we understand is not progressing quickly at present. Messrs. Pauling

have contracted to construct the extension of the Rhodesian line northwards *via* Broken Hill to Katanga and the Star Mine.

### Mono-Rails.

An interesting discussion is recorded in the December number of the *Journal of the Royal United Service Institution* on the strategical use of the mono-rail for the rapid concentration of a force. A number of advantages were claimed for the Isopede mono-rail, the principal being :—

(1) The running way is reduced to a single rail at a cost approximately one-half of a double-rail track.

(2) The rolling stock is provided with single carrying wheels running on the mono-rail, and equilibrium wheels resting and running on the ground. The mechanical union between these two types of wheels is such that the load is borne almost entirely by the centre rail.

(3) Any irregularity in the side-wheel track is not communicated to the vehicle.

(4) The Isopede will take with ease a circle described within a radius of 15 ft., and very steep gradients.

(5) A long train can be made up.

(6) The cost of laying the track is about £300 per train mile.

There is no question that such a line could be economically laid on a road or other level surface, but if there were much of a slope from side to side it would be necessary to make the ground approximately level, as for a two-line track. The expectation that the trucks would go round curves of 15-ft. radius is rather illusory. Mr. R. Elliott-Cooper, M.I.C.E., pointed out that "no doubt a single wheel will go round such a curve, but in order to get the tractive power that would enable it to carry anything more than about its own weight you would have to couple together a certain number of wheels." You then get a rigid wheel base, say, 8 ft., which clearly would not go round such a curve. Furthermore, the one rail has to carry twice as much weight as one in a two-line track, and must therefore be twice as strong. Nothing therefore is gained in this respect. As feeders for trunk lines such systems have the great disadvantage that the passengers and cargo have to change on meeting the lines, and special rolling stock would be necessary: for strategic purposes this objection seems fatal. On the other hand, the cost of construction and maintenance would probably be very much less than with any other system, and this vital consideration is enough to determine the matter in places where feeders are wanted and a break of gauge is comparatively unimportant.

The Isopede is a Belgian invention, and has been set up at Louvain.

**Chilled Iron Wheels.**

There is a temptation to use these wheels, as they are much cheaper than steel, and are used in America and some of the Colonies. A report from the Lagos Railway is decidedly adverse to their employment, notwithstanding the saving in cost. A considerable number on that railway have to be condemned. If through careless application of the brake a wheel is made to skid so that a flat is worn, this means a new pair of wheels with all the attendant work, whereas a flat worn on steel tyres can be turned out, unless the tyre is too thin. The cast-iron wheel, possibly owing to the fact that it cannot be turned up after being bored and pressed on the axles, presents on parts of its circumference slight irregularities on which the brake-shoe readily catches, with the result that the wheel is continually braked at the same spot; and, if any undue application of the brake is made, the wheel skids and a flat ensues, which is continually increasing in size. With a better class of brake-boy this might be partially avoided, but on such lines it is impossible to secure that the brake is not unduly applied. As soon as a slight flat is noticed the wheel should be ground up by a grinding machine, but defects are apt to escape notice until they are too serious.

---

**Welch Patent Long Burning Oil Signal Lamp.**

This lamp is now being largely used in England as it only needs to be trimmed weekly and burns for that time at least. The consumption of oil is small. But the lamp must be kept under observation for at least half-an-hour when trimmed, so as to see that the flame is at the right height when the lamp is warm. The cost of oil is estimated by the makers at 6*s.* 6*d.* per annum; the lamp is 14*s.* and the case 15*s.*

### MEDICAL NOTES.

THE Sleeping Sickness Bureau has issued a pamphlet containing Observations by Dr. A. D. P. Hodges, Principal Medical Officer in Uganda, on The Transmission of Sleeping Sickness in Uganda, The Distribution and Bionomics of *Glossina Palpalis* and Clearing Measures. Dr. Bagshawe, the Director of the Bureau, contributes a number of notes.

From the same Bureau comes a pamphlet entitled "Sleeping Sickness: how to avoid Infection," which is intended for the use of travellers and residents in tropical Africa. It contains illustrations of *Glossina palpalis* and other biting flies, and instructions are given for the recognition of the carrier of Sleeping Sickness, for the precautions to be taken to avoid infection, and for the recognition of the symptoms of the disease. Missionaries and others are invited to spread knowledge of the facts among the natives, and to assist in the collection of data and specimens of biting flies.

The concluding paragraphs are as follows:—

"It is very important that the flies which convey the infection should have no opportunity of suoking the blood of the sick. Infected persons must therefore be moved well out of the fly range to places where *Glossina palpalis* has no chance of reaching them. Owing to the habitat of the fly (edge of water) this would not usually involve difficulty or hardship. As, however, it is possible that other species of tsetse fly may occasionally carry the disease, a spot should be chosen free from all tsetses. One infected person within a fly area may cause the infection and destruction of a whole village. These proved facts should be explained to native chiefs and the more intelligent natives. They should be warned of the danger arising from the bites of the flies. If they are obliged to visit fly areas for the purpose of drawing water, the visits should be made early or late in the day when the flies are not active. Fishing, if carried on throughout the day in places where flies are present, is a dangerous occupation.

“ If it is necessary that European houses remain within the fly range they should be protected by wire gauze, which need not be of fine mesh. Native water carriers should not be allowed to enter, for the flies are known to accompany them for long distances. Steamers which ply on fly-infected rivers should be provided with wire-gauze cages into which Europeans can retire. Europeans can protect themselves by gloves, veils, etc., but few would have recourse to these in the tropics in the heat of the day; they can, however, avoid going about with bare arms and legs. There is little doubt that the wearing of white clothes gives some protection, as the fly is attracted by dark colours.

“ Europeans should be on the look out for the disease in their servants, for there can be no doubt that the constant presence of an infected person is a danger; biting insects exist everywhere in tropical Africa, and it may be that in rare instances the disease is conveyed by insects other than tsetse flies.”

---

The principal features of the third Bulletin issued by the Bureau are an article on the present state of our knowledge of the Tsetse Fly (*Glossina palpalis*) and an article on the Prophylaxis of Sleeping Sickness. The latter will be found to be of great interest even to the lay reader. “ If it were possible,” says the writer, “ to return to the status existing at the middle of the last century, when the tropical portion of the African continent had not been ‘ opened up,’ when each tribe was at war with its neighbour, and no man went more than a few miles from his home, we could stay the extension of the disease, but this is obviously impossible; nor can we exterminate the fly throughout tropical Africa by wholesale measures of clearing. It is possible, indeed probable, that a chemical substance will be discovered which will kill, without injury to the tissues, all the trypanosomes in a human body, but even with such a substance in our hands the Sleeping Sickness problem is not solved, for it would be very difficult to treat all infected persons and to treat them at an early stage of the disease: moreover, we have every reason to believe that there is no immunity, and that persons cured would be liable to reinfection. It is therefore irrational to suppose that under present conditions we can suppress Sleeping Sickness throughout Africa; we can, however, delay, or in some instances prevent, its extension to those *palpalis* areas yet uninfected if we make use of the knowledge which we have acquired of the natural history of the disease.”

The general conclusions of the author are summarized as follows: “ Broadly speaking we may say that the means for preventing or checking the spread of Sleeping Sickness are these:—Clearing; segregation and treatment of infected persons in places free from

fly; removal of villages from fly areas; and instruction of the native. The efficiency of clearing depends on our knowledge of the natural history of the fly. More work and more workers are needed in this field; when we have acquired sufficient knowledge of the breeding habits and of the natural enemies of *Glossina palpalis* we shall be in a position to control its multiplication, and perhaps in the neighbourhood of habitations or important roads to exterminate it. There is one important and urgent task before us: to map out fly areas as yet uninfected, and by persuasion, or compulsion if need be, to secure the removal of native villages there situated. Without native co-operation we can do little, but unless the African is made to see the reasons for the measures proposed we cannot expect his help. The first essential then for the prevention of Sleeping Sickness is to teach the African native about it, and in this work all Europeans should assist—missionaries and traders, as well as officials. He is by no means a stupid person where his own interests are concerned, and if he can be led to see for himself the means whereby he can avoid the disease, and the simplicity of those means, he will himself take the necessary steps. It is recorded from various parts of tropical Africa that the natives know that their cattle die if bitten by tsetse flies; it should not be difficult to induce them to apply the same reasoning to themselves. Meantime we must increase our knowledge of the natural history of the fly and the trypanosome in order to improve the efficiency of our prophylaxis."

The same issue of the Bulletin contains notes on Preventive Measures in Uganda and in North-Eastern Rhodesia, where the disease has recently made its appearance in the extreme north.

---

The fourth issue of the Bulletin contains a number of recent papers dealing mainly with methods of treating the disease.

---

The Institute for Medical Research in the Federated Malay States has issued a pamphlet on Surra in horses, cattle and other animals by Doctors Fraser and Symonds. It is illustrated by diagrams and photographs, and a note on the distribution of certain species of biting flies in the Federated Malay States by Mr. H. C. Pratt, Government Entomologist, is appended.

---

We have received from the Liverpool School of Tropical Medicine Vol. II., No. 4, of *Annals of Tropical Medicine and Parasitology*, which contains articles on Sleeping Sickness, Malaria and Goundou, and a curious study by Dr. Jeans of the artificially produced deformity of a Chinese woman's foot. The articles are illustrated by a number of plates.

The report of the Advisory Committee for the Tropical Diseases Research Fund for the year 1908 has been published (Cd. 4,476. Price 1s.). The income of the fund was £3,400, and the expenditure £3,583 6s. 8d., made up as follows:—

	£	s.	d.
Grant to London School of Tropical Medicine	1,333	6	8
„ Liverpool School of Tropical Medicine	1,000	0	0
„ University of London ... ..	750	0	0
„ Cambridge University ... ..	100	0	0
„ Australian Institute of Tropical Medicine ... ..	400	0	0
	£3,583	6	8

The last-mentioned item is a contribution to the initial cost of a new institute to be established at Townsville, in Northern Queensland, from which valuable work is expected. The appendix contains a number of reports on work done in the past year at the Tropical Schools and the Universities and in the Colonies.

---

The medical expedition sent to Jamaica by the Liverpool School of Tropical Medicine in November last returned in January. Dr. Prout has reported that there is an appreciable mortality among the negroes from malaria, a very large expenditure on indentured coolies suffering from malaria, and a very large amount of inefficiency and waste of labour on the banana and sugar estates. Practically nothing has been done in the way of anti-malaria measures, and the attention which has been drawn to the economical waste caused by the disease will no doubt strengthen the hands of the authorities in dealing with the tests of prevention.

---

### Danysz Bacillus.

The Lister Institute of Preventive Medicine have reported that, although this bacillus presents the closest resemblance to organisms which have been responsible for outbreaks of food poisoning, it is entirely different from the bacillus which occasions typhoid fever. The suspicion therefore which has arisen in some places that outbreaks of typhoid fever are due to the virus is without foundation. It is not, on the other hand, proven that the Danysz bacillus, if introduced into the alimentary canal, would be harmless to man. A few instances have been recorded which have led to the suspicion that the employment of this and similar viruses has been responsible for small outbreaks of acute and even fatal diarrhoea in man, but the evidence has not conclusively established the viruses as the causative

factor. The extensive employment of the virus in many places without ill result to mankind shows that the danger of human infection, if it exists, is small.

---

**"Ratin."**

This preparation has been tried by the Cape Department of Public Health, but the trial resulted in failure. Rats in confinement fed with the preparation consumed it with great greed. No results followed, and the rats remained still alive and looked well. The preparation was also strewn about in the unclaimed goods shed at the Cape Town Docks, with no better results. Several pieces of the Ratin were found to have been eaten or carried away, but no dead rats have been found, and, so far as could be judged, the number of rats in the shed has in no way decreased.

## COLONIAL STAMPS.

WE have had occasion in previous issues to refer to the attention which has been given in philatelic circles to certain surcharges on postage stamps, and a correspondence has been recently published in Jamaica which is interesting both from the philatelic and administrative point of view. The Commissioner of the Islands reported that a large foreign order had reduced his stock of  $\frac{1}{2}$ d. stamp to 17 sheets, which at the ordinary rate of sale would last eight weeks; and he accordingly requested that 40 sheets of penny stamps, of which there was a good stock, should be surcharged  $\frac{1}{2}$ d. The Jamaica Government agreed to do this, but directed that none of the surcharged stamps should be sold except across the counter, and that in future the speculative demands of dealers should be refused in such circumstances until a new stock could be obtained.

The correspondence which we print below gives some entertaining specimens of the efforts made to secure supplies of surcharged stamps.

“ CAYMAN ISLANDS.

“ COMMISSIONER'S OFFICE,

“ GRAND CAYMAN,

“ *April 30th, 1908.*

“ No. 164.

“ Sir,

“ I have the honour to acknowledge receipt of your letter No. 3537/3903 of April 6th, 1908, with enclosure from Messrs. Whitfield, King & Co. of Ipswich.

“ 2. I observe this firm, resident in the eastern part of England, commence their letter with the assertion that the recent issues of surcharged stamps were ‘unnecessary’—I am assuming the issues referred to are the ‘halfpenny’ on 1d., the  $\frac{1}{2}$ d. on 5s. and the 1d. on 5s. as they do not mention the actual ‘provisional stamps’ to which they refer.

“ With reference to the ‘halfpenny’ on 1d., my letter No. 143 of June 11th, 1907, clearly shows that this issue was more than necessary.

“ With reference to the surcharges  $\frac{1}{2}$ d. on 5s. and 1d. on 5s. At the time their surcharges were made I had for the supply of the whole Dependency one sheet of halfpenny stamps and not a single penny stamp. Both stamps were on order but had not arrived. The previous order would have been sufficient for two years had not stamp dealers bought in larger quantities and the law requiring so many legal documents to be stamped been passed. It is worthy of note in this respect that on one occasion I had to have some 5s. stamps surcharged 1d. in order that legal receipts might be given by parties receiving money from the Government.

“ The number of sheets surcharged: (a)  $\frac{1}{2}$ d. on 5s. was fifteen, on the following date, November 22nd, 1907. (b) 1d. on 5s. was fifteen, on the following date, November 22nd, 1907, and three sheets on December 9th, 1907.

“ 3. With reference to the remark ‘local speculation therein,’ again I feel entitled to wonder from whence and how did this firm in England gain the information authorising them to make the statement. They certainly made it without any support whatsoever, I knew nothing of ‘local speculation’ until I was informed this very firm, Whitfield, King & Co. of Ipswich, England, were making enquiries for their surcharges. By the people here these surcharges were treated in just the same way as ordinary stamps were treated, and it was not until the stamp dealers themselves put the idea into the minds of the people that any ‘local speculation’ took place. Again I respectfully submit that the people here are as much entitled to speculate in the stamps of the Cayman Islands as Whitfield, King & Co. are in England. Through the action of this firm and others ‘local speculation’ will now not only continue but develop, to the great advantage of the Caymanians but to the great disadvantage of stamp dealers.

“ 4. Referring to the application of the firm for His Excellency’s enquiry into the matter, I attach a letter from the postmistress on the matter. In their great desire to make things look as black as possible against us, it is worthy of note that the letter sent by them on February 20th, 1908, had not even been received at this post office when they wrote their letter, viz., March 10th, 1908.

“ ‘ Replies to the first three are long overdue.’ Here again these people make an assertion without supporting it in any way. A reply to their letter of December 10th, 1907, might have been a few days overdue, but even that I doubt. The other two were not even due on March 10th, 1908. And if these were not even due the remainder certainly were not.

“ 5. In what way to reply to the scandalous assumption contained in the remainder of the sentence in this letter I hardly know, viz.: ‘and it is our opinion that the stamps are being kept back in order to create a scarcity and so enhance their market value to collectors,

thus encouraging speculation on the part of the officials in the Cayman Islands.' I think in view of what I have said in previous sections, Messrs. Whitfield, King & Co. should be called upon for the names of the officials they refer to in their charge. It is an easy matter to 'assume' but I think they will find it a very difficult matter to prove that assumption on any person employed in the service of the Government of this Dependency.

" 6. Referring to the last sentence of the letter in which this firm ask for so much protection and assistance from His Excellency, I can only say that this firm has always received at the hands of the postmistress the same consideration as other firms have received. This firm always sends money by cheque, which I instructed the postmistress not to receive as cheques on English banks are useless to us here, besides they are not 'cash.' Though Miss Parsons, the postmistress, received after my giving her these instructions cheques from the firm she held herself responsible for the cash in order to oblige them. A few weeks ago I again informed her that no cheques unless first approved by me would be accepted at all, and as a result of this warning Messrs. Whitfield, King & Co. have during the past month had returned to them some £74 worth of cheques with a request that cash not cheques must accompany their orders. No other merchant or even private collector I am informed ever sends cheques, so if Messrs. Whitfield, King & Co. find they cannot supply their customers with all the Cayman Islands stamps they require, it is entirely their own fault, because they were warned, nearly a year ago.

" 7. It appears easy to see that Messrs. Whitfield, King & Co. feel aggrieved that they have not had the whole of the business in the Cayman surcharges and so vent the matter by means of assumptions wholly unfounded, and accusations against the characters of officials they know nothing whatsoever about.

" 8. I would respectfully request that this matter be pushed to the end, as the accusations made by this firm against the honour, honesty and probity of the officials of this Government is not only very painful to me and my subordinates, but must remain a reproach to us for some time unless this firm are called upon to substantiate and prove the charges they make.

" I have the honour to be,

" Sir,

" Your obedient Servant,

" GEORGE S. S. HIRST,

" Commissioner.

" The Honble.,

" The Colonial Secretary.

" CAYMAN ISLANDS.

" COMMISSIONER'S OFFICE,

" GRAND CAYMAN,

" June 10th, 1908.

" No. 229.

" Sir,

" I have the honour to acknowledge receipt of your letter of June 3rd, No. 5711/6385.

" 2. The stamp dealers realising that our stock of stamps is small do everything in their power to buy up all the stamps we have and then make objectionable statements when we are driven to surcharge, or curtail their orders.

" I have the honour to be,

" Sir,

" Your obedient Servant,

" GEORGE S. S. HIRST,

" Commissioner.

" *The Commissioner Cayman Islands to the Colonial Secretary.*

" Copy.

" CAYMAN ISLANDS.

" COMMISSIONER'S OFFICE,

" GRAND CAYMAN,

" October 15th, 1908.

" No 391.

" Sir,

" I have the honour to forward herewith for His Excellency's information copies of—

" (a)\* A letter from the Postmaster, Georgetown.

" (b) Copy of a letter found by him in the Post Office on taking over duty there.

" 2. I respectfully submit that the letter marked B should if possible be further enquired into as it appears to me little less than a gross attempt on the part of a stamp dealer, which fraternity appears so anxious to have nothing but honest transactions, to induce an official of this Government to commit a felony.

" 3. The writer of the letter lives in the United States of America and therefore there might be some difficulty in dealing with him.

" 4. Fortunately Miss Parsons and the present postmaster are above such transactions, but had this inducement fallen into the hands of less conscientious officials considerable harm would have resulted.

" I have, etc.,

" (Sg.) GEORGE S. S. HIRST,

" Commissioner.

" The Honble.,

" The Acting Colonial Secretary.

" Copy B.

" PURITAN OIL MINING COMPANY,

" Incorporated under the laws of the State of California.

" Capital Stock, \$1,000,000,000. Divided into 50,000 Shares of \$20,000 each.

" President and Manager: BREWSTER C. KENYON.

" Vice-President: GEORGE C. FLINT.

" Secretary and Treasurer: KENYON COX.

" LONG BEACH, CALIFORNIA,

*August 28th, 1908.*

" Miss GWENDOLYN PARSONS,

" George Town, Cayman Islands.

" Dear Madam:—As a collector of postage stamps for nearly forty years I am naturally interested in the stamps of your islands and as I also speculate some in provisional issues, beg leave to make you the following proposition and give you my word as a mason that all correspondence on the subject will be strictly confidential. My proposition is—to purchase of you £10 worth of 1d. stamps which on receipt by myself I will have surcharged 'Halfpenny' in a certain type and return same to you,—you to officially record the issue of the £10 worth as ½d. stamps just on sale the day of receipt by you, and register me a letter of that date bearing some of the stamps in prepayment of postage. At the time I return the surcharged stamps to you I will also enclose another £10 for your trouble in the transaction. I trust you will receive this in the spirit in which I wrote it, as a strictly legitimate proposition, and believe, as I have said, that the whole matter will be considered entirely between ourselves.

" Very truly yours,

" BREWSTER C. KENYON.

" P.S.—If accepted on what office shall I draw P.O. order, or would you prefer the money in some other form? I regret that I have no other return postage than the 3d. Jamaica.

" B. C. K.

" *From the Colonial Secretary to the Commissioner, Cayman Islands.*

" Copy.

" COLONIAL SECRETARY'S OFFICE,

*" 30th November, 1908.*

" No. 12027/13404/08.

" Sir,

" I am directed by the Governor to acknowledge the receipt of your letter No. 391 of the 15th ultimo, enclosing a copy of a letter from Brewster C. Kenyon of the Puritan Oil Mining Company of California to the postmistress at Grand Cayman making suggestions for surcharging certain Cayman Islands stamps.

" 2. In reply I am to inform you that a copy of your letter and its enclosures has been sent to the Secretary of State for the Colonies, as an illustration of the methods of action of the class of persons who have been complaining that they cannot get surcharged stamps from the Postal Authorities at Grand Cayman. I am to say, however, that His Excellency fears that no profit would result from any attempt to take legal action against the writer of the letter to Miss Parsons.

" I have, etc.,

" (Sd.) ROBT. JOHNSTONE,  
" Assistant Colonial Secretary.

" HIS HONOUR

" The Commissioner of the Cayman Islands,  
" Grand Cayman.

---

*Extract from letter from Harry E. Huber to the Postmistress of the Cayman Islands, Grand Cayman.*

" No. 5,913 RIPPEY STREET,  
" PITTSBURG, PENN'A, U.S.A.

" My dear Miss Parsons, please, would it not be possible for you to make a provisional 2½d. stamp out of the 4d. brown and blue, of the 'Postage' issue, which I am sending you, by surcharging it in the same manner as was done with those on February 12th? I'm just about frantic to get one of these stamps, and as an extraordinary favour please will you not grant it? There being so few issued makes it impossible for me to get a copy anywhere and for that reason I beg you to please do me this great favour, if it is at all in your power.

" Copy.

" RENVILLE, MINN.,  
" August 23rd, 1908.

" Miss GWENDOLYN PARSONS,  
" George Town,  
" Cayman Islands.

" Madam,

" I would like to have you send me from 5 to 10 sets of any new issues of stamps from your part of the country and I will give you 5 per cent. commission on same. I was very much interested in the account of the Provisionals in Markets trade Circular. I would gladly buy any old issues if you should have them.

" Yours,  
" FLOYD REID.

*Extract from letter from Whitfield, King & Co. to the Postmistress,  
Cayman Islands.*

" IPSWICH,

" 29th September, 1908.

" Miss PARSONS,

" Postmistress,

" Cayman Islands, *via* Jamaica.

" Madam,

" *Private.*

" We assume from this that you are expecting another lot of the farthing stamps and that you will send us the 4,800 which we asked for on August 4th, if not, kindly let us know and we will order other values instead of them, but we should like to point out to you that your refusal to supply these to dealers will only lead to increased local speculation, as the dealers will get them somehow, even if they have to pay agents in the Cayman Islands a commission to buy them.

" Yours faithfully,

" (Sgd.) WHITFIELD, KING & Co.

" Copy.

" *The Secretary of State for the Colonies to the Governor, Jamaica.*

" JAMAICA—No. 373.

" DOWNING STREET,

" 6th November, 1908.

" Sir,

" I have the honour to acknowledge the receipt of your despatch No. 302 of the 30th of June last, transmitting copies of correspondence with the Commissioner of the Cayman Islands, with regard to certain complaints respecting recent issues of stamps in that Dependency.

" 2. A letter has now been addressed to Messrs. Whitfield, King and Company, which I have reason to believe effectually disposes of their representations.

" 3. I am of opinion that Mr. Hirst has successfully replied to the allegations made by the dealers, and I approve of your communicating with him in the sense proposed in the second paragraph of your despatch.

" I have, &c.,

" (Sgd.) CREWE.

" GOVERNOR SIR SYDNEY OLIVIER, K.O.M.G.,

" &c., &c., &c."

There have been extensive forgeries in Paris of British North Borneo Company stamps. About 2,000,000 forged stamps were seized on the premises of a printer, and correspondence was found which it is stated showed that an order for them had been given by a London firm. The Paris police also found evidence that Transvaal and Fiji stamps had been forged.

The following Colonies have recently agreed to adopt the new colour scheme, viz., DOMINICA, GIBRALTAR, JAMAICA, ST. HELENA and SOUTHERN NIGERIA.

STRAITS SETTLEMENTS.—A supply of orange 5 cents stamps and purple 25 cents stamps has been despatched, the labels in the latter case being in singly fugitive and the centre in doubly fugitive ink. The 30 cents stamps will in future be printed in purple and yellow and the colour selected for the \$500 stamps, when required, is yellow with a purple centre. It will be remembered that the last-named stamp will be of large size and the value is one to which no colour is appropriated in the colour scheme. Besides the above, \$5 stamps in red and green on green paper have been supplied.

TRINIDAD.—The large 5s. and £1 stamps will not be altered to conform to the new colour scheme, although, as stated in our October issue, all the other values will follow it.

ST. VINCENT.—A supply of the new 1d., 2s. and 5s. stamps, described in our last issue, was despatched early in February.

NATAL.—In the latest printing of 6d., 1s. and 2s. 6d. Revenue stamps the colours of the centre and border of each has been reversed so that the border of each is in the doubly fugitive colour. The 10s. stamps were printed in the existing colours but on yellow paper. The centre and border of the 2s. stamps will be reversed when they are next printed. 6d., 1s., 2s. 6d. and 10s. postage stamps have been supplied in the new colours on unsurfaced paper. The last named are of large size.

GOLD COAST.—2d. and 3d. stamps in the new colours have been supplied.

SOMALILAND PROTECTORATE.—1 anna stamps, printed entirely in red, have been supplied; also  $\frac{1}{2}$  anna stamps in singly fugitive ink and 2 annas stamps for the first time on surfaced paper.

GIBRALTAR.—6d., 2s. and 4s. stamps in the new colours have just been shipped.

If any proof were necessary of the vitality and seriousness of Philately we have it in the two first volumes of *Melville's Stamp Books*, which are now before us. Vol. I. deals with "Great Britain :

Line-engraved Stamps" and Vol. II. with "British Central Africa and Nyasaland Protectorate." The interesting character and artistic get-up of the books do the greatest credit to Mr. F. J. Melville, President of the Junior Philatelic Society, which recently opened at Clifford's Inn Hall a most instructive exhibition of the processes of paper making as connected with the printing of stamps. The exhibition included a working model of a paper-making machine which was, at the time of our visit, turning a diminutive vat of pulp into wove paper suitable for printing stamps.

"British Central Africa and Nyasaland Protectorate," by Fred J. Melville; published at 47 Strand, price 6d. net.

## LETTER TO THE EDITORS.

## LETTER IV.

## The Future of the West Indies.

26th February, 1909.

SIRS,

Returning to this very interesting subject it will be found that my first letter, published in the *Colonial Office Journal* of July last, was intended to show how the existing Executive and Legislative bodies in the West Indies could constitute a Central Council representing themselves, to which they could delegate executive and legislative powers over certain defined subjects and matters of common interest, and be thus enabled to deal with those subjects more effectively than by independent action.

A second letter, written in October, indicated the principles of the Australian Constitution as a model, and suggested London as the first meeting place of a Convention of Delegates to be elected by the local legislatures for the purpose of formulating a draft scheme; and, finally, a third letter, dated January last, pointed out how the difficulties of consolidating separate Colonial Governments for purposes in common had been overcome by other Colonies, and the manner in which preliminary steps had been taken to accumulate information, and arrange a meeting of a Convention.

I propose in this letter to suggest that the Executive and Legislative Councils in the Colonies should take the first step by passing a measure having for its object the selection and summoning of members for the deliberative Convention, as there appears to be no doubt that there is a general agreement as to the necessity of providing that matters common to all the islands might be legislated for centrally, whilst leaving all local matters to be dealt with expeditiously on the spot and without any other than local authority. If, therefore, it is agreed that "Union is Strength," it is becoming more and more apparent that it is incumbent on the Governing

bodies of the West Indies to come to an agreement that subjects of common interest should be dealt with by a central and representative authority.

The best means towards effecting this would be a meeting in London of representatives of each Colony, so as to bring together in one place all the persons most capable of deciding what is necessary to carry out the work which in previous letters has been shown is the preliminary necessity, and the Imperial Government might assist by inviting representatives to meet in London. Thus we see there would be no difficulties about the preliminaries towards effecting the above objects for the mutual benefit of the whole of the West Indies.

Before closing this letter it would, perhaps, be as well to state one, if not the most important, question upon which a common agreement should be arrived at, viz., the settlement of uniform inter-Imperial import duties throughout the whole of the West Indies. Such uniformity has an immediate and practical bearing upon the trade relations between the West Indies and the rest of the Empire. Canada, for instance, could not deal effectively with the West Indies if each island required separate treatment because its tariff differed from the others. The preference Canada could give us is to one and all alike, and, therefore, each and every one of the islands must be prepared with a common tariff and a schedule which will meet the views of the finance ministers of Canada. In any tariff arranged to meet the views of Canada, the mother country and all British Colonies must share.

It is for the above reasons, and those contained in previous letters, that I venture to suggest that West Indians might usefully study and follow on simple lines, the principles which have developed in the Commonwealth of Australia.

I am, Sirs,

Your obedient Servant,

JOSEPH RIPPON.

## ULTIMA THULE.

HIGH up by Tristan's rugged wall  
The lonely exiles dwell,  
Where naught but the restless seabird's call  
Disturbs the brooding spell ;  
And the gathering weed-beds rise and fall  
In the long Atlantic swell.

They take no toll of the passing days,  
Of the fruits of eons past ;  
But they welcome the sight of a ship in stays,  
Or a syren's raucous blast ;  
And they pray, as their boat slips down her ways,  
For news of the world at last.

Like the saints of old the little band  
Toil for the common weal ;  
The eldest rules with a mild command  
Where all are true and leal ;  
They trust in God and the Motherland  
And the power of faith to heal.

And now and again there comes a day  
When the look-out man espies  
The smoke of a war ship under way,  
And the coded welcome flies  
To the grey-clad cruiser from Simon's Bay  
As she swings to her anchors, trim and gay,  
And in the roadstead lies.

The tale of the nations' toil and strife,  
Of the progress of the age  
Unfolds in their dull, sequestered life  
Like a wondrous fairy page,  
Till young men chafe and the wish is rife  
For an ampler heritage.

Someday the counsel of the rest  
With the elders will prevail ;  
Someday their boat will mount the crest  
Of the waves to a ship in hail,  
And all will abandon the isle in quest  
Of a life within the pale.

Then an echo from the rugged wall  
Will repeat their last farewell  
To the rock where naught but the seabird's call  
Disturbs the magic spell,  
And the gathering weed-beds rise and fall  
In the long Atlantic swell.

**RECENT TRANSFERS AND PROMOTIONS  
MADE BY THE SECRETARY OF STATE.**

## INDEX TO PRINCIPAL SUBJECTS IN VOLS. I. AND II.

---

### GENERAL.

ALL-RED ROUTE, I., 6 ; II., 1.

ASIATIC IMMIGRATION, I., 285 ; II., 3 ; II., 18.

AUDITOR, FUNCTIONS OF, II., 209.

AUSTRALIA :—

Labour movement, I., 68 ; old age pensions, I., 70 ; immigration, I., 206 ; II., 100 ; II., 168 ; naval defence, I., 287 ; New Hebrides convention, I., 289 ; "new protection," I., 298 ; tropical possessions, I., 344 ; financial problems, II., 116.

BRITISH COTTON-GROWING ASSOCIATION, II., 105.

CANADA :—

Payments to Provinces, I., 114 ; immigration, I., 206 ; I., 291 ; II., 2 ; II., 285 ; old age pensions, I., 239 ; trade with, I., 349 ; I., 156 ; capital in, II., 98 ; nationalism, II., 175 ; elections, II., 193 ; waterways convention, II., 285.

CEYLON :—

Rubber cultivation, I., 159 ; Colombo Harbour, II., 324.

COINS, II., 202.

COLONIAL HISTORY, EARLY, II., 215.

COLONIAL JUDGMENTS, II., 8 ; II., 26.

COLONIAL OFFICE, SECTIONS OF, I., 113.

CROWN AGENTS, II., 114 ; II., 301.

CYPRUS, II., 316.

EAST AFRICA, AFFAIRS OF, II., 297.

EMIGRATION AND THE E. I. O., I., 135.

EXTRATERRITORIALITY, I., 223.

FIJI, NATIVES OF, II., 313.

FRENCH METHODS IN WEST AFRICA, I., 147.

GOVERNMENT ORDERS, LORD CROMER ON, II., 27.

Vol. II., No. 4.

- GROWTH OF EMPIRE, I., 363.  
 HERBERT SPENCER ON COLONISATION, II., 14.  
 IMPERIAL CONFERENCE, I., 2.  
 IMPERIAL FEDERATION, I., 69.  
 IMPERIAL ORGANISATION, I., 121.  
 INCOME TAX ON COLONIAL OFFICIALS ON LEAVE, I., 9.  
 INSTITUTE OF COMMERCIAL RESEARCH IN THE TROPICS, I., 74.  
 LABOUR PARTY AND THE EMPIRE, I., 313.  
 LUCAS, SIR C., VISIT TO AUSTRALIA.  
 MALTA, CESSION OF, II., 203.  
 MARINE INSURANCE, I., 212; II., 141.  
 MAURITIUS, RACE CHARACTERISTICS, II., 221.  
 NATAL, NATIVE AFFAIRS, I., 227.  
 NEWFOUNDLAND:—  
     Elections, II., 194; Micmac Indians, II., 265; fisheries convention,  
     II., 285.  
 NEW ZEALAND, TRADE WITH, I., 349.  
 PACIFIC CABLE, I., 126.  
 RHODESIA, PROSPECTS OF, II., 289.  
 SHIPPING FREIGHTS CONFERENCE, I., 4; II., 257.  
 SOUTH AFRICA:—  
     Union of, II., 25; II., 196; II., 286; outlook, II., 129; agriculture,  
     II., 172; II., 290; immigration, II., 197; war losses, II., 211;  
     native education, II., 292.  
 STATE AS LANDLORD, I., 316.  
 STEAMSHIP SUBSIDIES, I., 213.  
 STRAITS DOLLAR, II., 258.  
 STRIKES, PREVENTION OF, I., 305; II., 6; II., 102.  
 TELEGRAMS, CHEAP, I., 198.  
 TRAINING FOR TROPICAL CAREER, II., 9.  
 TRANSVAAL, CONSTITUTION, I., 12; Native affairs, I., 15.  
 VISUAL INSTRUCTION, II., 201.  
 VOTES FOR WOMEN, I., 79.  
 WEST AFRICA:—  
     Cotton-growing, I., 211.  
     Gold Coast, Accra water supply, II., 235.  
     Lagos harbour works, II., 243; II., 323.  
     Northern Nigeria: Administration, I., 23; development, I., 143; II., 295.  
     Southern Nigeria: Mineral resources, I., 233; natives, II., 70; railway,  
     II., 330.  
 WEST INDIES:—  
     Cotton-growing, I., 210.  
     Federation, I., 295; I., 323; II., 7; II., 37; II., 78; II., 176; II., 269;  
     II., 350.  
     Jamaica: Grant and loan to, I., 7; rebuilding, II., 106.  
     Leewards, finances, II., 149; II., 298.  
     Riots in, I., 7.  
     Sugar, II., 298.  
     Tobago, geology of, I., 72.

## BUSINESS NOTES.

# MERRYWEATHERS'

LONDON-MADE

## "DUB-SUB" CANVAS HOSE

WOVEN AT

Merryweather & Sons' Works, Greenwich Road, London, S.E.

In order to meet the demand for a

### SPECIALLY STRONG CANVAS HOSE,

necessitated by the more general use of Steam Fire Engines and High-pressure Hydrants, Messrs. Merryweather & Sons have introduced their "Dub-Sub" (Double Substance) Canvas Hose.

This Hose is made of specially selected long flax of the very highest quality, and woven on greatly improved looms, which enable a hose of great strength to be manufactured, and with 15 strands instead of the 9 or 10 usually employed, and each individual thread is extra stout and strong. It is

### CAPABLE OF STANDING GREAT PRESSURE,

and is therefore suitable for the most powerful Steam Fire Engines and Pumps. It represents the very

### LATEST & BEST PRACTICE IN WEAVING CANVAS FIRE HOSE.

The special stoutness of this Hose ensures for it a very much longer life than that of ordinary Canvas Hose, as it is much better adapted to withstand the effects of the chafing and rubbing unavoidable in course of ordinary work.

The "Dub-Sub" (Double Substance) Hose, when first used, allows the water to pass through the pores somewhat freely, but after it has been in use a short time it becomes as tight as more finely woven hose.

## MERRYWEATHERS' INDIA-RUBBER-LINED "DUB-SUB" HOSE

Is a Watertight Hose of the Very Highest Class.

*CAUTION*—See that the name "MERRYWEATHERS," as well as the brand, appears on every length. Indent for MERRYWEATHER HOSE.

**MERRYWEATHER & SONS,**  
GREENWICH ROAD, S.E., and 63, LONG ACRE, W.C., LONDON.

Telegrams: "Merywether, London."

# MERRYWEATHERS'

## LONDON-MADE

# "DUB-SUB" CANVAS HOSE

WOVEN AT

Merryweather & Sons' Works, Greenwich Road, London, S.E.

THE BEST TO WITHSTAND CHAFING.

In order to meet the demand for a

**SPECIALLY STRONG CANVAS HOSE,**

necessitated by the more general use of Steam Fire Engines and High-pressure Hydrants, Messrs. Merryweather & Sons have introduced their "Dub-Sub" (Double Substance) Canvas Hose.

This Hose is made of specially selected long flax of the very highest quality, and woven on greatly improved looms, which enable a hose of great strength to be manufactured, and with 15 strands instead of the 9 or 10 usually employed, and each individual thread is extra stout and strong. It is

**CAPABLE OF STANDING GREAT PRESSURE,**

and is therefore suitable for the most powerful Steam Fire Engines and Pumps. It represents the very

**LATEST & BEST PRACTICE IN WEAVING CANVAS FIRE HOSE.**

The special stoutness of this Hose ensures for it a very much longer life than that of ordinary Canvas Hose, as it is much better adapted to withstand the effects of the chafing and rubbing unavoidable in course of ordinary work.

The "Dub-Sub" (Double Substance) Hose, when first used, allows the water to pass through the pores somewhat freely, but after it has been in use a short time it becomes as tight as more finely woven hose.

**MERRYWEATHERS' INDIA-RUBBER-LINED "DUB-SUB" HOSE**  
Is a Watertight Hose of the Very Highest Class.

*CAUTION*—See that the name "**MERRYWEATHERS**," as well as the brand, appears on every length.  
Indent for **MERRYWEATHER** HOSE.

**MERRYWEATHER & SONS,**  
GREENWICH ROAD, S.E., and 63, LONG ACRE, W.C., LONDON.

Telegrams: "Merywether, London."

**elure**

There is no paint on earth so **ELASTIC** as Velure, nor, **BECAUSE OF THIS**, so perfect in surface, so free from flaws, cracks and blisters, so easily kept clean or so durable for indoor or outdoor painting, especially if exposed to sun & weather which quickly destroy ordinary paint but leave Velure unaffected for years. No varnish required **ITS SECRET IS ELASTICITY.**

*PROVED BY LETTERS FROM HUNDREDS OF USERS.*

Send for Handbook with full particulars to **C. Chancellor & Co.,** 13, Clerkenwell Rd., LONDON, E.C.

*Name this publication.*

**VERY HOT  
AND  
VERY COLD  
CLIMATES**

WHERE EXPOSURE TO SUN AND EXTREMES OF TEMPERATURE MAKE ORDINARY PAINTS AND VARNISHES CRACK, CHIP, CRAZE AND PEEL OFF, SCARCELY AFFECT THE LASTING PROPERTIES OF

**Velure.**
