between the United Kingdom and India is the

**“ HOME AND COLONIAL MAIL ”**

(WEEKLY)

For INDIA, CHINA, JAPAN, and the COLONIES.

**E**STABLISHED over twenty-five years ago, this Journal occupies a unique position as a Commercial Newspaper, representative of the important planting and mercantile interests of India, Ceylon and the Far East.

It is filed in the offices of Tea Garden and Produce Agents in London and Calcutta, and is read by all interested in commerce, planting, and produce everywhere. Complete information is given about Tea, Rubber, and other produce, together with the machinery used.

Lists of Tea and Rubber Companies registered in London, Reports of Meetings and statistical information about produce, etc., appear every week.

Annual Subscription post free to India and the Far East, £1 7s.

# "HANDBOOK OF THE BRITISH COLONIAL EMPIRE."

BY

**W. H. MERCER, C.M.G.,**

*One of the Crown Agents for the Colonies ;*

AND

**A. J. HARDING,**

*Of the Colonial Office.*

---

"Whilst the 'Colonial Office List' is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring succinct and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts."

*Journal of the Royal Colonial Institute.*

\* \* \* \* \*

"The book is intended for educational purposes and is so attractively written, and contains such a fund of information, that it cannot fail to become popular."

*Education.*

BURGLARY

ACCIDENTS

During the past One hundred years the *North British and Mercantile Insurance Company* has built up and maintained a world-wide reputation for promptitude and liberality in dealing with all claims made under its policies. Since its establishment in 1809 the total claims paid by the Company have

**EXCEEDED 60 MILLION POUNDS**

## WORLD WIDE POLICIES

Giving exceptional freedom of Travel issued on specially favourable terms.

## IMPORTANT ARRANGEMENT

FOR

# NAVAL AND MILITARY OFFICERS

**T**O Naval and Military Officers who are stationed in the United Kingdom, or at any Station in the Mediterranean, Canada, British South Africa, Bermuda, Australia, or New Zealand, and who are not under orders for service elsewhere, **The North British and Mercantile Insurance Company** offer, in time of peace, at the ordinary rate of premium for Civilians, Policies of Assurance which, from the date of issue, are free of all restrictions—the Assured being at liberty to proceed to, and reside in, any part of the World, and to engage in active service without payment of any additional premium. The Policies are issued in the participation class—but participation in profits does not commence until the date of permanent retirement from the Service.

*An Officer holding such a Policy can never under any circumstances be called upon to pay an extra premium.*

Funds nearly £20,000,000.

Annual Income, £4,500,000.

COMMERCIAL VEHICLES TO CARRY LOADS FROM  
**10 cwts. to 5 tons.**

## LACRE OVERSEAS.

*Extract from "Sydney Morning Herald."*

"A clear demonstration of the advantages of motor traction against the horse vehicle was shown last week, when a 'Lacre' motor lorry pulled out a load of bricks from the suburban brick yard, the horses and drays standing idle on account of the heavy rains of Monday and Tuesday. The bricks weighed 33 cwts. and there were four able-bodied men on the lorry, but once the engine started it pulled the load out and ran ten miles and back, twenty miles in all, in 1 1/2 hours. It is stated the ordinary brick cartier's outfit would take a full day to do the same journey, and a ton would be the full load."

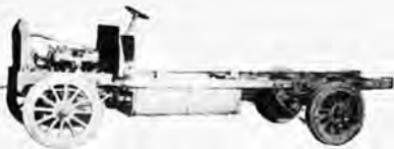

THE ABOVE-MENTIONED VEHICLE IS A TYPICAL EXAMPLE OF THE PRODUCTIONS  
FROM OUR MODEL FACTORY AT LETCHWORTH.

# NO DISINFECTANT

is so EMINENTLY SUITABLE for the use of  
THE TROPICAL SANITARIAN

as

**"SANITAS-OKOL"**  
(Emulsion),

"SANITAS-OKOL" has been largely adopted by Government Departments and Public Health Authorities throughout the Empire, and has been found the most suitable Disinfectant in every way. It can be used in all proportions and with all qualities of water, salt or fresh.

It has a high Guaranteed efficiency as a germicide, is non-toxic and non-corrosive, and retains, to a very marked extent, its efficiency in the presence of organic matter.

It is suited equally well for use by private persons as by Public Officials.

In addition to its germicidal character, it has marked value as a larvæcide and insecticide for use as a preventive measure against insect pests such as Flies, Fleas, Mosquitoes, and other disease carriers.

Special quotations given to Colonial Officials for large quantities.

# "HANDBOOK OF THE BRITISH COLONIAL EMPIRE."

BY

**W. H. MERCER, C.M.G.,**

*One of the Crown Agents for the Colonies ;*

AND

**A. J. HARDING,**

*Of the Colonial Office.*

---

"Whilst the 'Colonial Office List' is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring succinct and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts."

*Journal of the Royal Colonial Institute.*

\* \* \* \* \*

"The book is intended for educational purposes and is so attractively written, and contains such a fund of information, that it cannot fail to become popular."

*Education.*

## "EMPIRE" or STERLING SILVER PLATE

SPoons, FORKS, TABLE CUTLERY, AND OTHER HOUSEHOLD WARE.

"EMPIRE" PLATE is trebly plated on pure Nickel Silver. The patterns are reproductions from fine old Silver models, and have all the beauty of line and form of the Silver of 150 years ago; apart from the Hall Mark no difference is visible.

As far back as the 1862 Exhibition, "Empire" Plate was awarded Prize Medals for Excellence of Manufacture, and it still retains that pre-eminence for which it was noted fifty years ago, whilst the prices are, quality considered, strictly moderate, either for Cash, or on "The Times" System of Monthly Payments.

"THE VILLA" Solid Oak Case, with Lift-out Trays, containing 110 pieces of "Empire" Plate and Sheffield Cutlery.

A Service for 12 persons **£12 10s. to £21.**  
(Others £3 to £100.)

PRICE  
LISTS  
FREE.

No. 1, of Watches, Chains and Jewellery.

No. 2, of Clocks, "Empire" Plate, Cutlery, and Silver Articles for Presents.

Mention "Colonial Office Journal."

# NO DISINFECTANT

is so EMINENTLY SUITABLE for the use of  
THE TROPICAL SANITARIAN

as

**"SANITAS-OKOL"**  
(Emulsion),

"SANITAS-OKOL" has been largely adopted by Government Departments and Public Health Authorities throughout the Empire, and has been found the most suitable Disinfectant in every way. It can be used in all proportions and with all qualities of water, salt or fresh.

It has a high Guaranteed efficiency as a germicide, is non-toxic and non-corrosive, and retains, to a very marked extent, its efficiency in the presence of organic matter.

It is suited equally well for use by private persons as by Public Officials.

In addition to its germicidal character, it has marked value as a larvæcide and insecticide for use as a preventive measure against insect pests such as Flies, Fleas, Mosquitoes, and other disease carriers.

Special quotations given to Colonial Officials for large quantities.

# "HANDBOOK OF THE BRITISH COLONIAL EMPIRE."

BY

**W. H. MERCER, C.M.G.,**

*One of the Crown Agents for the Colonies ;*

AND

**A. J. HARDING,**

*Of the Colonial Office.*

---

"Whilst the 'Colonial Office List' is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring succinct and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts."

*Journal of the Royal Colonial Institute.*

\* \* \* \* \*

"The book is intended for educational purposes and is so attractively written, and contains such a fund of information, that it cannot fail to become popular."

*Education.*

## ELECTRICAL ENGINEERING

is the representative engineering journal of the electrical industry. It is read by the leading electrical engineers, and is regarded as the reliable authority in all matters connected with electricity.

The articles are of a practical nature, and well illustrated ; they deal with the technical and engineering aspects of electric lighting, electric power distribution, the use of electricity in mines, electric traction, telephony, and telegraphy.

Electrical Engineering is the best medium for advertisements.

EDITORIAL NOTES.

The British public has recently been told by many insistent critics that the British Empire has reached a crisis, and that some strong measures must forthwith be taken to prevent an early disruption. It is reassuring to find that the proceedings of the Imperial Conference bear absolutely no trace of these apprehensions. Never has the spirit of co-operation been so strong, but a clear reluctance was shown to adopt any ideas or machinery which might tend to interfere with existing relations to a serious extent. The result is to show that the political leaders in the Dominions are well satisfied with the character of the present connection, which has been built up naturally and in accordance with the political instincts of the race. Perhaps the most important feature of the proceedings is the increased importance which is attached to joint deliberation of military and diplomatic questions. Obviously the principle of local self-government cannot be followed in foreign affairs. If any one of our five nations could bring about a war without the consent of the others, the Empire would be exposed to disruption. The Conference has largely provided against the possibility of such a disaster by ensuring the participation of all the nations in important discussions. This arrangement not only goes far to preserve co-operation, but reduces the risk

of complications by making all the parties directly responsible. It can hardly be doubted that one early result will be to strengthen the defences of the Empire at all joints. No one can read the proceedings without being quite aware of the fact that the British Empire is at the present day the least militant or aggressive of all the historical world-powers. But it is also clear that there is a unanimous opinion that the connection is a valuable one and worth defending if need be. The Dominions are all anxious to provide for self-defence. This is the great thing, as certainly it is a difficult task to utilise and combine the local schemes so that the resources so created shall be effective on a great occasion for the common work, but the first requirement is the public spirit which is ready to make sacrifices for defensive ends, and this is being admirably displayed all round. There is no doubt an element of wastefulness in the fact that the navies of the Dominions will normally be on their own coasts and not concentrated on the lines which a naval strategist would select for the defence of the Empire as an organic unit. But human nature has to be reckoned with, and it is impossible to foster public spirit in such matters unless each community has something to own and see for its money. Much can be done, while respecting this feeling, to prepare the way for effective co-operation in any hour of need.

---

The proceedings of the Imperial Conference have not provided much "copy" for the newspapers, but it need not be assumed that they have been the less valuable on that account. There has been no full-dress debate on a current controversial topic in any way comparable to the preference discussion of 1907, and perhaps the most remarkable feature of the meetings has been the cordial manner in which the delegates of the overseas dominions have recognised the efforts of the home government to systematize and improve the working of the Conference, and to make imperial co-operation more constant and more regular. The suggestions for a reorganization of the Colonial Office were dropped after a very amicable discussion which made clear the general consensus of opinion that natural development along existing lines, and not drastic reconstruction, best meets the needs of the situation.

---

Each new Conference sees a change in the methods of conducting imperial affairs, brought about naturally, and almost without conscious intention, by the mere force of facts. It has always hitherto been the British method to allow such changes to come about normally, as in a living organism, and not to

anticipate developments, the exact course of which cannot be foreseen, by devising artificial machinery beforehand. The most important innovation at the 1911 Conference has been the attendance of the delegates at the Committee of Imperial Defence. The proceedings on these occasions have not been divulged, but it is known that the home government took the dominion statesmen into their confidence in the most complete manner, and their action in so doing was very warmly appreciated.

---

The result of the voting on the two referenda recently submitted to the Commonwealth electorate has been the defeat of the government proposals by a very large majority. A hostile vote was recorded in every State with the exception of Western Australia, where a small majority endorsed the new measures. This result must be regarded as remarkable in view of the sweeping success of the Labour party at the polls throughout Australia so recently as April, 1910. It is not easy to determine its exact significance nor its probable consequences to the position of parties in the Commonwealth. Mr. Fisher and his colleagues had left to attend the Imperial Conference before the vote was taken. In their absence it is impossible for the attitude of Ministers to be properly determined or announced, and there is necessarily something in the nature of a truce in federal politics for the time being. Mr. Holman, the acting Premier of New South Wales, and one of the labour leaders who failed to see eye to eye with the Commonwealth Ministry in this matter, has suggested an agreement among the States to transfer to the Commonwealth Government certain powers in industrial matters, which would necessarily be less wide than those which that Government has unsuccessfully sought to obtain. On the other hand, Mr. Hughes, who is acting for Mr. Fisher in the latter's absence, is reported to have announced that the recent proposals will again be submitted to the electorate concurrently with a general election, and to have obtained Mr. Fisher's endorsement of this policy. A final decision can hardly be expected until the return of Mr. Fisher and the reassembling of the Commonwealth Parliament.

---

Observers at home are perhaps more interested in what has occurred as an object-lesson in the working of the Referendum as a constitutional expedient than in the merits of the concrete questions at issue. At first sight the smallness of the poll—approximately fifty per cent.—is disconcerting. But it must be remembered that small polls are the rule in Australia. At the

General Election of 1910, the most keenly contested in the history of the Commonwealth, the percentage of electors voting was only 62. In 1906, it had been only 51. With the elimination of the personal element so strongly to the fore at a General Election a reduction in the percentage of voters is probably inevitable. But so far as a moral can be drawn, it would appear that a referendum, conducted—as this has been for the first time in the political history of the Commonwealth—apart from a General Election, hardly affords that clear, unambiguous and decisive verdict which its advocates have claimed as its principal merit. It requires keen partisanship, or great self-confidence, to express an opinion as to the actual wishes of the Commonwealth on the subject of the powers of the federal government in the matter of industrial legislation. If Mr. Fisher and Mr. Hughes really hold the intention attributed to them, they, at any rate, would seem to take the view that the old-fashioned General Election, with its alleged confusion of issues, is after all the best way of ascertaining the wishes of the sovereign people.

---

The question of promoting "closer settlement" upon the land in South Africa has been under the consideration of a Select Committee of the Union Senate, which has presented an interesting report, in the course of which it is expressly recommended that "the ranks of the settlers should be augmented by arrivals from oversea." Should the government hereafter be disposed to act on this recommendation, it may be conjectured that some controversy will be aroused in South Africa. The sub-continent is not free from the problem of the "landless man," and it will, no doubt, be urged that if money is to be spent on "closer settlement," the South African born has a prior claim on the consideration of the Government to the would-be emigrant from overseas. This argument has had a powerful influence on the policy of the Australian States—particularly Victoria and New South Wales—in the matter of immigration, and it seems likely to carry almost equal weight in South Africa. During the discussion on the Report, General Botha showed himself sympathetic but characteristically cautious, and laid stress on the necessity of recruiting immigrants from the country and not from the towns, saying that both Sir Wilfrid Laurier and Mr. Deakin had warned him on the subject. Those who see a danger in rural depopulation at home will thus find small comfort in General Botha's attitude. Its similarity to that of the Australian authorities may be shown by the following quotation from the

second Report on the Dominions Department of the Colonial Office:—

“The United Kingdom has no surplus of agricultural labour, the type of labour which the Dominions especially desire to attract. It is the town-dweller who is most often disposed, and most often encouraged, to emigrate. But Australia has no wish to add from external sources to her urban population, and she doubts, not without reason, the capacity of the adult town-dweller to succeed in agricultural pursuits.”

---

Australia has begun to experiment in the immigration of town-bred youths, who undergo a special agricultural training after their arrival. New Zealand is adopting a similar policy, and the prospects of success are said to be encouraging. To quote further from the Report above-mentioned:—

“There is much to be said in favour of the policy of catching the town-dweller young, and training him in the Dominions for agricultural work before he has had time to form the habit and acquire the temperament which unfit him for agricultural labour. In this way the needs of the Dominions can be met, and no exception can be taken to the transplantation from the United Kingdom of certain youthful members of the community for whom the industrial openings at home are few and unfavourable.”

---

It would certainly seem that on these lines the interests of the United Kingdom and the Dominions can best be reconciled, and Canada's experience of the results of child immigration has been admittedly very favourable. But in South Africa the problem is complicated by the supply of coloured labour which all but precludes the white man from accepting the position of a wage-earner on the land.

---

The London Chamber of Commerce has passed a resolution in favour of the reservation of Crown Lands in the Crown Colonies in return for any expenditure from Imperial funds for administration or development. The idea is that in return for his money the taxpayer at home shall have an asset in the shape of land in the Colony which may ultimately reimburse him. On the face of it this seems reasonable. It is fair to regard an Imperial grant, whether to provide for the construction of a railway or to carry on necessary administration, as an advance which is to be repaid when the finances of the possession allow, and it is logical that

some tangible security shall, if possible, be given in the meantime. As we recently remarked, the practice of making Imperial grants as a sort of investment is a recent one. Grants had been made in previous years to relieve cases of distress, but these were given to establish colonies to prevent bankruptcy or great hardship. But the grants which are being made to East and West Africa are given largely in the commercial spirit, to develop the territories for industrial purposes, and in such a case it would be reasonable to take a security for repayment if it is to be had. Rhodesia is administered by the Chartered Company on this principle, the theory being that the expenses incurred in administering the territory constitute a debt against the settlers, which will have to be discharged or taken over if Constitutional Government is set up. The difficulty is not in the theory of the matter, but in the practice. Sir Algernon Firth's idea was that, as a railway increases the price of land in its neighbourhood, the inhabitants of such land should make concessions to those who build the railway. But it would be extremely difficult to attempt to appraise the benefit given by the railway or to say to what distance it extended. The Government would have to settle these matters in some rough and ready way, and then to take possession of the land desired compulsorily. The benefits given by the railway might, however, to a large extent go to land at such a distance as would exempt it from such a contribution. In the case of "betterment" caused by public roads, the improvement is definitely located in the buildings lining the thoroughfare, and is capable of a fair measure of valuation, though even so the principle makes in particular progress in this country. In West Africa, which is the country chiefly aimed at, there is the further difficulty that land is held in tribal ownership, and it is not desirable that the Government should become a sort of landlord and displace the native chiefs. No railways have been, or are being, built on the lines recommended by the London Chamber of Commerce, for in those cases where grants of adjoining land have been made to companies, such land has been substantially unoccupied and uncultivated, and, therefore, has reasonably been deemed the property of the Crown. At the same time something could be done in the desired direction. The Governments might use their influence to obtain, if necessary by purchase, but for small sums, land in the immediate neighbourhood of stations, which may eventually be in demand for buildings. Undoubtedly, the building of railways encourages the purchase of concessions from the natives, but it must be remembered that the Governments take toll from such concerns, not only by railway rates and import duties, but by royalties, and in this way get a

direct share in the appreciation caused by the railways. It is true that this is not the same thing as a direct holding of land in trust for the British taxpayer, but, if the Imperial grants are to be regarded as advances to be repaid when the local finances admit, the best chance of repayment would be a healthy balance to the good in the Government accounts.

---

Sir H. Hesketh Bell, in his report for 1909, observes that while the progress of administration in Northern Nigeria may be considered to have made remarkable strides during the past decade, the development of external trade has been disappointingly slow. Most of the natives of the Protectorate appear to possess the instincts of commerce to a remarkable degree, and the amount of traffic done in the local markets is extraordinary. The great markets of the principal centres are full of wares of all sorts, and on every highway one meets a constant stream of petty traders carrying, from east to west and from north to south, the products peculiar to their districts. But everything is of local make or production. With the sole exception of Manchester cotton goods, hardly an article of European origin is to be seen. Here and there one may find a woman sitting behind a few boxes of matches, a tin of cigarettes, or a small pile of lump sugar, but otherwise nearly everything that is bought or sold is the actual produce of the country. Northern Nigeria seems to provide within its borders everything that enters into the daily life of the people. The consequence is that the imports and exports of the territory, when the vast extent and great population of the country are taken into consideration, are really almost trifling. During 1909-10, the estimated value of the imports into Northern Nigeria, excluding Government goods, railway material, and specie was only £331,000, while the exports barely exceeded a total value of £400,000. The fact that the Protectorate possesses no sea-board and that nearly all its external trade is conducted through Southern Nigeria, renders it very difficult to obtain accurate statistics as to the real volume of foreign commerce, but even by adding a liberal percentage to the figures given above, the value of the total trade of Northern Nigeria, with all its millions of inhabitants, does not equal that of even a small West Indian Colony.

---

Such external trade as there is is almost entirely in the hands of two or three rich and important firms, who have limited their operations mainly to a few stations in the vicinity of the Niger and Benue rivers. They have no cause to complain of the results of their traffic, and no one would begrudge them the

success which they have deserved by their energy and enterprise. Most of their business is done, however, on the pernicious barter system, and Sir Hesketh Bell is inclined to attribute largely to that fact the virtual stagnation of external trade in the Protectorate. It may confidently be hoped that the completion of the construction of the Baro-Kano Railway, and the linking up of the populous centres of the Hausa States with the seaboard, will rapidly alter existing conditions, and that, with the influx of traders and capital from the south, the natives of the Protectorate will quickly find it to their advantage to develop the latent resources of their country and to take advantage of the wealth of sylvan produce which lies ready to their hands.

---

Oil palms abound on the banks of the great rivers, the shea-butter nut tree is found in enormous numbers over thousands of square miles, valuable gums and various kinds of rubber exist in great quantities in districts which will soon be within touch of the railway. Fibre-producing plants and ground-nuts can be grown in Northern Nigeria to an extent that can hardly be paralleled in any other tropical country, while the cultivation of cotton on a large scale has been carried on throughout the territory from time immemorial. As soon as the attention of English capitalists has been properly directed to the potentialities of trade in this Protectorate, a very great extension of industry and enterprise can confidently be expected.

---

Contrary to what is the case in most other parts of British Africa, the English trader can, so far, have it all his own way in Northern Nigeria. Such trade as there is is almost entirely in the hands of British firms, and it is earnestly to be hoped that the start which they already possess will enable them to maintain their advantage against the foreign competitors, who are certain, sooner or later, to turn their attention to this Protectorate.

---

The commercial progress of Northern Nigeria has been all along rather disappointing. The small results were due largely to the monopolies of the carrying trade. Such monopolies with their attendant restrictions are fairly sure to arise wherever the natural difficulties are considerable, and require a well organised service. The construction of the railway and the improvement of the harbour at Lagos are designed to lessen these difficulties and to make general trade practicable. But

before the advantages of the new communications can be utilised on a substantial scale, the country opened up has to undertake new production for export business. It cannot buy until it can sell. This is always the case, and we do not think that the great amount of the existing production and traffic is a bad sign for the future. It denotes a state of industry and civilization which is more promising than a start of sloth and ignorance. Natives of this sort will readily spend British money when they get it, and their wants will, as in other localities, expand with their incomes. The railway will be the turning point, and we trust that British traders will now follow the flag and exploit the undoubted resources of Nigeria.

---

The announcement of the Chancellor of the Exchequer that a loan of £250,000 had been granted to East Africa is very welcome. The purposes for which it is intended have been in mind for a long time. The light railway to cover the thirty miles between Nairobi and the Thika River will be a great convenience to a fertile and promising district and should materially help to increase the exports which it is so much desired to develop in the interests of the Uganda railway. The deep water jetty at Kilindini is urgently needed. The water supply at Mombasa is, of course, a necessity, if sanitary obligations are to be considered at all. When this port has been provided, and the works at Accra and Lagos, now in progress, are completed, a very substantial advance will have been made in sanitary matters in tropical Africa.

---

The British Cotton Growing Association has turned the corner financially, showing a net profit in 1910 of £1,385 as against a deficit of £14,421 in the previous year. The Government had promised a grant-in-aid of £10,000 a year for three years towards the cost of experimental work, on condition that £150,000 more capital was raised; this money was raised, and the work was pushed on quickly. Two new centres have been opened in West Africa, and others are under consideration. Direct operations have been commenced in Nyasaland and Rhodesia; the work in these countries will be extended as rapidly as possible. Considerable additional financial assistance has been given to the British East African Corporation and to the East African Cotton Syndicate. Two very large schemes are under consideration in connection with the Soudan and the Juba River in East Africa, and there is a possibility of the Association entering into direct operations in Sind. It will, therefore, be seen that great possibilities present them-

selves of large and immediate developments. But it is to be regretted that the whole of the nominal capital of £500,000 has not been subscribed. A very much larger sum than that will be required to provide Lancashire with a substantial amount of cotton. The progress made, however, must not be measured only by the quantity grown. An experienced staff has been collected together, and knowledge has been gained which will be invaluable in future work. Now that additional funds have been provided, and with the assistance of the Government Grant, the work is being pushed on in every direction as rapidly as possible; and the Council confidently expect that in a few years from now a really appreciable quantity of cotton will be produced under the auspices of the Association.

---

In the meantime, however, Lancashire cannot wait, and it appears that the Fine Cotton Spinners and Doublers' Association have considered the question of acquiring the control of 30,000 acres of the choicest land in the Mississippi delta. This is for the purpose of obtaining fine long stapled cotton, the supplies of which have fallen short of the demand, so that the price has gone up greatly. It has been complained that this cotton should have been planted within the British Empire, and it has been argued that this course would have given buyers greater protection against "corners" and market manipulation. But the step is not directed against corners but against the high prices which result naturally from short supplies. Nor, indeed, is British territory, in these days of world-wide combination, any adequate protection against corners. Lancashire's policy is plainly to secure a bigger supply, and the new field is expected to yield from 15,000 to 20,000 bales a year of exceptionally fine cotton. The incident shows the reality of a strong demand, and it rests with the colonies to secure as much of it as they can.

---

The Wallis Islands, under the protection of France, have experienced the excitement of a sort of *coup d'état*—a rare event in Polynesia. The Catholic missionaries have long been installed there and have made themselves the real masters of the place. A magnificent cathedral, in the original style of the 13th century, has been built, the natives having been compelled to work on this for nominal wages. Recently, however, the French official representative persuaded the king that his subjects were being shamefully exploited, and an order was given for the expulsion of the head of the missionaries. This

step caused a rising of the inhabitants, who invaded the palace and deposed the king. They had it all their own way, and there was no fighting, and they selected a new king who was known to be in favour of the missionaries. The matter was referred to the Governor of New Caledonia, who settled it by acknowledging the new king and withdrawing the French representative. The decision is not altogether to the taste of some of the French papers. The French resident is very much at the mercy of the mission, which can cut off all supplies of food. He is, therefore, usually induced to adopt a passive attitude. The missionaries own two-thirds of the land, and in effect make the laws.

---

The colonial policy of another country is always interesting, and attention may be given to a discussion which is taking place in France on the economic relations with her colonies. A law of 1892 divided the colonies for the purposes of the French tariff into two groups. The first consisted of the old Colonies, which were subjected to the "demi-droit" of the French ("Métropolitain") tariff. The second comprised the newly acquired possessions which were not developed enough to permit of their being taxed in this way. The intention was to transfer the latter to the former class as and when their development permitted. But experience of some twenty years has been such as to throw doubt on the wisdom of this policy. The second group has developed exceedingly well, while the first group shows every sign of arrested growth and diminishing power of purchase.

---

A close study of the psychology of the West African negro is shown in the notes by Mr. R. F. Hunter, Director of Education in Sierra Leone, submitted to the Imperial Education Conference. The communistic sense is deeply implanted in him, and this explains many features of his social organisation, his religion and his laws. One result is that, while individually he is lacking in energy and foresight, collectively he is capable of hard work, because as one of a crowd he readily falls in with whatever is being done. "These people have a vivid idea of co-operation in production. Africans must have their leader in every action of life; even 17 bearers must have their head-boy, and the produce of labour must be divided according to the work done." "They are possessed of a strong communistic sense; each individual has his or her place in the general economy; the affairs of the community are discussed by the community, but in the circumstances the chief or the Head-man has large powers in influenc-

ing public opinion. Education does develop the individual, and to a certain extent undermines the communistic system. There are advantages in the latter, but education will tend to destroy objectionable features in it, like, for instance, a species of domestic servitude." A curious result of this characteristic is that it affects the conception of truth.

"The sense of co-operation even in the educated African seems to contend with what the European may designate the moral sense. I have observed classes of children from 7 to 16, set to work out a sum in arithmetic, at first working individually and then, unless the teacher interfered, consulting with each other over the result; on inquiry, in many cases, I have discovered that the majority of those who had attained the right solution preferred to abide by the verdict of the majority of the class rather than trust in themselves. It is not so much a matter of copying as a trust in the good sense of the many. This idea manifests itself in its most emphatic form in the tribal system." Any suggestion from a recognised authority may entirely displace personal knowledge. "If you meet children with their parents, on your evening's walk, after the day's work, in the village, and you ask them if they had been to school that day, the parents, usually the mother, ask the child 'you done go school to-day,' the answer in 80 cases out of 100 is 'I done go,' whether the child has gone or not. The question 'you done go' is equal to 'you went, didn't you,' and the physical authority of the parent imposes on the child an erroneous conception of truth."

---

This attitude of mind can no doubt be traced, partly to the difficulties and dangers of primitive life which made co-operation an absolute necessity, and partly to the empirical character of native education, which is confined to manual labour and sexual matters as explained by the elders. Clearly, the recognition of these mental habits is useful in administration. Education is most effective if it is shown at an early stage to be productive of material results, and labour can best be organised by encouraging co-operation with a fair division of the proceeds.

---

The proceedings of the Conference also include a thoughtful memorandum by the Governor of Hong-Kong on the inculcation of a high moral standard in Eastern Universities, without the compulsory teaching of the Christian religion. In such institutions the instruction must be entirely secular, and the problem is to secure the moral tone which characterises the educated Englishman who has been brought up in an environ-

ment of Christianity, even if he has renounced it as a religion. Sir F. Lugard attaches great weight to the importance of having competent English teachers. This is the point in which Hong-Kong, and the Crown Colonies generally, differ from India. In the absence of dogmatic teaching, it is personal influence which tells, and in India the proportion of British to native teachers is insignificant. It is useless in these circumstances to expect that English habits of thought in moral matters will spread. The difference in results, as between India and the Crown Colonies, is clear. The Oxford and Cambridge Colleges have taken steps to restrict the number of Indian students whom they will admit in future, and presumably they had their reasons. But no one who has had experience of native students from the Crown Colonies can say that they are distinguishable as regards their ideas or habits from English students of the same class. It may be dangerous to generalise from the comparatively small number of Chinese, Malay, and Cingalese students who come to this country, but so far as they go the results indicate that they reach a high standard in these respects, even under the exceptional strain of removal from family influences.

It may be added that it is easier to get young men to go out as teachers to the Crown Colonies, except West Africa, than it is to India. The Conference have noted that there are signs that the young men of the present day are not so anxious to make that dependency the scene of their lives as were those of a previous generation. In the Colonies there is a larger British element, and there is the chance of an appointment in the administrative service.

---

A judgment of interest to Civil Servants has been delivered by the Judicial Committee in the case of *Williams v. Giddy*, an appeal from New South Wales. Under a Colonial Act the plaintiff was "entitled to a gratuity not exceeding one month's pay for each year of service from the date of his permanent employment." On his retirement the Public Service Board awarded him a gratuity of this amount, but for a shorter period than his service, and upon being pressed to allow the whole period they did so, but for the additional period they allowed for each year, not one month's pay, but one penny. The award was contemptuous on the face of it, and seemed to import some fault in the retiring official, but there was nothing of the kind. Of course, where such an act simply fixes a certain sum as a maximum, it is plainly the intention that the Government should have a discretion as to what sum should be adopted, and in the Colonial Court there was a difference of opinion as to whether the Government, in the exercise of their discretion, were entitled

to make the sum one penny. But the Judicial Committee were clear and emphatic. Lord Macnaghten said:—

“The real question seems to be this: Did the Government, or rather did the Public Service Board, in whose province the matter lay, exercise any discretion at all as regards the Plaintiff's claim in respect of service subsequent to the 23rd of December, 1895? They have awarded seven pennies for seven years' employment, or to be quite accurate, they have awarded one farthing for every quarter of a year spent in the service of the Government, and they have thrown in an extra farthing to make even money. Well, this is not the first occasion on which seven years' faithful service has met with a recompense at once unexpected and undesired. That is probably the best that can be said for the action of the Board. But was it reasonable? Was it fair? Few would deem it a generous or handsome tribute to the work of an old and faithful servant even with the extra farthing thrown in. Plain folk would call it a mockery—a sham—a pretence. Nobody, of course, can dispute that the Government or the Board had a discretion in the matter. But it was not an arbitrary discretion as Pring, J., seems to think. It was a discretion to be exercised reasonably, fairly, and justly. The learned Counsel for the Appellant, who were not apparently in the secrets of the Government, seemed to think that the Board would have stood better in Court if they had not resorted to the artifice of a pretended exercise of discretion. It was suggested that the Board may have thought that the Plaintiff had got enough already, and that perhaps on the former occasion they took into consideration years of service beyond the limit which they thought applicable. But, if so, they did unintentionally the very thing they were told by the Act not to do. They can hardly be heard to say that they have erred intentionally in order to conceal or compensate an unintentional error. Whatever their motive may have been, whether they were resolved, right or wrong, to stick to a determination once officially announced, and to let the Service understand that nothing was to be gained by asking for a reconsideration of an erroneous decision, or whether they had some better reason which has not yet been disclosed or discovered, it seems to their Lordships to be quite plain that an illusory award such as this—an award intended to be unreal and unsubstantial—though made under guise of exercising discretion, is at best a colourable performance, and tantamount to a refusal by the Board to exercise the discretion entrusted to them by Parliament.”

The moral is that an Act must be followed substantially. The judgment illustrates the growing tendency of the Courts to decide cases on broad grounds and in accordance with common sense.

## BALLADE OF OTTAWA CITY.

Ottawa stands by her Grande Riviere,  
 As a queen in the mirror regarding her face,  
 With a beauty so proud, so stately an air,  
 That the waters must curb their impetuous pace,  
 For the pleasure of slowly reflecting her grace,  
 From the dancing cascade of the Chaudiere Fall,  
 Past pinnacled palaces high in their place  
 To the shades of the bowers of Rideau Hall.

In the hush of the dawn she awakes to her care  
 (As the sun from his chamber steps forth on his race),  
 For the forests, lakes, prairies and mountains so fair,  
 Of her people bespreading a continent's space;  
 And her thought travels on in its circuit to trace  
 The vision and scope of her national call;  
 An Empire united in world-wide embrace,  
 With its heart in the bowers of Rideau Hall.

When the curves of the hills their glory declare,  
 In the flush of a sunset that nought can efface,  
 The soul of her past we once again share,  
 That thrilling romance at her history's base,  
 Of the brave with a tomahawk scalping apace,  
 In defence of his squaw and papoose in a shawl,  
 And with arrow and spear slaying beasts of the chase,  
 In their lair by the bowers of Rideau Hall.

*Envoi.*

Earl, by your favour, for six days' space,  
 I was guest in the bowers by river and fall,  
 For the pleasure of slowly reflecting their grace;  
 'Tis the hour for adieux to Rideau Hall.

H. W. J.

## LAND AND LABOUR LAWS IN NEW ZEALAND.

*State Socialism in New Zealand*, by J. E. Le Rossignol, Professor of Economics in the University of Denver, and W. D. Stewart, Barrister-at-Law, Dunedin (George G. Harrap and Co., 5/- net).

*New Zealand Official Year Book, 1910* (Eyre and Spottiswoode).

---

In social and economic legislation, New Zealand has in recent years set the pace. It has enormously influenced this country. The policy pursued is not that of socialism as that many-sided term is usually understood. It does not aim at securing property for the State, but at giving larger opportunities to all of acquiring property for themselves. The land legislation, though often denounced as socialistic, has actually produced results quite opposed to the socialistic idea by putting great numbers of people in possession of their own land. The movement has not been against capital. There has been no serious agitation for an increase of the income tax. The mischief attacked was the concentration of the land in a few hands. It is rather curious that a young country should be troubled, to a much greater extent than old countries, with the land problem. This problem is largely due to the climatic conditions. In a large part of Europe and of North America the severity of the winter operates against large holdings. A man has only a short season for agriculture, and in winter he must house and feed his stock. In Australasia, owing to the mildness of the climate and the character of the soil, sheep raising was more profitable than agriculture, and sheep-raising is most successful when carried out on a big scale. The result was that the small agriculturist was shut out. The Year Book puts the matter thus:—

“ In the earlier years of the settlement of New Zealand there

were opportunities for men of capital and judgment to acquire large estates, and while there were plenty of good Crown lands to select from this was of great advantage when money was needed for administration and roads and bridges. These large estates employed hired labour, and most of them did little towards cultivating their lands, and consequently progress beyond the pastoral stage ceased in the districts in which they were situated. As the best lands in the course of years passed from the Crown, the country became a series of agricultural communities interspersed with large properties occupied by a manager and a few shepherds, and the people urged that they and their sons should be allowed to occupy these large estates instead of being compelled to go into inaccessible back country without roads or railways."

The consequence was that large areas were originally granted under lease for pastoral purposes. Then the holders proceeded to agitate for perpetual leases or the freehold. The result goes to suggest that the retention of state ownership of land with the grant of leases, is not altogether advantageous. It creates a class which will use its strong political influence to obtain further concessions. The objects of the State are more conveniently obtained by the taxation of land values, which can be arranged to discourage very large holdings if that is desired. The legislation of New Zealand has recently been on this line. The Act of 1908 comprised an ordinary land tax, a graduated income tax, a tax on absentee owners, and the total exemption of small properties and owners. The ordinary tax is assessed on the unimproved value (which, as this country has now learnt or is trying to learn, is not the original value, but the original value plus "community" value) and is 1d. in the pound, while the graduated tax begins at  $\frac{1}{8}$  of a penny and increases till, in the case of estates over £200,000, it reaches 2½ per cent. It is clear that such a tax will effectively break up the big estates. If the owner is an absentee, the graduated tax is doubled. The result will be that the country, instead of remaining a thinly populated sheep-run, will become a closely settled agricultural community, and the drastic measures which have been taken to bring this about can, of course, be better defended in the case of a country where the ownership of the Crown is more recent than where it has been obliterated by centuries.

The rating of unimproved values for the purposes of local taxation in New Zealand is left to the option of the local authorities. Where it is adopted the valuation roll is supplied to them by the Valuer-General. The system, of course, favours those holders who own improvements which are relatively greater in value than the unimproved value, as they get a reduction of

their taxes. The opposite class suffers, but as land values have almost everywhere gone up, there is not much ground for complaint. The system operates to shift such industries as suburban dairies and market gardens further afield, and this causes hardship in some cases. The Imperial Government took considerable interest in the example when a similar system was being considered, and in 1906 it requested information as to its working. The district replies varied considerably, but on the whole they were in favour of the system. Certainly, in many parts building has been greatly stimulated by suburban land being broken up and brought on the market, and this operated to reduce rents. Land values have risen greatly notwithstanding the tax. The authors of *State Socialism in New Zealand*, however, are not disposed to admit that the policy is a proved success. "The benefits of rating on unimproved values," they observe, "are not so obvious as to command unanimous approval or to persuade all the rating districts to adopt it without delay. The opposition to the system appears to be growing stronger as the people are coming to recognise its relation to the propaganda for the single-tax. The small farmers like to shift the burden of taxation from their own shoulders to those of their wealthy neighbours, but they do not enjoy the game when they are on the losing side. They are strong supporters of freehold tenure, and will not readily consent to have their property confiscated by any radical extension of the principle of the single-tax.

"The growing political power of the labouring class, for whose benefit much of the recent legislation of New Zealand has been enacted, may ultimately bring about the nationalization of land, but surely not until the Dominion has become an industrial nation, rather than a pastoral and agricultural community as it is to-day. Up to the present time the effects of rating on unimproved values have been insignificant. The most notable feature of the system is the shifting of the burden of local taxation from one class of taxpayers to another. It is an interesting phase of the tendency which prevails in both New Zealand and Australia towards an equalization of wealth by means of a legal transfer of the property of the wealthier classes to the pockets of their poorer neighbours. How far this process will go it is impossible to foretell, but that its ultimate results will be beneficial to the majority of the people is by no means certain."

These remarks do not, we think, sufficiently take into account the historical origin of titles to land and the manner in which the early grantees took advantage of the Crown. The original regulations were apparently designed with a view to the creation of small holdings. But the object was defeated by various

devices. How this was done is admirably explained by the authors in another place.

“In the South Island the wide fertile plains of Canterbury offered a tempting field for pastoral life. On these plains occurred the most classic examples of land grabbing that New Zealand has seen. And yet, the early land regulations seem to have been expressly designed to prevent the creation of large estates. The public lands of Canterbury were originally opened for sale at £3 an acre, later at £2. The purchaser selected and applied for his land, and, on payment of the price, received a license to occupy. The land was then surveyed and a Crown grant was issued. The price was high as compared with the price of land in other parts of the Colony, and was expressly designed to insure close settlement, in accordance with the Wakefield policy.

“How then was it possible to acquire large holdings? The explanation lies in the fact that until land was purchased from the Crown it could be rented for pasturage purposes at a nominal rental of £1 per 100 acres. A tenant pasturing sheep under these licenses held the land subject to the right of any settler to select and pay the Government for any part of it, whereupon the sheep farmer's license ceased as to that part. His occupancy was intended to be temporary, and subordinate to the claims of the farmer when the farmer should arrive.

“But the wishes of the sheepfarmer by no means coincided with the intentions of the founders of the province. It was not long before a limited number of squatters held immense areas—indeed, all the best lands of the province—under licenses to depasture. They next directed their efforts toward retaining possession without purchasing the land. In this they succeeded to a large extent, as is shown by the great holdings in Canterbury, which have descended to the present generation like the lands of the great county families in England.

“The methods adopted were as various as they were ingenious. For example, for each shepherd's hut they received by law what was called a pre-emptive right over 50 acres besides a homestead pre-emptive right over 250 acres. For every 38 1-2 chains of wire fencing erected they received a pre-emptive right over 50 acres. The squatter was thus granted the first right to buy the areas in question, but without being compelled to do so for a number of years, so that by running sub-division fences up all the watered valleys and across all open flats nearly the whole ranch could be secured against purchase by outsiders.

“‘Gridironing’ consisted in buying a series of 20-acre sections so surveyed as to leave 19 acres unbought between each two sections bought; and as no one could buy less than 20 acres

without going to auction, the alternating 19-acre sections were left to be occupied by the runholder.

“ ‘Spotting’ consisted in buying small sections of from 20 to 100 acres so as to include all the available creeks, rendering the adjoining ridges secure from purchase owing to lack of water. A close watch was kept on strangers, and if it was supposed that they desired to purchase any piece of land, the runholder sent post haste to the land office and forestalled them. One writer has said that ‘a man wanting a bit of land had to take as many precautions as he would in Scotland to stalk a stag in a well-preserved deer forest.’ A settler was looked on as an intruder and a mean fellow, if he outwitted the runholder and secured a piece of land which the latter was supposed to occupy merely pending closer settlement. When a ‘cockatoo,’ as the small settler was called, managed to secure land, the runholder took care to leave a narrow strip of land between their holdings so that the whole cost of fencing must be borne by the ‘cockatoo.’

“ For a long time the political power was in the hands of the large landholders, who made the laws and spent the public funds on roads which fronted their lands. In some ways they encouraged immigration, but were unwilling to cut up their estates and sell the land to small farmers, even at a high price. They had the English idea of building up a great landed estate and founding a family.”

When these memories are fresh and recent, it is surely not surprising if counter measures are devised, and there is no need to conclude that the majority of the community have declared war on capital. As a matter of fact, the taxation policy has had little effect in the direction of equalising the distribution of wealth, as is shown by the Year-Book's return of the value of the estates of deceased persons. A bad system creates discontent; reforms remove it. A large class is growing up of small but prosperous farmers, whose influence is now on the side of the sanctity of private property.

The other features of New Zealand policy, which are spoken of as having a Socialistic character, might indeed be defended on the ground that they are calculated to fend off Socialism. The case of the railways is in point. Probably they have not until the last year or two paid the charges. But development, and not profit, was the object. The big landowners were the loudest advocates of State Railways and low rates. More prudence and restraint is shown in these days when the balance of power has shifted to a larger class. It is admitted that the railways could be sold for at least what they have cost, and the State ownership has undoubtedly contributed enormously to the present prosperity.

The Arbitration Act has been severely criticised as unduly hampering employers. On the other hand it is regarded by the more radical workers as an instrument of capitalism to keep the working class down. There are means of evading the Act, and they have been used successfully by bodies which have gone on strike. But on the whole the policy has been successful. It is the more conservative among the working classes who support it. They have a great stake in the country through the systems of insurance and pensions, and the provisions for permanency of employment and fair wages, and they realise that they have lost more by strikes than by arbitration. Employers, too, are more and more disposed to abide by the Act, and there is every prospect that, despite occasional failures, it will be a great instrument for good. As time proceeds the decisions lead to a more static condition, and the risk of outbreaks becomes smaller.

No complaint can be made of the advances to settlers and to workers. Both systems have done much good and are economically on a sound basis. The life insurance has admittedly been on fair lines; the fire insurance rates have, perhaps, been too low, and the private Companies bitterly resented them, but the premium income is rapidly increasing, and lately there has been a profit. In one article—coal—the State has itself carried on an industry. The object was to reduce the price when it was exceptionally high, but the State's price was not intended to discourage private enterprise, and has not had that effect to any serious extent.

The final chapter in Messrs. Le Rossignol and Stewart's book is devoted to a general survey and estimate of results, and is more favourable than was presaged by the preceding chapters.

“As to State insurance, State ownership of coal mines, and other forms of State trading, while their utility is questionable, they cannot be shown to have done much harm; and if in the future they are conducted on sound financial principles they will not drive private enterprise from the field, but will do only a part of the business and operate as a check upon the fixing of extortionate prices by private combinations of capitalists. The only danger is that the Government, under pressure of public opinion, may sell products and services at less than cost, ruin private business and establish monopolies in these and other fields of production. But the Government cannot afford to carry on business at a loss, and there is no general demand for the further extension of governmental functions; for many people think that it would be well to wait until the success of the various State experiments is assured before trying any more.”

There are no indications that the State contemplates any in-

cursions into the realm of trading. Insurance is hardly within the term, and the coal-mining was undertaken in very exceptional circumstances. There is no prospect of the State endeavouring to exploit those assets which are usually left to private enterprise.

We would add that *State Socialism in New Zealand* is clearly written, and is full of evidence of care and thoroughness. The last example of legislative enterprise, the "National Provident Fund Act, 1910," which anticipated Mr. Lloyd George's recent scheme, does not come within its purview.

## THE ENCOURAGEMENT OF AGRICULTURE.

In our July number, last year, we referred to the proposal to establish Agricultural Banks in Ceylon and to the Indian practice, and the subject is being discussed in many other places where agricultural developments are kept back by want of capital. It is a universal fact that men are willing enough to farm if they can get a little help, but if they have to pay a high rate of interest they must struggle hard to make a living. The security which they can offer is, however, usually sound, and justifies special methods. There are now many established cases in which the agricultural credit system has been financially successful and has greatly stimulated production. In Australasia there has been considerable experience, the policy being a general one. The limits of the advance vary from £800 in Queensland, to £5,000 in South Australia, and the interest charged from  $4\frac{1}{2}$  to 5 per cent. The security is a first mortgage, and the advance is restricted to a proportion of the improved value which varies from one-half to three-fifths. Repayment is to be made in 25 to 42 years. The Banks or Boards making the advances are practically Government Departments, but the form varies; thus in Victoria the management is vested in the Sinking Fund Commissioners; in New Zealand there is a Government Advance Department, and in other States there is a State Bank with statutory powers of raising money. The first matter to look at in considering the results of the policy is the extent to which the repayments due have been made. In this respect the Australasian experience has been very gratifying, the failures being extremely few and unimportant, and even in the rare cases where farms have had to be seized and sold, no appreciable loss has been incurred. But obviously the success of this method depends mainly upon the prosperity of the agriculture of the country. In Australasia this has been very great, as is shown by the great increase in the exports of agricultural produce.

The thriving settler has no great difficulty in paying interest and instalments. It would be rash finance to lend money on the large scale adopted in Australasia on agricultural undertakings of a dubious character. The State must make sure that it has good security, and this depends not merely on the ratio of the amount lent to the nominal value of the land, but on the prospects of the undertaking. It is also essential that the farmers as a class should be honest, and should appreciate the character of the transaction. In some cases advances are made on a stereotyped plan and without much enquiry into personal considerations; thus in Western Australia the Government Agricultural Bank advances up to £400 without any security except the land, upon which the settler has paid 3d. an acre. But the necessary conditions are amply satisfied in Australasia. Then in New Zealand, by the 31st March, 1910, the capital advanced (in a period of five years) was £9,343,660, of which £3,680,686 had been repaid, and the overdue payments were only £4,659 for instalments, and £18,189 for interest. The cost of management was 0.15 per cent., and in the year ended 31st March, 1910, the net profits were £41,833. The weak point in the Government system is that political influences may be brought to bear on the management, even though the officials are nominated by the Governor. Then it is said that in Queensland the Labour Party are not satisfied with the operation of the Agricultural Land Bank, charging the Trustees with a want of sympathy with farmers. Naturally the party that lends and the party that borrows look at the matter with different eyes. But amongst an intelligent population things are not likely to go far wrong. There is no doubt that the system has stimulated agricultural production remarkably. It is the universal opinion in Australia that the great developments of recent years have been mainly due to it. As constituting a Government investment, it goes hand in hand with Government works helping agriculture. Vast areas in Australia will grow almost anything if given water, and this prime requisite is being provided and sold to landholders by Government, at prices which make irrigation in Australia probably the cheapest in the world.

The continental or "Raiffeisen" method has the same object, but is on a quite different principle. Raiffeisen was mayor of a Rhine province where the peasant proprietors were largely the prey of Jewish usurers. He induced nearly all of them to form an unlimited liability society for the purpose of borrowing money on the joint credit and lending it at reasonable rates. The strength of this system consists in the unlimited liability. Capitalists and bankers are willing to lend money on this security, knowing that every precaution is taken to ensure

that money advanced shall be properly employed. The safety of the system depends on close supervision of the borrowers. Each association consists of a small number of members, resident in the same district, and knowing one another personally. In the early cases the borrower had to find someone to go bail for him, but this is not an essential characteristic. The association is so strictly local that the members know one another's circumstances, and keep a watch on one another's proceedings. The direct interest which each has in the fund and the administration is found in practice to strengthen individual energy and encourage a healthy condition. Both the social and the economic results are good, and the small peasant who has lived in isolation and ignorance is raised to a position in which he takes a large interest in public affairs and becomes accustomed to the responsibilities of practical administration. Financially the system works well. The association has no inducement to go beyond its legitimate business or to seek for new outlets. When the work of the district is accomplished it is usually wound up. This method is well adapted to districts where small culture is practised, but it requires the presence of a few educated men who will explain the idea, obtain support from the banks, and keep the accounts. But the very local and limited nature of the undertaking makes it unnecessary to have such skilled management as has been found necessary for ordinary co-operative societies. So the cost of administration is trifling.

Another method is in existence in which each member must take shares and his liability is limited to them. This seems more in accordance with commercial principles, and has the advantage of raising an initial capital. But it loses the backbone of the Raiffeisen system. If you abandon the features of unlimited liability you abandon the necessity for care and watchfulness. The lending of money is not watched when each member's liability is limited to a trifling sum as it is when the liability is unlimited. The element of family interest in the concern is gone. The reason why many continental associations have shares is that the German Government insisted on it, but the associations usually make them practically nominal.

It will be seen that the Raiffeisen system is only suited to small areas and small proprietors. It would be impracticable in those Colonies where the population is widely scattered and composed of different races. In such places the close knowledge and feeling of fellowship, which are essential conditions, are not to be found. But there are numerous places where they are to be found, at any rate, with proper encouragement, and without imparting an official character to the undertakings, Government officials could do much to initiate and supervise them.

The Raiffeisen system has been closely followed in India, with the addition of an initial Government advance and of an official audit, and the results are extremely satisfactory. The Government advance is imperative where there are no banks in the field, and the logical result is the Government audit, but the advance should be limited and designed only to encourage the formation of the association.

The case of the advances made under the Hurricane Loans Laws of Jamaica (1903) is very useful as showing the results of a system which was introduced for a special occasion but which might be the foundation of a wider application. There local committees were formed whose function was to advise whether repayment could be made and to see that the money was properly applied. It was found that persons of good standing were willing to serve on these bodies, and the work was well and carefully done. Theoretically, the plan was not so good as the Raiffeisen. It involved the Government in some financial liability; it did not make repayment so secure; it excluded the poor men who were known only to their fellows. It was necessary under the circumstances, as there was no time to build up the co-operative system, and the results were distinctly encouraging for a plan of a permanent character more akin to the Raiffeisen. In British Guiana, on the other hand, the scheme proposed last year by a Committee of the Combined Court was entirely of the Government order. The Committee felt the difficulty of securing co-operation and raising capital, and accordingly recommended the formation of a Bank as a Government institution. They suggested that loans should only be granted on approved security, though they realised that some persons desiring assistance might find it difficult to furnish it, and that the services of the Village Councils and Local Authorities might be utilised for obtaining information for the assistance of the Board of Management. The large areas and mixed population of the Colony, no doubt, make the Raiffeisen system impracticable, and the liability to both floods and severe drought put purely local schemes out of court. In Grenada, on the other hand, a recent committee recommended the system of Government advances to local societies in preference to the establishment of a Government Bank. "We have given," they said, "the proposals put forward on this subject the most careful consideration, for we believe the formation of a people's land bank would be productive of a great amount of good, and would lessen if not do away with many oppressive burdens on landowners with insufficient capital. The experience of the Government in the sale of land for unpaid taxes, in which instances frequently occur of valuable lands remaining unsold,

or being sold for insignificant sums, convinces us that it would be extremely undesirable for the Government to undertake to run a Land Bank. We see no reason, however, why the Government should not advance funds to local credit societies established on the principle of mutual unlimited liability of the members. It is this principle which is the secret of success in all the people's land banks in all the countries of the world where they have been established and are flourishing. This safeguard against the improper advancing of money is in our opinion as essential in Grenada as in any other country. The absolute security thus afforded to investors attracts money at a lower rate of interest than can be secured by almost any other organisation, and the members of the bank thus obtain the maximum benefit from their co-operation."

A more advanced form of Government encouragement is the purchase of estates and a scheme of land settlement under which the purchase price is spread over a number of years. This policy is suitable, generally speaking, to the great population of the West Indies, and at a critical period, intensified by a destructive hurricane, it was acted on in 1897 in St. Vincent. An Imperial grant-in-aid of £15,000 was expended on the acquisition of land, and plots were sold on payment of 25 per cent. of the valuation, the remaining instalments being spread over 12 years. The scheme has been a financial success, and is being extended. This plan is especially suitable when, as in the West Indies, the Government can give instructions as to the products and work of cultivation, as in this way it can ensure that the land is suitably worked.

The operations of an Agricultural Bank may extend beyond advances to settlers, and embraces schemes for the general benefit. Then supplies of necessaries may be bought more cheaply by a central body, and in Barbados it is now proposed that the Agricultural Bank should raise the money acquired for a Central Factory and undertake its management. These branches of business are or may easily become somewhat speculative, and are outside the ordinary character of such a bank; in this country and on the Continent they are undertaken by separate co-operative bodies; but in undeveloped countries where co-operation is not easily arranged, such extensions of operation may be quite legitimate. It is now proposed in India to provide, by an amendment of the law, facilities for co-operative purchasing and production.

In this country the Board of Agriculture has a scheme for the establishment of Agricultural Credit Banks, which, it is understood, will receive the support of the ordinary banks, and will not require a Government guarantee in the first instance.

## THE RHIO AND LINGGA ARCHIPELAGO.

The information that the Sultan of Lingga-Rhio and Dependencies, together with his heir presumptive, has been deprived of his rank and honours must have been received with great interest in the Straits Settlements and especially at Singapore, where a brisk trade is done in the products of the neighbouring islands and, consequently, the putting of the Lingga-Rhio house in order is a matter for congratulation. The story of this new *roi en exil* revives the memory of centuries of strife between the Portuguese, the Dutch, the English, the Malays and, last not least, the Bugis, an incessant battle for supremacy in that island-studded sea of contention until the Dutch settled permanently at Tanjong Pinang and Sir Thomas Stamford Raffles founded the rival city, which was to become, and has become, one of the world's chief emporia. It is here that British and Dutch Malaya meet, a week-end at Rhio giving a pleasant diversion to the inhabitants of Singapore, and *vice versa*, nothing being more marked than the contrast between the hustle and bustle of Tanjong Pagar, Johnston's Pier, Collier Quay and Commercial Square on the one side of the Straits, and the drowsy *aloon aloon* on the other.

The Residency Rhio and Dependencies comprises, besides a slice of Sumatra, more than a thousand islands and islets, most of them still *terra incognita*, scattered *banjaknja segantang lada*, to quote the Malay saying: as many as there are grains of pepper in a *gantang* (a measure of about  $8\frac{1}{2}$  liter), over a surface of water 900 kilometers long by 840 kilometers wide. The population consists, at a rough estimate, of some 200 Europeans, 22,000 Chinese, a few Arabs, some 400 Cingalese, 80,000 Bugis and Malays. Many of the islands are not inhabited at all, others exclusively by Chinese, by Malays or Bugis, who generally keep close to the beach and whose more capacious dwellings are distinguished not only by sculptured ornament, but often, illustrative of their origin, by the roofbeam cut in the form of a ship's prow, or by vanes shaped

like their coasting vessels or fishing boats. Politically, Rhio with its dependencies is divided into the Government domain and the two vassal-states, Rhio-Lingga, and Indragiri, the latter on the main land of Sumatra. Under direct Government control are the territories Reteh, Gaoong, Igal, Mandah, Kataman and Danei of Indragiri, the island Bajan and the settlement at Tanjong Pinang. The island Loos belongs to the missionary society of Rotterdam which, however, has abandoned it. For purposes of administration we have the division in Lingga under an assistant-resident at Buton; Tanjong Pinang under a contrôleur; Basam under a contrôleur at Boyan; Karimon under a contrôleur at Tanjong Balei; Pulau Tudjuh under a Chinese lieutenant at Siantan; Indragiri under a contrôleur at Rengat. Lingga includes, besides Lingga proper, the island Singkep and the surrounding islets which produce principally gambir and pepper, mostly, if not all, exported to Singapore. The edible birds' nests of Saya are of high repute among Chinese gourmets. Salaya is known of old for its weapons, its cunning workers in iron, one of the mineral assets of the archipelago, with gold (found in Jamaya), antimony (found in Sirhasan), etc. Singkep yields tin in abundance and, thanks to the Singkep Tinmaatschappy, which, like the Billiton Company in the island of that name, exploits the wealth of this island in private enterprise, while the tin mines of Banka are a Government concern, it has been thoroughly explored; in fact, it is the only one of the Rhio and Lingga groups so far mapped out with something approaching to accurate topography.

The struggle for the mastery of those fine islands covers a very interesting, but too little known, chapter in the history of the relations between East and West, and is intimately connected with the past and the present of the Straits Settlements and the Federated States of the Malay Peninsula. In the early years of the 16th century the Portuguese cast longing eyes on Malacca, which became an apple of hot discord between them and the Dutch, the Malay potentates also being perfectly aware of its strategical value as the key to the waterway dividing their dominions in Sumatra and on the continent. The Portuguese took it in 1511; the Dutch took it from the Portuguese in 1641, with the assistance of the Sultan of Johor, a descendant of Sultan Mahmood who, when the Portuguese became too troublesome for him even in Bentan, had removed his capital to the South, out of their reach. After 1680 we find the Sultans of Johor rather restless, occasionally residing at Rhio, in consequence probably of their wars with Jambi. And Rhio was the residence of the usurper Abdul

Jalil Rajat Shah in the beginning of the 18th century, when the Bugis appeared on the scene, members of the widely spread Malay family, but quite distinct from the Malacca Malays. Sailing from their home in South Celebes to seek spoil and adventure in distant lands, they devastated the coasts of the Sunda islands as the Normans before them had plundered and made the red cock crow along the coasts of western Europe down to the Mediterranean and equatorial Africa. The full history of those intrepid "tigers of the sea" is still to be written, and the more pity that the late Dr. B. F. Matthes, our highest authority on their language, on the habits and customs of their descendants, whose country he knew so well, never put his hand to a work of the kind. Buccaneers *de primo cartello*, they established themselves in the Rhio-Lingga Archipelago as conquerors and developed a statesmanship of no mean order. They deposed Abdul Jalil Rajat Shah in favour of his son Suleiman, whom they gave a Viceroy of their own nationality, Daeng Cambodja, real ruler of the Sultanate.

The vicissitudes of Buginese power, with the Dutch East India Company intervening on the *divide et impera* principle, now inclined to uphold the authority of the Sultan and then again to back his masterful seneschal, might fill many a page of thrilling intrigue, terror and bloodshed. To be brief: Raja Ali, son and successor of Daeng Cambodja, sought and obtained the Company's protection against Raja Haji, another Bugi of noble birth who, after leading his gang of freebooters in several expeditions to the Malay Peninsula and the West Coast of Borneo, had assumed the viceregal dignity without worrying much about the consent of the then Sultan Mahmood, like his father a puppet in the hands of successive Buginese *maires du palais*. A force, sent out from Batavia, succeeded in defeating him, June, 1784, near Telok Katapang; he was killed in the engagement and Raja Ali reinstated. When van Braam, the commander of the victorious flotilla, began to treat directly with the Sultan, Raja Ali, however, turned against him and, the Dutch flag being hoisted at Rhio, this opposition resulted in the breaking of Buginese influence by the stipulation that the office of Viceroy should never more be occupied by a Bugi. Conquered Johor was henceforth considered a vassal-state of the Company, which erected a fortress at Tanjong Pinang and appointed a Resident to advise the Sultan in all matters of foreign policy—the fear of increasing British activity in that corner of the world may also have entered into the counsels at Batavia which prompted this settlement. Raja Ali, who had fled, offered his quasi-sovereign to free him from Dutch tutelage and in 1787 Tanjong Pinang was attacked by men of Solok in

his service. The garrison capitulated and withdrew, but in 1788 the Company's soldiers landed again in Rhio which they found deserted, both by the Sultan, who moved from island to island, and by his allies from Solok. After new feats of arms and new three-cornered negotiations between the Company and the leaders of Malay and Buginese interests, Sultan Mahmood was restored to the throne with his residence at Lingga, and Raja Ali to the viceregal rank and honours with his residence at Penjengat, just opposite Tanjong Pinang. When the Malay Archipelago returned to Dutch rule in virtue of the Treaty of London of 1814, Mahmood's son, Abd'arrahan Shah, was Sultan and Raja Ali's son Jafar was Viceroy. When the Dutch government renounced its claims to the Malay Peninsula in virtue of the Treaty of London of 1824, the former had consequently to renounce his claims to the part of his realm situated on the main land and since then, leaving Johor out, he and his successors have called themselves Sultans of only Lingga and Rhio and Dependencies, subject to orders from Batavia and Buitenzorg where their Viceroys or *raja's muda* were chosen from among the Buginese nobility, preferably scions of the house of Daeng Cambodja.

Things went well until Sultan Mahmood Muhtafar created difficulties at the death, in 1844, of the then Viceroy. He wished to abolish the charge, but his obstructive attitude tended on the contrary to the reduction of his own prerogatives by the ruling, when the appointment of a successor took place, in 1845, that the Sultanate should be governed from Penjengat, not from Lingga, which was another victory scored by the Buginese party. More trouble followed by Mahmood Muhtafar's meddling in the affairs of the Malay Peninsula, against the agreement of 1824, and British complaints thereanent led to his deposition in 1857. Repairing to Sumatra, he put himself in relation with Panglima Besar Suloong, chief of the Solok pirates, after whose dispersion he sought refuge with and died among his Malacca friends in 1864. These events induced the Dutch Government to revise the old contract with their vassal at Lingga, and on that concluded with Sultan Suleiman, who succeeded Sultan Mahmood Muhtafar, all the following ones have been founded, though revised again and again to suit new conditions, in always narrower limitation of the native rulers' ancient rights, as customary in agreements with independent and semi-independent or dependent princes and princelings. The Viceroy Muhamad Yoosoof, meanwhile, had shown himself more and more restive in his subordinate position, intriguing for a separation between the Lingga and the Rhio group, of which latter he aspired to become the sole master, discarding

even the fiction of a supreme lord at a distance. Plots and counter-plots took an unexpected turn at the demise of Sultan Suleiman in 1883, no eligible heir being available. The oldest son of the Viceroy, Muhamad Yoosoof, was made Sultan and invested on February 18th, 1885, under the name of Abdul Rahman Maadlam Shah. This preferment of a Bugi to the Sultanate, regardless of the claims of the descendants of Abdul Jalil Rajat Shah, the *anaks raja* of Singkep and other claimants, regardless also, it must be said, of treaties and promises, terminated the Malacca Malay dynasty to the intense discontent of the Malays *par excellence*. Persevering Buginese diplomacy had at last attained its goal and the anomalous situation of Muhamad Yoosoof at Penjengat, acting as *jang di pertuan muda* for his son, the Sultan at Lingga, came to an end in 1899 by the former's death. Ali Kelana, a younger son of the last incumbent, renounced his claims to the viceregal dignity and Sultan Abdul Rahman Maadlam Shah was invited to remove to his late father's *astana*, nearer the watchful eye of the Dutch Resident.

During the long negotiations which preceded the substitution of the old contract of 1857 by a new one, a strong party, composed of the native nobility, had caused a good deal of obstruction. Their interest was bound up with the vicious conditions which the Government tried to ameliorate. Sultan Abdul Rahman Maadham Shah, succumbing to their influence, wavered continually in sanctioning the implied reforms, in several instances went back on his word, given at his investiture, and neglected on occasions of gala to hoist the Dutch flag, forgetful of his obligations. Severely reprimanded, first by the Resident and afterwards by the Governor General at the audience granted to him when he had asked permission to travel to Java for a personal explanation, he consented at last, May 18th, 1905, to sign the new contract. This agreement, however, was not based on the principle of distinction between the personal income of the Sultan and the assets of the Sultanate, in other words, on the institution of a civil list apart from the revenue reserved for public works and, generally, for improvements planned to benefit the Sultan's subjects, in accordance with the contracts signed by or in preparation for the independent and semi-independent princes of the East Coast of Sumatra. The Sultan's desire to have his favourite youngest son, Tengku Umar, designed as Tengku Besar or heir presumptive, was used to make him approve of the proposed changes, at least to give them his consideration. But the party in opposition to the Government began to get the upper hand in the counsels at Penjengat, where they found a willing instru-

ment in Tengku Umar, while the Sultan himself revealed his recalcitrant disposition by neglecting again to carry the Dutch flag in April, 1910, when travelling in his motor-boat, and to hoist it, in May, 1910, when entertaining the Raja of Trengganu at Daik. Admonished by the Resident de Bruyn Kops, he not only apologised, but promised to sign the amended agreement, and actually did so, October, 1910, in the presence of the Resident and other Dutch officials, assembled for the purpose with the native dignitaries of the Sultanate. Yet, two months later, December, 1910, when steaming from Tolop to Penjengat, the Dutch flag was absent once more from the masthead of the *Sri Daik*, on board of which he made the voyage. The Resident having requested him to order the Amirs of Reteh, Gaoong and Mandah to appear on a certain day at Renget, he ordered them, on the contrary, to repair to Penjengat, etc., etc., a long list of delinquencies and acts of contumacy, which showed that, instead of obeying the Dutch Government as a faithful vassal, he rather made himself the tool of Raja Ali, Raja Hitam and Raja Abdulrahman Ketjil, ring-leaders of the faction hostile to reform, reason why the Governor-General of the Dutch East Indies saw fit, by resolution of February 3rd, 1911, No. 1, to depose him from his rank as Sultan of Lingga-Rhio and Dependencies, at the same time abrogating the resolution of May 17th, 1908, No. 5, by which Tengku Umar, his third legitimate son, had been acknowledged as his future successor, under the title of Tengku Besar.

When the resolution and the warships, sent from Batavia to enforce its contents, arrived at Rhio, the Sultan happened to be at Lingga, while his son Umar, the Tengku Besar, was at Penjengat. Both, having been summoned to Tanjong Pinang, failed to appear; the former excused himself on the ground of bad weather and a contrary wind, the latter on the ground of illness. Meanwhile, troops were despatched from Tanjong Pinang to occupy Penjengat, and a contrôleur, accompanied by a detachment of thirty men, went to Lingga, carrying a letter from the Resident to acquaint the Sultan formally with his deposition. Everything remained quiet, peace was nowhere disturbed, and when his Highness at last repaired to Penjengat, the Resident having crossed from Tanjong Pinang to meet him, he received oral confirmation of the message from Batavia, delivered the insignia of office and left shortly after with his whole family for Singapore. There he complained in a letter to the *Straits Times* that the Dutch Government had tried to impose upon him in the matter of still another new contract, the one laid before him for his signature on December 26th, containing stipulations, he alleged, quite different from

those he agreed to, being calculated to deprive him of all his power. Asking for less onerous terms, the only answer had been his deposition, which he ascribed to the desire of defrauding him of his revenue from the tin mines in his dominions and valuable agricultural concessions. Concerning the succession, the Government at Batavia wished to substitute one of his grandsons for his son Tengku Umar as heir apparent, but he refused to confide the child to the care of the Dutch officials.

However this may be, the change from Malay to Buginese sway in the name as well as in the deed, has evidently not resulted in the expected improvement either in the mutual relations between the Dutch Government and the Sultanate or in the status of the native population, demoralised by centuries of spoliation, harried and oppressed by their chieftains, Buginese and Malay, among whom, except those already named, the expelled Tengku Mahmood made himself conspicuous, like Tengku Ali, a brother of the Sultan, who resided at Singapore where he, the Datu of Siantan, the *raja's* of Pulau Tudju, etc., spent with a free hand what money their agents exacted from their serfs in the islands. Every step taken to rescue these people from the bondage of Sultans and Viceroys, each with a numerous train of unscrupulous relatives, *anaks raja* and other dependents, to bring them under direct control of the Government, is a step towards the betterment of their lot, towards the development of the resources of the Rhio and Lingga Archipelago, towards the increase of shipping and trade. The tardy act of the Dutch Government, punishing Sultan Abdul Rahman Maadlam Shah for his violation of the agreements entered into and his defiance of Dutch authority, depriving him and his heir presumptive of their respective ranks and honours, means something more than the satisfaction of Malacca Malay versus Buginese pride. It means, apart from the natural inclination of the Malays of bluest blood to regard the failure of Buginese overlordship as a visitation for the iniquity of sacrificing Malay rights to Buginese presumption, that a wide region is gradually reclaimed from mismanagement and lifted to a higher plane of progress and prosperity, which must redound to the good, not only of the Dutch East Indies, but also of the neighbouring colonies.

J. F. SCHELTEMA.

**BRITISH GUIANA UNDER DUTCH RULE.\***

The preparation of the British case in the arbitration proceedings, first with Venezuela, and afterwards with Brazil, by which the present frontier of British Guiana were determined, involved a vast amount of historical research most painstaking in character, and most fruitful in results. English, Spanish and Dutch records were ransacked and much previously unknown material was brought to light. But the mighty volumes in which the results of all this labour are enshrined are not within the reach of the ordinary reader. Even the student who has access to one of the few libraries in which they are to be found may well be appalled at the vast mass of material presented to him. Mr. Harris and Mr. de Villiers, to whose labours the satisfactory outcome from the British point of view of the two arbitrations above mentioned was very largely due, have done well to present to a wider, though still somewhat restricted, circle of readers this sample of the historical discoveries which were incidental to their official labours.

Laurens Storm Van's Gravesande well deserves a place of honour among the worthies of the British Empire, for their number is not to be restricted to those who actually served the British Crown. Canada still takes pride in Champlain, Frontenac and Montcalm; South Africa in Van Riebeck, Piet Retief and Brand. British Guiana may well rejoice in the reawakening of the memory of a son who served her well and truly under the Dutch flag. Born in 1704, at 's Hertogenbosch in Holland, he went out to Essequibo in 1737 in the service of the Dutch West India Company as secretary and book-keeper, though his previous service had been in the army. Five years later he became Commander, a position corresponding to that of Governor at the present day, and which was subsequently

---

\* *Storm Van's Gravesande: The Rise of British Guiana.*—Compiled from his despatches by C. A. Harris, C.B., C.M.G., and J. A. J. de Villiers, of the British Museum. Two Volumes. Printed for the Hakluyt Society.

enhanced in dignity by the change of the title to that of Director-General. He continued to hold this office until 1772, and during that period only visited Europe once, being absent from the Colony for some two years altogether. On surrendering office, he retired to his plantation of Soestdijk in Demerara, and died there in his seventy-first year in 1775. For thirty-eight years he was thus closely identified with the life of the Colony, which was to fall into British hands for the first time some six years after his death, though the present occupation dates only from 1803 and the formal title only from 1814. The selection from his despatches here printed gives a complete picture of the life of the Colony, and brings the writer himself very near to us, and the editors have done well to include in the introduction a sketch both of its earlier and of its later history, the latter including a convenient account of the stages by which its frontiers were determined and delimited. British Guiana to-day retains abundant traces of the period of Dutch rule. The law is still Roman-Dutch. The "regulations of Their late High Mightinesses the States of Holland" may still have to be quoted in its Courts. Its constitution, unique in the British Empire, continues with but little modification the old Dutch system. Its architecture and town-planning, its methods of drainage and irrigation, the names of its plantations, all recall the old Dutch days. By way of contrast, it is interesting to find how largely English capital and energy was interested in it already in Storm's time. Many plantations were in English hands. Demerara, an off-shoot from the older Colony of Essequibo, seems to have been almost predominantly English from the first. A large part in its development was played by one Gedney Clarke, of Barbados, who, from the scale of his operations, must have been a veritable prince among planters. In 1764, when a revolt of the slaves had for the time being reduced the neighbouring Colony of Berbice to ruin, it was Clarke's promptitude in sending help from Barbados which was, to use Storm's own words, "after God, the salvation of Demerara." But Storm's feelings towards his English fellow-colonists were, to say the least of it, mixed. He found them to be inveterate smugglers of slaves, and disposed to treat with little respect constituted authority which had a very inadequate backing of force. Still, he found it necessary to have English planters in the Court of Policy, and defended the practice by referring to "Dutch families like the Bentincks, the Keppels and others even in the House of Lords." The Director-General had many and various troubles to contend with in his long term of office. Besides the serious rising of slaves in the neighbouring Colony of Berbice, to which refer-

ence has already been made, there were spasmodic outbreaks in Essequibo and Demerara, one of the most serious occurring at the very end of his time. They were due in part, at least, to the habitual cruelty of some of the planters, against which Storm, a humane man, set his face as firmly as circumstances allowed. With the Indians, his relations were almost uniformly friendly, and he employed them as useful allies not only against deserting slaves, but also on occasion against the Spaniards whose repeated encroachments, actual and threatened, were a constant cause of alarm. But the worst difficulty with which he had to contend was that caused by the niggardly policy of the Dutch West India Company which constantly kept the Colony in a half-starved condition, and left him to support unaided the burden of a strange multiplicity of offices. Their interest in the Colony was that of traders and merchants, and even so, they allowed a shortsighted policy to frustrate the opportunities for profitable development. For many years Storm appealed in vain for his discharge, and his later despatches are pathetic in their reiterated demands for relief from the burden of labour which physical infirmities rendered intolerable. "A starving beggar," he writes, "cannot long for a crust of bread as I long for the arrival of my successor." With advancing old age, Storm, always a ready writer, developed a habit of what can only be described as garrulity. The eighteenth century was a period of leisurely and long-winded composition, but even in that period Storm's despatches with their odd medley of Latin and French quotations are a curiosity. Once, at least, the Directors took him to task for dealing with so many topics in a single communication, and asked for separate despatches on each subject in accordance with the best practice in our modern days of the Colonial Regulations. But the old Director-General was incorrigible. "Your Honours' suggestion," he replies, "that I should split up my letters into several smaller ones is a very useful one, and might, if carried out, prove most convenient, but kindly consider, Your Honours, how difficult it would be for me (especially now, at the end of my term of office) suddenly to alter my custom. *Recens imbeuta servat odorem testa diu*. Secondly, if I were to write a separate letter concerning each specific subject, Your Honours would have a great deal more to read than at present, since, in order to avoid being voluminous, I express myself as briefly as possible, whilst in the other event I should certainly write more fully and circumstantially, for when I once begin to argue in my letters I cannot stop myself and must adduce all that is pertinent to the subject." We are not told how the Directors took this, but we may conjecture that they gave it up. The

following is a good example of his leisurely style. "The New Year having commenced I have the honour to wish Your Honours every possible happiness, blessing and good fortune in the course of the same, and in a long series of following ones. I hope that the Omnipotent Creator and Ruler of the Universe may shower in full measure upon Your Honours' persons, families and government His dearest blessings, both temporal and spiritual. May He grant Your Honours unfailing health, perfect peace and prosperity in all Your Honours' undertakings, in a word, all that can be desired by us mortals here in this sublunary and hereafter in His Eternal Realm." Not so does the modern Governor address the Secretary of State, though we do not doubt that his sentiments are equally amicable. But for all his valour with the pen, Storm was essentially a man of action, and in every time of crisis he rose to the needs of the occasion. In particular, he showed a proud front to the Spaniards, and deserved a better backing than he got from his masters. Storm was a whole hearted adherent of the old doctrine of Colonial policy. "That the interests of the Colonies must be subordinate to those of the mother country is so self-evident a principle that I do not think it is possible for anyone to doubt it." But he reminds the Dutch West India Company (who stood in need of the admonition) that the obligation is not all on one side. "If there be a duty, and an unshirkable duty, on the part of children towards their parents, there is also a duty incumbent upon parents towards their children—they are compelled, whilst the latter are young, to feed and cherish them, and when grown up to seek and to further their welfare." Had Storm lived to-day, he would have been an advocate of the "interchange of officials." He is fond of repeating that "in order to have West Indian understanding one must have been in the West Indies." At times he can be delightfully philosophical. "This Colony resembling Noah's ark, in which were clean and unclean beasts, by its mixture of all tongues, races and nationalities, patience and forbearance, so far as circumstances permit, are the best qualities to cultivate." Storm lives for us in these pages as an honourable and disinterested man, gifted with a many-sided ability and carrying out, with very slender resources, a variety of tasks beyond the reasonable capacity of any single official. We are grateful to Messrs. Harris and de Villiers for having introduced him to our acquaintance and we cannot leave the book without a word of praise for the excellent English style in which the despatches are rendered.

## REVIEWS AND NOTICES.

**The American Colonies--1583-1763.** By A. WYATT TILBY, 2nd edition. (*Constable & Co.* 4s. 6d. net.)

In the Middle Ages the national characteristic of the English was considered by their neighbours to be independence of character. The quality was by no means always admired by the leaders of thought and action. Froissart said plainly that the English were the worst nation in the world, because they asserted liberties which made them insolent towards those whom Providence had placed over them. No doubt the wanderer on the continent and on the seas showed a spirit of freedom which easily allied itself to turbulence and aggression. The first Colonies were pervaded by the national disposition. The New England Settlements never were Colonies in the usual sense of the word. They represented not an extension of England, but a revolt from it. Almost from the first they protested their independence. They conducted their own affairs, and their nominal rulers, however much they resented it, were on the whole helpless. Other colonising countries repressed these local ambitions. They had a ready-made system and carried it everywhere. England alone had no system and took little pains to enforce her authority. The irony of the matter is that the countries which studied systems failed, while the one country which neglected system succeeded. It would be unjust, however, to our ancestors to ascribe this neglect to want of interest or intelligence. Local administration had been ingrained in this country for centuries, and it was continued in the Colonies in the ordinary course. The difference which this made in the popular feeling, as compared with that in foreign settlements, was very marked. Thus the Dutch settlers of New Netherlands saw with envy the freedom of the English, and when the opportunity came they went over to them without striking a blow.

The history of the first century and a-half of the American Colonies turns largely on this practical test of systems, and on

the vicissitudes of European politics. It is admirably presented from this point of view by Mr. Wyatt Tilby, who gives a clear but compact explanation of the European politics and movements which affected North America. Occasionally an anticipating reflection on the current results is more open to criticism. Thus exception may fairly be taken to the statement that the remainder of the history of the West Indies, after the great wars, "offers little but gloom—a gloom that is the more depressing with the brightness of their past, and the ideal beauty of their situation." This mournful dictum does not recognise the recent economic improvement, which is to a great extent substantially based on the growth of a peasant proprietorate. Of Mr. Tilby's style in his proper field, the following may be given as an example:—

"Each of the southern colonies had sprung from a different impulse. Virginia was the child of the Elizabethans. Maryland was the forerunner of an age of toleration. The Carolinas represented in miniature the greedy and the philosophic forces that mingled grotesquely at the Restoration. Georgia, again, was the firstfruits of the philanthropic eighteenth century. The four differed fundamentally from each other at their foundation and for many years after; yet did the chain of circumstance envelop them, and a common want produce a common interest. Tobacco was the product of the two first; rice and cotton of the two last. For all, negro labour was cheaper and better than white: and negro labour accordingly was procured.

"A further tie that bound them together was a common danger that now threatened from without. The French were blocking the way inland: the Spaniards prevented expansion southwards, and indeed claimed the very soil on which they stood. The great colonial wars were at hand, which taught all the English dependencies in America to sink their differences for a time, and stand together. And in these wars vanished almost the last of the distinctions which had been so carefully planned: the southern colonies already formed the nucleus of the 'solid south' that nearly wrecked the United States a century later."

---

**The Tragedy of Quebec. The Expulsion of its Protestant farmers.** By ROBERT SELLAR. Third Edition. (*Toronto: Ontario Press, Limited.*)

This volume is a powerful, and even bitter, statement of the case against the Roman Catholic Church in Canada. Mr. Sellar embarks on an elaborate study of Canadian history, with much reference to the original documents, with the object of showing that there has been a continuous encroachment by the Catholic Church upon the rights of the civil power. That church appears

to him to have succeeded in obtaining under British rule privileges and authority greater than any which it enjoyed under the French Kings. He sees a steady retrogression from the original Terms of Surrender which conceded to Catholicism nothing more than toleration, and provided for the establishment of English law. By the Quebec Act a fatal mistake was, he thinks, made in conferring upon the church the power to levy tithes and other dues, and preserving French law. But even the Quebec Act limited the scope of these provisions to the seignories. It was the Act of 1841, which, by placing the balance of power in the hands of the Quebec members, rendered possible the extension of the parish system, with its anomalous attendant of clerical taxation, beyond the seignories, led to the recognition of French as an official language, and forced a system of separate schools upon Ontario. Mr. Sellar sees the undeviating policy of a church, persistently followed generation after generation, achieving by direct and indirect means a succession of victories over vacillating governors and divided politicians. He sees Quebec converted into a priestly stronghold, and clerical ambition extending its scope into the other provinces. It should be made clear that his attack is directed not against a race, but against a religion, or rather against a church. "A French Quebec," he writes, "free in thought and action, would be no menace to the Dominion; a Papal Quebec is, for it stands for a power that is not working for the common good, but for a church; which is not seeking to exalt our country by strengthening its unity, binding man to man in the bonds of common interests and of a common brotherhood, but schemes to keep them asunder, to set race against race, and by every art and means within its reach, to obtain more influence, more power for an organization of ecclesiastics who draw their inspiration from a foreign country and a foreign court." It is a curious incident in history that the church which has been so ruthlessly shorn of its powers in France, should retain, in France's old Colony under the British flag, a position of acknowledged predominance. We are compelled to regard Mr. Sellar's book as a somewhat exaggerated presentation of the facts. His view of history is too one-sided to be complete. But he writes earnestly and with conviction, and throws much interesting light on aspects of Canadian life which are little known in England.

**The Golden Land; the true story of British Settlers in Canada.** By A. E. COPPING. (*Hodder and Stroughton.* 6s.)

A number of books have been issued recently to explain the attractions of Canada, and how the immigrant can profit by

them, and in all of them prospects and possibilities are set out in most alluring manner. One of the best is "The Golden Land," written by an experienced journalist, who can describe things with a practical hand, and can also, as is the characteristic of his tribe, put himself in the position of the persons for whom he is writing, and find out what they most want to know. The details of the steerage passage and the railway journey are faithfully reproduced, and would unquestionably enable emigrants to avoid much inconvenience. The figures by which indigent newcomers are converted into prosperous farmers are given with much detail. A man who has, as he should, even if he has capital to begin with, worked on a farm for at least one season, can start with a capital of £100, which sum he could save in two seasons' work.

"All he would have to buy at first would be three oxen, costing about £50, a plough (£15) and a disc harrow (£7). He could, if he liked, pay by instalments for the plough and harrow, and later on for fencing wire. Of course he would build his own shack and stable, the only expense being a pound or so for tools and nails and getting the timber sawn. Then there is the cost of living. They mostly find it worth while to get a few fowls and a cow. You can buy a fine three-year cow, after her first calf, for £5 or £6—in fact, the poorest people about here keep three or four cows. It means a lot of hard work to break the land, and three months' residence on the quarter-section is, of course, compulsory. But the right sort of man would still find time to work for his neighbours and earn a bit of money that way."

"What would he have to buy in the second year?" I asked.

"The chief thing would be seed. For he could make do with his oxen for ploughing. If he worked hard the first year, he ought to have forty acres ready. He must make his first payment for a seeder, which costs £16. Sowing is done from the 15th to the 30th of April—sometimes you can go into May. By the middle of August he must get a binder (£30); and his first crop ought to be a thousand bushels, which would bring him in £160, less £12 for threshing. Meanwhile he will have been breaking more land, to be ready for a larger acreage in the third year. So now he must sell his oxen, which will be too slow for the ground he has to cover; and when the weather opens he must buy three horses. They will cost about £90; but it's no use shirking that expense—you must have proper power. He has got to get through somehow until harvest, when he will receive about £300. From that time, you may say, he has turned the corner, for the debts on machinery will soon be paid off, and every year will see an increase in his acreage and live stock.

Once he has got his quarter-section fairly going—well, he can buy more land, start a business, and go ahead as much as he likes, the same as anybody else.”

“And his homestead will have acquired a substantial value?” I suggested.

“It will be worth,” Donald explained, “anything from £800 upwards, according to the sort of house on it. And do you know,” he added, “that an unbroken quarter-section which costs nothing is a much dearer investment than a quarter-section under cultivation that costs £800? In the one case you have to face the early years of development, the terrible hard work, and the small returns; in the other case you get full harvests from the start—I have even known the first year’s crop to cover the total cost of the land. My advice even to the man who arrives with only a few hundred pounds is—buy; don’t take up a free homestead.”

That these figures have a substantial basis is testified to by the number of farmers who have made a comfortable position. No doubt the life is hard and rather lonely, and we do not hear much in this kind of literature of the cost of living or the difficulties. The conditions, however, make for economy, and there is no doubt that Canada is giving a magnificent opportunity to great numbers of people who see no opening in this country. The Salvation Army, by dint of trying to find better occupation for the submerged classes, has become the greatest emigration force in the world, and it is an edifying fact that it secures a much higher ratio of repayments of assisted passages than do the various Committees. The wide organisation and personal supervision account for this. Several charitable bodies sent out men in shiploads, but with so little selection or subsequent attention that the failures were numerous and lamentable, and an indignant public opinion led to the restrictions of 1908. Now the standard is higher all round, and we are not likely to hear much more of the complaint of undesirables. A pleasing feature is the remarkable success of the boy emigrant from Great Britain. 95 per cent. prove quite satisfactory, a much higher proportion than in the case of any other class—fine proof that there is something yet in the Mother-Country.

**Empire Builders in Australia; Early Days in New South Wales, Victoria and South Australia.** By EDITH RALPH.  
(*T. Fisher Unwin.* 5s.)

The settlement of Australia practically began with the loss of the North American colonies, and no doubt its progress would have been greatly retarded if that event had not taken place.

Up to the date of the War of Independence the desperate men who were plentifully produced in this country by severe laws could be sent to work in Virginia. The result of the war ended this expedient, and England looked elsewhere. The Government decided, largely on the advice of Sir Joseph Banks, who gave evidence before a committee, to try Australia as a dumping place for the criminal. This was only eighteen years after the landing of Captain Cooke in Botany Bay in 1770. No less than eleven ships were despatched together with the first batch of convicts, a number which seems to show that there had been a considerable accumulation of undesirables.

Unfortunately the authorities brought with them the heavy punishments and penalties which were in vogue at home, and for several years the progress was slow and the outlook unpromising. But gradually, in spite of harsh Government and bad characters, the wide country did its work. Emancipists and free settlers steadily did the rough work, while at home the war with France was raging. In one respect the character of the settlement was very different from that of the North American colonies. There was nothing political or religious about it. In those days Australia was in the diocese of Calcutta, and General Darling, in 1825, was the first Governor who attended divine service regularly. The first clergyman certainly laboured under difficulties. An example of them is shown in the following extract, which, however, incidentally explains the origin of one of Australia's successful industries.

"A naval captain, with strong ideas on the subject of discipline, Governor Hunter looked upon this little church, though built entirely at the parson's own cost, as another means of preserving order among the convicts, and commanded that they should attend service. They obeyed, but very unwillingly. It seemed like an infringement of their rights to order a part of Sunday to be thus occupied. The Governor and officials holding aloof from the services, the convicts simply regarded them as another badge of servitude and therefore another grievance. The discontent grew. Sunday after Sunday the congregation assembled with black looks and lowering brows in the poor little church; till at last the malicious thought occurred to one of them, that if there were no church there could be no prayers.

"One summer day, when the unsheltered beams and rough branches composing the little sanctuary were hot from the burning rays of the semi-tropical sun, a light was applied to one corner by a sacrilegious hand, and in an hour only a heap of ashes was left to mark the spot where it had stood for four years, the convicts chuckling as they passed the smouldering embers.

"But their triumph was short. Governor Hunter, furious at

what he considered a breach of discipline, determined to inflict a new and appropriate punishment; for lashes or imprisonment were inadequate here. It chanced that a Government store, built of stone, was in course of erection; this should be finished immediately as a church; it would do for a store some day, the Governor reflected; and the convicts should now attend service *twice* a day, instead of once, as formerly! So the services were more hated than ever. Moreover, the building was so damp and chilly in the winter that Mr. Johnson's health at last broke down, and in 1800 he was forced to return home.

"To the very last his work was opposed in every possible way. Soldiers would noisily play cards close to the church door during service. The time allotted to this was also made so short that the poor chaplain could scarcely get in a few words of instruction or exhortation. Orders would be given that service should commence at 6 a.m., and only last three-quarters of an hour. Accordingly Mr. Johnson left out the hymn, he sadly complains, that he might preach a short sermon; which, however, he had scarcely begun when, it being 6.45, the drums beat outside loudly, and, with one accord, the whole congregation rose and left. Moreover, he and the colleague who had assisted him for the last few years were insulted in the streets, as well as hindered in the performance of their duties. What wonder, that in frail health and with treatment such as this, Mr. Johnson felt that his days of usefulness in the colony were over.

"For some time he had not been entirely dependent on his small stipend, as land had early been allotted to him in a favourable spot, on the main road leading to Parramatta, where the suburbs of Camperdown and Petersham now stand; and here he cultivated orange trees with great success and profit, as, being the only oranges to be had, they fetched as much as 6d. to 9d. each.

"On the way out, Governor Phillip's fleet had made a stay of a month at the port of Rio Janeiro, and large quantities of oranges were brought on board. The astute chaplain was the only one of all those enjoying them who thought of saving the pips, thinking it possible that the climate of Australia might be favourable to their growth. To the same hand, therefore, Australia owes the introduction of one of her most successful cultivated fruits, as well as her first church."

There was, however, at any rate, one religious movement to Australia, but it was from a foreign country, and was the outcome of the dissensions between the two Protestant bodies in Germany, the Lutheran and Reformed Churches. The King of Prussia had commanded both to use the same liturgy, that of the Reformed Churches, and this led to the emigration of many

Lutherans to South Australia. Evidences of the settlement are still clear.

“The first German settlement was about two miles north of Adelaide, in the valley of the Torrens; but as other vessels, bringing large numbers of their co-religionists, arrived, their borders were extended. The third ship, the *Zebra*, with one hundred and ninety-nine emigrants, was commanded by Captain Hahn, who, on arrival, endeavoured to procure more land from the authorities, pleading the cause of his countrymen with such success that 150 acres of the Mount Barker district were appropriated to their use, besides other assistance being given them. The name of the village of Hahndorf bears testimony to the gratitude felt by the Germans for the good captain, who had thus interposed on their behalf. The pointed gables of the houses on either side of the village street, the German appearance of the inhabitants, and the names on the sign-boards, make one feel, in driving through Hahndorf to-day, as though suddenly transported to the Fatherland. This thought is dispelled, however, the moment the village is left behind, and one passes again into the Bush with its gum trees and wattles, that ‘Bush’ that no other land but Australia could produce.”

Another curious instance of transplanted was that of the willow trees of which a traveller visiting the tomb of Napoleon at St. Helena took cuttings, and when planted in Australia they were particularly successful. The continent was remarkably deficient when discovered in useful fruits, trees and grain, but it is no less remarkable in the prodigality with which imported varieties are grown. In one private garden near Adelaide no less than twenty-three kinds of fruit are successfully grown.

From the point of view of constitutional history Australia was slow to make progress, and one does not find in its early records the assertiveness of the North American settlers and the continual disputes with the home Government. This, no doubt, was largely due to the greater distance and infrequency of communication. When, however, the movement for representative institutions set in it went on fast. A council was elected for New South Wales in 1843. For some years Victoria, or, as it was then known, Port Phillip, was supposed to be represented on it, but as Sydney was 500 miles away they could not send their own representatives, and had to elect residents of Sydney. In 1848, they resorted to a felicitous expedient. By an enormous majority they elected Earl Grey, the Secretary of State for the Colonies. It is said that the Earl was greatly bantered over this selection, and, at any rate, it brought about what petitions had failed to accomplish. Victoria got its representative Government. The following year gold was discovered.

Much as many years later the gold boom in Western Australia followed the grant of responsible Government. Soon afterwards a similar constitution was granted to Southern Australia. It is stated that on the arrival of the vessel bearing the charter a deputation came down to receive it with fitting honour. It was, however, not to be found. The disappointed deputation had to return without it. Later on, it was found in the captain's soiled linen bag, where, doubtless, it had been stowed away for safe custody.

The story of the pioneering days has often been told, but the present volume gives an exceptionally interesting account of them. The early explorations and the hardships of the settlers are graphically set out, and the manners and modes of life of the blacks are described with a detail which bespeak personal observation.

---

**The First Decade of the Australian Commonwealth. A Chronicle of Contemporary Politics. 1901-1910.** By HENRY GYLES TURNER, Melbourne. (*Mason, Firth & M'Cutcheon.* 9s.)

There are probably as many ways of writing history as there are of composing tribal lays, and there is something to be said in favour of most of them. But there are, in particular, two strongly contrasted methods, which have the merit of being complementary to one another. There is the method of the chronicler, who sets down facts in an orderly sequence as they occurred; and there is the method of the historical philosopher, who analyses the stream of events, not into facts, but into tendencies, providing his readers with a series of essays on different aspects of his subject rather than with an exhaustive chronological narrative. From writers of the latter type, Australia has received at least her due share of attention. She has been officially reported upon for the benefit of the British Government, and the United States Government. She has been described and appraised by the peripatetic journalist. Her industrial experiments—so inseparably connected with her politics—have been weighed in the balances and either found wanting, or found to be all that could be desired, according to the political and economic complexion of the observer at the scales. The writing of contemporary history is always a difficult task, and in the case of a new country, still to some extent in the experimental stage of politics, the difficulty of forming a right estimate of "movements" which have not yet reached their goal, and "tendencies" still imperfectly developed is almost insuperable. Mr. Turner has, we think, been well advised not to add a further volume to this particular section of literature. Instead of doing

so, he has compiled in narrative form an account of the political history of the first ten years of the Commonwealth, and, in so doing, has produced a book which will not cease to be valuable even should time refute many of the judgments expressed in its pages. Mr. Turner's subject is Parliamentary history, and he sticks to it with a tenacity which must have involved a considerable degree of self-denial. For he is not one of those who see in Parliamentary history the sole matter of importance in the life of a nation. Those who have spent a strenuous lifetime in the political arena often undervalue the importance of what takes place beyond its circumference. But Mr. Turner is not a politician. He has never attended a Parliamentary debate. He "counts a few Federal Members among his personal friends, but he has sedulously avoided discussing political questions with them." Sustained by a sense of duty and a consciousness of disinterested sincerity, he has wandered through the wilderness of Parliamentary oratory from one distant oasis of practical achievement to another. But he lets the reader know that the journey has been a toilsome one. As he enumerates, from time to time, the columns of "Hansard" devoted to some particular topic, one is irresistibly reminded of the saying, "As hills of sand to the steps of the aged, so is one of many words to a quiet man." There is something almost Olympian in his attitude of detachment. In his preface he frankly admits his want of sympathy with the Labour Party, and it is clearly apparent throughout his narrative, and particularly in his account—very complete and useful—of the session of 1910. We fancy that had this volume appeared after, instead of before, the federal referenda of last April, it would have contained something like a pæan of triumph on the result. But if Mr. Turner is an enemy—or at least an exacting critic—of the Labour Party, it is impossible to label him as a partisan of any other political section, and if he has any particular *bête noire* among prominent Australian politicians, it is not to be sought in the Labour ranks. He distributes reproof impartially and with considerable liberality, and any member of the Australian Parliament who reads the volume is likely to put it down with feelings akin to those of the schoolboy who has enjoyed the privilege of hearing a lecture from his headmaster. The first ten years of the history of the Commonwealth have been a troubled time. Seven different Ministries have held office during that period, and cross-currents and personal issues have made the course of politics unusually obscure. "Tetchy and Wayward was thy infancy" is the motto which Mr. Turner borrows from *Richard III.* for his title-page. Upon the whole, we are inclined to think that he is somewhat unduly severe in his judgments. Australians—

who show a likeness to Englishmen in this respect, as in so many others—are inclined to resent criticism from outside, but are ready to lavish it on themselves and on one another. Though there are failures, false starts and delays to be recounted, and in spite of the “loquacity of Members on unimportant issues and irrelevant matter,” recorded, with a touch of pathos, in the synopsis of contents, this volume embodies a record of much solid Parliamentary achievement, a not unworthy product of the Constitution, which Mr. Chamberlain described as “a model of legislative competence.” Mr. Turner has rendered a service to his countrymen in urging them to do still better in future. His book is invaluable as a work of reference, and is at the same time thoroughly readable. The verb “to concuss” in the sense of “to coerce” is new to us, but Mr. Turner has a particular predilection for it. Perhaps it is a local product.

**British Dominions: Their present Commercial and Industrial Position.** Edited by W. J. ASHLEY. (*Longmans, Green & Co.* 6s. 6d. net.)

This volume contains nine lectures delivered by men of note last winter, under the auspices of the University of Birmingham. Mr. Ashley observes in the preface that, while there has struggled into being a central representative organ of the Empire in the shape of the Imperial Conference with its secretariat, it is not distinctly realised that, on a more everyday level than this “conspicuous but discontinuous” body, there has been coming into existence the outlines of something like a permanent imperial organisation for trade affairs. He refers to the appointment of trade commissioners by the Board of Trade as an Imperial Intelligence Service, to the Imperial Institute as an Imperial Scientific Research Centre, to the Advisory Committee on Commercial Intelligence as an Imperial Advisory Board on Commercial Affairs, to the Pacific Cable Board as a model of a Federal Executive, and to the Congress of Chamber of Commerce as a sort of non-official Commercial Parliament of the Empire. The Right Hon. Alfred Lyttelton contributes a very philosophical address on the Empire generally. From the early colonial history he draws the following conclusions:—

“1. The British are found at their best and summon their highest resources at times of emergency, under the pressure of danger and in the necessity of self-defence. They appear averse to thinking out deliberate and systematic schemes of policy, and shrink from the arduous and painful processes of organisation for remote ends.

so, he has compiled in narrative form an account of the political history of the first ten years of the Commonwealth, and, in so doing, has produced a book which will not cease to be valuable even should time refute many of the judgments expressed in its pages. Mr. Turner's subject is Parliamentary history, and he sticks to it with a tenacity which must have involved a considerable degree of self-denial. For he is not one of those who see in Parliamentary history the sole matter of importance in the life of a nation. **British Dominions : Their present Commercial and Industrial Position.** Edited by W. J. ASHLEY. (*Longmans, Green & Co.* 6s. 6d. net.)

This volume contains nine lectures delivered by men of note last winter, under the auspices of the University of Birmingham. Mr. Ashley observes in the preface that, while there has struggled into being a central representative organ of the Empire in the shape of the Imperial Conference with its secretariat, it is not distinctly realised that, on a more everyday level than this “conspicuous but discontinuous” body, there has been coming into existence the outlines of something like a permanent imperial organisation for trade affairs. He refers to the appointment of trade commissioners by the Board of Trade as an Imperial Intelligence Service, to the Imperial Institute as an Imperial Scientific Research Centre, to the Advisory Committee on Commercial Intelligence as an Imperial Advisory Board on Commercial Affairs, to the Pacific Cable Board as a model of a Federal Executive, and to the Congress of Chamber of Commerce as a sort of non-official Commercial Parliament of the Empire. The Right Hon. Alfred Lyttelton contributes a very philosophical address on the Empire generally. From the early colonial history he draws the following conclusions:—

“1. The British are found at their best and summon their highest resources at times of emergency, under the pressure of danger and in the necessity of self-defence. They appear averse to thinking out deliberate and systematic schemes of policy, and shrink from the arduous and painful processes of organisation for remote ends.

"2. In their successes they had the wisdom to be moderate, and displayed good sense and even generosity in the terms imposed on the vanquished, were willing not to exact the uttermost farthing, clearly distinguished the faults of foreign rulers from those of their subjects, were careful not to excite the permanent enmity of peoples, or to press on those who had been the involuntary victims of ambition and self-aggrandisement.

"3. The development of the Empire was necessarily trans-oceanic, and its existence and stability has depended and will depend on the control of sea communication and on naval supremacy."

Mr. Lyttelton thus points out the absence of system on which Mr. Wyatt Tilby descants in his history of the American colonies. It may, however, be suggested that it was not due to any intellectual shortcoming. The Anglo-Saxon genius has not shown any inability to frame political constitutions or to undertake political campaigns when suitable occasions have offered. But the early Colonies were adventures which in their very nature forbade cut and dried schemes. Of present times it is excellently observed that "In the British Empire there appears little danger of uniformity or stagnation. Each Dominion, far from being a replica of the Motherland, is a centre of separate vitality, working out under free institutions her own problems and her own aspirations. In such work, and in pressing forward together schemes in which all parties are roughly agreed, wholesome emulation is stirred."

Sir George Reid explains the resources of Australia, and Sir Albert Spicer, fresh from his visit to that country, sets out the commercial aspect; he makes a suggestion that the boys who are employed in great numbers by such departments as the Post Office, and who are dismissed when they are becoming men, should be sent out to Australia and settled on the land. Mr. W. P. Reeves has a very readable address on New Zealand, in the course of which he sums up very fairly the results of the labour arbitration legislation. Sir W. Hely-Hutchinson graphically describes South Africa, especially in its physical aspects, and Mr. H. Birchenough discusses the economical questions. Sir Daniel Morris furnishes an account of the West Indies, which contains a statement of the origin and purposes of the Imperial Department of Agriculture. Mr. W. L. Griffith, speaking of Canada, considers that there is every reasonable ground for anticipating that its expansion will be more rapid than was that of the United States, and that at the end of the present century its population will be greater than that of the United Kingdom. Sir Edmund Watkin, on the other hand, sounds a note of alarm. He thinks that farmers are impoverishing the land, and that

out West the speculation in real estate has gone much too far. He considers that Canadians are not nearly so contented now in the days of prosperity as in the days of struggle and of small results, and that there is an unusual agitation by one interest against another. Moralists tell us that increase of wealth brings about a decay of public spirit, and no doubt as commercial interests wax big they fight more and more for their own land; but Canada is not the only example of these fundamental tendencies.

The volume as a whole sets out a great amount of information and comment in an exceptionally readable and up-to-date form.

---

**Rubber and Balata in British Guiana.** By J. B. HARRISON, C.M.G., and F. A. STOCKDALE, F.L.S. (*Department of Science and Agriculture of British Guiana.* 6d.)

Great numbers of rubber seeds have been recently imported from the east, and there are now some fields of young rubber which have made exceptionally good growth. There is a very large area of suitable land available, and considering that the situation is so near the home of the *Hevea Brasiliensis*, the prospects are very promising. A sample from Demerara River has obtained the top London price. This booklet contains the terms for 99 years Crown leases of land. No rent is charged for ten years, and afterwards the rent is 10d. an acre rising to 2s. 1d. The cost of cultivation varies slightly in different districts, but on flat lands, which have to be thoroughly drained and empoldered, the cost, including application and survey fees, superintendence and purchase of plants, might be estimated to be from \$65-70 (approx. £13-14) per acre during the first year, with an annual expenditure of from \$25-30 (approx. £5-6) per acre in subsequent years.

The first year's expenses may be estimated as follows for cultivation of about 100 acres:—

	Per Acre.
Fees ... ..	\$ 3 50
*Buildings and Boats ... ..	13 50
*Superintendence ... ..	14 00
Felling and Burning Forest ... ..	9 00
*Drainage ... ..	19 50
Plants and Planting ... ..	5 50
Miscellaneous ... ..	5 00
	<hr/>
	\$ 70 00
	<hr/>

The expenses after the first year could be estimated as follows:

*Superintendence ... ..	\$ 12 00
Weeding and Supplying ... ..	7 50
Attention to Drains ... ..	3 50
Miscellaneous ... ..	2 00
	<hr/>
	\$ 25 00

The labour available for rubber cultivation consists of black labourers and East Indians that have completed their indentures with the sugar estates or were born in the Colony, while in some districts Aboriginal Indians are available. For felling the forest the Aboriginal Indians are preferred if they can be obtained, the black labourers are well suited for the work of empoldering and digging drains, while the East Indians, when properly housed, easily settle down to continuous work. Most of the initial work of clearing, draining, etc., is done by task work, while planting and attention to cultivation is usually carried out by labourers earning a daily wage. The prices paid for task work in the different districts vary slightly, as also do the wages paid for daily labour. Near to town or any of the village settlements the rate of pay varies from 1s. 4d. to 2s. per diem, while in the more remote districts the wages range from 2s. to 2s. 8d. per diem, as the costs of living are somewhat higher.

None of the rubber estates have so far complained of a scarcity of labour for their operations, and it is thought that sufficient labour will be available to meet the advances that may be made in the rubber industry during the next few years. A Commission has recently been appointed to consider the labour question in this Colony, and their report should shortly be available. With the advance of the industry, it is thought by many that indentured labour from the East will have to be obtained, on terms similar to those pertaining to the East Indians indentured on sugar estates."

The demand for balata is steadily rising, and the export from the colony is rapidly increasing. The collection now ranks as the third industry. The use of balata for belting is spreading, as it is practically unaffected by atmospheric changes and chemical fumes.

---

**Grenada: Report on Economic Industries, &c.** (*Printed at the Government Printing Office.*)

This is the report of a Committee appointed to consider the high prices of foodstuffs in the colony. Complaints of difficulty

in getting employment, and the encouragement of industries. The Committee evidently did its work carefully. The cost of living has gone up, a phenomenon which is observable in most other places. But in Grenada the rise is accentuated by a falling off in the local production of food and vegetables. This is largely due to the absorption of the most fertile land by the cultivation of cocoa. This is a profitable industry, but in a small island and with an increasing population the results are bad for food supplies. Not much more can be done in such a case than to instruct the peasants in the production of vegetables, and steps for this purpose are recommended. The Tenants' Compensation Act, which is closely modelled on English legislation, has been found not to work well, and apparently tends to deter landlords from accepting tenants. Some provisions to simplify the procedure and regularise the compensation payable are suggested.

The Committee did not think that the complaints of unemployment were borne out. There has been much emigration lately to Brazil, where higher wages are paid, but this sort of emigration is an uncommon feature in the West Indies. Probably the emigrants work a good deal harder in the new country than they did in the old, as is the way of emigrants generally, and justify higher wages. The Committee considered that a rather higher rate of wages should be paid on the cocoa estates, and probably economic causes will eventually bring this about.

Voluminous evidence was given on proposals to establish industries, but for the most part it was highly unpractical. The peasants are too scattered for the sugar factory system, and the Tortola system, a provision of a small primitive mill built by Government near holdings, is mentioned with approval. It is expected that, with giving facilities, there would be an early revival of cotton-growing. An income tax is proposed, to take the place gradually of the export tax and the import duty on certain articles of food consumed chiefly by the working classes. In this matter the Grenada Committee have not taken the views which were quoted in our last number as having been expressed in British Guiana against such a policy of setting up an income tax in place of one on food. An export tax is, however, really a land tax, when the products in question are mostly exported, for then the exports are in accordance with the productiveness or value of the land and are the most convenient means of assessing it for the purpose of taxation.

---

**Lyra Nigeriæ.**—By ADAMU. (E. C. ADAMS). (*T. Fisher Unwin.*  
3s. 6d. net.)

These verses epitomise the ordinary life and common feelings of the white resident in West Africa. There is a great straining

for the heights of Parnassus. The author's object is to reproduce the usual experiences and to point the usual moral, and he does this with a freshness and frankness that make his productions entertaining from beginning to end. Verse after the style of the Ingoldsby Legends, as modernised by Rudyard Kipling, is a convenient vehicle for straight talking, and for freely banning or blessing things where prose would have to be discreet. This, for instance, is the N.C.O.'s view of Northern Nigeria:—

“It's a cock-eyed, back-ended, fair muddled-up show,  
In a real topsy-turvy condition,  
And you won't find another land like it on earth,  
If you look from Peru to Perdition.

“There you have to go short of the things you most need,  
'Cos the Government ain't got no money;  
But if you saw the things what the Government buy,  
It 'ud make you laugh, it's too funny.

“There the land don't grow nothing of any account,  
Not for food nor for clothing nor liquor;  
Yet it's one of our proudest possessions on earth;  
What we're there for at all is a nicker.

“And those wonderful cities and palaces too!  
It's a lie, it's a big giddy fable;  
There isn't a house in the whole of the land,  
What's fit for a dead donkey's stable.

“There the least bit of brass is a threepenny bit,  
And they'll charge you ten quid if you're willing,  
Though the whole of the stuff in the market, most times,  
Don't add up to the worth of a shilling.”

No doubt a province in the making is trying to the Army Sergeant, who is not even grateful for the “simple furniture” in such case made and provided. The waste of energy on the part of the higher official is exemplified as follows:—

“They all had one opinion about him, and with Coast frankness  
told it him straight to his face,  
And then made him a District Superintendent of the Police,  
away in some unpronounceable place.  
There he had a gaol and a police barracks about which he  
could worry and fuss,  
The gaol was as big as a pig-sty and the barracks about the  
size of a twopenny 'bus.

- “ He fussed about writing reports about his ‘ department ’ and other people’s as well,  
Till the other people found out about it, and requested him to mind his own business and go to Hell!  
But he would not even do that, he worked with much energy, that there was no doubt of,  
Till he’d have worried those police and those prisoners right out of their wits, if they’d any wits to go out of.
- “ And he went on buzzing about day and night, like a bug on the end of a pin,  
Till one midnight there was a shower of rain and the back wall of the gaol fell in.  
The police had a consultation, and one grey-haired philosopher said,  
‘ When them fool man sees this, he go talk we all dead.  
Besides he no catch any savvy, he go beat we and kick we for sure,  
So I just go back to my own country, for I no fit to stay any more.’
- “ One prisoner remarked bitterly, it was hardly worth while being in prison with such a damn fool as the boss of it,  
And if they all gave up the job and retired, they wouldn’t feel the loss of it.  
So to end up with they agreed *nem. con.*, and all walked away in a mob.  
They have not come back yet, perhaps they will, but they won’t find Theophilus; he’s out of a job.”

The general *leit-motif* of the pieces is made up of mosquitoes, strikes, fever, and general rottenness, but homage is paid to the strange attraction of the coast, which makes the retired official almost regret that he has left it.

Malta : A Neglected Outpost of Malta.—Some plain speaking by AUGUSTO BARTOLO, LL.D. (*Malta*).

Mr. Bartolo’s grievance is that the English newspapers, the Imperial Press Conference, and the Festival of Empire, have taken very little notice of Malta, and that generally a lamentable ignorance is shown in this country of a possession which played a great part in the war which secured for Great Britain the command of the seas. We are afraid there is much truth in this. But a great many of our smaller possessions might say the same thing. You cannot expect the average citizen, or the papers

which are written for him, to give much notice to places overseas, unless he is putting money there, or seeing his relations off to them, or interested in some trade connection. Even the Dominions have occasion to complain of incorrect references. But it would be a mistake to infer that the daily pre-occupations of the public make it insensible of the value of such a possession as Malta.

---

**Imperial Telegraphic Communication.** By C. BRIGHT, F.R.S.E.  
(*P. S. King & Co.*)

This is a collection of various articles written by Mr. Bright, who has shown a great and continuous interest in the subject since the days when the Pacific Cable project was being considered. Some of the matter has been put out-of-date by the accomplishment of that project, but the completion of one Government cable naturally lead to the discussion of others. Mr. Bright (L. 169) gives a useful account of the agreements or amalgamation of the Trans-Atlantic Companies, a movement which may seriously influence the question of further Imperial developments, and discusses various plans for strengthening cable communication within the Empire. At present the subject lies on the knees of the gods, and the views of the Governments interested will be better known after the Imperial Conference.

---

**William Ford Stanley: His Life and Work.** (*Crosby, Lockwood & Co.*)

The Stanley instruments are lower throughout the Empire, and the life of the remarkable man who founded the business is full of interest to those who value technical education. He was himself a natural mechanic and appreciated the gift in others. He saw that the system of apprenticeship was dying out in many trades where foreign competition was keen. This was largely due to the sudden introduction of free trade, as on the continent there were certain industries which were better organised or conducted with more scientific knowledge. The remedy was more technical education, and of this Stanley was a strong advocate and able exponent. His description of a proper course of instruction for boys who are intended to become workmen is well worth the attention of educational authorities, who have seldom, if ever, been brought up on such lines or for such a purpose themselves.

---

The Coronation issue of the "Financial Review of Reviews" contains articles on Australia, Canada, and India by Sir G. H. Reid, the Duke of Argyll and Lord Lamington. Sir G. H. Reid observes that the character of the Australian people makes for stability rather than revolution. No doubt some of the measures which have been taken to deal with new conditions have an appearance to the ordinary Britisher of doubtful experiments, but they are all the result of close study of the circumstances, and no one can accuse the Australian of political levity. The Duke of Argyll points out the wonderful variety of Canadian enterprises which are certain to have prosperous issues.

## MEDICAL NOTES.

### Jamaica and Malaria.

The Special Commission, appointed to investigate and take measures to remedy the conditions that give rise to malaria in the island, applied itself to an extensive programme, in the forefront of which came instruction by lantern lectures and demonstrations on the causes of outbreaks. Sanitary improvement is so largely dependent on education and public spirit that it is highly important to bring home to all classes the nature of the disease, and "visual instruction" is an excellent method for the purpose. Up to the present the Parochial Boards have for the most part failed to grapple with the problem systematically, but useful work has been done in Kingston, and no doubt the attention which is being given to the subject will have a salutary influence. Some swamps are so large that they could not be effectively dealt with except by systematic filling, and this would best be done by a sand-dredger, but the cost of such a vessel is apparently considered prohibitive.

---

Dr. K. S. Wise, Government Bacteriologist in British Guiana, has prepared an elaborate report on the results of the Nastin treatment for leprosy at the Public Leper Asylum in the Colony. The treatment was commenced in December, 1908, by Professor Deycke, the originator and discoverer of the drug, and since his departure in May, 1909, has been continuously carried out on similar lines by the Medical Superintendent and the Government Bacteriologist. In his covering despatch, the Governor writes as follows:—

"It will be seen that Dr. Wise expresses himself very cautiously, and considers that a larger and wider experience of the treatment is necessary before a definite conclusion can be arrived at.

"It is, however, a fact that since the Nastin treatment has been introduced four lepers have been discharged as cured, and I am in a position to say that at the present time there are fifty-six cases in which no leprosy bacilli can be found, and of this number it is hoped that 75 per cent. will be fit to be discharged within the next three months. Never before in the history of the Leper Asylum of British Guiana has leprosy been successfully fought, and the results which have now been obtained will doubtless lead to further research, and to a further and more complete conquest of this most terrible of all diseases."

In view of the far-reaching importance of this report, it has been presented to Parliament (Ed. 5,583; price 1/2), and circulated to all Colonies in which the disease exists.

---

We have received Nos. 25 and 26 of the Bulletin of the Sleeping Sickness Bureau, containing further technical articles on various forms of trypanosomiasis in human beings and animals, and complete information with regard to all recent developments in connection with the disease. We have also received Vol. V., No. 1, of Annual of Tropical Medicine and Parasitology, issued by the Liverpool School of Tropical Medicine.

---

## BUSINESS NOTES.

### Cotton.

Early in the year the demand for Sea Island cotton fell off. There has been an unusually large accumulation of stock in the United States, and proposals have been made to reduce the output. It is not, therefore, a time for extending growing in the West Indies, and every effort should be devoted to increase the yield per acre.

The British Cotton Growing Association have had an "undoubted check" in parts of West Africa, and have decided to abandon the position on the Gold Coast and to try the Northern Territories. In the latter district there will at any rate be a clearer field for the industry; the trouble elsewhere is that at present other products are more valuable, both for bulk, and away from the immediate neighbourhood of railways this counts for a good deal with the natives. In Nyasaland the position and prospects are very satisfactory, and a great increase of sowing is taking place in Uganda; given a favourable season, the output will show a very big advance. In Northern Uganda the prospects in the Muri and Bassa provinces have been favourably reported on, and it has been decided to erect a small granary at Ihi. It must not yet be concluded that Northern Nigeria generally is suitable for cotton growing; opinions have been expressed that the climate is too dry.

The Fine Cotton Spinners and Doublers' Association, which is credited with a proposal to acquire a cotton-growing area in the United States, has actually, it is understood, planted some 400 to 500 acres with cotton in trenches as an experiment, and the prospects seem favourable.

## Cotton growing.

The following calculation of cost and profit has been made in South Africa:—

The cost per acre should be approximately:—

Preparing and breaking ...	£0	7	0
Harrowing ...	0	2	0
Planting ...	0	1	0
Cultivating ...	0	5	0
Harrowing and hand hoeing ...	0	7	0
Picking 1,000 lb. ...	0	10	0
Cartage to gin ...	0	1	0
Wear and tear of implements ...	0	1	0
Sundries ...	0	3	0
	<hr/>		
	£1	17	0

One acre should produce 1,000 lb. seed  
cotton with at least 30 per cent. of  
lint, *i.e.*, 300 lb. @ 8d. per lb. £10 0 0  
Total cost of production per acre ... 1 17 0

Profit per acre ...	8	3	0
300 lb. lint @ 8d. per lb. ...	£10	0	0
Cost of production ...	1	17	0

Showing a profit per acre of ... £8 3 0

The cost of production, as thus shown, is, it is believed, much the same as in the United States. But it does not include any allowance for railway and steamship charges. The South African farmer would usually have to pay about 2d. per lb. to transport to England, and in this matter he is at a disadvantage as compared with the American planter, to say nothing of his having no home market. It is satisfactory to find, however, that South Africa can and does produce a better article than American upland varieties.

The principal item in the cost is that of picking. In South Africa suitable labour for this work is hard to get. What is wanted is a good machine, and nothing would benefit growers, and as a result Lancashire, more than such an invention. One has been now put forward in the United States, and should solve the problem, if the following description in the "Hopkinsville Kentuckian" is correct:—

"Washington, 24th July. Patents were issued to-day to Crawford Elliot, the inventor of the book typewriter, on a cotton picker or harvester which he has perfected as the result

of nearly seven years' constant effort. The basic patent granted covers forty different claims. The machine has been tested for two years in the cotton fields, and with it one man and a team of mules will do the work of forty hand pickers. Only the ripe cotton is picked, and this is done without injury to the green cotton or the flowers. The successful cotton picker has at last arrived and will enable the planters to greatly increase the present acreage under cultivation.

"The principle of the machine is a double row of bristle brushes about one and a half inches in diameter and fourteen inches long, spinning rapidly in such a manner that the revolving brushes are introduced into the plants close to the ground and drawn up in a verticle line through the plants, the brushes penetrating the bushes from both sides of the row. The ripe cotton adheres to the brushes, while the rest of the plant is not in any way affected, the brushes travelling to a receptacle where they are stripped of the cotton, and the operation is repeated.

"It has been thoroughly tested and demonstrated that it will do the work at a quarter of the cost of hand labour, which means the saving of 150,000,000 dollars a year to the cotton growers.

"The invention, which has been purchased by the National Cotton Harvester Company, of Chicago, means much to the growth and expansion of the cotton industry, and it will undoubtedly add immensely to the wealth of the cotton growing States."

---

## Rubber.

The Annual Report on the Forestry and Agricultural Department of Southern Nigeria (No. 30 of 1910) contains some useful information about the tapping of *Funtumia Elastica*. It is found that the best method is to open shallow channels in the tree, just deep enough to allow the latex to flow, and then to make incisions in them with a pincher. Trees so treated can be tapped three times a year without the yield falling off. There is no occasion for the natives to employ expensive chemicals in the preparation of rubber, as good thin biscuit can be made equally well by boiling small quantities of the latex, and washing and pressing it.

If it appears that pricking does not damage the trees, this treatment could be applied to them at an early age, though the rubber will not be so good as from mature trees. The chief drawback to the process is that the rubber is in the form of balls or "scrap," but this can be altered by using a washing-machine. Rubber so collected has been found to contain an unusually large

proportion of proteid and resin, and therefore fetches a low price. Recent experiments tend to show that the best way to remove resins and prevent a dark colour developing is to coagulate the latex with boiling water.

The latest discovery of a rubber field is that disclosed by Sir Salter Pyne, C.S.I. It is a forest extending over some five or six hundred square miles, in the valley of the Tugela in Natal, where the British Army found it to impede operations. The number of trees said to be ready for tapping is enormous and the rubber obtained is of very good quality. In these trees, however, the resin predominates, taking up over 53 per cent. of the extraction, while the rubber is only 11 per cent. The rubber, therefore, will be a by-product, though vast quantities are available. It is probable that the latex will be treated in London. Natal, however, does not possess the persistent rainfall which makes rubber trees grow so quickly in such places as Malaya.

Lately it has been difficult to obtain rubber seed from the East owing to the great demand for planting. The seeds are best when taken from untapped trees, but should not be from very young trees. The cost of collection is lower in the Straits Settlements than in Ceylon, but it is difficult to ensure that a fair proportion of the seeds are suitable.

The seeds should be collected as soon as possible after they have fallen, but not freshly gathered from the trees, as they are not then ripe enough. They should be packed in closely-fitting tins in dry charred rice dust, but the tins should not be hermetically sealed, as the seeds require some oxygen to retain their vitality; if no oxygen gets in, the seeds will after a time be pickled in the products of their decomposition. The packing should not be so close that the seeds almost touch one another.

---

### Tobacco Growing.

Tobacco has been grown in South Africa for many years, but it is only lately that an article of a superior kind has been attempted. Considerable attention is now being given to the industry, and the following directions have been given by the Government experts:—

*The Seed Beds.*—The best way of making the seed bed is to select a warm, sheltered spot with soil not liable to dry out and preferably with a northerly or easterly aspect. The ground should be trenched, unless it already happens to be a piece of well-watered garden soil. Mark out beds 3 feet wide and any length, separated by paths a foot in width. Remove the soil to

a depth of 10 inches, and lay at the bottom 4 inches of pure hot manure, which must be tramped down well, then fill in the trench with a proportion of one-third soil to two-thirds of old rotted manure, well mixed together. A very fine seed bed is then prepared with the rake, after which it must be thoroughly wetted and the seed sown on the wet ground very thinly at the rate of about one ounce to sixty square yards of seed bed. To do this, the seed is well mixed with sand or ashes, about  $\frac{1}{2}$  oz. of seed to a soup-plate of sand, and sown half in one direction and half in another, to secure uniform distribution. The seed is covered by riddling over it a quarter of an inch or less of sand or a mixture of old manure—sifted—and sand. To protect the plants from insect pests, weeds, etc., the proposed seed beds should be burnt by making a fire of branches or rubbish on top of them till the soil is scorched to a depth of 3 inches; the resulting ashes must be mixed with the soil previous to sowing the seed. The sprouting plants must be protected from frost and wind. This is best done by surrounding the beds with planks and covering them with muslin or butter cloth.

*Treatment in Seed Beds.*—The beds are kept moist until the seeds sprout, which may take from ten to fifteen days according to the weather. The beds are then watered every day, before sunrise, with a watering can having a fine rose, held low so as not to wash the plants out of the ground. When the plants stand about  $\frac{1}{2}$  inch high, either a little guano water, say about one handful of guano to every three gallons of water, or fine sifted old manure, should be given at least once a week, the remaining days pure water. Should sifted manure be applied, it must be watered at once so as to prevent any damage to the foliage by burning. After the plants are well grown, the covering must be removed at least a fortnight before planting, and watering must cease one week before planting so that the plants may be hardened for their change.

The rate of growth during the first month is very slow, but thereafter at the rate of about  $1\frac{1}{2}$  inches per week. A common fault is to sow the seed too thickly. If the plants are dense, it is imperative that they be thinned out—but not before they stand an inch high—otherwise the plants grow thin and lanky and about 25 per cent. to 30 per cent. die off in transplanting. The most important branch in tobacco culture is the raising of good and healthy plants without which a good crop of tobacco need not be expected.

*Planting Out.*—It is customary in Turkey, when the plants attain a height of 5 inches above the level of the bed and after watering has ceased for a week, to test a plant by twisting it round the finger, and should it not be brittle, the plant is con-

sidered fit for transplanting, but if it shows signs of being brittle it must be watered again, after which it must remain a few days without water. When the plants are fit for transplanting, they may be watered the previous evening, so as to facilitate the pulling the following morning. The plants are conveyed in flat boxes or baskets to the field, great care being taken to prevent the roots from drying in transit. It is better to transplant on cloudy days, otherwise the best time is late in the afternoon. As regards distance, it is found best to have the rows 3 feet apart and the plant 8 or 9 inches in the rows, which rows should run in the direction of the prevailing winds. This distance apart has the advantage of permitting cultivation with horse hoe, free circulation of the air, and it also produces straight stems, with a large number of leaves of small but equal size.

*Treatment during Growth.*—A fortnight after planting, hoeing by hand is necessary, and when the plants are well established and the rows discernible, the horse hoe may be passed through to keep down weeds and maintain a surface mulch. Cease cultivating as soon as priming, viz., the removal of lower waste leaves, is completed.

As the tobacco is liable to suffer from the attack of surface caterpillars (cut-worms), etc., trapping with poison should be resorted to as a remedy. The poison may consist of cabbage leaves, lucerne or green barley steeped in arsenite of soda, and scattered over the land towards evening a few days previous to planting.

Mildew is another cause of damage to tobacco, mainly due to climatic influences, but it may be checked somewhat by avoiding damp sheltered and close situations, and by allowing free circulation of the air. In the event of mildew, it is advisable to remove the diseased leaves from the field and destroy them, particular attention being paid that no such leaves are threaded with good ones, as such a procedure would ruin the quality of the tobacco.

Tobacco planted early in the season in wide rows, running in the direction of the prevailing winds, is not so liable to mildew.

If the seed is sown at the right time, and the flower heads are left undisturbed, very little trouble will be caused by suckers, but if planted out of season and in damp places, these grow vigorously, and reduce the strength of the tobacco very materially. All suckers should be nipped out when between 1 and 2 inches long.

The flowers are on no account to be removed as is done with ordinary tobacco.

*Priming.*—When the plant commences to bloom, and the lower leaves to turn yellow, four to six of these should be picked,

removed from the field and destroyed; in fact, in Turkey eight or ten of the lower leaves are destroyed, although in the Colony to remove so great a number seems unnecessary. Compared with the upper, the lower leaves are weaker, smoother, flatter and thinner. About ten days or a fortnight after the priming—according to the weather—the crop leaves proper commence to ripen.

*Signs of Ripening.*—The indications of ripeness are:—

(1) The lowest and the oldest leaves show a yellowish tinge in place of the previous vivid green, and this is most obvious towards the tip of each leaf.

(2) A limp feeling instead of the crispness of an unripe leaf.

(3) Translucency in place of the previous opacity when held up to the light.

With Cavvalla and other varieties, when grown on rich soil, yellowish spots appear on the leaves, and when these are distinct, the leaf is ripe. These signs of maturity are much more easily seen before sunrise or in cloudy weather, as bright sunshine misleads the eye.

*Gathering the Leaf.*—Each man takes a single row of plants and the leaves are plucked with the right hand, using the thumb above and the two fingers beneath the leaf stalk, the main stem being held firm by the left hand. The leaf is gathered in the early hours of the morning, which not only allows of easier discrimination between ripe and green, but at this time the leaf breaks from the stem sharply without causing injury to the plant. In picking, err rather on the side of over-ripeness than risk taking green leaves. For the foregoing reasons the leaf is harvested from bright daybreak up till 8 a.m. in summer, and until about 11 a.m. on dull and cloudy days. Never under any circumstances gather tobacco after rain till all signs of moisture has disappeared, as the leaf is apt to turn mouldy if this is done, besides losing its oil and gum.

Unripe leaves always retain a greenish tinge, which is very objectionable; overripe leaves lose colour and strength. One or more ripe leaves are plucked from each plant, in no case over four at one picking. The leaves are gathered from the lowest leaf upward in succession. The leaves gathered are placed evenly one above the other, and all facing the same way, in boxes or baskets. Methodical handling at this stage facilitates subsequent treatment. The remainder of the day will be occupied in manipulating the leaves gathered during the morning hours. If left over the day, fermentation is likely to set in. This has happened occasionally (owing to pressure of other work) when the leaves turned black and had to be thrown away.

*Threading the Leaf.*—The baskets or boxes, when full, are

conveyed to a cool shed where the leaves are graded into two or more grades, according to size. Damaged leaves are set aside. If the leaves are properly sorted at this stage and graded according to size, much time is saved at later stages and a more uniform colour is secured. This matter cannot be too strongly emphasised. Ultimate price depends very much on attention to this one simple detail. Past experiments show that those who neglected this matter were put to much labour and trouble at pressing time. The aim must be to keep the leaves as flat as possible, and if they vary in size the edges become folded and crinkled and a ragged, shrivelled effect is the result. The assorted leaves are now picked up one by one and threaded on to the tobacco needles at a point about one-half inch from the base. The leaves are then passed on to a thread of strong twine about 8 feet long, care being taken to keep all the butts of the leaves at the same level. All leaves must face the same way and be packed close together. A rod is laid along the string of threaded leaves, either end of which is attached to the corresponding end of the rod whilst securing bands, keeping the thread to the rod, are tied on at intervals of about a foot apart. Finally a label is attached to each rod, giving the date of picking and grade of the leaves.

*First Step in Curing.*—The rods with their burdens of leaves are taken to the curing shed and supported at their ends on wooden rails and the rods should be kept about 6 inches apart on the rails. The aim is to let the leaves wither slowly and turn to a pale yellow colour without mouldering or decaying. Under ordinary circumstances this process will occupy from three to four days, including the day of picking, if the leaves were properly ripe before picking. If there is too much draught, the edges of the leaves dry and shrivel instead of becoming faded and limp.

The curing house proper may consist of any convenient out-house, clean and cool, and, if possible, with a temperature not higher than 70 degrees. An empty wine cellar or coachhouse will serve the purpose, the essential being freedom from heat, hot wind, dust, rain and light. Lofts under corrugated iron roofs, stables where animals are kept, verandahs or lean-to sheds exposed at side and front, are to be avoided.

*Second Step in Curing.*—The greatest care must be taken to prevent the tobacco from touching or rubbing and the rods from slipping along the wire, to prevent this the ends should be secured with strong string. The first day the rods are kept two inches apart, the tobacco being close but not touching, and in the event of a scorching hot day, should be covered by bags or canvas sheets, though for the first day only. The second day the rods

are kept about four inches apart, and the third and subsequent days six inches. The object of varying the widths is to expose the tobacco gradually and prevent sudden or too rapid drying and to attain a good colour. The leaves gradually change from a pale yellow to a warm yellow brown colour, and become dry to the touch. This process takes usually from 12 to 15 days, subject to the weather.

In the event of rain threatening, all rods hanging outside must immediately be brought under cover and hung up singly, but not touching, nor must they be taken out again until the weather is perfectly clear. It sometimes occurs that the weather continues threatening for two or three days and the fresh tobacco may become mouldy. As a preventive, a heating oil stove may be allowed to burn in the curing shed to reduce the dampness in the atmosphere.

The tobacco in the curing camp must be covered without fail every night, dew or no dew, otherwise loss will result.

*Third Step in Curing.*—When the mid-rib of the leaf is brittle and perfectly dry, the rods are removed from the trellis and laid on the grass or on clean sacking, each one singly, and allowed to remain thus for the whole day and covered at night with bagging to keep out the dew. After removing the sacking the next morning, the rods must be turned, exposing the other surface of leaves to the sun. This is repeated for two days, and on the third morning the tobacco is removed to the shed and stacked.

It sometimes happens that the leaves having been picked a trifle green, or from some other cause, do not colour properly. In such cases they are damped with pure water applied as a very fine mist spray through a spray pump at sunrise. One day the one side is sprayed, the next day the other. This is repeated only once on each side of the leaf. Spraying is not necessary in every case if the proper colour is acquired without it.

*Fertilising.*—Tobacco seed being very small (about 300,000 to the ounce) the reserve material for the nourishment of the seedling is very soon exhausted, and the seedling is forced to feed itself much sooner from the soil than with most plants. Therefore, seed beds must be made in such a way that the seedlings will easily find plenty of available food. If they should not be sufficiently rich in plant food, fertilisers must be added, in addition to the humus which has been previously added in some form and which will keep the beds better provided with moisture.

If the beds have not received any kraal manure or tobacco stems or stalks, a complete fertilizer, containing, say, 10 per cent. of potash, 4 per cent. of nitrogen, and 10 per cent. of phosphoric acid, all in an available form, may be used.

*Sterilizing.*—On the Experiment Stations at Rustenburg and Barberton, seed beds were sterilized in a way which gave excellent results, and can therefore be recommended to tobacco planters. This method is as follows:—After the soil has been properly prepared and is in readiness for receiving the seed, boil some water in old paraffin tins or any other utensils at hand, and pour the boiling water as quickly as possible on to the beds so as not to let the water cool off too much, and allow it to soak in to a depth of about six inches. Repeat the treatment once or twice on one or two consecutive days. Sow the seed after the beds have dried up a little. This method of treating seed beds has resulted in our experiencing no trouble from fungus diseases or insect pests, notwithstanding the fact that on some of the beds fresh stable manure had been used. The application of boiling water on the bed not only seems to practically sterilize the surface soil, destroying disease germs and insects that may be present, but also destroys the weed seeds present, which would otherwise produce weeds and interfere with the growth of the young tobacco seedlings.

This method of applying water on the beds is a cheaper and simpler method than steaming the beds and far better than the method of burning them, adopted in some parts of America.

---

### Tobacco Seed Beds Sterilization.

There seems to be a general agreement now that tobacco seed beds should be sterilized. It has been proved that a faster and healthier growth of seedlings is secured on properly sterilized soil, the reason for this being that after the soil has been heated it is drier and can be worked into a better seed bed. Subjecting the soil to excessive heat helps to break down chemical compounds in the soil and liberates plant food. If the soil is sterilized by burning wood or trash on it, plant food, such as potash salts, is left in the ashes of the burnt material, and when these ashes are mixed with the soil, all the plant food they contain, being in a water soluble form, is readily available for the young plants. Another good reason for sterilizing seed beds is to destroy the germs of the weed and grass seeds usually lodged in the surface soil. If weeds are allowed to grow in the beds, the young seedlings will certainly suffer.

There are four methods of sterilizing with heat that have been applied with varying degrees of success. They are:—

(1) Open fire method: This is accomplished by simply burning wood or other waste material on top of the soil, thus providing sufficient heat to destroy weed seeds to a depth of 2 or 3 inches.

(2) Roasting process: This is accomplished by digging up the soil and throwing it into a large receptacle and heating it until the soil attains a high temperature, approximately 212 degrees Fahrenheit; the soil is then replaced in the hole. A machine is manufactured and sold in America, under the name of the "Wyatt Tobacco Bed Burner," which is a patent movable device especially designed for this sterilizing work. The machine is made throughout of heavy sheet-iron, with adjustable wheel carriage so that two men can move it. The soil pan over the surface is 3 feet wide, 9 feet long, and 4 inches deep. The soil is thrown into this pan, where it is roasted for about an hour. During the process, the soil is turned over with a long-handled shovel two or three times. A fire of wood brush or mealie stalks is kept going under the front end of the furnace. A block of soil 3 feet wide, 9 feet long, and 3 inches deep alongside the machine is shovelled up and put into the pan and baked as indicated above, then it is thrown back into the hole from whence it came and another similar block from the other side is treated in a like manner; by this time the block of soil covered by the machine is also sterilized. Thus it will be seen that at each setting of the machine a space of 9 square feet is sterilized. Under ordinary circumstances two men can sterilize 40 or 50 square yards in one day. If a dry soil is being treated less time will be required for each operation, and consequently more ground can be covered in a day, while, on the other hand, when dealing with a very wet soil, a longer time will be required for each operation.

(3) Steaming process: This is accomplished by first preparing the seed bed, and then by means of a steam engine, and a specially constructed air-tight steam box of any convenient size, the steam is led by a pipe into the box, which is inverted over a portion of the bed. The steam pressure should be up to at least 120 lb. to begin with, and the steaming should continue, over each portion of the bed for about fifteen minutes; the bed should then be allowed to dry properly before the seeds are sown.

(4) Hot water method: This is accomplished by first preparing the seed bed, then pouring boiling water on it till the soil is wet three or four inches deep. Wait three or four days and repeat the operation. After this do not sow the seeds till the bed has dried out properly, and the surface has been worked into condition.

In recent experiments, the open fire method of sterilizing gave the best results. The roasting process came second, and was almost as good as the open fire method. The steaming process came third, and was not quite as good as the roasting process. The hot water method gave the poorest results of all, and was but little better than the check or untreated plot.

**Fibres.**

Frequent inquiries are being made as to fibre plants, and banana and plantain fibres have been considered. Plantain fibre is suitable for cordage and canvas, but is not so strong as Manila hemp. It is whiter, finer and stronger than ordinary banana fibre. It grows well in British Guiana. Banana fibre from British Guiana and Trinidad has fetched as much as £25 per ton, but usually it is worth only £12 to £15, and that only when there is a shortage of manila and sisal hemp.

Banana and plantain fibre can be prepared by any of the ordinary scraping machines now in use; the chief difficulty appears to be found in dealing with the large percentage of water in the stem. One hundred stems can be crushed in twenty minutes with one horse, allowing five minutes for rest.

After crushing, the fibre is boiled to separate the gluten and colouring matter. Carbonate of soda and quicklime are used as chemical agents. To prepare three tons of fibre per day requires four boilers of 800 gallons capacity each, and to give five boilings in a day, which gives 1,650 lb. fibre, net, for each boiler, or 6,650 lb. for the four boilers. About 300 lb. of soda are required, and a proportionate amount of quicklime. The different grades of fibre are pressed separately, and are kept separate in the process of boiling. The lighter fibres require about six hours to bleach, while the darkest require fully eighteen hours.

Fifty years ago there was an extensive industry in the preparation of banana and plantain fibre in the island of Jamaica. A capital of £5,000 was required for carrying on the cultivation of the plantain on an extensive scale, eighteen tons of fibre being produced on  $5\frac{1}{2}$  acres at a cost of about £175, or a little under £10 per ton. Apparently the low prices obtained for the fibre made the industry unremunerative, for it seems to have ceased to exist many years ago.

The Sisal hemp plantations, which are extensive in British East Africa, are now nearing the productive stage, and a substantial export may be looked for shortly.

---

**Concrete Buildings.**

A report has been issued by a departmental committee of the Board of Education on the building of schools, in which local authorities are urged to consider the use of "Novel materials or methods." These comprise:—

(1) *Steel Frame Buildings:*

- (a) with thin solid curtain walls of concrete;
- (b) with hollow curtain walls of concrete slabs;

- (c) with curtain walls of brick, hollow or solid;
  - (d) with curtain walls of patent materials;
  - (e) with hollow curtain walls of expanded metal faced with cement and plaster.
- (2) *Reinforced Brickwork.*
  - (3) *"Ferro" Concrete Buildings.*
  - (4) *Brick Buildings with solid 9-in. walls.*
  - (5) *Brick Buildings with thin hollow walls.*
  - (6) *Timber Frame Buildings with slab casing.*
  - (7) *Wooden Buildings.*

Evidence was given to show that the steel frame buildings are very cheap as compared with brick. Concrete walls should be hollow, to obviate the condensation which takes place on the inside owing to the non-absorbent character of the material. Method (e) is being extensively employed for cottages in Suffolk on Captain Pretzman's estate.

A steel framework is constructed, strengthened by cross-wiring, and this frame is filled in with expanded metal lathing on both sides; the outer side is faced with a layer of cement and rough-cast  $1\frac{1}{2}$  in. thick, and the interior with  $\frac{3}{4}$  in. of plaster, a cavity  $6\frac{1}{2}$  in. wide being left between the two sides; the lower part of the wall is built in brick up to plinth level, or, in the case of a school, to the under side of the window sills. The result appears to be satisfactory. An advantage common to all forms of steel framework is the economy in foundations rendered possible by the lighter building; and on an insecure foundation a wall contained in a steel frame is certainly safer than a plain brick wall. On the other hand, all the forms of filling proposed require to be made weather-proof by a facing of cement rough-cast or a similar material.

As regards ferro-concrete, Mr. W. N. Twelvetrees gave evidence that the material (a) lends itself to any style of architecture; (b) can be employed for the construction of every detail from foundations to roofs, the building being monolithic throughout; (c) can be used for the construction of a skeleton frame supporting and transmitting all loads to the ground; the panels of the walls and roofs can be filled in with ordinary materials, which, having no load to carry in the walls, may be much thinner than the usual type; (d) makes a building of exceptional strength and capable of acting as a single unit, and thus unaffected by any subsidence or local weakness under the foundations; (e) is one of the best fire-resisting materials known; (f) is suitable on hygienic grounds, being impenetrable by vermin, harbouring no germs, and checking exhalations and moisture; being non-porous and non-conductive, it conduces to equable temperature; (g) concrete increases in strength with age and is free

from decay and corrosion, thus needing no maintenance or repairs beyond cleaning and painting for decorative purposes. On the last point, he drew attention to the fact that the durability of steel and concrete used separately had never been questioned by architects, and, therefore, their durability when used in combination ought to be accepted.

On buildings of two storeys there would be a saving of about 5 per cent. all round on first cost and on higher buildings an additional 5 per cent. per storey up to a maximum of 15 or 20 per cent. In any case there would be a saving in maintenance, as no repair would be required. Witness would prefer to make a reinforced concrete skeleton, like a steel skeleton, and fill in the walls with concrete hollow blocks, bricks, or hollow bricks. There would be a saving of 10 to 20 per cent. over a steel skeleton, and the same over ordinary brick construction.

Taking the items of construction separately, witness said that in foundations reinforced concrete offered great economies for unstable soil, while even in fairly solid soil reinforced concrete column bases required far less material than ordinary footings extending beneath the whole length of the walls, and thus effected a saving. He quoted a case of a building at Newcastle-on-Tyne where a reinforced concrete raft had been put under the building, and had resulted in a saving of 50 per cent. on the original design of a concrete foundation of piers going down to the solid. Similarly, at the General Post Office column foundations in reinforced concrete had been used and saved about 50 per cent. on ordinary concrete blocks.

In regard to columns, he estimated that reinforced concrete would give a saving of about 25 per cent. over steel columns to carry the same loads and could be used to carry a strain where a brick column would be of prohibitive cost, as the safe compressive strength of concrete properly reinforced averages ten times that of brick masonry. The concrete column would also be better than protected steel for resisting fire. He agreed, however, that from the point of view of the Board of Education steel columns from a good maker would require less supervision during erection than reinforced concrete columns, unless the latter were executed by thoroughly reliable and experienced contractors.

Witness thought that the only economy in the construction of walls arising from the use of reinforced concrete would be due to the possibility of replacing thick masonry by thin curtain walls, as these would not have to carry any load. Interior walls could be put up very cheaply of special slabs or by plastering cement mortar on expanded metal or other types of lathing.

As regards floors, he admitted that reinforced concrete was

dearer than timber, but considered it would usually come out cheaper than steel joists with plain concrete or tile panels; he had particulars of three cases where the saving was  $11\frac{1}{2}$ ,  $12\frac{1}{2}$ , and 15 per cent. respectively. The reinforced concrete was also less susceptible to heat, and so safer in case of fire, than steel joists.

For the purpose of staircases there was no saving in the use of reinforced concrete, but the material was better. When exposed to fire, it did not splinter and crack like stone, it did not burn like wood, and it did not buckle like steel.

He thought that for flat roofs there was an economy in the use of reinforced concrete; there would be no saving in a sloping roof, but the material might be employed with advantage, as it would make a roof impervious to moisture and immune from injury by fire.

The Science Standing Committee of the Concrete Institute have arrived at the following conclusions on the rusting of steel in concrete:—

Reinforced concrete will last as long as plain concrete in any situation provided that special precautions are taken during its construction. The precautions to be taken are as follows:—

*Concrete.*—The materials (cement, sand and stone) must be of good quality. They must be most carefully and thoroughly mixed and scientifically proportioned, so as to be practically waterproof and airproof. The mixture must be fairly wet, and must be well punned into position so as to minimise voids. The aggregate should be as non-porous as possible, and any aggregate which is known to have a chemical action on steel should be avoided. The aggregate should all pass through a  $\frac{3}{4}$ -in. mesh. The concrete covering should in no case be less than  $\frac{1}{2}$  in., and it is suggested that if round or square bars be used the covering should not be less than the diameter of the bar. In structures exposed to the action of water or damp air, the thickness of covering should be increased at least 50 per cent., or the size of the aggregate should be reduced so as to ensure a dense skin. In the case of structures exposed to very severe conditions, the concrete might be covered with some impervious coating as an extra precaution.

*Steel.*—The reinforcement should be so arranged that there shall be sufficient space between one piece and its neighbour to allow the concrete to pass, and to completely surround every part of the steel. All steel should be firmly supported during the ramming of the concrete, so as to avoid displacement. It should not be oiled or painted, and thick rust should be scraped and brushed off before placing.

*General.*—The scantling of the various members of the

structure should be sufficient to prevent excessive deflection. If electric mains are laid down, very great care must be taken that no current is allowed to pass through the reinforced concrete. Fresh water should be used in mixing, and aggregates charged with salt should be washed.

---

### **Concrete Machines at the Building Trades Exhibition.**

Mixers are of two main types, one where the materials are measured by hand and a definite quantity of concrete is supplied, the other where the discharge is continuous. They may have a rotating closed box or an open pan and an open trough with paddles. In the Ransome the rotating box is a short cylinder with blades to mix the materials, and a shoot carries the discharge. The Ransome hand-mixing machine has an open box with paddles, which are set at such an angle that the materials are always delivered to the centre of the drum, and jamming of stones between paddles and drums is avoided by providing springs to the paddles. Another convenient type was shown by Messrs. F. Johnson and Co.

Several block-making machines were exhibited. In the Winget, one movement of a lever opens or closes the mould, and the blocks are rapidly turned out (U.K. Winget Concrete Machine Co.). There were also machines for concrete bricks and tiles. A large sphere of usefulness is opened up by the extension and improvements of these appliances.

---

### **The Electrical Industry.**

This did well last year and is likely to do well this year. The metal filament lamp has had much to do with the extension of the use of electricity. It is still, however, rather expensive to hold its own where the voltage is not sufficiently steady for the metal lamp. It has been found in Japan that the best lighting results for factory purposes are obtained by fixing flame arc lamps with reflectors. The inverted arc lamp is being more and more adopted. Paraffin electric lighting sets are coming into use on tropical estates, being easily worked by coloured labour.

---

### **Condensing Plant for Electric Light Stations.**

The use in the boilers of the condensed steam requires considerable care to prevent the access of oil into the boilers, and, though by the use of a surface condenser it is possible to avoid the provision of an elaborate water-softening plant, it is still

necessary to provide a purifying plant to precipitate the oil which gets into the water. In marine engines the use of oil in the cylinders is small, but it is different with high-speed engines.

---

### Wireless Telegraphy.

It is proposed to establish communication between Colombo and Madras. The plant, with a guaranteed range of 450 miles, would cost about £3,700, and the other expenses would bring the total to about £5,000.

The competition of the Companies will no doubt be restricted by the result of the patent action lately won by the Marconi Company, which appears to give them the control of all "spark" wireless telegraphy for the next few years. The smaller concerns will now be between Scylla and Charybdis: on the one side the judgment protects the Marconi patent on a broad interpretation, while on the other the regulations of the International Radio-Telegraph Convention requires a method of syntonic transmission embodying recent practice in syntonisation of the circuits.

---

### Oil Fuel for Steamers.

By certain recent systems oil fuel is efficiently burnt without the use of steam or air jets, as is at present the common practice in the mercantile marine. The liquid fuel is injected into the furnaces under pressure by special oil fuel pumps, and on its way to the burners is passed through filters and heaters in which it is filtered and heated to the proper temperature; it is then forced into the furnace in the shape of a conical spray of fine particles, which burst into flames 6 to 8 inches from the nozzle. The lower and upper portion of the boiler are heated uniformly, and as there is no inrush of cold air, as there are no furnace doors to open, there is none of the strain caused by coal stoking.

---

### New Light-house at St. Lucia.

This is to be erected at Cape Moule-a-Chique. There will be a 3rd order revolving light, 90 ft. T. H. lantern with mild steel framing, copper roof and ventilator, mercury float pedestal, and Chance 55 m/m incandescent vapour installation with container as for 88 m/m installation. The price of all the materials constructed in this country is about £1,700.

The report on the mineral survey of Southern Nigeria is rather disappointing, or at any rate not exhilarating. The survey was commenced in 1903, and it was clearly desirable to make a general examination of the mineral resources of such a large and unexplored country. Nothing much of commercial value has been found, but in such cases the samples taken can only represent a small proportion of the possibilities, and experience shows that accident may bring to light treasures which the official survey has not hit upon. There are some places where gold is worked by natives, but not with such results as to interest the city at present.

---

It is to be hoped that the West Indies will make good use of the Canadian National Exhibition, which will be held in Toronto from August 26th to September 11th. As previously, Messrs. Pickford and Black will, it is understood, carry exhibits free to St. John. The rapid increase of population and prosperity in the Dominion is adding greatly to its value as a market for West Indian produce, and a good opportunity of advertising should be made the most of. Some day perhaps the West Indian colonies will have a commissioner in Canada, as South Africa has in England, to advise growers and arrange for sales.

## RAILWAY AND HARBOUR WORKS.

### To Northern Nigeria via Lagos.

A through rail service will be inaugurated in the current year from the Port of Lagos, the capital of Southern Nigeria, to Minna (the junction with the Baro-Kano Railway), the time occupied in transit being about 30 hours. The weekly mail train, which will connect with both the outward and homeward mail steamers at Lagos, will consist of saloon carriages provided with every modern convenience, including comfortable sleeping accommodation, lavatories, and bathrooms, and fitted throughout with electric light and fans. A restaurant car will be a special feature in connection with this train.

The route is *via*

#### LAGOS LINE

{	Abeokuta (60 miles)
	Ibadan (123 miles)
	Oshogbo (186 miles)
	Ilorin (246 miles)
	Jebba (306 miles)
	Zungeru (429 miles)
	Minna (467 miles)
Rigachikun (585 miles)	

the present nearest point of the Nigerian railway system to the Tin Mines of Bauchi.

At Lagos, passengers and their luggage, etc., are conveyed to and from the Ocean Liner by a tender which lands them conveniently at the Customs wharf. Arrangements will be made to convey them from the Landing Stage to Iddo Station, the present terminus of the Lagos Railway, where they may at once entrain. The saving in time by this route will be from 8 to 10 days on each journey, in comparison to the Niger River route *via* Forcados.

On the 8th of April the first train steamed into Kano, nearly 360 miles from the base. The cost will only moderately exceed Sir P. Girouard's estimate of £3,000 a mile, though as the line has only been built as a "pioneer" line a good deal of work remains to be done to complete it thoroughly. The line from Lagos is rapidly approaching Lungeru and when it is open the journey from Lagos to Kano will be done in little more than three days. The branch line from Zaria to the Bauchi highlands will not only open up the tin fields but will provide an exhilarating retreat for invalids from the low-lying coast and river regions.

The rapid completion of the Baro-Kano railway has been a feat on which all who have taken part in it may well be congratulated. The interest will now soon shift to questions of traffic. Experiences will settle the vexed question whether the Lagos railway or the river Niger will secure the best part of the traffic to Northern Nigeria. From Buruteu to Lokoja is only 350 miles, and of this only about seven miles require dredging to secure a six-foot channel all the year round. This would admit vessels of 9,000 tons gross burden. On the other hand, the Lagos merchants hold the key of the position, and there is a much freer market there than in Northern Nigeria.

It is unfortunate that in the Zaria country there is a long stretch where there are very few people and where appreciable returns cannot be expected for some years. But from Zaria northwards there is an enormous and intelligent farming population. From Kano eleven great main roads restart to every quarter of the compass, and not less than 1,000,000 acres are under continual cultivation within thirty miles of the town. It is necessary to take into account a certain sort of inertia in a people which is accustomed to live on something like a penny a day, but there is no question that they are capable of hard work and all experience shows that the approval of European civilization rapidly enlarges the ideas and stimulates the demands of West African races.

The original estimate of the cost of the Baro-Kano railway was £1,230,000, which included £30,000 for a river dredger and barges. The excess is now put at £100,000, chiefly due to under-estimating the amount of bridgework, and a further £100,000 will be provided for various items of improvement and equipment. The Treasury expressed a doubt whether their future expenditure was justified before the traffic had made some progress, but the expenditure is to be spread over three years, and will be devoted to improvements which can be justified on their individual merits. £10,000 is suggested for draining the foreshore at Baro,

it being considered that this work will be directly remunerative as providing suitable sites for trading firms.

The inspection of the Baro-Kano railway by Major Waghorn has been postponed till November on account of the difficulties caused by the rainy season.

---

### Lagos Railway.

By the end of January the North Channel Bridge over the Niger was practically complete. The north approach bank to South Channel Bridge was approaching the full width in places. The completion of the foundation of bridges and culverts in Division II. was delayed by the want of stone, owing to the limited amount of rolling stock. The substructure on Kaduna Bridge proper was completed. The works are now making good progress.

---

### Lagos Harbour Works.

The Eastern wall has made steady progress, extending at the end of last year 4,072 feet seawards from the centre of the Harbour Works Wharf. It was expected that the Western wall wharf would be finished next September, but the loss of materials in the "Axim" will cause a serious delay, and the commencement of the West wall cannot be made before next year. The connexion between wharf and foreshore will be, as on the Eastern side, by means of a causeway of tipped stone.

The channel across the bar has in each year towards the end of the rainy season become more difficult and hazardous since the dredging and harbour operations were started, and the draught has had to be temporarily reduced. The steamer "Harold" stranded last September in the channel proper, and was refloated by the efforts of the dredger, "Sandgrouse," but the "Sandgrouse" herself got ashore just at the end of the operations and was so injured that she had to be sent home to be repaired. Owing to this and the docking of the second dredger, hardly any dredging was done in the latter half of 1910, and it is fairly evident that the scour produced by the Eastern wall already completed has helped greatly to maintain the channel at nearly its dredged depth. A large tug, with salvage apparatus and fire extinguishing apparatus, is to be provided, which while available in cases of fire in the town near the harbour will be used chiefly to assist the navigation of vessels entering and leaving the harbour.

The length of the Apapa Wharf is now fixed at 343 feet to facilitate the landing of materials for the water works at Iju. The consideration of this matter led to a delay in the commencement of construction. The laying of the rails on the railway was completed and the line opened for light traffic early this year, but the wharf will not be completed till the beginning of next year.

A considerable amount of swamp land on Lagos Island still requires reclamation. Up to the end of 1909, £49,425 had been spent on this much needed sanitary improvement. During 1909-10 the "Sandgrouse" did excellent work, but as the operations proceeded and the site of discharge became more distant the progress was retarded. With the lengthening of the pipe line the time occupied by the discharge became excessive. Lieutenant Child, while on leave, visited Holland to study the methods followed there, and found that the right course was to duplicate or even triplicate the single pump fitted to the vessel. The supply of this additional pumping power was authorised at an estimated cost of £7,000.

During 1910, the sewage and local work preliminary to the preparation of estimates of cost and detailed schemes for the extension of the railway from Iddo across Lagos Island to Wilmot Point, and for the construction of large quays for ocean steamers, were completed.

Good progress has recently been made with the erection of the Customs and West Wall wharfs. The progress of the East wall is comparatively small owing to the high tonnage rates required for lineal foot of the work. At the end of April the length was 4,589 feet from Section I.

---

### Sekondi Harbour Works.

Good progress has been made with the filling in of the reclamation area and the formation of the blockyard. The second yard Goliath crane and the block-setting crane were despatched in March and April, and the construction of the breakwater can be proceeded with; it is anticipated that it will be sufficiently advanced by the end of the year to render practicable the construction of permanent slipways. Several steam launches and a large number of lighters are engaged at the port, and facilities for repair would be welcomed.

It has been decided to build a sea-wall or pitched slope between jetties Nos. 1 and 2, at an estimated cost of £900. The reclamation will provide a valuable piece of ground for railway purposes.

**Sekondi Railway.**

A serious washout which occurred last autumn on the Sekondi-Coomassie Railway, at 113 miles, is attributed partly to the extensive clearing of trees which has taken place on the headwaters of the rivers Jym and Nyam Lu, in the neighbourhood of the mines at Obuasi, Sansu and Ayenim. The mischievous results of such deforestation are well established. Trees are the natural material for holding the humus together, so that water can be arrested and absorbed, and if they are removed a cause is set up of sterile land and violent watercourses. In this case the local mischief will be met by providing a 30-foot span.

It is proposed to make a new station and loop at Cinnamon Beppo to accommodate the increasing traffic of the place.

---

**Tarkwa, Prestea, Branch and Broomassie Connection.**

The Tarkwa line was opened for traffic in January, and is reported to be in good order. The ballast laid is 1,880 cubic yards per mile, a larger quantity than was anticipated, owing to the clay soil. The expenditure has been about £151,000. The Ankolna bridge was built under extraordinary difficulties, the space to work on being small and the river liable to rise unexpectedly. The Broomassie connection was opened at the same time.

---

**Accra Water Works.**

Last year was devoted to the laying of a light railway to the scene of operations and preliminary buildings. The railway was pushed through to destination to allow materials to go up, but a good deal of work remained to be done in building culverts in masonry and widening cuttings. The line is 10 miles long, and is being used for general trade. Good progress has been made this year, though there has been a shortage of labour.

---

**Accra Akwapim Railway.**

The contractor has sunk a well in Accra Station Yard, with very promising results. At 170 ft. a steady flow set in, yielding 2,500 to 2,800 gallons in 24 hours through a 4 in. bore hole. Analysis has shown that the water is practically quite pure. There seems reason to expect that a great supply would be obtained by increasing the diameter of the hole.

**Freetown.**

It is proposed to construct a dam for the waterworks 25 ft. high, which would give a storage of 2,000,000. The nature of the ground seems to make a greater height inadvisable. This gives a 28 days' supply approximately. The cost would be about £3,500.

---

**Trinidad Railways.**

The island is intersected about its mid-length from north to south by the central range of hills, extending from Point à Pierre, four miles north of San Fernando on the west coast, in about an east-north-easterly direction to El Branch on the east coast, and the Caparo line, built in 1896-98, pierced this range by tunnel, terminating about a mile to the south of it at Tabaquite. This central range throws off roughly north-westerly and south-easterly bearing spurs, two of which on the northern side form the Caparo Valley, while Tabaquite is situated on the crest of one of the most important spurs on the southern side.

The Tabaquite spur beyond that place follows an easterly course and is broken and tortuous, turning back almost on to itself, then it turns generally southward and south-eastward with many windings, and terminates on the northern side of the river Ortoire, south of Rio Claro. Its top is very narrow, practically a knife edge crest, where the line gets on to it between 5 m 70 chs. and 6½ miles, and on this crest, with continuous turns and twists, ascents and descents, has been built the Tabaquite Mayaro Main road, since the opening of the Caparo valley line.

This road joins, a little eastward of the selected Rio Claro terminus, the San Fernando Mayaro Main road about 26 miles eastward from San Fernando and 19 miles from the present railway terminus at Princes Town; its general direction is east and west.

The Tabaquite spur is the watershed between the streams flowing west and south to the Ortoire, and those flowing south and east to the eastern coast, and it throws off along its course on either side a labyrinth of other spurs and valleys, the latter being almost precipitous where they terminate in the main spur. The spurs are, of course, more or less at right angles to the direction it is proposed to follow, are tortuous and very broken, and while too important to be cut through, have slopes not sufficiently bold to be contoured with curves of which use might be made, so rendering the selection of a practicable route for a railway a task of much difficulty, which is increased by the dense forest growth obscuring the country.

The general idea proposed in 1898 was to follow the Tabaquite spur to Rio Claro, thence east to Mayaro, the only place of any importance on the east coast at that time; but that would have left the large blocks of valuable agricultural country between Rio Claro and Sangre Grande to the north a distance of about 30 miles, and the whole south-eastern corner of the island to the south without other than road communication with the outer world. Later the present scheme was proposed, *i.e.*, to extend eventually the Rio Claro Line to Guayaguayare to open up the south-eastern corner of the island, and this is likely to be greatly advanced by the present development of oil mining there, and later to run a second line eastward from Tabaquite approximately mid-way between Rio Claro and Sangre Grande, to open up that country, and to terminate at Mayaro on the east coast. The better way of reaching Guayaguayare from Tabaquite would have been to follow the valleys of the "Palmiste" and "Poole" rivers into the valley of the "Ortoire" and thence to Guayaguayare, but that would have left Mayaro for the present 18 to 19 miles from the terminus, whereas the proposed terminus at Rio Claro will be only 12 miles distant.

To return to the Rio Claro extension proposals, owing to the broken nature of the spur eastward of Tabaquite, it is necessary to avoid that part of it at any rate, and if it could be immediately regained, there is another point near the sixth mile where it must be left on account of its sinuosity; added to this, inequalities of the crest would necessitate heavy earthworks and some heavy walls, and the works would destroy the existing main road, there being insufficient room for both road and railway on the narrow crest.

Another suggested route descends from Tabaquite by the valley of the "Palmiste" stream for approximately 3 m. 60 chs., then turns eastward at a level of approximately 295, and crossing two minor watersheds at the St. John's road and the Brothers Settlement road respectively, holding approximately its level of 295 to 300 above datum joins the main watershed at 5 m. 75 chs. on the line, or 6 m. 30 chs. on the road mileage. It follows the crest to 6 m. 60 chs. (line mileage) where it reaches the source of the "Guayanapa" stream, the valley of which it descends and in which the Rio Claro terminus is situated at 12 m. 70 chs., adjoining the main road from San Fernando to Mayaro. This terminus has been selected.

The Tillage passed through is without exception that of Cacao, for which an orchard cultivation, under superimposed treeshade, is used. This extends for 1 m. 47 chs. from Tabaquite, after which, with the exception of one piece near 4 m. 20 chs. alienated but not under cultivation, this section of five miles passes through Crown Forest.

**Barbados.**

A scheme is under consideration for improving the coaling facilities by building coaling yards and wharves at Needham's Point on the Southern extremity of Carlisle Bay. The scheme would necessitate a breakwater and quay walls, and a considerable amount of dredging.

---

**Ceylon.**

On the Ratnapura Extension railhead was on 1st February at 12 m. 20 chs. The cost of land has been Rs. 714 per acre against Rs. 600 allowed in the estimate, the demand for rubber land having sent up the price.

On the Mannar Extensions the rails in March were of a total length of 18 miles. The masonry contractors gave a good deal of trouble, being petty men who often disappeared leaving work unfinished; better progress is being made by employing masons departmentally, though the cost will probably be slightly increased.

A flying survey has been ordered of a proposed line from Ratnapura to Pelmadulla, *via* the valley of the Wey Ganga. This line would tap the traffic from a very large district of recently opened rubber land at Dela and Niuitagala.

A survey of the main line to Rambukkana is contemplated with a view to altering the grades and curves and doubling the line.

---

**Malaya.**

On the Semantan Kuala Tembeling Railway, the service road was completed for 41 miles at the end of last year. At the end of March the rails were linked for six miles.

On the Gemas Kirola Semantan Railway, the first two sections were opened for traffic. By the end of March last the rails had been linked in for the whole length of 76 miles.

---

**South African Railways.**

Last year about 500 miles of new lines were opened for traffic, and some 400 were under construction. These were authorised before the Union, at an estimated cost of about £4,000,000. Since the Union, rates have been reduced, but there is still an enormous profit, and, no doubt, further reductions will follow, when the administration has had time to consider the large system which has been taken over.

**Superheating.**

Superheated steam is apparently a bad conductor of heat, and can, therefore, be used to reduce cylinder condensation. In the Phoenix system the superheater consists of a series of small tubes fitted to a steel casting in the smoke box; steam passes from the Boiler through various sets of tubes, and ultimately into the cylinders. A certain amount of low superheat is thus obtained. The method has the advantage of being capable of removal should it be found desirable at any time to dispense with superheating, at comparatively small cost. It is also applicable to engines fitted with an ordinary slide valve. A further advantage consists in the system being comparatively simple, and not too complicated to require extraordinary technical skill in attention. It has the additional claim of being applicable to boilers of an ordinary locomotive type without costly alteration to the fire and smoke box tube plates.

The disadvantages are:—

(1) Excessive weight in the smoke-box in addition to that of the locomotive. This varies from a ton to a ton and a half, thus considerably interfering with the adjustment of weights on the wheels.

(2) It presents grave difficulties in obtaining access to the boiler tubes and wash out plugs in cases of repair or cleaning in the smoke-box.

(3) The deposit of ashes at the casting to which the lower ends of the tubes is fixed undoubtedly tends to the corrosion of the superheater tubes.

(4) The economy in coal consumption is less than that of the Schmidt system.

(5) As a system, it is still in the nature of an experiment and hence will not compare with the Schmidt which is in use on some thousands of locomotives.

(6) It is questionable if a thicker smoke-box is not required.

(7) Its cost is believed to have been in certain locomotives about £110 to £120 more than the Schmidt.

In the Schmidt system the superheater proper consists of a series of tubes inserted into the ordinary boiler tubes. A steam collector is arranged to stand in the smoke-box either vertically between the nest of tubes or horizontally above the tubes. These collectors are in two parts, one taking the saturated steam from the boiler from whence it passes through the superheater tubes and is delivered, superheated, into the other steam collector, and so to the engine. The ends of the superheater tubes, where they join the steam collectors, have a collar which forms a joint and are held in place by a cast-steel dog, which holds the tube ends

and is secured with a single bolt. Should it be necessary to remove one of the superheater pipes, in order to either expand or stop a leaky boiler tube, this operation can be quickly performed by unscrewing two nuts. The superheater tube can be removed, a stopper placed in the holes where the tube entered the collector casting and the dog screwed up again, or the superheater tube may be replaced. When removing one of these elements, it is only necessary to close the stop valves and blow out the steam contained in the tubes and collectors; the latter being fitted with a valve for this purpose and for drainage. As the superheater tubes are usually cleaned each time the boiler tubes are swept, the efficiency of the superheater remains unimpaired.

The advantages of the Schmidt system are:—

(1) It is a system of some years standing and is in use on a great number of locomotives, in consequence the claims and advantages have been definitely established beyond possible dispute.

(2) The amount of superheating is greater and therefore the economy in coal consumption is correspondingly greater than the Phœnix.

(3) No unsurmountable difficulty is experienced in obtaining access to the boiler tubes and plugs in the smoke-box.

(4) The weight is distributed more evenly over the general arrangement than is the case with the Phœnix.

(5) It is less weight in addition to the ordinary weight of a locomotive than the Phœnix.

(6) Arrangements are made to automatically close or open the dampers which cover the portion of the superheater in the smoke-box.

(7) It presents no grave objection from the standpoint of deposit of ashes and corrosion resulting therefrom.

(8) It is cheaper to instal on a locomotive, if fitted when built, than the Phœnix.

(9) It is stated that the system does not involve any additional cost in maintenance, but this point would appear to be open to question.

The disadvantages of the system are:—

(1) The impossibility of removing the whole system and reverting to the use of ordinary steam, if it is desired to abandon the use of superheaters, without costly and tedious alteration to boilers.

(2) To enable the best possible results (*i.e.* greatest economy) to be obtained, it is necessary to use piston valves in place of ordinary slide valves.

(3) It is a more complicated system than the Phœnix.

(4) A greater number of spare parts than would otherwise be the case have to be stocked in the Colony.

(5) Some degree of experience is necessary with the driver in charge before the full benefit is obtained.

(6) It is questionable if it is not desirable or even compulsory to have all pistons fitted with tail rods.

Regarding the general question of superheating a sequence of its introduction is the necessity for forced lubrication of pistons and valves; the use of metallic packing; larger cylinders than would otherwise be necessary; an improved gland; better cylinder oil; special care in making steam joints; the replacement of copper pipes in the smoke-box (main steam pipes) and possibly in the boiler by steel pipes; and special equipment for cleaning out boiler tubes.

The Schmidt system, also, is admitted to require, and it is doubtful, also, if in this respect the Phoenix is not somewhat similar, a much longer time to raise steam in the boiler than an ordinary locomotive.

---

#### Bridge Foundations.

Screw piles are convenient and economical, but it must be remembered that they are only suitable for good foundations, and that the bridge will probably have to be reconstructed when the loads are heavy and the speed high. The sinking of cast-iron cylinders present some difficulties, but built steel cylinders can be substituted, and though these are now expensive they weigh less, and therefore the freight and carriage are less. Very satisfactory results have been obtained by a lining of concrete to assist in sinking the cylinders. With the cylinders should be provided a cast-steel cutting edge, or a built one with a lip upon which the concrete core should be built. This core should commence at the bottom, and it has been found that there is then very little tendency for the cylinders to get out of either position or plumb during the sinking.

---

#### Panama Canal.

The effects of the canal on shipping and shipbuilding are being discussed with rapidly increasing interest. The Suez Canal has regulated the types of vessels plying to the East, their sizes having regularly increased in proportion to the deepening and widening of the canal. A further development will be brought about by the Panama, which will have a minimum breadth of 300 ft., as against 213 in the Suez, and a deep of 41 ft., as

against a maximum of 28. On the other hand the length is limited to 1,000 ft. on the Panama, and is unlimited on the Suez. The former will be capable of passing four times the present traffic of the latter. New York will have the great advantage over London of being 2,770 knots nearer to the canal, but the impulse which will be given to ship-building will be a great benefit to this country.

### COLONIAL STAMPS.

The attempt to obtain an equally useful and more attractive design for stamps printed from the Universal keyplate, referred to in our last number is being continued. If it is crowned with success and a way can be found by which stamps of the improved design can be supplied without incurring charges for new duty plates a short delay in the supply of the stamps will be, in the opinion of most people, amply compensated.

The portrait of H.M. the King, which will be used, is the same as has been adopted by the Imperial Government.

The following changes have taken place since our last issue:—

ANTIGUA.—6d. arms design on surfaced multiple watermarked paper instead of on Crown CC paper.

BAHAMAS.—6d., on multiple watermark paper for the first time.

GOLD COAST.—2/6, for the first time in the new colours.

JAMAICA.—6d., printed for the first time from the arms keyplate.

4d., in red on yellow paper (still from the Queen Victoria plate).

LEEWARD ISLANDS.—2d., 6d., 1/- and 2/6, printed for the first time, in accordance with the Universal colour scheme.

N. NIGERIA.—3d. and 5/-, printed for the first time, in accordance with the Universal colour scheme.

**RECENT TRANSFERS AND PROMOTIONS  
MADE BY THE SECRETARY OF STATE.**

- Mr. A. G. LASCELLES, K.C. (Attorney-General, Ceylon), Chief Justice, Ceylon.
- Mr. T. ANTON BERTRAM (Puisne Judge, Cyprus), Attorney-General, Ceylon.
- Mr. C. C. BOWRING, C.M.G. (Treasurer, East Africa Protectorate), Chief Secretary, East Africa Protectorate.
- Mr. STANLEY FISHER (District Judge, Cyprus), Puisne Judge, Cyprus.
- Mr. T. W. HAYCRAFT (District Judge, Cyprus), Police Magistrate and Coroner, Gibraltar.
- Mr. H. A. NISBET (Magistrate and Registrar of the Supreme Court, Grenada), Registrar of the Supreme Court, Hong-Kong.
- Lieutenant R. M. REYNOLDS, R.N.R. (Deputy Marine Superintendent, Northern Nigeria), Marine Superintendent, East Africa Protectorate.
- Captain F. N. LE MESURIER (late Major and Officer Commanding the Sierra Leone Battalion, West African Frontier Force), District Commissioner, Northern Territories, Gold Coast.
- Mr. M. G. S. SHERRIFF (late of the Foreign Labour Department, Transvaal), Assistant District Commissioner, Northern Territories, Gold Coast.
- Lieutenant C. J. ELKAN (late Assistant Commandant, Northern Territories Constabulary, Gold Coast), Assistant District Commissioner, Northern Territories, Gold Coast.
- Mr. R. L. PAYNE (2nd Clerk, Secretariat, Grenada), Supervisor of Customs (2nd Grade), Southern Nigeria.

- Mr. W. J. O'HARA (Postmaster, Nyasaland), Assistant Postmaster-General, Northern Nigeria.
- Mr. F. G. W. HADDRELL (retrenched from the South African Constabulary), Supernumerary Sub-Inspector of Police, Leewards.
- Mr. H. B. SMEETON (late Trooper, Natal Police), Assistant Inspector of Police, East Africa Protectorate.

**OFFICIALS ON LEAVE OF ABSENCE  
IN THIS COUNTRY WITH DATE OF  
EXPIRATION OF LEAVE.**

---

This List is compiled from the Leave Certificates sent to the Crown Agents for the Colonies. The Editors will be glad to receive notice of any other cases of Colonial Officials on Long Leave.

# THE COLONIAL OFFICE JOURNAL.

---

---

VOL. V.

OCTOBER, 1911.

No. 2.

---

---

*[This Journal, though published with the approval of the Secretary of State for the Colonies, is not official, and the Secretary of State is in no way responsible for the opinions expressed in it.]*

---

---

## EDITORIAL NOTES.

THE Imperial Conference has left the constitution and the organization of the Colonial Office, to use the words of the Secretary of State at the Corona Club dinner, untouched and unchanged. It will be remembered that after the Conference of 1907 Lord Elgin altered the arrangements of the office so that there should be a separate division dealing with the self-governing Dominions. This, however, did not carry out Mr. Deakin's views, as he contemplated an organization entirely separated from the Colonial Office, and for a time it seemed quite possible that a complete bifurcation would have to be effected. The offer to do so was, in fact, made by Mr. Harcourt, and it was one of the signs of generous and appreciative feeling that the Conference decided not to accept it. That such a step is not necessary is implied in the high praise which was given to the multifarious work prepared by the Secretariat for the information of the Conference. The argument for a complete separation was based on the idea that a staff which dealt with the Dominions in contiguity with a staff which controlled the Crown Colonies would be influenced by the more or less autocratic methods of the latter. But it was hardly probable that a department which has so much occasion to study constitutional positions would make the mistake of confusing the status of the self-governing communities with that of the Crown Colonies, and we have no hesitation in expressing the opinion that it has never been done. No doubt in the last quarter of a century a change has come over the political relations of the

Mother Country and the Dominions. It should be remembered when we speak of autonomy and self-government that the constitution acts reserved considerable powers to the home Government. A gradual development has made these reservations almost nominal. Not again, for instance, would the Crown here veto such measures as the New South Wales Deceased Wife's Sister Bill, as it did in the eighties. A national growth has taken place and there is no possibility of a return to obsolete relations.

---

We greatly regret that Sir C. P. Lucas is compelled to give up official work before the usual age of retirement. All considerations have to give way before failing eyesight, and we can only hope that with the removal of the severe strain imposed on him he will be able to continue the literary studies in connection with colonial subjects by which he has been distinguished. Sir C. P. Lucas had a long connection with the East and the West Indies, and we have no doubt that his retirement will be much regretted by his many friends in those parts. In the high position which he has recently filled he has been concerned with the Dominions, and if any proof were wanting that an official thoroughly versed in Crown Colony methods could apply himself to the dealings with the Dominions with a full sense of respect for their position and sympathy with their policies we could point to this instance. Certainly his visit to Australia had no little to do with the greater confidence in the Colonial Office which was shown at the recent Conference.

---

The most valuable fruit of the Imperial Conference will probably appear to most people to be the arrangement arrived at between the Admiralty and the representatives of Canada and Australia. The memorandum states that the naval services and forces of those Dominions will be exclusively under the control of their respective governments, but provision is made in several ways to facilitate the co-operation of the Dominion and Admiralty ships, and it is declared that in time of war, when the naval service of a Dominion, or any part thereof, has been put at the disposal of the Imperial Government by the Dominion authorities, the ships will form an integral part of the British fleet, and will remain under the control of the British Admiralty during the continuance of the war. The autonomous position of the Dominions can only be preserved by the retention of the right to decide whether the ships are to be placed at the disposal of the Imperial Government, but as to this the British public may well take satisfaction from the fact that it was the suggestion that British naval supremacy was threatened that spurred on the

Dominions to action. For the present the great thing is to secure the ships and the men.

The interest now taken by the Dominions in questions of defence is a comparatively new feature. Within our own generation the general tone was one of indifference. The energies of the Colonies were absorbed by the heavy work of development. At the early Conferences the presence for consideration of the subject came entirely from the home Government. The change is due mainly to a great alteration in the relative position of the British Empire. Not many years ago it practically stood alone in the world. No other Power had entered into the field, and in Great Britain itself there was no little doubt whether its position was not "half blunder, half crime," and no little disposition to withdraw from it if opportunity permitted. But when other Powers, as a result of accumulating wealth and expansion of industries, set to work to appropriate territory whenever it could be conveniently taken, Great Britain had either to fall ignominiously out of the race or to protect herself by sharing in the expansion. Inevitably, though to a great extent reluctantly, she took the second course, with the consequence that the area of its possessions was vastly increased and with it the burden of responsibility. The international rivalry which has thus arisen has come to the doors of the Dominions. The politics of the Empire are no longer concerned chiefly with European complications which had no interest for the overseas settlements, and they turn largely on considerations which affect the whole organizations. The new rôle which the United States have undertaken as a colonizing power, the quick rise of Japan, and the opening up of vast possibilities in China, have further widened the international community of affairs.

---

A good deal of criticism has been excited by the articles of the South African *Volkstem* on the possibility of South Africa remaining neutral in the event of Great Britain being engaged in war, and the bare mention of such a contingency is enough to cause much indignant comment. It is only fair, however, to the *Volkstem* to recognise that the suggestion was that South Africa might remain neutral in the interest of the British Empire. The argument appears to be that South Africa could not herself resist invasion, and that the trouble of defending her would only add to Great Britain's burdens. This involves a familiar fallacy. The defence of South Africa, and of all other parts of the Empire, will not be conducted by a multitudinous number of operations on their various coasts, but by centralized operations which will take place where the enemy's ships are in force. The strength of the British fleet is determined with a view to this purpose; it depends, not on

the local requirements of the Empire, but on the amount of force which might be brought against it. No substantial relief, therefore, would be gained by not being compelled to defend South Africa. No invasion of that country is possible until a safe highway is established for transports, and that is out of the question so long as the British navy holds its own in European waters. There is, therefore, no occasion for South Africa to desire neutrality out of consideration for this country's burdens. There is another and perhaps still stronger objection to the suggestion, and that is that the option would rest, not with the Dominion, but with the enemy. On such an occasion clearly "nemo exuere patriam potest," unless the adversary agrees. That he would do so is extremely improbable. On the hypothesis that South Africa is helpless, he has no inducement to recognise her neutrality; but he has a good deal of reason for treating her as a belligerent. It may be noted that General Botha has expressly deprecated the doctrine put forward by the *Volkstem*.

---

The "All-Red" route idea came into prominence at the Ottawa Conference of 1894, and was received with favour by the Australian as well as the Canadian representatives. But since then the circumstances have gone against it so far as Australia is concerned. At the Ottawa Conference there was a solid expectation that Canada and Australia would enter into reciprocal commercial arrangements if they were made free to do so. The technical difficulties—the German and Belgian treaties—were removed eventually, but the commercial treaty did not materialise, and there has, therefore, been less to say for the proposed steamship service. The second point is that in 1894 the advocates of the idea were able to show that the service via Canada would be quicker than that via the Suez Canal, but this claim was altogether upset last year when the new Australian mail contract put the advantage with the latter route. The result is that Australia now shows no enthusiasm for the project, which it can hardly be denied would be expensive. It is out of the question to expect that there will be any substantial through freight between the United Kingdom and Australia by this way. The double transshipment and the railway rates make this impossible. Even on the west side of Canada it is cheaper to send such goods as tinned salmon to this country round the Horn than across the Dominion. So far as freight goes, therefore, the Pacific section must rest on its own merits. The present monthly service between Canada on the one side and New Zealand and Fiji on the other takes about three weeks, and the question is whether it is worth while to give a larger subsidy in order to cut this down to, say, two weeks.

The doings of the Pacific Cable Board have at present a special interest in view of the proposals for extending the sphere of government operations for the purpose of communications, and it is satisfactory to find the improvement in the financial position continues. The revenue for 1910-11 was £138,677, and the amount available towards the double purpose of meeting the interest and sinking fund and providing a replacement fund is £11,378 more than was available last year. The contribution of the contributing parties is thus reduced to £48,210. No interruption occurred during the year—a good proof of the reliability of the service. The results of the arrangement of the land line across Canada have been entirely satisfactory. The average time of transmission between the United Kingdom and Sydney has been reduced by 15 minutes, and there has been a marked improvement in accuracy. It is proposed to arrange for “deferred” messages “in clear” at half rates, and the Board has worked hard, in the face of serious difficulties and delays arising out of the Berne Convention, to bring this important change into effect. Its example will, no doubt, have far-reaching effects. The following extract from the Chairman's annual report refers to the matter, though it passes over the complicated negotiations which have been necessary.

“The subject is one that has for long engaged the attention of the Board, and in May, 1910, they drew up a scheme for giving effect to this principle in the case of traffic passing over the Pacific Cable. The Postmaster-General, on being communicated with as regards the adoption of the principle in the service between the United Kingdom and Australasia, considered that the advantages of the proposal were such as to make it desirable to secure its adoption throughout the cable service of the Empire, and, so far as might be possible, in the extra European services between the British Dominions and external States. In order to facilitate this it was thought advisable to secure beforehand the co-operation of the cable administrations throughout the world. For this purpose the Postmaster-General discussed the proposals with the British and American Cable Companies, and after obtaining their approval of them, entered into negotiations with foreign Governments. As a result, such a measure of general agreement has been reached that there is every prospect that within the next few months it will be possible for messages in plain language to be sent at half the existing rates of charge, subject only to the condition that the transmission of them must await, for a period not exceeding 24 hours, an interval during which the cable is not in use for traffic at the ordinary rates. It is hoped that the concession will confer an appreciable boon upon the general public who may desire to communicate with friends at a distance, without incurring on the one side the great expense of a cable

message at full rates, or on the other the long delay involved by use of the post."

---

The Government cable across the Atlantic which was advocated at the Imperial Conference would complete the service from the United Kingdom to Australasia, and would give the owners complete command over the through rates and management. The Pacific cable is only a section, and undoubtedly there is a sort of logic in the idea that the Government service should be carried from end to end. From the point of view of public opinion the project would be greatly strengthened if, as seems likely to be the case, the existing cables come entirely under American control. There are, however, considerations on the other side. At present all the trans-Atlantic Companies, including the French and German, are interested in obtaining traffic for the Pacific cable. They are its natural allies, as against the Eastern route, and their numerous offices receive and collect messages for it. In this way (to say nothing of the special terms given) a great amount of business is done for the Pacific cable at no cost to it. The Board has not a single collecting station of its own in this country. It is obvious, however, that if the governments invaded the Atlantic domain by putting down a line of their own, they would cease to be the ally and would become the competitor of the companies, and all the help they are now getting would go by the board. Secondly, the amount of business which the Pacific cable would secure for the Atlantic section would be a mere fraction of the quantity required to make the latter pay, and it would be extremely difficult to supplement it with any substantial business in Canada or the United States in face of the very strong combinations between the cable and land organisations. The new line in fact would find those fields occupied. One thing is certain, and that is, that no telegraphic project of this kind will be financially successful in these days unless it is framed on a large scale and secures a wide field of custom. Perhaps some day the subject will be considered in connection with the needs of the West Indies.

---

It is announced that a scientific expedition has started in Australia to investigate the possibilities of the Northern Territory for the white race.

"Our observations," said Professor Baldwin Spencer in an interview, "will be preliminary to those of the larger expedition which we hope will go over the ground afterwards. We shall be making collections the whole time, including microscopical preparations of the blood of different animals, so as to investigate human and stock diseases.

“Our principal object is to show the relationship of whites to life in the Northern Territory.

“Our observations on this expedition will probably give us some idea as to what further work could with advantage be carried out on a larger scale later on. It has been proposed, if the second expedition goes out, that its work shall be undertaken by members of scientific staffs of the various Australian universities. Some of the work would be done in winter, and some—the medical work—in the summer months, when the climate is most uncongenial to human beings. Whether this second expedition shall go out or not depends on the results of the present expedition. Of course, we are extremely anxious that the Commonwealth should complete its scientific investigation before the conditions of the Territory are affected by the presence of a large number of white men.”

The object of the Government is to occupy the territory as far as possible with white settlers, and no coloured labour will be permitted. The climate is said to be healthy, though the coast is more or less malarious, and in this respect it is probably similar to East Africa and Uganda. It may be noted that, warned by previous embarrassments, the Government grants no freeholds, but only leases both here and in Papua, and this policy does not seem to deter applicants.

---

Australia is particularly interested in the question whether the white man can work and thrive in a tropical climate. She possesses a huge territory of that character which, by a kind of geographical accident, is intimately associated with the comparatively temperate regions to the South, and though the Australian has no great desire to settle in it he is under the apprehension that if he does not someone else will. The result is a strong desire to see it proved that the white race can accommodate itself to the conditions of the tropics. There is little actual experience of value, as where Europeans have survived for a long period in hot countries there has been race-mixture. On the other hand it is not fair to infer from the lack of instances of survival that it is impossible, because the sanitation of tropical countries is nearly always vastly inferior to that of temperate regions. In the old-established Colony of Java the insurance companies have found that the expectation of life is as good for a European man, and better for a woman, than it is in Europe. This, however, appears to be the only instance of the kind, and there is a great amount of race-mixture. From a medical point of view, it appears that the old idea that the metabolism of the body of an individual will adapt itself to tropical conditions is without foundation. The body undergoes no essential changes. There is no malady which is special to any one race, and natives and Europeans show the same

symptoms in illness and are affected in the same way by drugs. There are, of course, certain effects of tropical heat which eventually will make racial distinctions. Such heat brings about the saturation of the skin with perspiration which the moisture prevents from evaporating, so that the epidermis thickens and grows opaque. The result of this loss of translucency is that the complexion becomes paler and afterwards darker. The moisture also encourages the growth of fat. The skin is closely related to the nervous system and it is undeniable that neurasthenia is common in hot countries. There is in fact too much sunshine, and insomnia and irritability result, as may be seen even in this country when there is an abnormal spell of heat. The natives suffer from this when taken out of their national life into the hustle of civilization; education in fact puts them on much the same level as Europeans. The observations, so far as they go, seem to tend towards two conclusions, neither of them encouraging. The first is that, if the European can survive the new conditions, it would be at the cost of his original characteristics. He would either be swept away by nature as out of place, or suffer conversion to the type which nature has produced in the country. In a negro region he would ultimately become black, too; all rays and all protoplasm are essentially identical and developments in any given conditions must be the same. The second is that it is vain to expect that natives can assimilate the habits and characteristics of Europeans. The general result of the education of the best specimens, is that while quick to learn and excellent at examinations, they lack the nervous stability of the European. All this merely emphasizes what the history of the world shows, that the most vigorous races are developed by temperate climates. The greatest hope that Europeans may be fitted to live in the tropics rests with medical science. Panama is the most striking instance of what can be done, the death rate of white workers having been brought down to less than 4 per 1,000. But medical treatment does not stop the course of natural forces, and race evolution is beyond control. The moral seems to be that, as Europeans cannot be acclimatized individually and cannot be adapted racially without loss of characteristics, the natives of tropical countries are necessary for their development.

---

The "Universal Races Congress," various as its discussions were, threw no light on this question. The main object was to testify to the growth of a wider sympathetic feeling between natives of different characters, and in this the Congress was quite successful. Greater contact at all points is making this improved understanding at once more desirable and more easy, and the illustrations provided by the meeting were interesting and instructive. But it remains obscure what effect all this will have on racial developments. There have

been numerous instances of fusion between Europeans and natives, and there are some idealists who look to the extension of this practice to break down the barriers and bring about the fraternity of the world. Unfortunately for this hope the signs at present are the other way. In the early European settlements overseas fusion was inevitable. The settlers were practically cut off from home and had to make the best of things. Nor were they, generally speaking, of the sort to pride themselves particularly on race distinctions. The mixture therefore in Portuguese, Spanish, Dutch and British Settlements came about naturally. It may be urged that the uplifting of native races as they reap the benefits of civilization will make the process even more easy in future than it has been in the past. But there are some solid facts against this. The vastly improved facilities for crossing the seas tend to bind the settler to his own kin. The improved sanitation and better supplies of everything make European family life more possible. More perhaps than anything else, the advance of education among the white races has widened the barrier and set up a feeling of racial superiority which is now one of the most active social forces of the time. The citations which we make in another place from a Rhodesian report show that this feeling has attained a strength in a representative community of British settlers which has no parallel in history. It is there proposed, certainly with some reluctance but with a belief that the public good demands it, that all race-mixture, whether under the sanctions of marriage or not, should be prohibited. The "Colour-bar" provision of the Union of South Africa Act is of recent memory. This provoked protest in this country because it brought the matter of racial antagonism into the sphere of politics. The social matter is a different affair, and there is little prospect at present that the world will merge its differences by inter-marriage.

---

Public opinion is so largely dependent on press news that any improvement in the supplies of information between this country and the Dominions should be heartily welcomed. When there is a vast choice of material there is nothing easier than to pick out matter which by itself creates a totally wrong impression of the facts or of public feeling. The London news reaches Canada almost entirely through United States Agencies, and what Canada has got in this way was the selection made in New York to suit the New England and Northern States. Against this there has been a revolt, and it has now been arranged that the editing and distribution of this news service in Canada shall be controlled by Canadians.

---

The importance of Basutoland to South African industry is

shown by the large number of passes issued last year, the number having risen from 68,900 in the previous year to 82,000. As there are 348,000 natives in the territory it may be presumed that a greater supply is available if the attractions are strong enough. 32,000 men were despatched to the mines in the Transvaal and Orange Free State, and many of the others who started as free lances eventually drifted there. The Government Secretary in the annual report states that a regrettable feature of the year has been the number of tribal fights in which Basutoland natives have been embroiled at the mining centres. These disturbances have formed the subject of much discussion in the Basutoland Council, where all members promised to use their influence with the young men going out to work to prevent their participation in such disturbances while at the mines. In their own territory the natives occasionally show a turbulent spirit, but the cases are not important. These small quarrels, wrong though they are and much to be condemned, must not be taken to have any political significance, or to be in any way referable to what is called "unrest among the Basuto." They have in every case been dealt with judicially, and the young chiefs and their followers responsible for the disturbances have been imprisoned and fined.

---

The Mozambique Company have commenced the publication of a mining journal, published in Portuguese and English. It is announced in the first number that Professor Wyndham Dunstan will shortly begin a topographical and geological survey of the territory. The present mining district is near the Rhodesian border and is believed to be highly mineralized. The Company is showing considerable energy and endeavouring to attract exploiters. A deep water pier is to be constructed at Beira, and other developments are in contemplation. All such improvements will benefit Rhodesia and East Africa.

---

It is reported from Lourenço Marques that Captain Galvas has visited Quelimane to examine the possibilities of a harbour there. If the result of the investigation is satisfactory, it is expected that a railway would be constructed to Port Herald, and the matter is therefore of great importance to Nyasaland. At present there is no satisfactory wharf for ocean-going steamers at Quelimane, and the local trade has to be taken by small vessels to Beira or Lourenço Marques. There is so much activity in the Portuguese Colony that it is very probable that this state of things will be remedied if possible, and the creation of an up-to-date harbour would make a vast difference to the territories in the interior. The Secretary of State has stated in the House of Commons that matters of a confidential

character are in progress and that important developments for the assistance of the Protectorate are not very distant.

---

The prosperity of Southern Nigeria looms large in Mr. Birtwistle's trade report for 1910. "Following the full year of 1909, when the commercial imports and exports exceeded those of any previous twelve months, another wonderfully good year's business, showing an increase of more than two millions sterling over 1909, is to be recorded. This marked advance, which is equal to 29% more than the preceding year, may be mainly attributed to the very high values which palm produce commanded in the European markets during 1910, these high prices as a natural sequence increasing the purchasing power of the people, which is reflected in increased imports." The improvements in transport by rail, river and road have also contributed to the result. With palm produce and cocoa doing so well, there is little chance for cotton, which showed a marked decline. It pays the natives better at present to work the trees, and the work is lighter, especially as the women and children prepare the oil and crack the kernels, but as the trees are worked out or if the high prices fall there will be a greater inducement to cultivate. At present palm produce supplies five-sixths of the value of exports.

---

We are all proud of the progress of our West African possessions, and the high officials who are called upon to give post-prandial statements of cheerful facts and reassuring figures have an easy task. But it appears that France is even more enthusiastic over West Africa than we are. A writer in the *Grande Revue* elaborately argues that, when the future historians ask what is the particular claim to glory of republican France, the answer will be "l'Afrique Occidentale." The latest proof is that the imports and exports of the five French Colonies amounted in 1910 to 278,288,000 francs, an increase of 100 millions in three years.

---

It is a well established belief in this country that the French do not make good colonists, but this, according to a recent article in *Les Annales Coloniales* is a legend "stupide et fausse." The argument is that the old French Colonies are too small, and too much exposed to disastrous cyclones to give the settler a chance, and that the magnificent advance of the newly acquired territories in Indo-China and West Africa shows that the Frenchman can do the work of development as well as anyone. There is undoubtedly abundant proof of the ability of France to make good use of Colonies where

there is a native population. But the belief which the French journal attacks is not based on any idea that suitable ability is lacking, but on the fact that, partly from reluctance to emigrate and partly because the population does not materially increase, France is not and is not likely to become the source of great settlements. As regards methods of administration, *Les Annales* maintains the equality of France. It admits that Martinique or Guadeloupe do not show the prosperity or comfort of Jamaica or Trinidad, but, to compare them with places more of their size, it considers them better off than St. Lucia, St. Vincent, or Dominica. Since the earthquake of 1902 Martinique has made a remarkable recovery, and affords another instance of the rapidity with which the effects of such disasters pass away in tropical countries. It is now proposed to issue a loan of six million francs, on the credit of the Colony alone, one half for water and sanitary work, and the other for the improvement of the port of Fort-de-France in anticipation of the opening of the Panama Canal.

---

Lieutenant-General Sir R. Baden Powell has given in the *Pall Mall Magazine*, no doubt for the edification of the rising generation, an account of a hardening process to which young Zulus are subjected. He writes:—"This is the way that the Zulu tribes, including the Matabele and Swazis, and followed by the Masai and other warlike clans, carry out the idea. When a boy wants to be recognised as a grown up man he does not do it as in civilized countries by taking to smoking cigarettes, he has to prove himself a capable all-round fellow. He is stripped and painted white all over, and he is given a shield and an assegai, or short spear, and is then turned out of the village to go and shift for himself until his white paint has worn off. This takes a month or two. In the meantime he has to keep out of the way, because if seen by the others they will kill him. He has therefore to hide away in the bush, to defend himself against wild beasts, to hunt his own food with his assegai or by trapping, he has to make his own clothing and shelter, to make a light for his fire, and so on for over a month without help of any kind. When his paint wears off he can return home—that is, if he is still alive, which sometimes he isn't. He is then received with great welcome, and is installed as a warrior, having proved that he is able to look after himself. I wish we had some such training for our boys." We are afraid that considerable modification of the custom would be necessary before it could be adopted in this country. We venture to suggest that the admirable treatment described is proving too much nowadays even for the South African native. The painted boy is, we imagine, becoming a rarity in these times of domestic service and other industrial pursuits.

The clash of opposing interests resounds through the recent correspondence on the subject of the preservation of game in East and Central Africa. On the one side are the people who advocate the preservation of the wild fauna, and to them belong the sportsmen who are attracted by the well-advertised opportunities of the country; on the other are the farmers and others who find their operations impeded by the presence of game reserves. The latter hold that big game and civilization are incompatible, and complain that the present licensing system gives considerable protection to many of the most obnoxious species. When a territory is in a primitive state, it is a proper field for the hunter, and it is no doubt natural to regard the big game as a valuable asset, and to give them a sort of sanctuary where they can only be shot at under special licences which bring in a revenue. In Uganda you pay £50 for a "sportsman's licence," and a special licence to hunt an elephant costs £10. The revenue derived from game licences in 1909-10 was £3,872, mostly at the expense of elephants. But as settlement advances, the comparative importance of this revenue decreases, and the reserves become a real hindrance to the cultivation of the land. The time has now come, alike in East Africa, Uganda, and Nyasaland, when this aspect of the matter becomes important. Another consideration is adding greatly to the strength of the agitation against big game. It is the belief that they harbour the tsetse fly, the source of human trypanosomiasis. How this may be put may be seen from the argument of Dr. Prentice, a missionary medical officer of considerable local experience. "The situation assumes a more serious aspect than ever. *The tsetse fly must be cleared out if either this country is to be saved for the people or the people saved to the country.* In all my travels in North Eastern Rhodesia and in Nyasaland I have never seen tsetse whose presence could not be accounted for by the presence of game. Had I seen certain districts only at certain seasons of the year, I might have been misled as others have been misled. Further, though I need not now state all the arguments for and against my view, my honest conviction is that the presence and increase of game is entirely responsible for the presence and increase of tsetse, and that our game regulations are mainly, if not wholly, responsible for the increase of game. I hold that those who are responsible for the game laws are responsible for the presence of tsetse, and that the victims of trypanosomiasis are martyrs to the foolish policy of game protection."

---

There is no doubt that in some parts there has been a gradual invasion by tsetse, but it is not proved that this is due to game, or that tsetse are dependent on game. But it seems probable that there is some connection between the numbers of tsetse and the numbers of game, and that, even if the game do not bring tsetse, they form

reservoirs of disease-causing trypanosomes which the tsetse transmit to stock. The whole question will be investigated by a Commission appointed by the Secretary of State to carry out an enquiry for a period of three years. Its proceedings will be of interest to South Africa and Rhodesia, where the policy of fighting ticks by clearing spaces of game has been much discussed.

---

The Commission of Enquiry into the riots which took place in Mauritius in January came to the conclusion that the colour or racial question had not been shown to be a predisposing cause of the trouble in itself, but that there existed amongst the lower classes a certain feeling of discontent, and of distrust of their superiors in the social scale, to whom they attributed a practical monopoly of political power and patronage. Certain leaders arose who voiced the hitherto inarticulate views of the lower classes, and transformed them into a political party with a sufficiently strong voting power to make itself felt in the Council of Government.

On the other hand the "Oligarch" party, embracing the Whites of French descent and their adherents, justly proud of the distinguished part their families had played in building up this Colony, realising that its present prosperity depended in a very large measure on themselves, and accustomed as they were to pride of place and position, resented the advent of the new party so largely recruited from the lower and coloured classes, and the methods adopted by it for pushing its views.

The Commission considered that the present elective system is a cause of trouble, and that the Press was responsible for inflammatory party passions. On these points they state that they "are agreed that the present elective system in Mauritius is not suited to its heterogeneous population with its various races, idiosyncrasies, and interests, and generally excitable dispositions, and that its introduction 25 years ago was a grave mistake, encouraging, as it did, sections of the population to interest themselves in politics for which they are even now unfitted.

"We realise, however, that the existing system could not be abolished without most careful consideration, more especially at the present juncture, when it might be taken as an act of partiality in favour of one or other of the rival parties.

"All parties are agreed that the unbridled recrimination and inflammatory articles of the party Press on both sides have been responsible for much of the bitterness which led to the recent riots, and we are thoroughly in accord with this opinion. Each party naturally urges that the Press of their opponents was the worse offender, and that their own was more or less forced to adopt similar methods. But we are of opinion that there was little to choose between them.

"We understand that under the present laws of the Colony it is very difficult to deal with the Press except in clear cases of sedition. If this be so, the sooner the laws of the Colony are amended and strengthened the better for the future maintenance of peace and good order in the community."

---

Last year the small State of Brunei emerged, as the Acting British President puts it, "from its former comatose condition into a sphere of active expansion," by being administered under British protection. Trade increased enormously and the prospects are bright. Large areas of State land have been granted on generous terms, as it did not seem likely that British capital would be attracted to Brunei. Native cultivation is also encouraged and rubber seeds and germinated coconuts supplied at cost price in large numbers. Certain difficulties in settling land claims seem to indicate that the community is by no means unsophisticated. "A further difficulty was to be found in the fact that many of the claimants did not know where the land which they claimed was situated.

"Again, in some cases, one claimant had sold the same land to different purchasers, all of whom had 'purchased' suitable 'chops' to cover their incomplete rights.

"Many claimants were loth to accompany the Assistant Resident over their claims. As some of these claims covered from two to four thousand acres of entirely uncultivated land, the hesitation displayed was not unnatural.

"The last difficulty lay in the enormous prices which claimants set upon their 'land' even when they were totally and confessedly unaware where such land was to be found. Volubly expressed claims to huge plantations of rotan segar, to young and vigorous rubber, to green islands of coconuts, faded (in the light of actual visit to the spots indicated) to inconsequent whines when deep swamp and virgin jungle were found to represent the valuable properties of the claimants' dreams.

"A contingent difficulty which also occurred lay in the fact that several well-substantiated claims were found to lie inside the large areas provisionally approved for European applicants. The indignation of the latter at being informed that the Government had every intention of protecting well-proven and prior native rights formed one of the least pleasant contretemps which occurred between the Government and the applicants concerned."

However, cultivation has now commenced and is likely to be developed greatly. A tribute is paid by the Acting Assistant Resident to the natives capacity for work, as is done in the Southern Rhodesian report which we quote in another place. "The idea that the natives of Brunei are idle, hopelessly and constitutionally idle, is

entirely incorrect. Their energy in the cutch factory, the value placed on their services as workers in the coal mines of Labuan and Sarawak, even when pitted against the stolid unsparing energy of the Chinese coolie, has amply disproved this."

---

In Rhodesia, the year 1910 was one of unexampled progress in all directions. The Chamber of Mines reports that capital has come in in increasing quantities, development at depth has proved the permanence and continuity of the values of many mines; while the individual working movement has borne fruit in the number of properties formerly worked by tributors and individual workers, which, after prosperous careers, have been acquired by Companies, and are now being developed on a larger scale than the small worker would himself have found possible.

The small workers, when they have finished their ore or disposed of their interests, go on to further prospecting and no doubt there is great advantage in this combination of the individual enterprises of the prospectors who find the metal and of the capital which works it in a scientific manner. A lurid picture is drawn in "Off the Main Track" of the hardships of the early prospector and of the severity with which he was exploited by the companies, but presumably he would not be so active as he certainly is in Rhodesia if those things were true at this date. The gold industry is now producing over 2½ millions sterling a year, and there is every prospect that this output will be greatly increased. A sure proof of progress is given by the railway returns, which have about doubled in the past three years.

---

In British Guiana the estate owners are allowed to indent for 4,000 immigrants yearly, but for the last five years the average indent has been for 2,200 only. This points to the conclusion that the cost is found to be too high, but on the other hand there is a risk in increasing the liability of the colony for returning immigrants. The colony does not offer the same inducements to the time-expired coolie to settle down as such places as Trinidad and Fiji do. The subject of the labour supply has been considered by a Commission appointed by the Court of Policy. The information given to it led to the belief that there is a shortness of suitable labour for the development of the agricultural resources of the colony and for the maintenance, at the same time, of the established agricultural industries, fresh ventures of the kind being necessarily accomplished at the expense of those already in existence. But with respect to the supply of labour for industries other than those connected with the cultiva-

tion of the soil, the evidence did not appear sufficient to warrant so definite a conclusion; and it is just possible, in the Committee's opinion, that a re-organization of the present supply may tend to the lessening of the complaints which have been made as to the unreliability of the average labourer in the balata "bush" or the gold-fields. The rates of wages paid to the "free" labourers in the various agricultural industries range from 24c. to 64c. (rations, in some instances, being given in addition) for a day of from 7 to 11 hours, the average being about 40c. for 9 hours' continuous work. In the gold-fields and for similar work, 48c. per day, with rations and lodging, appears to be the usual remuneration. Under the circumstances the Committee did not think that there is reason to anticipate any objection to the introduction of fresh labour on that account. On the sugar plantations ranges of an approved construction have been erected by the resident labourers, but on the other estates or lands under cultivation the arrangements do not appear satisfactory. In the event of immigrants being applied for by the proprietors of these estates or lands, it would be necessary for them to provide proper accommodation in this respect before the allotment could be made. In connection with the balata industry it has been pointed out that, in consequence of the scene of operations being transferred from one district to another at short notice, the provision of substantial dwellings is not practicable, and as the same reason would prevent effective supervision by the Government over the labourers it appears sufficient to warrant the refusal of immigrants under indenture in such cases. This objection applies, in a lesser degree, to the timber industry also.

It is recognised that the labour of the East Indian can be more profitably employed in connection with the cultivation of the soil, and it is suggested that applications for his services might be entertained from persons engaged in such industries as that of sugar, rice, rubber, limes, cocoa, coffee, sisal, etc., alone. If Javanese were introduced they would be found equally useful in the timber and balata bush, rubber plantations, or on the sugar estates.

From the general tenor of the evidence taken, it appears to be the opinion that the practice now in existence of acclimatizing and training the immigrant under a system of indenture is that most suitable in the peculiar conditions of the country and its climate, the only divergence of opinion expressed by the witnesses being with regard to the duration of the indenture, several recommending a short contract of two or three years. It is doubtful, however, whether the advocates of this curtailment would, in any case, take advantage of the opportunity afforded to them of obtaining immigrants under indenture, and the shorter period

during which the immigrant's services would be reserved exclusively to the employer might and no doubt would be regarded as a grievance. The introduction of the immigrants under indenture appeared to the Committee the only means by which continuous work during the year could be guaranteed to these people.

The question as to the manner in which the labourers introduced should be treated when sick is that on which the greatest diversity of opinion has been found to exist. In the balata "bush" the sudden change from one district to another of the people employed in bleeding the trees renders it impracticable to build permanent hospitals, or to provide the necessary medical attendance, and the requirements of the law could not, therefore, be complied with.

With regard to other industries the law forbids the allotment of immigrants to any plantation on which there is not hospital accommodation for all the immigrants resident thereon in the proportion of ten beds for fifty, fifteen for one hundred and five for each additional hundred. This restriction has hitherto prevented the promoters of industries other than sugar from availing themselves of the benefits derived from the employment of immigrants under indenture, and it is to be feared that the large expense entailed in keeping the hospital itself up to the requirements of the Medical Authorities has restrained some of the sugar planters themselves from making applications. It is true that under the provisions of section 75 sub-section (2) of the Immigration Ordinance a joint hospital for two or more estates can be authorised, but the distance of the dwelling yard on one estate from that on another is so great that hitherto there has been no permission asked for in this connection, except when two neighbouring plantations, intended to be worked as one, has been owned by the same proprietor. In the Trinidad Ordinance, however, the Governor has authority to permit the allotment of immigrants to an estate on which there is no hospital if he is satisfied that adequate provision exists for the reception of such immigrants in a public hospital situate at a convenient distance from where the immigrants are located should such immigrants require medical treatment.

The class of labourer most suited for the present needs of the colony is generally acknowledged as being the East Indian, and it has been suggested that trial should also be made of the Javanese. Should, however, the efforts to obtain a sufficient number of recruits from India and Java be fruitless, then several of the witnesses recommended that recourse be had to the West Indian Islands.

Of the East Indian little need be said, his good qualities being known and generally appreciated. But one fact should be borne in mind and that is that the colony being, at the present, and likely to be for many years to come, mainly dependent on agriculture, every immigrant should be selected with a view to his subsequently

becoming a settler on the land. It is the East Indian's qualifications in this respect which have led to the general recommendation for his introduction into the colony.

Of the Javanese the information obtained is but scanty. From the last report at hand of the Immigration Agent General of Suriname it appears that he earns about the same wage as the East Indian, the average number of days he is absent from work is about one half—16 as against 28—the death-rate is equally favourable, the percentage to population being 1·20 against 2·70. His expenditure would appear to be greater, judging from the fact that his average savings are *fl.* 67·83 against *fl.* 97·62 of the British Indian. An unsatisfactory feature in his case, however, is the comparatively large number of proceedings taken against him for breaches of the labour laws, the percentage of cases to population being 15·94 as compared with 10·55 against the East Indians. His physique is said to be much better than that of members of the other race, and this, with his greater power to resist disease, may be taken to show that his services might be utilised in the forest after the term of his indenture has expired. The regulations under which he is indentured in Suriname are much the same as those for the East Indian in this colony, except that he is entitled to return to Java at the end of five years instead of ten.

The Indian Government have reserved to themselves the power to declare emigration illegal to any country where, *inter alia*, the mortality among the emigrants is excessive; or where proper measures have not been taken for the protection of emigrants immediately on their arrival in the country or during their residence therein, and to secure this protection to the people, more particularly while under indenture, the provisions of the Immigration Ordinance have been enacted. It is very unlikely therefore that the Indian Authorities would permit emigration from India except under conditions which would render that protection effective. Nor is it probable that the Government of Holland, which, in connection with the emigration of Javanese to Suriname, has practically adopted our regulations with respect to East Indians, would relax the stringency of these regulations in favour of a British colony.

The problem therefore as to how the labour supply can be augmented remains unsolved. The immigrants must be protected, and this can only be done on the larger estates. The development of the forests and mines must wait upon the increase of the settled population.

---

The Bahamas annual report (1910-11) expresses a regret that the Royal Commissioners on Trade Relations between Canada and the West Indies were unable to visit the Bahamas, and that the detailed

information which was supplied by the Colony did not find a place in the appendices to the report; and further that the Colony is dismissed with only a brief reference in the report. It is with some significance that the next paragraph goes on to mention the development of a movement in favour of the incorporation of the Bahamas in the Dominion of Canada. "During the last season two well-known unofficial Canadian gentlemen organised public meetings in Nassau, and succeeded by their eloquence and enthusiasm in carrying the meetings with them, and ultimately in inducing the House of Assembly to pass by a large majority a vote desiring the appointment of Bahamian and Canadian Commissions to jointly discuss the question. The subject is under the consideration of His Majesty's Government.

A stimulus to trade with Canada will no doubt result from the anticipated visit to Nassau, as part of a tour to the West Indies, of a large number of Canadian business men next winter."

---

Tenders are being invited for a fortnightly mail service between the United Kingdom and Jamaica, and a service with Bermuda may be offered. The vessels must be British, not less than 4,500 tons, capable of attaining a speed of 15 knots and will be required to maintain an average of 13. They must have accommodation for 60 first-class passengers and for perishable produce. It is to be hoped that a satisfactory result will be arrived at.

---

The complete census which was taken in Dominica in April, under great difficulties, brings out the fact that there is a good deal of overcrowding. In Roseau a large proportion of families occupy houses of one or two rooms, and among insanitary conditions. This may seem curious in a country with large sparsely populated areas, but, as the towns of the middle ages in Europe showed, there is no relation between urban and surrounding country spaces. Another fact is that the percentage of illegitimate births is 57.3. The Registrar-General comments on this as kindly as possible.

"While not wishing to conceal the fact that immorality does exist here to a considerable extent, still it should be stated that the above condition is due far more to social custom than to immorality as it is known in places more advanced in civilization." Whether it is the "social custom" of the country or not, it is invariably associated with over-crowding.

---

The Weihaiwei report for 1910 shows that the campaign against opium smoking is being actively prosecuted, but an ugly sign is that

as this mischief is put down drunkenness increases. It can only be hoped that the more European vice is the less injurious.

"During the past year, the importation, sale, and smoking of opium were discouraged in every possible way. In 1909 the number of licensed smokers was reduced from 220 to 110, and during 1910 the number has been still further reduced to 50. During 1909 the admissions to the Refuge established by the Government for those desirous of abandoning the opium habit amounted to 31, whilst during last year they rose to 70, the ages of those admitted ranging from 24 to 74. The Police were very active in discovering the illicit smoking and sale of opium, there having been during the year 135 convictions for breaches of the Opium Ordinance. This activity on the part of the Police was naturally unpopular amongst those who have been accustomed to smoke opium, and led to the publication in certain Chinese newspapers, printed in Manohuria, Chefoo and Shanghai, of serious libellous charges against this Government and its Police, who were accused of extortion and maltreatment of the Chinese, especially the female population. Steps were taken to bring to justice those responsible for the publication of the libels, with the result that in some cases a fine was imposed, in others the publication of the paper was suspended for a certain period, whilst all the newspapers published an apology, retracting the libellous and unfounded statements to which they had given currency.

"No opium was imported under licence during the year, and only one shop was licensed to sell opium. It may be impossible to prevent entirely the smuggling of opium into this Territory across the border or along the coast, but as every step possible is being taken to discourage the use of opium, and as public opinion among the Chinese of Weihaiwei is, if anything, more than ever firmly set against the opium habit, there seems every reason to hope that opium smoking will become even a rarer habit than it is at present. But the diminution in the use of opium seems to be leading to an excessive use of alcohol, and though drunkenness cannot yet be said to be a prevalent vice cases of intoxication are undoubtedly more numerous than in previous years."

## AUSTRALIA'S ATTRACTIONS FOR IMMIGRANTS.

IN attempting to present "Australia's Attractions for Immigrants," it seemed to me that the most simple and useful course to pursue would be to answer as briefly as possible such questions as might reasonably be expected from a prospective immigrant. As such an enquirer I should be glad to have reliable information as to position, area, natural features, climate, population, production, commerce, politics, railways, telegraphs, wild (*i.e.*, dangerous) animals, New Guinea; in a word what reasonable prospects does Australia hold out to persons contemplating emigrating thither? If such interrogations can be answered satisfactorily, there should not be much room for hesitation on the part of men blessed with health, courage and perseverance. Those qualities will assuredly be needed, but compared with the task undertaken by the first pioneers, or even of those fifty years ago, the dangers and privations to be encountered to-day are insignificant. It is plain sailing now.

### THE COMMONWEALTH

embraces six States, placed here in the order of their founding:—

- |                     |                       |                |
|---------------------|-----------------------|----------------|
| 1. New South Wales. | 3. Western Australia. | 5. Victoria.   |
| 2. Tasmania.        | 4. South Australia.   | 6. Queensland. |

### POSITION, AREA AND NATURAL FEATURES.

Australia (proper) is the largest island in the world—so large that it is designated a Continent, and it ranks as the fifth division of the land surface of the globe. Lying between the parallels of 11° and 38° south latitude and the meridians of 112° and 154° east longitude, its extreme breadth from east to west is 2,400 miles, and from north to south 2,000 miles; thus enclosing an area of about 3,000,000 square miles, or one-fourth less than that of Europe. Its irregular coast-line of over 8,000 miles is broken up by two principal indentations—that on the south extending from Cape Otway to Cape Leeuwin, a distance of 1,600 miles, with a depth from the line

so drawn of four hundred miles, this is known as the "Great Australian Bight." The other indentation, on the north-east, is the Gulf of Carpentaria, which is about four hundred miles wide and deep. Besides these, there are several large expanses of water, such as Port Phillip Bay, Western Port, Twofold Bay, Botany Bay, Port Jackson, Moreton Bay, Shark Bay, King George's Sound, Spencer's Gulf, and not a few fine river harbours. A mountain chain, starting at Cape York, runs down the eastern side of the continent at varying distances from the coast, and terminating at Wilson's Promontory. For convenience this great chain is regarded as broken into groups which bear local designations, and these branch off into lateral spurs which become the sources of rivers and creeks. The highest point in the range, Mount Koskiusko, 7,260 feet, in New South Wales near to the Victoria border, is the source of the Murray (flowing westerly 1,600 miles). There are mountains on the west coast, but they bear no comparison with those on the east, either in extent or elevation, and consequently there are fewer and less constant rivers. Isolated mountains of no great altitude are dotted about the central portion.

Soon after the founding of New South Wales (1786) curiosity was awakened as to what was hidden behind the mountains that threatened disaster to anyone who should attempt to penetrate their mysteries. But the spirit of enquiry could not be long suppressed. One after another intrepid and skilful explorers passed beyond the frowning sentinels that guarded the west, each one invariably adding something to the accumulating store of knowledge, and setting further back the limits of possible production. The track of the explorer was quickly followed by the squatter with flocks and herds; and although the latter suffered severely in periods of drought, recovery was rapid with the return of favourable seasons. By the achievements of Stürt, Mitchell, Leichhardt, Grey, Eyre, Gregory, Stuart, Burke, Warburton, Forrest and others, the continent was eventually crossed from south to north and from east to west, leaving only four or five detached portions of comparatively small area unexplored. The result is that instead of a mere fringe on the coast line being available for industrial occupation, immense territories have been disclosed suitable for various productions, and for ever dismissing a long prevalent belief in a vast inland sea. A considerable portion of Queensland, the Northern Territory (which still forms a part of South Australia), and Western Australia, or 1,149,320 square miles, is north of the tropic of Capricorn, but the whole area of the Commonwealth within the temperate zone is 1,825,261 square miles.

Unquestionably there is a considerable expanse of the central depression of the continent that is desert, and will remain so. Rock and sand, and the utter absence of vegetation and of surface water for scores of miles constitute a picture of desolation that it is difficult

to describe. And yet in the outlying districts of New South Wales, Queensland, South and Western Australia, there are large areas of water-bearing strata, some of which have been tapped by artesian wells, principally at a great depth, even 2,000 feet. Many of these bores yield as much as 2,000,000 gallons daily, and though the water is not the best for human consumption, it is suitable for stock and irrigation. By means of these wells, runs that were dependent on a precarious and scanty rainfall have been provided with a copious and permanent supply of water, thus saving the lives of hundreds of thousands of sheep and cattle, and increasing the value of the properties immeasurably. Possibly the artesian basin may be wider than has hitherto been ascertained, if so these wells will largely mitigate Australia's principal natural defect—a sparse general water supply. It may turn out, as was suspected several years ago, that the rains falling on the vast catchment of Central Australia sink through the porous surface to form an underground river discharging into the Great Australian Bight, in a certain part of which evidence of such an outflow is said to be discernible. The pressing want of at least the remoter districts to-day is a largely increased and constant supply of water. This want has been felt for more than half a century, and it is surprising that no well-devised and concerted scheme has been put forward for securing this desideratum, which would double the producing and sustaining capabilities of the continent.

A few words must be devoted to Tasmania, which is not included in the foregoing. The island is separated from the continent by Bass Strait, which is from 120 to 130 miles wide. It is situated within the parallels of 40° 33' and 43° 39' south latitude and the meridians of 144° 39' and 148° 23' east longitude; its length from north to south is 170 miles, and from east to west 160 miles. Exclusive of islands and lakes, its area is 24,330 square miles, or 15,571,500 acres; its islands—Flanders 513,000 acres, King 272,000, Cape Barren 110,000, Bruni 90,000, Robin 24,500, Maria 24,000, Clarke 20,000, East Hunter 19,000, West Hunter 18,400, Schouten 7,000, all others 33,100, total islands 1,131,000 acres; lakes, 75,500 acres; total area 26,215 square miles, or 16,778,000 acres. Like its larger neighbour, Tasmania has two principal mountain chains running from north to south parallel with the coast and at no great distance from it, probably a continuation of the eastern chain of Australia. The western chain, known as the Western Tiers, is an almost unbroken range extending over the entire length of the island, the highest among many peaks being the Cradle Mountain, 5,069 feet, about fifty miles in a straight line from the Indian Ocean, and thirty-five from Bass Strait. On the eastern side the chain is less continuous; the highest summit, Ben Lomond, about the same height as Cradle Mountain, is thirty-five miles from the South Pacific Ocean, and fifty

from Bass Strait. Between these ranges lies the central plateau from which rise several isolated mountains of much lower elevation, amongst which is situated the Lake Country, the lakes being from two to three thousand feet above sea-level. As might be expected in such a mountainous region, rivers are numerous, many of them carrying a large volume of water, and all ever flowing. Tasmania has been correctly described as a "beautiful well-watered island, rich in harbours and inlets, traversed by high mountain chains, full of craigs, glens, and ravines of commanding appearance. . . . Everywhere there are good anchorages and many excellent harbours. Altogether the coast offers the most manifold changes and generally charming scenery, being for the most part of a bold, rocky character. The interior especially is delightful, and here are united, so to speak, the climate of Italy, the beauty of the Apennines, and the fertility of England. Mountain and valley, hill and dale, crowned with high forests, and rich pasture grounds in the plains, afford the most pleasing variety." Besides the noble estuaries of the Derwent and Huon in the south, and the Tamar in the north, there are several very fine expanses of water, such as Macquarie Harbour and Port Davey in the west; Storm Bay, Frederick Henry Bay, and Norfolk Bay in the south; Oyster Bay, George's Bay, and Bay of Fires in the east; Ringarooma Bay, Anderson's Bay, Noland Bay, and Emu Bay in the north.

The remarks that follow apply to all the States.

#### CLIMATE.

Australia is greatly favoured in regard to climate, being in a measure free from the extremes of heat and cold characteristic of other continents, and which are so trying to many constitutions. Taking the entire group of States, the average temperature is congenial to all races, and only in the furthest north is it likely to seriously interfere with the ordinary labours of Europeans. Here, as in other large stretches of land, the range between extremes increases with increasing distance from the coast. The following useful summary of winter and summer temperatures in the several States is from the Commonwealth "Official Year Book," 1909 :—

"The extreme range of shade temperature in summer and winter in a very large part of Australia amounts to probably only 81 degrees. In Siberia in Asia the similar range is no less than 171, and in North America 153, or say, nearly double the Australian range.

"Along the northern shores of the Australian continent the temperatures are very equable. At Port Darwin, for example, the difference in the means for the hottest and the coldest months is only 8·7°, and the extreme readings for the year, that is, the highest maximum in the hottest month and the lowest reading in the coldest month, show a difference of under 50°.

"Coming southward the extreme range of temperature increases gradually on the coast, and in a more pronounced way inland.

"Perth.—The more exact climate history of Perth did not properly commence until 1897, when the present Observatory was established. During the period 1897 to 1907, the mean annual shade temperature of Perth was 64°, about a degree higher than that for Sydney and Adelaide, over 5° higher than that for Melbourne, and 10° above that for Hobart; but on the other hand, 4° below that for Brisbane. The extreme average temperature for the month of January is 73·6°, and for July 55·2°. The extreme maximum shade record of 107·9° was registered in December, 1904, and the lowest minimum shade temperature was 36·4° in July, 1906.

"Adelaide.—In Adelaide the climate is drier and more sunny than in the other capitals, and consequently radiation is less hindered. The extremes of heat are consequently more marked, especially in the summer months. The mean shade temperature for January and February is 74°, and that of July 51·6°. . . The highest record of shade temperature in Adelaide is 116·3°, registered in January, 1858, and the lowest 32·2°, a range of 84·1°. The freezing point, although closely approached, has never actually been reached by the shade temperature thermometers, notwithstanding the fact that records have been kept for fifty-one years. Frosts have, however, occurred on the grass (four feet below the shade thermometer) at various times between the beginning of April and the end of November.

"Brisbane.—In Brisbane the monthly mean shade temperature ranges from 77·3° in January to 58·0° in July, a difference of 19·3°. The extremes have varied from 108·9° in January to 36·1° in July, viz., through a range of 72·8°.

"Sydney.—In Sydney the highest monthly mean is 71·5° recorded in January, while the lowest is 52·3°, giving a range of 19·2°. The extremes of shade temperature recorded at Sydney over a period of nearly half a century are 108·5° in January, 1896, and 35·9° in July, 1890, i.e., a range of 72·6°.

"Melbourne.—In Melbourne the January mean shade temperature averages 67·3°, and that of July 48·5°; the highest reading ever recorded being 111·2° in January, 1862, and the lowest 27·0° in July, 1869.

"Hobart.—The mean temperature for the hottest month at Hobart is 62·0° in January and February, and that of the coldest 45·7°; the highest reading ever recorded being 105·2° in December, 1897, and the lowest 27·7°, nearly a degree higher than the lowest experienced in Melbourne.

#### HUMIDITY.

"Next after temperature the degree of humidity may be regarded as of great importance as an element of climate.

"Perth.—Annual mean at 9 a.m. 63 in June; greatest monthly mean is 83 in June, and the lowest 45 in January.

"Adelaide.—Annual mean is only 56; the monthly mean has been as low as 33 in January, and as high as 84 in June.

"Brisbane.—Annual mean 68; lowest monthly mean recorded is 47 in September, and highest 85 in March and May.

"Sydney.—Annual mean 73; greatest monthly average occurred in May, 1889; the wettest month on record during the last forty years was 90, while the lowest monthly mean was 55 in October, 1867.

## Australia's Attractions for Immigrants. 131

"Melbourne.—Annual mean 72 ; greatest monthly average 88 in June and July, and lowest 54 in February.

"Hobart.—Annual mean, 72 ; highest 92 in June, lowest 51 in February."

Probably the above capitals, from local causes, do not represent the actual means for their respective States ; but as shown by the returns they stand in the following order:—Sydney, Hobart, Melbourne, Brisbane, Perth, Adelaide ; Sydney being the wettest and Adelaide the driest.

### RAINFALL.

To any community, especially to that portion directly interested in land cultivation, the amount of its annual rainfall is of prime importance. I quote from the authority mentioned:—

"The rainfall of any region is determined mainly by the direction and route of the prevailing winds, by the varying temperatures of the earth's surface over which they blow, and by the physiographical features generally.

"Australia lies within the zone of the south-east and westerly trade winds. The southern limit of the south-east trade strikes the eastern shores at about 30° S. latitude. Hence we find that with very few exceptions the heaviest rains of the Australian continent are precipitated along the Pacific slopes to the north of that latitude, the varying quantities being more or less regulated by the differences in elevation of the shores and of the chain of mountains upon which the rain-laden winds blow from the New South Wales northern border to Thursday Island. The converse effect is exemplified on the north-west coast of Western Australia from the summer south-east trade winds. Here the prevailing winds, blowing from the interior of the continent instead of from the ocean, result in the lightest coastal rain in Australia.

"The westerly trade winds, which skirt the southern shores, are responsible for the very reliable, although generally light, rains enjoyed by the south-western portion of Western Australia, by the south-eastern agricultural areas of South Australia, by a great part of Victoria, and by the whole of Tasmania.

"The wettest place in Australia is Geraldton, on the north-east coast of Queensland, where the average rainfall is no less than 145 inches, the maximum yearly total being 211·24 inches, and the minimum 69·87 inches. The difference of range between these extremes is 141·37 inches.

"The driest known part of the continent is about the Lake Eyre district in South Australia (the only part of the continent below sea-level), where the annual average is but five inches, and where it rarely exceeds ten inches for the twelve months.

"The inland districts of Western Australia have until recent years been regarded as the driest part of Australia, but authentic observations taken during the past decade at settled districts in the east of that State show that the annual average is from 10 to 12 inches."

The mean annual rainfall at the capitals of the different States, deduced from observations taken for a great number of years, was—  
at Perth, 33·18 ; Adelaide, 20·88 ; Brisbane, 48·44 ; Sydney, 48·54 ; Melbourne, 25·57 ; Hobart, 23·71.

## POPULATION.

A census of the Commonwealth is to be taken in 1911, meanwhile the estimated population of the several States at 31st December, 1907, is as follows:—

TABLE A.

	WHITES.			ABORIGINES.		
	M.	F.	Total.	M.	F.	Total.
N. S. Wales ...	838,913	730,029	1,568,942	2,451	1,836	4,287
Victoria ...	623,683	624,412	1,248,095	163	108	271
Queensland ...	294,959	246,806	541,765	3,089	2,048	5,137
S. Australia ...	208,076	184,588	392,664	14,076	12,357	26,433
W. Australia ...	152,159	109,404	261,563	2,933	2,328	5,261
Tasmania ...	94,690	89,318	184,008	—	—	—
Commonwealth ...	2,212,480	1,984,557	4,197,037	22,712	18,677	41,389

With an area of 2,974,581 square miles, the population of Australia represents only 1·41 persons to the square mile; Europe has 111, Asia 55, Africa 13, and America 10. Obviously, therefore, there is ample room for expansion, though the rate of increase is very slow. If the present rate continues until 1950 the population of the Commonwealth will be 7,949,000, whereas if the rate was equal to that of the United States of America it would be 15,058,000. Surely there is something here which demands instant attention.

The population is distributed thus:—In Sydney 577,180, or 36·79 per cent. of the whole; in Melbourne 538,000, or 43·11 per cent.; in Adelaide 178,300, or 45·41 per cent.; in Perth 50,380, or 19·26 per cent.; in Hobart 40,326, or 21·92 per cent.; Commonwealth 1,519,841, or 36·21 per cent. In Wellington the population is 70,947, or 7·63 per cent. of the whole population of New Zealand, leading to the inference that in the Dominion the primary industries are more sedulously prosecuted, resulting in a proportionately larger foreign trade. Excluding Sydney, Melbourne, Adelaide, and Brisbane, there are in the Commonwealth cities or towns with inhabitants of 20,000 and under 100,000—N. S. Wales 2, Victoria 3, Western Australia 3, Queensland 1, Tasmania 2. 10,000 and under 20,000—N. S. Wales 3, S. Australia 2, Queensland 6. 5,000 and

## Australia's Attractions for Immigrants. 133

under 10,000—N. S. Wales 10, Victoria 4, S. Australia 1, W. Australia 1, Queensland 3, Tasmania 2. 3,000 and under 5,000—N. S. Wales 13, Victoria 12, W. Australia 3, Queensland 3, Tasmania 2.

It is interesting to note that 77·23 per cent. of the population of Australia were born in the Commonwealth, 0·68 in New Zealand, 18·03 in the United Kingdom, 1·98 in other European countries, 1·25 in Asia, 0·08 in Africa, 0·33 in America, 0·28 in Polynesia, 0·14 at sea. Thus about 96 per cent. are our own countrymen.

In Tasmania there are no Aborigines, the race having become extinct for many years. The continental tribes, though still numerous, especially in the northern parts, are rapidly disappearing before the white man.

Births and deaths registered in the year 1907 :—

Commonwealth ...	56,489	53,858	110,347	25,939	19,366	45,305

Amongst the principal causes of death, non-specified or ill-defined diseases represent 9,954, 3,136 senile debility, 3,801 organic diseases of the heart, 3,038 congenital debility and malformations, 2,679 violence, 3,166 tuberculosis of the lungs, 2,940 cancer and other malignant tumours, 1,901 congestion, hæmorrhage, and softening of the brain, 1,788 pneumonia, 1,760 nephritis and Bright's disease, 2,733 diarrhoea and enteritis (children under two years only). The remaining deaths are ascribed to various causes inevitable in growing communities, though often preventable by prudence and timely attention. A case of Asiatic cholera has never occurred in the Commonwealth.

The rate of infantile deaths during 1907 was—N. S. Wales 88·46 per 1,000 births registered, Victoria 72·60, Queensland 77·65, S. Australia 66·57, Western Australia 97·51, Tasmania 82·97, Commonwealth 81·06. Twenty-three centenarians died in the same year, 13 were males and 10 females. Of these, six males (one 119) and one female died in N. S. Wales, three males and five females in Victoria, two males and one female in Tasmania, one male in Western Australia, one male and one female in South Australia.

#### PRODUCTION AND COMMERCE.

Australia's natural productions are varied and unique. It has large forests of very fine hard and soft woods, durable and ornamental, from the jarrah of Western Australia to the pines and cedars of N. S. Wales and Queensland; besides a host of others suitable for every purpose. Some of the eucalypts, particularly in Gipps Land and Tasmania, attain a height of 300 feet, 14 to 16 feet in diameter, and 100 feet to the first limb. But timber of this size is not met with in the more northern States; indeed, immense plains are there on which there is scarcely a tree, however diminutive. In favourable seasons these plains are covered with grass so high that cattle in it are distinguished with difficulty, and sheep may be entirely concealed. Then after a few months of dry weather the grass is dried up, and if not accidentally fired, it is trodden down and nothing remains but bare earth, from which the stock must be removed immediately, or perish. In past years this has happened on numberless stations, and hundreds of thousands of sheep and cattle have perished from thirst and starvation. More recently the settlers have adopted means to mitigate these terrible droughts. By converting the native grasses of good seasons into ensilage, and boring artesian wells, stock owners in many localities are able to tide over droughts that would otherwise prove disastrous. Much more will probably be done in this direction by individuals, but a thorough cure will not be effected until water conservation is undertaken on a scale so vast that it can be attempted only by the governments of all the continental States acting in concert.

An enquirer interested in land cultivation will probably glean the information most desired as to the capabilities of the Commonwealth by learning what crops are grown, the acreage devoted to each and the yielding per acre. From such evidence an intelligent practical farmer would be able to arrive at fairly accurate conclusions, for the principal crops with which Europeans are familiar are also the principal crops in Australia, slightly varying in productiveness with the climatic differences of the respective States. Wheat, oats, barley, hay, and potatoes are common to the whole as they are also

## Australia's Attractions for Immigrants. 135

in the British Isles and Europe, and this is how a State comparison of these crops stands for the harvest of 1907-8:—

TABLE C.

		Wheat.	Oats.	Barley.	Hay.	Potatoes.
N. S. Wales	{	1,390,171	75,762	11,890	541,761	31,917
	}	9,155,884	851,776	75,148	367,800	55,882
	}	6.59	11.24	6.32	0.68	1.76
Victoria	{	1,847,121	398,749	63,074	682,194	54,149
	}	12,100,780	5,201,408	1,059,295	682,370	135,110
	}	6.55	13.04	16.79	1.0	2.60
Queensland	{	82,461	715	6,943	54,037	7,889
	}	693,527	9,900	64,881	77,601	13,177
	}	8.41	13.85	9.34	1.44	1.67
S. Australia	{	1,753,755	66,297	37,321	328,672	9,062
	}	19,135,557	874,388	566,937	376,170	20,263
	}	10.91	13.19	15.19	1.14	2.24
W. Australia	{	279,609	46,666	6,019	131,056	1,854
	}	2,925,690	721,753	76,205	137,511	5,671
	}	10.46	15.47	12.66	1.04	3.06
Tasmania	{	30,794	54,625	5,852	73,859	38,640
	}	644,235	1,526,002	149,186	98,406	145,483
	}	20.92	27.94	25.49	1.33	3.77

The yield of Hay and Potatoes is given in tons.

Of course there are other crops, and in the northern States those which are not suitable or practicable for higher latitudes. For instance, there is maize: during the harvest just dealt with the yield was—New South Wales, 4,527,852 bushels; Queensland, 3,093,789; Victoria, 508,761; Western Australia, 1,080; South Australia (more attention being given to wheat), 6,263. Tasmania did not attempt it, although in a few instances it has been successfully grown for green fodder.

The production of cane sugar, hitherto confined to the northern part of New South Wales and Queensland, has developed into a very important industry. Whether it can be carried on permanently to the exclusion of coloured labour is a problem that only time can solve. In 1907-8 the area under cane was—New South Wales, 17,953 acres; Queensland, 126,810; yielding 277,390 tons, and 1,665,028 tons, or 27.97 and 17.64 tons per acre respectively.

Wine-making is another branch of trade that has developed into prodigious proportions in this young country. The climate of Tasmania does not permit the growth of the vine for this purpose,

but it flourishes in all the other States, the acreage of each in 1908 being as follows:—New South Wales, 8,483; Victoria, 26,465; Queensland, 1,973; South Australia, 21,080; Western Australia, 3,231; a total of 61,232 acres. The wine produced was:—New South Wales, 778,500 gallons; Victoria, 1,365,600; Queensland, 90,191; South Australia, 2,061,987; Western Australia, 153,755; total 4,450,033 gallons.

Orchards occupy a large area in each State—in New South Wales, 46,714 acres; Victoria, 54,111; Queensland, 14,397; South Australia, 20,736; Western Australia, 15,049; Tasmania, 19,441; total 170,448 acres. “The principal varieties grown in Victoria are the apple, plum, peach, apricot, cherry, and pear. In New South Wales citrus fruits (orange, lemon, &c.) occupy the leading position, although apples, pears, peaches, plums, and apricots are also extensively grown. In Queensland, the banana, orange, pineapple, apple, peach, mango, and plum are the varieties most largely grown. In South Australia, in addition to the apple, pear, peach, apricot, plum, orange, and lemon, the almond and olive are largely grown. In Western Australia the apple, orange, peach, pear, plum, fig and apricot are the sorts chiefly grown; while in Tasmania, although the apple represents more than two-thirds of the area in that State devoted to fruit growing, small fruits, such as the currant, raspberry and gooseberry, are extensively grown, and the balance of the area is mainly occupied with the pear, plum, apricot, peach and cherry.”

Space will not permit further details respecting productions from the land, and perhaps sufficient has been said to show that Australia (including Tasmania) is “a goodly land” literally “flowing with milk and honey,” and only needing industrious, thrifty, upright workers to turn its still high solitudes into prosperous and happy homes. But room must be found to give what the Federal Statistician records as the “annual average of gold production, 1901 to 1907,” viz., Western Australia, £7,931,059; Victoria, £3,155,021; Queensland, £2,518,101; New South Wales, £991,840; Tasmania, £282,302; South Australia, £79,886—£14,958,209; New Zealand, £2,017,554; or a grand total of £16,975,763 annually! Think of it: it almost takes away one's breath!

Some idea may be formed of the vast industrial resources of the Commonwealth when it is stated that during the year 1907 the value of imports from the United Kingdom and British possessions amounted to £38,607,877, and from foreign countries to £13,201,156—together £51,809,033. Exports were:—to the United Kingdom and British possessions £47,098,252, and to foreign countries £25,725,995—together £72,824,247. Thus one year's trade represents the enormous sum of £124,633,280, nearly £29 per head of the whole population.

## RAILWAYS, TELEGRAPHS, &amp;C.

The length of railway (Government and private) open for traffic in the several States in 1908 was:—New South Wales, 3,743½ miles; Victoria, 3,443; Queensland, 3,694½; South Australia, 1,937½; Northern Territory, 145½; Western Australia, 2,581½; Tasmania, 667½; total, 16,212½ miles. It may be useful to give the capital cost of construction and equipment of the Government lines in each State up to 1908:—New South Wales, £45,683,484; Victoria, £41,928,567; Queensland (narrow gauge), £22,575,603; South Australia, £13,909,635; Northern Territory, £1,180,174; Western Australia, £10,732,941; Tasmania, £3,977,611; Commonwealth, £139,988,015. The cost per mile open was:—New South Wales, £13,156; Victoria, £12,346; Queensland, £6,721; South Australia, £7,402; Northern Territory, £8,115; Western Australia, £5,524; Tasmania, £8,590; Commonwealth, £9,550.

Adelaide, Melbourne, Sydney, and Brisbane are connected by rail, and branch or short separate lines run back to the principal centres of settlement on the whole of the eastern side of the continent, and from Brisbane to Cook Town, on York Peninsula. A line was commenced to cross the continent from north to south (Adelaide to Palmerston), of which about one-fourth has been completed; and a line is projected and is now being surveyed to unite Adelaide with Perth, thus to link all the continental capitals together—doubtless a most important work for defence purposes. Hobart and Launceston are united by rail. Launceston is also united on the west with Burnie, and on the east with St. Mary's and Scottsdale; the latter line is being extended in the direction of Ringarooma.

Not only is Australia reticulated with telegraph wires, but it is united by cable with Great Britain and the world by the Eastern Extension Telegraph Company and the Pacific Cable Company. A separate Federal cable connects Tasmania with the mainland. Telephone services have also been established throughout the Commonwealth, in which there are now something like 50,000 connections.

## POLITICAL.

The form of government is substantially the same in all the States. There is in each a Governor appointed by the Crown, and two Houses of Legislature, both of which in Victoria, South Australia, Western Australia, and Tasmania are elective; in New South Wales and Queensland the Legislative Councils are nominated by the Crown for life. All the Houses of Assembly are elected on a practically manhood suffrage (including women); for the elective Legislative Councils there are a few trifling property qualifications.

The Federal Parliament is constituted on the same model, a

Governor-General appointed by the Crown, and two Chambers, both elective.

Customs, Exoise, Postal, Telegraph, Telephone, Patents, Quarantine, and some other Departments have been taken over from the States, between which there is absolute free trade.

Primary education is free, compulsory, and undenominational. The State Schools are well staffed and furnished, and the scholars are thoroughly equipped for the ordinary avocations of life. For the more advanced branches of study there are High Schools, Colleges, and Universities, besides special Colleges for Mining and Agriculture.

Old age pensions have been paid in Victoria and New South Wales (following the example of New Zealand) since 1901; but in 1908 the Federal Government undertook that duty, and it came into effect in July, 1909. It is expected that the sum needed for this purpose will reach £2,500,000, but there can be no question that it will prove a great blessing to many thousands of aged and infirm.

Facilities exist in all the States for acquiring land on terms exceedingly easy for men possessing only a small amount of cash. To attempt even to outline them here would occupy too much space, and then would be unsatisfactory. An enquirer had better apply direct to the Lands Department of the selected State, and he will be promptly furnished with all the information desired.

Within the last few years a disturbing element has found its way into Australian politics, as also into the politics of other countries, in what is known as the "Labour Party," which claims to specially represent the labouring classes, and practically does so exclusively. Its existence is the natural outcome of the education of the masses, and the gradual but substantial improvement of their social condition. Neglected and oppressed for centuries, in the past their only means of protest was insurrection, which was put down with violence. Their hard lot had been greatly alleviated, but society needed to be shaken up. With the spread of education, the extension of the franchise, and the introduction of the ballot-box, the labouring man became capable of thinking—for brains are not limited to classes—and of giving expression to his thoughts at the polling booth. From among his fellow-workers there quickly arose men who undertook to be his guides in political matters for whom the way had been prepared by antecedent trade unionism. Some of these men were undoubtedly impelled by a sincere desire to benefit their fellow-labourers, and to deliver them from the bitterness of a bondage with which they were too familiar; but there were others influenced by less worthy motives, and the last hindrance to their ambition was removed when salaries were paid to Parliamentary representatives. The effect of this departure from long established usage, it is held by many, has been to create an order of professional politicians who seek entrance into

Parliament as a convenient way of earning a tolerably easy income. The novelty of the situation will wear off; the prizes will after all be comparatively few; experience will show that exclusively class legislation, whether labour or anti-labour, cannot satisfy a community. When this discovery is made it may be hoped that moderate views will prevail all round. Meanwhile industrial legislation is receiving more attention than ever, by which the hard condition of the workers has been greatly ameliorated.

#### WILD ANIMALS.

But little room remains to discuss the wild animals of Australia, and in truth but little is needed. The marsupial wolf, the "native tiger" of the early colonists (*Thylacinus cynocephalus*), the largest and most formidable of the carnivorous mammals, is limited to Tasmania, where it is now but rarely met with; it attacks only sheep. The dingo, or wild dog (*Canis dingo*), was numerous in Australia (unknown in Tasmania), and was very destructive amongst the flocks, but it has been so hunted that its numbers have been greatly reduced. There are a good many smaller animals, but as they do not menace man they need not be individualised here. In Australia there are many species of snake, most of which are venomous, but there are some not venomous, including a python in the tropical zone, where also there are alligators. In Tasmania there are three species of snake, all of which are venomous, but fatalities from snake-bite are very rare.

#### NEW GUINEA.

This immense island, exceeding 300,000 square miles, has been annexed by Great Britain, Germany, and Holland. The whole of the portion west of the 141st meridian, about one-half, is claimed by the Dutch; the eastern half is divided nearly equally between Great Britain and Germany. The south-eastern portion, about 90,540 square miles, lying nearest to Australia, is British, and on 16th November, 1906, was proclaimed a dependency of the Commonwealth, by which its Government is administered. The revenue for 1907-8 amounted to £26,019, and the expenditure to £48,525. The country is well watered, there are large forests, good harbours, gold mining is prosecuted, and ere long an important trade is likely to be developed.

#### CONCLUSION.

I fear my limit has been exceeded, though the half of the wonderful and varied resources of this great Commonwealth has not been told. An attempt has not been made to accentuate any assumed or supposed advantage that one State may possess over another. The object has been to treat all as forming a single entity endowed with extent, productions and capabilities so vast and diversified as to render it suitable for every branch of the human family. Perhaps

sufficient has been said to satisfy our imaginary enquirer that he is not in danger of being transported to a wilderness tenanted by black fellows yelling for his life. On the contrary, he is invited to a land occupied by his own kith and kin; where the men have fair skins and speak his own language; where "the virgins are soft as the roses they twine"; and where the cities and towns (supplied with trams, water, gas, electric light, and all modern conveniences and refinements) are as imposing as most of those he will leave behind; a land, too, where he will find larger spaces, kindlier skies, greater freedom—a sphere affording ample scope for intellectual activity, social development, scientific research, religious fervour, and hopeful effort: in short, a land where the whole environment is favourable to the upbuilding of a noble character in both individual and national life. It is such a land that extends to him a hearty and helpful welcome, in the firm conviction that the prosperity that smiles upon it to-day is but the dawn of a future whose meridian glory may well mock the wildest flight of present fancy.

The Commonwealth occupies a unique geographical position. At the confluence of two civilisations: that of the Orient, hoary and senile—that of the Occident, youthful and aggressive—she may take the hand of each and draw them together in mutual embrace. The East is especially her sphere of influence, and by the character of her dealings with the teeming millions of India, China, Japan, and the islands of the surrounding seas, will her claim to be their teacher be judged. If, avoiding racial antipathies and ungenerous aspersions, in her relations with these peoples she displays a kindly tone, a loftier morality than their own, and a purer faith, it may be that they will be gradually won over to the enjoyment of those inestimable privileges and prospects which Christianity alone confers. So will the Commonwealth fulfil its highest mission, and peace and plenty will diffuse their blessings over the Southern Hemisphere.

Rise, crowned with light, imperial Salem rise!  
 Exalt thy towery head, and lift thy eyes!  
 See a long race thy spacious courts adorn;  
 See future sons and daughters yet unborn  
 In crowding ranks on every side arise,  
 Demanding life, impatient for the skies!  
 See barbarous nations at thy gates attend,  
 Walk in thy light, and at thy temples bend;  
 See thy bright altars thronged with prostrate kings,  
 And heaped with products of Sabean springs.

See heaven its sparkling portals wide display,  
 And break upon thee in a flood of day.

HENRY BUTTON.

## THE NATIVES OF SOUTHERN RHODESIA.

IN Southern Rhodesia, as in many other countries where a new civilisation is gradually encroaching on the old customs, the social conditions of the natives are in a state of flux. The tribal system is being undermined, and with it the ancient institutions and ideas. In our April number we remarked on the same process in West Africa. The problems of administration are similar in all such places, and the study of the subject in one has an interest for the others, though the point of view is by no means always the same. The report of the Native Affairs Committee of Enquiry in Southern Rhodesia is full of suggestive matter and is marked by the directness with which the essential difficulties are attacked.

The first use of a native, in the ordinary European relations with him, is to supply labour. It is an easy and common corollary that he will not work, or only to little purpose, except under a white master. It cannot be denied that this view of the matter has had a large acceptance in South Africa. But it gets no countenance from the Committee of Enquiry, or from a Conference of Superintendents of Natives to which the Committee refer.

"It is," the Superintendents remark, "a commonly made statement that most of the male natives of Southern Rhodesia do no work at all, and, if left to their own inclinations, lead a lotus-eating existence at their village, while their womenkind perform the manual drudgery required to keep them supplied with the necessaries of life. It is argued that the native, unless engaged in working for a white master, is a useless member of the community.

"We submit that the time has arrived for this fallacy to be once and for all exposed.

"The proposition ignores the fact that the native, in his natural state, is an agriculturist and stock-breeder, and those who put it forward forget that his products are an important factor in the commercial output of the country. At his own kraal the native man performs the following duties, all more or less incidental to his agricultural and pastoral life:—

“He carries on all the heavy preparation of the land, the greater part of the tillage falling to his lot; in harvesting and threshing he also takes his share, and finally he transports the bulk of the produce of his land to the market. The whole process of hut-building, with the exception of grass-cutting and plastering, is undertaken by the males, and, finally, the care of the cattle and other stock is entirely in their hands.

“The grain produced by natives during the year 1908 in Southern Rhodesia was estimated at over two million bags, and, at the close of the year, the value of the cattle owned by them, at an average of £3 per beast, was £600,000, small stock, at 5s. a head, amounting to a further £200,000.

“Do those who press for compelling all natives to work for European employers realise what would be the economic result of withdrawing them from their agricultural and pastoral industries?”

“We know that during certain seasons of the year their home work does not press very hardly on the natives, but these intervals are short, and the employment of natives at such times would be of little practical assistance to the chief industries of the country which demand engagement for continuous periods.”

On the other hand it is urged by the Superintendents that “any legitimate means of inducing the natives to work should be adopted, and we say this in their own interests, for it is only by becoming workers that they can be elevated from barbarism.” This argument only applies to the surplus labour which is left unabsorbed by the native agricultural work. The substitution of peace and order for internecine strife and spoliation has left a considerable proportion of the native population free to work for wages, and the administrative object is to secure this labour for European employers. No doubt the waning of the tribal system produces mischiefs which go far to justify this object on moral grounds. “The Committee have received overwhelming evidence as to the gradual weakening of the restraining influences of tribal control, and of the adverse effect which this has had upon marital and parental authority. The result is that the young men are losing all sense of discipline, obedience and self-control, and all respect for their elders, and for authority generally. We cannot but realise that the surroundings under which a native youth is reared at his kraal are far from healthy—morally, mentally, or physically. He should undoubtedly be subject to some more rigid discipline than that exercised by his parents.”

Having arrived at the conclusion that a paternal government is necessary, the road is clear for definite recommendations, and these are given by the Committee as follows:—

(1) That officials who directly control the native population be authorised and requested to preach the doctrine of labour as civilising factor.

(2) That these officials be authorised and requested to endeavour, by all legitimate means, to induce parents to apprentice their boys, between the ages of 14 and 18, to some approved employer or industrial institution for at least six calendar months in each year.

(3) That the minimum rate of pay in each district should be fixed by the State, and that a portion of the prospective wages, say 30s., should, in the case of the apprenticeship of a boy, be paid to the parent, as compensation for loss of his services, at the date of the entry into the apprenticeship, the balance of the wages to be paid monthly to the apprentice.

(4) That the State should provide machinery for the safeguarding of all boys so indentured, including the due fulfilment of the contracts.

(5) That where possible the apprentice should be afforded facilities for simple religious and literary instruction, including English.

(6) That where the official who directly controls the natives of a district finds that a youth of between 14 and 18 years of age is being materially prejudiced by the absence of proper control and discipline at his kraal, such official may cause such youth to be brought before the Magistrate of the district, who may, after due enquiry, cause him to be apprenticed, even without the consent of his guardian, to some approved employer or industrial institution; provided that he shall not be apprenticed in the mining industry except with the consent of the parent or guardian.

It will be seen that the policy advocated contemplates a considerable degree of pressure in the direction of inducing boys to work under Europeans. The case of native settlements near towns is also dealt with. It is said that the control of these "locations" is not satisfactory. "There is very little semblance of home life in any location, and we think this accounts for a good deal of the disorder and immorality which is reported to be prevalent in them. Forms of recreation are few, other than gambling and drinking. This naturally attracts indifferent characters, and those natives who are law-abiding and quiet have to suffer. Kaffir beer, often adulterated, is illicitly sold in most, if not all, locations. In the vicinity of many towns there are private plots where natives of doubtful character congregate. These are a constant source of trouble to the police." The Committee make the following recommendations:—

(1) That at all the larger towns the locations should be under the supervision of a European of good character, who should live either in the location, or in the vicinity.

(2) That squatting on plots in the vicinity of towns should be absolutely prohibited.

(3) That improved dwellings of different classes be erected in the locations, and that moderate rent be charged in accordance with the class of dwelling. This would give the better class of native, who is

usually more highly paid, an opportunity of improving his surroundings.

(4) That garden plots be granted, at a reasonable rental, to the occupants of the location. This would give the wives of men who are away at work all day some legitimate means of occupying their spare time, instead of spending it in a less wholesome manner.

(5) That a rest house be provided in each location for the use of natives who visit the town and are unable to complete their business in time to leave the same day.

(6) That a refreshment room or kaffir eating house be established in each location, strictly under the control of the local authority. Food and good wholesome beer in reasonable quantities should be sold there. It appears that this system has been adopted in Durban, and has proved a success.

(7) That the sale, introduction, or manufacture of beer, otherwise than by local authority, be absolutely prohibited.

(8) That every encouragement be afforded approved educational bodies in establishing institutions for religious and literary instruction, but that such institutions be under the supervision of the Education Department.

(9) That at smaller towns where it is not possible for the local authority to sell beer, natives be allowed to brew it in small quantities under written permit, but not for sale. That all unauthorised beer be confiscated, and the person in whose possession it is found be liable to punishment.

(10) That, where beer is sold by the local authority, any profit derived from the sale, or from rent, be utilised in improving the location.

(11) All house boys should be medically examined periodically.

Many witnesses urged that a reason for increasing the personal tax on natives (£1), which was substituted for the old hut tax of 10s., was that the supply of labour would be increased. A man would have to work more to earn the increased amount. The Committee considered (Col. Grey dissenting) that an increase of taxation on this ground would not be justified, and that it was extremely doubtful whether it would have that effect.

It is recognised that there are features of certain industrial employments which tend to deter natives from accepting them. "The work is arduous, the hours are long, and it is not a matter of surprise that they do not take to them readily. There are other circumstances connected with European employment which do, no doubt, have some effect on the labour supply. To these the Committee desire to refer. In enumerating them, they do not wish to say that they are largely present. There is abundant evidence that the vast majority of employers treat their native employees with great consideration and fairness, as will be seen later in the report. On

the other hand, there is proof that the grievances do exist, that they are very real ones to the natives, and that they warrant attention.

“Complaints are made of short payment of wages. On this point the Committee consider that the evidence is strong that instances of it do occur.

“Another objection was that the labourers are frequently kept unduly long on the minimum wage. This was particularly referred to in the case of natives engaged by the Bureau. The explanation given by one witness was that the capitation fee was so heavy that the employer could not afford the same pay as that given in the case of labourers engaged independently. The question of the minimum wage is an extremely vexed one. The contracts of the Bureau purport to specify what is intended to be the commencing wage of labourers, but they contain a protecting stipulation to secure that employers shall increase the pay of men who prove efficient to the amount which is current for their particular class. The following is the relative clause of one of such contracts (paragraph 3 of form No. 2):—‘If any native efficiently performs work for which voluntary natives on the mine are paid a higher rate than 9d. per diem (more especially underground drill or hammer work, firing boilers, or mill work), then such native shall receive the higher rate of pay applicable to the class of work performed.’ The trouble that arises in connection with a condition of this sort is the fact that in a very large number of cases the natives are not very well informed as to their rights or as to the methods of enforcing them, and it is feared, therefore, that at times, legitimate increments are withheld.” The remedy for these and the like cases must be found in close supervision.

The shortage of labour is, however, more acute on many farms than on the mines. In spite of its hardships and risks, mining has greater attractions even for indigenous labourers than farm work. The rate of pay is higher, the food and supervision better, and the social side of life on the mine is more agreeable, though it might be supposed that farm labour is more in harmony with their own traditions and inclinations. Probably, if in cases in which married men are engaged their families could be induced and permitted to settle on the farms with them, conditions might be created which would afford them inducements to remain. By such a system, too, a farm labour class would probably grow up, as has happened elsewhere in South Africa. It is apparently difficult to induce indigenous natives to accept such an arrangement, and the Northern Administrations do not encourage it in the case of labourers from those territories. As a consequence natives, largely alien in number, live on farms without their families, and without the attractions which town or a large mine affords. It is not difficult to realise that such an existence is not calculated to encourage them to remain under a prolonged term of engagement.

While the report shows that advance under civilization is manifested in many ways, it is admitted that there are serious drawbacks. "From the evidence of many of the witnesses, it would appear that the natives have degenerated in some respects, and that contact with civilization has had a retrograde effect, especially in regard to sexual immorality and in the lack of respect for parental and tribal authority. This may be attributed largely to the weakening of tribal control which has resulted from a civilized system of government and to the discouragement, which is inevitable, of time-honoured ceremonies and customs, which, though appearing in European eyes to be influenced by mere foolish superstitions, have, nevertheless, played an important part in compelling respect for tribal, parental and marital authority. These superstitions represent the religion of those who profess belief in them; and, as regards some of them, at least, it is questionable whether it is wise to suppress them suddenly or until they are replaced by a higher order of faith and worship.

"The immorality of women, both married and single, in the vicinity of mines and other industrial centres, is a growing danger to the future welfare, both moral and physical, of the native races. It is alleged that husbands allow their women to take beer for sale to natives employed at these centres, that this leads to prostitution, and that the former share the proceeds of money so earned. It may be mentioned that prior to our rule prostitution was practically unknown amongst natives, as the punishment for the offence was so severe. The sale of beer is contrary to all native traditions, and is largely the cause of moral decline.

"We are told that even amongst the natives more remote from civilization sexual immorality is common amongst children of 12 or 14 years of age. Excessive beer drinking is also a pronounced evil. In the old days the younger people were only allowed a limited quantity at assemblies, whereas they now demand and receive as large a share as their elders. This tends to immorality, and is also the cause of serious crimes of violence. At the same time, it is only right to point out the marked absence of serious crime amongst the indigenous natives as compared with aliens."

On the subject of immorality there is some plain speaking, which is the more important in view of the agitation over the "black peril." Paternal government carries with it responsibilities in such a matter which the Committee fully recognise. "Earnest representations were submitted on the subject of the irregular sexual relations which it is alleged frequently exist between white men and black women. The question is an extremely important one. Apart from the moral aspect of the matter (a grave enough one of itself) the prestige and influence of Europeans are seriously affected by such incidents. On the other hand, the natives evidently object to relationships of

such a nature. Besides European evidence to that effect, native witnesses gave emphatic testimony on the subject: 'It is very bad; whites ought to take whites, and blacks ought to take blacks'; 'It is very evil, and a thing we resent very much in our hearts'; 'It is a very evil thing'; were expressions of view of different native witnesses; and an instance was mentioned by a minister of religion in which a native resisted the taking of his sister by a white man. The Committee are of opinion that the subject should, if possible, be actively dealt with. Marriages between European men and native women, though lawful, are admittedly unwise, to say the least, and it is equally clear that the results even of such unions will create formidable complications both socially and politically in the future. The territory is already faced with a sufficiently grave political problem in the native question pure and simple, and it is clearly the duty of those responsible for administration to endeavour, while there is time, to head off the further difficulties which inevitably follow in the train of miscegenation, accompanied, as they always are, by serious social evils. At present the law forbids illicit intercourse between black men and white women under severe penalties (Ordinance No. 9 of 1903), but it goes no further." The Committee have carefully considered the best means of dealing with this very serious question. A majority are in favour of legislation prohibiting marriage between white men and black women. But they recognise that for any useful purpose it would be of little avail to forbid such marriages unless concubinage is also prohibited. Instances of the latter will be infinitely more frequent than the former, and will therefore cause proportionately more mischief from a political and other points of view; it would be illogical to forbid a union which is *per se* moral, and to acquiesce in or be silent with regard to immoral relationship; and, lastly, merely to forbid marriage would have the effect of encouraging the class of connection which, after all, is the true cause of most of the troubles arising from miscegenation. The Committee, as a whole, feel that, if it be possible to give effect to legislation dealing with concubinage, both such relationship and marriage between white men and native women should be prohibited. "With regard to the question generally, the evil is one which can, to a great extent, be dealt with by the force of public opinion and by active measures of discouragement, official and private. The Committee learn that illicit relationship with native women of persons in public employ is viewed in the gravest light by the Government, who have imposed in the past, and would impose in the future, extreme penalties for an offence of such a nature. If private employers of Europeans would follow the policy observed by the Government the evil would, the Committee think, be considerably abated."

## REVIEWS AND NOTICES.

**International Law.**—By F. E. SMITH, K.C., M.P. 4th Edition, revised and enlarged by J. WYLIE, Barrister-at-Law. (*J. M. Dent & Sons, Ltd.* 7s. 6d. net.)

Mr. F. E. Smith's work was published eleven years ago and has had a high reputation, but in that period the subject has had a great development and a revision of the book has become necessary. The Hague Conventions have not merely added matter; they have gone far to alter the character of international law. Before them there was no authoritative body which could decide what such law is, or which could interpret an international agreement, or which could supply any sort of "sanction." The risk of war was the only deterrent which could prevent nations from trampling on the doctrines generally accepted. Now there is a court which is competent to decide questions, and though it has no means of enforcing its judgments its composition and influence undoubtedly give it a great actual strength. International law has in fact now found a sort of sanction in the wide public opinion which will support orderly agreement against the law-breaker. The task of incorporating The Hague decisions has been excellently carried out in the present volume, and the work is now indispensable to those who may be concerned with international law. There is also a useful account of the controversy concerning the Declaration of London.

It seems regrettable that all works on this subject are devoted so largely to belligerent matters. War, after all, is an exceptional state of things, and though the old writers had to keep it constantly in view there is now a larger opening for the discussion of questions which arise under normal conditions. It would, for instance, have been interesting to read a discussion by Mr. F. E. Smith and Mr. Wylie on the interpretation given in the United States of the most favoured nation clause in commercial treaties. There it has been held judicially that an international commercial

agreement entered into for special consideration is outside such treaties. According to this view the most favoured nation clause does not secure the same treatment as is given to a particular country under a bargain by which special terms are obtained. Whatever may be said for the special bargain, the result seems to be a derogation from the original agreement, and the American view does not appear to be that generally entertained. In any case the only possible rule for the interpretation of treaties is to follow the same method and principles as in the case of other written instruments. We confess to some surprise to find it laid down by the authors that "No independent Government can indefinitely and for all time bind its successors by treaty, for the community so shackled would no longer be completely independent. It should follow therefore that every state became legally entitled to repudiate a treaty of indefinite obligation as soon as the conditions which preceded its formation have undergone substantial modifications." The Declaration of London of 1870 laid it down explicitly that "no power can liberate itself from the engagements of a treaty, nor modify the stipulations thereof, unless with the consent of the contracting powers, by means of an amicable arrangement." It is quite true of course that treaties have been torn up, and the statement is upheld as a statement of fact. It may be submitted however that, while the statement has unfortunately been correct in certain cases, to elevate it into a principle, legal or moral, is anarchic.

---

**Off the Main Track.**—By S. O. HYATT. (*T. Werner Laurie.*  
12s. 6d. net.)

Mr. Hyatt's pen is generally dipped in gall, but he has lived in the midst of the scenes which he has described and whether his impressions are correct or not they have been genuinely acquired. The work, for all its invective, is salutary reading, and will attract many by a candour and realism which contrast strongly with the superficial optimism characteristic of most literary travellers. He spares no classes—the settlers, the blacks, Rhodes, the Chartered Company, all come under the lash in turn. The author of the *Diary of a Soldier of Fortune* is still a free lance. He has no respect for the old state of things and no liking for the new. Much of his description is no doubt accurate, but he makes no allowance for the difficulties of a transitory period and acknowledges no merit in recent developments. He has, in fact, a grievance which blinds him to these things. He has lived on the Transport Roads, and these have been supplanted by the railways. The old life in Mr.

Hyatt's eyes was far preferable to the new. He has the feeling which we all have at times that railways are unromantic things and that the only way to understand and appreciate a country is to follow the road.

"Every man who has lived on the Road—as distinct from those who have merely travelled on it—loves it. He must love it, or he would never have remained on it. The passenger views it in a different light altogether. To him waggon trekking is merely a tedious and uncomfortable way of reaching his journey's end, of getting to the place where he hopes to make sufficient money to repay him for the hardships he has undergone in reaching it. He never knows the road, he has not time to learn to know it, and if he is of the storekeeping or mining type, the chances are that he could never, in any circumstances, learn to know it. His will not be the nature which understands such things." The result is that "the new man, the settlers or colonists or whatever else they call themselves, are grossly uninteresting." As against this it may be gathered freely from Mr. Hyatt's pages that the predecessors of the "new man" did not have either a long or a particularly bright and merry life. Everybody, he says, who counted is either dead or has disappeared. No one will be surprised at this if they trust Mr. Hyatt. Gambling, drink and vice were the principal occupations in the townships, according to his narrative. If so it could not and did not last. "I suppose all these places have changed since my time. Salisbury must have become more decent, or it would surely have met the fate of the cities of the plain; whilst Victoria, with a railway creeping out in its direction, has probably grown almost conventional. Never again will they dance war dances round the judge's quarters, or insist on the retirement of the local parson because he had four native wives, and they reckoned one was sufficient for a cleric." These good times have gone, and a drab respectability has succeeded. The new state of things does not make for the good stories such as abound in *Off the Main Track*, and one can understand Mr. Hyatt's antipathy to the good citizens "who intend to carve a home out of the wilderness, or do something equally estimable," and who "ooze with virtue and respectability."

Mr. Hyatt has made up his mind that South Africa has a terrible time in front of it. The only doubt he has is whether the third Boer War or the Native War will come first. He believes that the only way to settle the native question would have been to put South Africa for ten years under military rule and after that under direct Imperial control. He is almost as bitter against the South African Union as against the British South Africa Company. It is all a long way from practical politics, but the book is an honest one and puts forward novel points of view which are at any rate interesting. One instance is his opinion of the kind of women who are wanted in such

places: "If you are going to build up a colony with wholesome ways and wholesome ideals, you must have wholesome women of British birth, not strong-minded women, or 'pioneer women' who can make butter, or hammer a native, or cut up a pig, but nice, dainty women who will serve to remind men of things at Home, and so keep them up to the mark. I like a woman who can do things, womanly things; but I have no respect for the woman who wants to do the work of a man, at least on the frontier." This is hardly the conventional view, but Mr. Hyatt knows more on the subject than most people do.

---

**The Fiji of To-day.**—By J. W. BURTON. (*C. H. Kelly. 7s. 6d. net.*)

Fiji has a tropical climate, but without the scourge of malaria. Hence, the Rev. J. W. Burton observes, the European has much less strain on his health than in most lands of similar temperature. The life insurance companies take risks at ordinary rates. The soil is good. The Colony is prosperous. For a long period after annexation the cultivation of land, for proper and worthy motives, was restricted, but the result was that commercial enterprise was checked. The natives cultivate only a trifling quantity of their land, and show no disposition to use more. Within recent memory the Colony had a hard time, so hard that the salaries of the civil servants were reduced all round—the only case of the kind, as far as we are aware, in Crown Colony administration. In recent years, it has been made easier to acquire land, and a new era of activity has been opened up. The trade now amounts to about a million and a half, 86 per cent. of which is with Australasia. This development is largely due to imported labour. There are now some 40,000 coolies in Fiji. Of natives there are about 86,000: fifty years ago there were 200,000, and the present annual decrease is at the rate of 15,000. It does not require much foresight to see the way the country is going. The Fijian under present conditions is dying out before the Hindu, and a population which has been converted to Christianity is becoming Asiatic in religion. It may prove that there is little place for the lazy islander under a commercial system. The pent up forces of the East may sweep him out of the way. The prospect is not a pleasant one for the Christian missionaries. They have on the whole been remarkably successful in the South Pacific. But this was when the field was not disputed. It is now invaded by the chartered ships from Calcutta, and the breach made will grow wider and wider. "Capital, followed by his busy servant Commerce, has paid a visit here, and left pledges that he will fulfil the contracts he has entered into.

These are nothing less than the complete revolution of the Pacific. In these days the golden sceptre of Wealth in the hand of Enterprise does more to decide the destinies of peoples than the fiat of kings. Capital sits upon the throne of the gods, and the other deities nod to his decrees. At his sordid behest nations are born—or more often destroyed—in a day. No race, however interesting or attractive, will be allowed to live which does not pay tribute to this merciless Cæsar. No considerations of sentiment have a place in this kingdom of Mammon. Peoples, traditions, virtues, and tastes, must all be expressed in term of pounds, shillings, and pence. If the present occupants of these islands do not furnish the labour that capital requires, a fleet will soon be on the waters bearing the type demanded. We may object as much as we will to the exploitation of these countries, but it will go on in spite of our caveat, and congested wealth and congested population will together seek relief in these fruitful islands.”

The coolie shows no disposition to become Christianised, and in his new surroundings he is probably not at his best. The government in Fiji as in other colonies can make provision against his ill-treatment by his employers and give a medical supervision over his health.

Mr. Burton freely admits that the Immigration Department in Fiji takes every care, so far as possible, to prevent the oppression of the coolie. His indictment is that the system is a barbarous one, and that there are occasional cases of brutal conduct by the overseers on the estates. Things, however, he remarks, were better than they were. When the five years service are over, the coolie is a “free man,” and has no difficulty in leasing a piece of land. In most cases he does very well, and there are very few who after a long residence are not fairly well-off. It is hardly necessary to say that he has already almost entirely secured the retail store-keeping trade. Physically he seems to do very well—better than in India. Whatever occasional abuses there are in connection with the indentured system, the ultimate result seems to be undoubtedly good, if the position and habits of the emigrants in their own country are properly taken into account. Mr. Burton has much to say, and says it in plain terms, about the immorality of the Indian. But he did not acquire these things in Fiji, where in fact the level is little if at all higher among the natives, and in spite of all he thrives and prospers. Intellectually, he is greatly above the Fijian.

This contrast of races makes the study of Fiji exceptionally interesting, and Mr. Burton's pages are full of close observation and suggestive comments. He knows the Hindu well, and while he regrets the victory which the latter is achieving, he recognises his good points. He rests his hopes for the Fijians on industrial education. It is quite possible that the diminution of the race may

be arrested. It is undoubtedly capable of education, and is now at a much higher level in this respect than were other races which have withered away at the touch of Western civilisation.

**A Resident's Wife in Nigeria.**—By CONSTANCE LARYMORE. (*George Routledge & Sons, Ltd.* 4s. 6d. net.)

A second edition is welcome of this book, which is written with a delightful freshness and a cheerfulness which almost obscures the very real pluck with which Mrs. Larymore faced adventures and mis-adventures. One, and not the least drawback to service in West Africa is that, in addition to the climate, lack of accommodation has prevented wives from accompanying their husbands. A few brave efforts have been made, and no doubt the railways and harbour improvements will now rapidly make things easier for such women. It is remarkable how great a fascination West Africa has exercised over the few women who have tried it. They have certainly been highly prized there, nor have the natives been backward in admiration, though not many in future will have "greatness thrust upon them" as happened to Mrs. Larymore, as the first white woman seen by a tribe. The natural cheerfulness of the natives has a good deal to do with the attraction, and many who have served on the Coast will echo the following. "Indeed, I can never conquer that curious feeling of chilly depression that overtakes me each time I return to England, and feel that, except for the tiny majority of my own friends, I am alone in a crowd; infinitely more alone in Bond Street, where almost every brick and stone is familiar, than I could ever be in the busy streets of Kano, or any other city of Nigeria, which I might enter even for the first time, where I should find two hands and one willing tongue all inadequate for the due return of the ceaseless shower of smiling salutations and greetings that would be poured upon me from every side. And this is by no means a tribute to any personal charms of mine. Any traveller, black-skinned or white, receives the same treatment as a matter of course."

A good deal of water has flowed down the Niger since Mrs. Larymore first described her travels, but they can be still read or re-read with interest. The most useful part of the book consists of the household hints, which contains a great amount of matter not to be found in the official information or the numerous treatises on domestic requirements in the tropics. Mrs. Larymore is not satisfied with the bare necessities, but shows how the bungalow can be made cheerful and attractive by simple methods. She gives good advice as to poultry keeping and gardening. The leave system interferes with the continuous attention which is required in such matters, but much might be done to increase the comforts of life. The keeping

of poultry should certainly be tried wherever possible, as the native fowl is a wretched specimen; it is fairly easy to get them out, and though Mrs. Larymore's stock suffered from animal depredations, the use of wire netting could stop such losses. The gardening notes are excellent, recording as they do both the successes and the failures.

---

**The African Rubber Industry and *Funtumia Elastica* ("Kichxia").**—By CUTHBERT CHRISTY, M.B., C.M. (*John Bale, Sons, and Danielson.*)

Africa, Dr. Christy states, is supposed to yield about one-third of the world's annual production of rubber, but the product is markedly inferior to that from South America and other places, not on account of inherent inferiority in the latex of either trees or vines, but chiefly owing to faulty preparation. Even more important than the question of quality is that of the diminution of supply. There seems very little prospect of staying the extinction of the indigenous wild rubber, particularly the trees. The industry must in the future, Dr. Christy thinks, be largely dependent on planting, and certainly all the indications point that way. The cultivation, however, of the African rubber tree, the *Funtumia Elastica*, has not been successful, owing to a want of knowledge of its special characteristics. Dr. Christy vigorously attacks the policy which has allowed this.

"It is to be feared that Colonial administrations in tropical Africa have in the past been too apt to regard the apparently unavoidable devastation of the forests with complacency, being content to formulate regulations which can never affect the individual rubber collectors. A special study, extending beyond the limited sphere of each particular colony, of the tree which is capable of producing, and has produced, more wealth than any of the other African forest products, should long ago have been instituted. Knowledge of the best methods of cultivation and of tapping *Funtumia*, and of the preparation of its rubber, seems to have remained until quite recently, in our own dependencies at least, almost what it was at the time of its discovery now nearly thirty years ago. The resultant loss is incalculable.

"No other rubber can be planted so cheaply or with so little skilled labour. If only ten years ago the natives in the best forest districts had been induced, as the result of expert investigation, to plant *Funtumia* on the communal plantation system so successful in Southern Nigeria, or upon the principles now becoming well recognised in the Kamerun plantations, a very different state of things would exist. The African rubber industry would to-day, with very small capital outlay, be an ever-expanding one, instead of being in

sight of extinction, its rubber the worst on the markets, and the forests ruined." No doubt there is much force in this indictment, but we do not think that in our own possessions the devastation of the forests has been regarded with complacency. The fact is, as Dr. Christy shows elsewhere, it is practically impossible for a government to prevent the devastation of wild rubber. The idea that efficient control can be maintained over vast areas is almost chimerical. Moreover, the knowledge and experience required for planting operations comes slowly. Even now in the East, where the subject has received a vast amount of study, there are problems which await solutions. No one is quite sure yet what the commercial life of planted *Hevea* is, or when tapping should best begin. Dr. Christy's book is itself the result of eight years work. While, however, we suggest that there is some excuse for a want of precision on the part of governments, we can hardly give too much praise to the comprehensive manner in which Dr. Christy has dealt with this important subject, and it is to be hoped that good results will follow. A beginning has at any rate been made with planting under administrative auspices, and the studies contained in this volume will be appreciated.

In the Gold Coast, rubber assumed the first place among the exports in 1904, but, owing to crude preparation and the inclusion of dirt, stones, etc., the quality was exceedingly poor. We regret to find that, according to Dr. Christy, the quality at the present day is in no way improved. In Lagos the export attained magnificent proportions in 1896, but in the following year the disastrous results were obvious. The Ibadan and Jebu forests were ruined. The natives quite understood that a source of profit was being destroyed, but it was idle to expect that they would exercise any providence on that account. "I notice that no rubber trees are left along the road. A year ago, although the trees were dead or dying from the over-tapping, the trunks remained standing and were much in evidence. . . . Discussed the state of affairs with Alambo, King of Ibese. He agrees that the rubber is entirely killed out and says, 'Yes! Yes!' to suggestions as to the advisability of making some country law against destroying young rubber plants in the bush. He is fully alive to the fact that they represent money. One can see, however, that his acquiescence is purely a matter of politeness. He thinks that the hunters and the bush people are the ones to be interviewed about it.

"The hunters at Ilogbord did not seem to take an intelligent interest in the matter, but said that the big men at Ilaro are the only people who can take steps to initiate anything in the shape of protective measures. The big men at Ilaro care not a scrap about the whole matter. The rubber was God's gift and came in handy. It is now finished, and so we will continue to live happily with our

wives, with our mouths open for whatever Providence and the white men may next bring us. African kings seem purely ornamental when they are not obstructive." (*Diary of Mr. C. Punch, Director of Agriculture.*)

The export, Dr. Christy observes, continued to fall until in 1902 it was less than one-sixth of that of 1896; subsequently, owing to greater demand in the home markets, the output rose again. The increased quantity exported in 1906 was said to be due mainly to the tapping of the Ilesha forests, one of the richest rubber areas in the western district, after being closed for nine years. On the prohibition being removed, no less than 3,266 licences to tap were at once issued. The state of that forest was soon worse than at first.

In the Belgian Congo there was a good deal of ruthless destruction at first, but the State saw the mischief, and about 1899 planting was begun on a system which provided for 150 new trees or vines for every ton of rubber collected. This policy is now having good results. The energy shown in the matter by the administration, as contrasted with the inactivity elsewhere, was no doubt due to the direct interest of the State in the commerce. In Liberia no great harm has been done so far. But on the whole the industry is rapidly declining in West Africa, and the only hope of recovery lies in extensive planting. In East Africa also the trade has been threatened by destructive practices, but it will no doubt be protected there by the greater powers possessed by the governments of dealing with land, as by reserving areas and making large concessions to companies which show more forethought and can be better supervised than individual workers.

It is of the utmost importance, therefore, that the best modes of planting should be carefully considered, and for this purpose Dr. Christy's work is of the greatest value. He appears to establish clearly that the future in Africa rests with the Funtumia. "It cannot," he says, "be disputed that Funtumia may be planted in Africa on a very large scale infinitely more cheaply than Hevea, or indeed, than any other rubber; and the yield per acre per year is not much if at all inferior to that of Hevea. Under European supervision and sufficiency of skilled labour, Hevea is possibly the best of all rubbers to plant in suitable localities, but Funtumia, I maintain, is second to none, not even Hevea, for general planting by natives and others in tropical Africa; by its means and by no other will it be possible for West Africa to regain its position as a rubber-producing region." To allow the Funtumia a fair chance, the underwood must be cleared. In open ground the tree is a fairly quick grower, and attains much larger dimensions than when in the forest. It must also be coppiced, for if planted weak it grows all head and foliage. A considerable depth of loose and well-drained

soil is desirable as the main root, almost equal in diameter to the trunk, goes down five feet or more and then divides into roots which descend a great distance.

---

**Social Insurance: Report by the Australian Commonwealth Statistician.—G. H. KNIBBS.**

Australia is remarkable for the departmental reports which collect material from all sources and discuss administrative questions from a local point of view. Mr. Knibbs' report is a good example of the care with which the doings of the other countries are examined on such occasions and of breadth of treatment. He observes that the fundamental doctrine underlying the whole fabric of social insurance, a doctrine which has to some extent become concrete in the countries of Europe, is that a proper regard for the solidarity of each community requires that all classes belonging to the community should be protected by the strength of the community as a whole against the incidents of misfortune on the class or on the individual. This notion of solidarity, viz., that the strong must carry the weak, is regarded as essential to a favourable development of the nation, and it is recognised that the national welfare requires sacrifices to be made, by those able to make them, for the well-being of its weaker elements. In other words, it is recognised that, in order to advance the prosperity of a nation as a whole, and to conserve its vital forces, it is better that a misfortune falling on an individual should be distributed and borne lightly by the whole community, rather than that the individual should be crushed by the weight of his own misfortune. The full scope of social insurance was first recognised in Germany, largely owing to the rapid development of an agricultural into an industrial country and to the growth of social democracy. In 1881, that country attacked the problem of the insurance of workmen against industrial accidents and against disability caused by old age or invalidity, and other continental countries rapidly followed suit. Between 1889 and 1908 there were no less than eight international congresses to discuss the subject. Insurance against unemployment was first tried by Switzerland and Belgium. These schemes and those more or less founded on them are explained in detail by Mr. Knibbs, who finds much to say in favour of the principle. As regards the action to be taken in Australia, he sums up as follows:

“The question now arises whether it is advisable and practicable for the Commonwealth to adopt some method of unemployment insurance. Though none of the systems which have been tried in Europe offer a complete solution of the problem of unemployment insurance, much may be learnt from a study of the efforts which have been made. Though these efforts must be regarded as faulty, it is

not desired to give an impression that such municipal institutions cannot serve a useful purpose. On the contrary they have been of great value, and though not based on scientific principles, they have afforded a species of "assisted insurance" far preferable to the old methods of indiscriminate and uncertain relief. The principle of registration, the fact that the workman is contributing regular premiums, and that he has a legal right to unemployment allowances are valuable features of these systems. The unemployed are brought under the supervision of the municipal authorities, and are assisted in finding work, and workmen are required to make some personal sacrifice before they are entitled to relief, which can only be obtained by *bonâ fide* residents.

"At the present time there exist no sufficient data relating to Australian experience of unemployment to indicate what the effects of any such system would be. The necessary information on which to found any proposals for practically dealing with this question could be obtained by proper inquiry.

"It should be observed that any scheme for Australia must devise some means of reaching those classes not possessing labour organizations, if it is to fulfil its normal functions. There is no reason why the organized trades should not themselves develop systems of unemployment allowances, and there is ample warrant for giving national State encouragement to such development. A most important part of any system would be in rendering assistance (through efficient labour exchanges) to the unemployed in finding work.

"Finally, it remains to be said that all social insurance, and particularly that against unemployment, can hope to succeed only if a higher degree of total industrial efficiency can be secured thereby. If the alleviation of the load of trouble should result in relaxing in any measure strenuousness of effort on the part of workmen, then the schemes of social insurance are foredoomed. Not only so, but what might have been singularly helpful in creating a healthy social solidarity by reinforcing the energies and favourably influencing the destiny of the nation can, on the other hand, assuredly bring about its doom."

---

**The Canadian Annual Review, 1910.**—By J. CASTELL HOPKINS, F.S.S. (TORONTO).

Empire matters came in for a large amount of attention during 1910, and many animated discussions took place with the usual diversity of opinions. The question of eventual "Independence" was discussed widely in connection with the Navy debates in Parliament and the French Nationalist movement. The Review

gives a very full account of the debate on the Naval Service Bill, which brought on a Nationalist campaign in Quebec and probably caused the defeat of the Government at the Athabaska bye-election, and a very good idea of the conflicting views may be gathered from these pages. For a knowledge of both Dominion and Provincial events the Annual Review is indispensable.

---

### **Report of the Bahamas Commission on the Customs Department.**

In the many colonies where the revenue is almost entirely dependent on customs receipts, the revenue department should be distinguished by sound business method, but in the Bahamas at any rate this has not been the case. The Commission say frankly that the opportunities for smuggling under the existing conditions are unlimited. No adequate precautions are taken to supervise transshipments into lighters or to the dock, and the examination of packages is insufficient. A disturbing circumstance is that the statutory power of the revenue officers to demand from the master of a ship the bills of lading has been ignored in practice, and instances have occurred where goods have been delivered to persons not at the time of delivery actually entitled to them as holders of the bills of lading, but on the mere production of the invoices, to the detriment of persons to whom the goods were consigned to order.

This state of things has made the work of the Commissioners far from easy, but they have attacked the problem carefully and their treatment of it and recommendations merit the attention of revenue authorities generally.

---

### **The Story of the Rubber Industry in Malaga.—By H. M. RIDLEY, Director of the Botanic Gardens, Singapore. (Malay States Development Agency.)**

This little book gives a history of the rise of the industry of rubber cultivation, which has brought the Straits and its hinterland into prominent notice in the last few years. The exceptional advantages of the country are explained and concise directions are given for cultivation and preparation. The following figures show the immense development which has taken place.

“The area under cultivation in Para rubber in the Malay Peninsula is estimated at 400,000 acres; that alienated for planting but not yet planted up is 700,000 acres. These estimates are only approximate, but not very far above or under the actual one. The capital sunk in the industry is:—

## STERLING COMPANIES.

(a) Capital of 189 Malay Companies included in the Guide published in September, 1910	£17,728,000
(b) Capital of Companies founded since the issue of the Guide and private ownership is (estimated) ... ..	3,000,000
	<hr/>
	£20,728,000

## DOLLAR COMPANIES.

(c) Capital of 42 Malayan Companies as given in published Guide ... ..	\$18,457,000
(d) Other Companies and private estates (estimated) ...	6,543,000
	<hr/>
	\$25,000,000 = 2,916,666
	<hr/>
	Total £23,644,666
	<hr/>

“Probably (b) and (d) are underestimated—the calculation is certainly on the cautious side.”

As most people interested in rubber are anxiously conjecturing what the effect of the increasing supply will be we cite Mr. Ridley's remarks on this aspect of the matter. “As a very large area has not yet come into bearing, and a large number of producing trees have not by any means arrived at their maximum output, it will be easily imagined what a vast store of rubber will be produced when the whole 1,100,000 acres are in full swing. It will not, however, be more than is wanted by the world, for not only does the demand increase, but should the price fall from the large amount poured into the market, the result would be the replacing of the inferior jungle rubbers and recovered rubbers by the superior cultivated product, and so cheap is the latter to prepare that even if it were to fall to a lower figure than it has done since the original industry was first started, still the profit from a properly conducted estate would be a very good one. There is no likelihood of what may be called over-production for very many years to come.

“Synthetic rubber, a bugbear to many, is even less likely to interfere with the planting industry. It is quite possible to make real synthetic rubber in the chemical laboratory, but its cost would be so great that it could not compete with the real article at a price which would leave a big profit to the planter. Many of the so-called “synthetic” rubbers are merely poor imitations, and

cannot replace rubber at all, while others are merely adulterated rubbers.

“Those who have read this little pamphlet will easily gather the immense importance and value of this quite new industry in the Far East, and will see that it is not a mere flash in the pan affair got up to sell shares, but a thoroughly sound, steady and profitable business, planned and carried out with the utmost care in the region which has proved to be the most suitable one in the world—that is, the Malay Peninsula.”

---

**Johore in 1910.**—By D. G. CAMPBELL, General Adviser to the Johore Government. (*Kelly and Walsh, Singapore.*)

This report contains ample evidence of remarkable progress and the country appears to have a prosperous future before it. The revenue for 1910 was \$3,323,185, and the expenditure \$2,718,105, and the utilisation of a considerable amount of such surplus revenue will, it is expected, render vast areas of fertile land accessible and convenient to Singapore, and favourable terms of alienation should ensure that much Singapore capital which hitherto has been sent further afield will come to Johore. Lands are granted mostly subject to a rent of  $2\frac{1}{2}$  per cent. on the value of the produce removed and in many cases to a quit-rent as well, and during the year a great number of applications were received; 223 were granted, embracing over 360,000 acres.

---

**Trees and Timbers of the Malay Peninsula.**—By A. M. BURN-MURDOCK, Conservator of Forests. (*Price \$1.*)

The primary object of these notes is to enable forest officers and others to identify the more useful trees in forests, of which there are at least 100 kinds in Malaya. It is difficult to take photographs of such trees owing to the density of the forests and the height of the leaves, and the notes are particularly valuable for the photographs taken by Mr. Burn-Murdock under these difficulties.

## BUSINESS NOTES.

### Rubber.

The rubber boom of 1910 was caused mainly by the operation of the ordinary law of supply and demand, but two special circumstances helped largely to make it a sensational incident. One was that the companies which had taken up this industry had a much sounder footing than is usual. They commenced business with a moderate capital, frequently privately subscribed and free from promotion expenses, and they were carefully managed by the men who conducted the planting. When the demand went up and prices increased, the market found these concerns soundly established and paying handsome profits. Another was the severe drop in prices which was caused by the financial depression in the United States in 1908. This necessitated great care and caution on the part of planters and investors, and a healthy position was made all the stronger by the trials to which it was subjected. The crisis was as short-lived however as it was sudden, and as it passed away the boom set in. It could not be expected that prices would remain at the high level which they touched, but for the future the solid foundation on which most of the undertakings rest assures a substantial amount of success. The Amazon and Congo have probably had their best times in the competition. This output is, if anything, being reduced, and this process of reduction is likely, at present prices, to continue. The demand is increasing steadily, and planters have good reason to look forward to a favourable market.

No country is so much concerned in the prosperity of the planting industry as ours. The British possessions already contain more than half the planted area of the world. Every colony in the tropics is eagerly considering how far it can share in the profits, and the comparative merits of every kind of rubber tree or vine are being carefully examined. In Ceylon and Malaya the question of selection was settled long ago. It was in 1876 that Kew Gardens procured seeds of *Hevea Brasiliensis*, and soon seedlings were sent to those colonies. It was not till quite recently that planting was undertaken

on a large scale, but such has been the activity of late that Ceylon has now some 200,000 acres under rubber, and Malaya 400,000. Malaya is, indeed, an ideal place for the industry, for it possesses in an almost unique measure the combination of heat and of constant rainfall throughout the year. As the supplies from these sources are developed, inferior countries will no doubt suffer. A higher standard of quality will be set up, and adulteration and bad preparation will be punished. It must be admitted that in many places under the British flag there is plenty of room for improvement. Not only is liquid added, but such insidious adulterants as yaws and cassara. There may be some wood and stones. The agent who buys from the natives has no particular interest in protesting against these practices. He is usually paid by the weight, and the devices which suit the collector suit him unless they are too flagrant. Naturally, the authorities, when this state of things becomes notorious, endeavour to stop it, and orders are issued with that object. The result is that the business falls off, and complaints arise immediately of the mischief caused by government interference. It may perhaps be argued that the quality of the rubber is the trader's concern. It is difficult for the authorities to persuade the natives to adopt honest methods when it is clear that less scrupulous treatment will pay better. There are numerous regulations, but it is extremely doubtful whether they are carried into practice to a satisfactory extent. Thus it was observed in Southern Nigeria in 1907 that the revenue derived from the 10s. licences to collect rubber was only £53 10s.; the quantity exported was 210,566 lbs., and it was ridiculous to suppose that 107 licence holders could collect such a vast quantity. Illicit tapping on a big scale must therefore have been carried on. When it is considered that a large native staff has to be paid to try to stop these practices, it will be evident that the system is at any rate not economical. The difficulty of policing enormous areas is the reason why in some countries an export duty is imposed in place of licences. This tax is more just in the sense that it can be efficiently collected, and therefore falls equally on all, and it makes it possible to protect the quality of the product. This is the system in the French colonies. However this may be, it is certain that the industry is rapidly falling off in West Africa. It seems almost hopeless to attempt to put things right by checking wasteful methods. Whenever rubber can be got, it is got and usually the collectors are ruthless. The best remedy is to replace waste and circulate better ideas by encouraging the natives to plant. The treatment of such plantations and the tapping in due course can be supervised, and the operation will be an object lesson of which the natives are quite capable of profiting.

It is to be hoped that the natural anxiety to begin tapping as soon as possible will not lead to planters giving the trees insufficient

time to come to maturity. It may be the fact that the latex has little to do with the growth of the tree except the bark. But the general experience is that the best rubber is taken from old and untapped trees. It is particularly important to avoid premature tapping where there is a lack of moisture.

The importance of the industry was well evidenced by the exhibits at the second International Rubber and Allied Trades Exhibition held in July at the Royal Agricultural Hall. The President, Sir H. A. Blake, prophesied that the time will soon arrive when rubber will be used for paving streets. This application would certainly open up a magnificent prospect for growers, and would incidentally do away with most of the racket and dust of great towns. There are a few instances of such paving, but they are very special luxuries. They suffice to show however that an inch of vulcanized rubber may last under heavy traffic some 30 years, though it gets very hard under the pressure. The cost at present would be about 4s. per square foot, and the initial outlay would therefore be very heavy, but it is more than possible that some combination of materials may result in a satisfactory roadway at a lower price. The principal consideration is the longevity of the paving, and the increase of motor traffic tends to make this greater. It is therefore quite possible that we may see development in this direction. For the present, however, planters must look to the established art and manufacturer, and it is a good indication of coming demands that the American motor car makers are now showing increased activity.

The exhibits of machinery were remarkably comprehensive. Every process was represented and many valuable inventions were on view.

The most important purpose of machinery in connection with rubber is to secure good coagulation. On this process quality mainly depends. Formerly rubber was rudely coagulated on the spot by primitive methods, that is, spontaneously or by boiling; then plants and barks were used, not very satisfactorily; and recently a large number of chemical coagulants have been tried, such as tannic acid, alum, and the patented "purub." It is remarkable, however, that notwithstanding all these new methods, the buyer, who looks at results only, prefers Para, which is prepared by a simple smoking process, to any other. Much thought has been given to the discovery of the secret of the excellent results of this coagulation. Mr. Wilhelm Pahl claimed in a statement made at the International Conference in connection with the Exhibition to give the solution. He explained that carbonic acid is the only agent. This is what gives Para its peculiar "nerve." It contains metallic salts (carbonates) which play an important part in the subsequent vulcanization; it never oxidises or putrifies; it consists of strongly polymerized rubber molecules, and its solution has a high viscosity. Hitherto the planted rubber

has not possessed these qualities, but the discovery of the carbonic acid method of coagulation opens up a new prospect.

At the Exhibition there were machines shown which are designed to smoke and coagulate the latex by a process substantially the same as that used by the natives in Brazil. The system was introduced by Mr. José Da Costa, of Belem do Pará, many of whose machines are now used in the East. A Da Costa "Rapid" coagulating plant was shown by Messrs. Bridge & Co. of Manchester. In this the latex is poured into tanks, and steam raised from wood, the distillation of which produces some acetic acid, is forced into the tanks by an injector. The latex is thus violently agitated so that every particle is reached, and in a few minutes the caoutchouc globules coagulate and rise to the surface. It is a very quick process, and it is claimed that any kind of rubber can be treated in this way.

---

### Bacterial Disease of Bananas and Plantains.

The Trinidad Board of Agriculture has issued a pamphlet by Mr. J. B. Rorer on a disease which appears to be different from those generally recognised.

The presence of the disease is as a rule first detected in the lower leaves. The leaf-blades droop a little more than usual and have a slightly yellowish tinge, symptoms very similar to those brought about by drought. Soon however the petiole of one of the leaves gives way just at the base of the leaf-blade, and all the other leaves quickly break down in a similar manner. Eventually the terminal leaf, too, bends over and the plant dies and rots down to the ground.

Transverse sections of the pseudo-stem show that practically all the vessels are discoloured, the colour ranging from pale yellow to dark brown or bluish black, and filled with bacteria. The discoloured bundles run back into the true stem and thence into the young suckers and buds. Sometimes in badly diseased plants the tissues of the leaf-stalks and stems are broken down completely so that fairly large bacterial cavities are formed.

If transverse sections of leaf or stem are let stand for a short time the cut surfaces soon become covered with bacterial drops which have been forced out from the ends of the bundles. If the sections when freshly cut are put in large covered dishes away from the air, pure cultures of the organism may be obtained directly from these drops. If the disease is not severe, or a plant does not become infected until it has just formed a bunch of fruit, it may remain perfectly healthy looking, but many of the young fruits, or "fingers" do not properly mature; they remain small and eventually become black and rotten. In such cases it is found that there are some discoloured bundles filled with bacteria in the leaves, stem, fruit-stalk, or fruits. When diseased

suckers are planted the terminal leaf frequently turns black and dries up so that the plant dies.

Mr. Rorer states that this "moko" disease has been well controlled in Trinidad on several small plantings of plantains and bananas, purely by sanitary measures. As soon as a diseased plant is found it is dug up and destroyed on the spot, and all tools and implements used in the work sterilized by fire. It is needless to emphasize the importance of examining all suckers before they are planted.

### Sponges.

The demand is continually increasing, but production is hampered by the fact that the business is almost entirely in the hands of a ring. Probably new fields will be opened up and some of the colonies have good opportunities. The Commissioner of the Turks and Caicos Islands makes the following observations on cultivation. "Sponges may be artificially multiplied and improved by grafting, from the egg, and from cuttings. The first two methods require great skill and are impracticable for those generally engaged in the industry, but the growth of sponges from cuttings is a feasible method of cultivation, provided suitable methods of handling and attachment are adopted. Experiments with small cuttings of about  $1 \times 1 \times 1\frac{1}{2}$  inches, or about 120 cuttings from a 6-inch sponge, show that, growing at the rate of 1 inch in a year, they would in 4 years give a size of 75 times that of the original sponge. It has, however, been fairly established that, for commercial purposes, equilateral cuttings of from 8 to 10 cubic inches, or about  $1\frac{1}{2} \times 2\frac{1}{2} \times 3$  inches, are the most suitable. These cuttings are raised on the sea bottom or on discs mounted so as to allow the salt water currents to have full play below the sponges. Discs, about 10 inches in diameter and  $1\frac{1}{4}$  inch thick, perforated by two holes and made of a composition of 1 part cement to 3 or 4 parts of sand, with spindles, are the best form of attachment, and the cuttings are bound to the discs by short pieces of aluminium wire passed through the holes."

An experiment is being tried by the Marine Products Board of the Bahamas with the view of increasing the growth of sponges, and if successful it will no doubt be followed elsewhere.

The Board during the past year has buoyed a small space of water off the Port of Governor's Harbour for the purpose of carrying out an experiment with the view of increasing the numbers of the valuable sponge (known to the trade as current wool) which grows on the southern coast of Eleuthera.

The Board from time to time has heard of curious substances on which these sponges have adhered to and grown. Owing to the

depth of the mud in that locality, the sponge seeds that are thrown off from the mother sponge can find nothing to adhere to but the conchs which live in those waters; these, however, are insufficient in number to save the millions of seeds that are produced, and in consequence the waste of sponge life must be very great.

The Board has strewn the enclosure with wattles and other material to which it is hoped the seed may cling and live.

Should this experiment prove successful, it is the intention of the Board to carry on this work on a large scale, not only on the Eleuthera coast, but on other well-known sponging grounds where such conditions obtain.

The Board is of opinion that this method will prove more practical and economical than that of propagating sponges by cuttings.

---

### Nigerian Tin.

In Northern Nigeria the promising position of the Naraguta mine shows that the difficulties of development can be dealt with successfully. No doubt tin in these territories lies frequently in very shallow deposits which would soon be worked out, but the concessions granted are mostly of large areas, and if only a small proportion proves payable the concerns will do well. The Chairman of the Naraguta Company has stated that if only 5 per cent. of their property prove payable they can be satisfied as to the future. Under present conditions it would take about 60 years to work out a square mile to a depth of six to seven feet, and, though no doubt better machinery will lead to quicker working, it is clear that there may be a long life before the industry if the workings yield encouraging results.

Messrs. Waterlow and Sons Ltd. are publishing a plan prepared by Mr. E. A. Langslow-Cook, Government Inspector of Mines, showing 9,000 square miles round Naraguta and including all mining leases, exclusive prospecting licences, and applications under consideration. It is intended as a guide to prospectors and investors, and can be obtained from the Crown Agents for the Colonies, price £2 2s. 0d.

---

### Malaya Tin.

The production of tin in the Federated Malay States fell by about 10 per cent. below that of the previous year, which itself showed a drop from 1908. There has been a great reduction in the number of miners, who in 1910 numbered 170,361 as against 231,000 in 1907, and the output suffered accordingly, and in fact to more than a proportionate extent. No doubt the attractions of rubber

suckers are planted the terminal leaf frequently turns black and dries up so that the plant dies.

Mr. Rorer states that this "moko" disease has been well controlled in Trinidad on several small plantings of plantains and bananas, purely by sanitary measures. As soon as a diseased plant is found it is dug up and destroyed on the spot, and all tools and implements used in the work sterilized by fire. It is needless to emphasize the importance of examining all suckers before they are planted.

### Sponges.

The demand is continually increasing, but production is hampered by the fact that the business is almost entirely in the hands of a ring. Probably new fields will be opened up and some of the colonies have good opportunities. The Commissioner of the Turks and Caicos Islands makes the following observations on cultivation. "Sponges may be artificially multiplied and improved by grafting, from the egg, and from cuttings. The first two methods require great skill and are impracticable for those generally engaged in the industry, but the growth of sponges from cuttings is a feasible method of cultivation, provided suitable methods of handling and attachment are adopted. Experiments with small cuttings of about  $1 \times 1 \times 1\frac{1}{2}$  inches, or about 120 cuttings from a 6-inch sponge, show that, growing at the rate of 1 inch in a year, they would in 4 years give a size of 75 times that of the original sponge. It has, however, been fairly established that, for commercial purposes, equilateral cuttings of from 8 to 10 cubic inches, or about  $1\frac{1}{2} \times 2\frac{1}{2} \times 3$  inches, are the most suitable. Messrs. Waterlow and Sons Ltd. are publishing a plan prepared by Mr. E. A. Langslow-Cook, Government Inspector of Mines, showing 9,000 square miles round Naraguta and including all mining leases, exclusive prospecting licences, and applications under consideration. It is intended as a guide to prospectors and investors, and can be obtained from the Crown Agents for the Colonies, price £2 2s. 0d.

---

### Malaya Tin.

The production of tin in the Federated Malay States fell by about 10 per cent. below that of the previous year, which itself showed a drop from 1908. There has been a great reduction in the number of miners, who in 1910 numbered 170,361 as against 231,000 in 1907, and the output suffered accordingly, and in fact to more than a proportionate extent. No doubt the attractions of rubber

seriously interfered with the employment of capital in mining, and of late the decline in value of rubber enterprises has had the effect of locking up the capital put into them, as owners are unwilling to sell at a great sacrifice. On the other hand the increased price of tin should have a marked effect in stimulating production, but there is no indication of this, and probably the Chinese find that the difficulties of mining the metal are increasing. If the price advances the eventual result may be the formation of large concerns to take the place of the present small producers and the use of better appliances.

---

### **Cement.**

It is well to bear in mind that recent improvements render cement more liable than it used to be to deterioration by exposure to air. Aeration used to be desirable with coarsely ground cement, but the material is now finely ground and the finer it is the more readily it absorbs moisture, and this water combines with the silicates and aluminates, ultimately causing the formation of calcium carbonate or chalk. This renders inert a part of the cement, and if it is allowed to go on long enough the whole would be rendered useless. It is only a question of time, and the moral is that cement should as far as possible be bought as required and not kept stored.

---

### **Wireless Telegraphy.**

A tender for a 5 kilowatt installation has been accepted by the Falkland Government from the Marconi Wireless Telegraphy Company, the price, including the services of an engineer, being £2,800. This is the outcome of a deputation of sailing ship owners, which waited upon Mr. W. L. Allardyce in London last October and urged the establishment of wireless communication between the Falklands and the mainland of South America. The station will no doubt be of the greatest value to ships which in the course of the Cape Horn voyage are obliged to put into the Falklands.

---

### **Vacuum Cesspool Exhauster and Combined Water Cart.**

A novel apparatus, adapted for either cesspool emptying or road watering, has just been placed on the market by Messrs. Merryweather and Sons. It consists of a cylindrical tank of 300 gallons capacity, mounted on a four-wheeled van, on which an air pump is

also fitted. For cesspool work a vacuum is created in the tank by means of the air pump, and on suction piping being dropped down the cesspool, the contents thereof are drawn up into the tank without contaminating the atmosphere in any way. The water spreader is fitted at the rear of the tank, and the water can be turned on and off from the driver's seat in the usual manner.

The vacuum system of cesspool emptying was introduced into this country about fifteen years ago by Messrs. Merryweather, and the apparatus has since met with considerable success and has been extensively adopted in districts where cesspools are in vogue. The addition of a water spreader to a plant of this kind constitutes a new departure, and should be a further inducement to public authorities to adopt it.

## RAILWAY AND HARBOUR NOTES.

### Lagos: Northern Extension.

It is understood that all bridges will be completed by the middle of October, with the exception of those at Taraji, Pimmi and Ebba (miles,  $68\frac{1}{2}$ , 81, and  $74\frac{1}{2}$  respectively), and that the track will be sufficiently ballasted and in good enough order to permit of passenger and public goods traffic being carried. The bridges above referred to are not of great magnitude.

At the Niger Bridge both slipways are completed, and the "Fabius" has been working whenever there has been material to cross.

The two rail-heads, from Zungeru and Jebba, were connected on 17th June.

---

Mr. Glasier's administration report for 1910 has some ominous references to the future of the line. So far all is well. In 1910 there was a surplus of £95,737, the revenue showing an advance of 24.6 per cent. on that of 1909. But in the current and subsequent years the addition of the Jebba-Minna Section of the "Political" line, as it is now called, will, it is feared, put a different complexion on the matter. The cost of this section and of the bridge over the Niger will come to nearly a million, and the traffic prospects over it are not encouraging. Through rail communication with Kano may save the situation, but it takes a long time to alter customs and trade routes which have been established for generations. It will be no easy matter to settle the rates, especially as some sort of correspondence should be observed with those *via* Forcados and the Niger, but it is important that they should be agreed upon and published as soon as possible.

### Lagos Harbour Works.

During the first half of this year satisfactory progress was made with the construction of the East Mole, though naturally the lineal progress diminished as deeper water was entered upon. At the end of June 6,362 feet had been completed. Good progress was made with the iron wharf required in connection with the

construction of the Mole Works on the West side of the entrance to the harbour; and it is expected that stone-tipping on the West Mole can be begun shortly after the end of this year. The two dredgers "Egerton" and "Sand Grouse" dredged in the six months 990,000 tons, and 25,000 were deposited on the reclamation. The improvement works on the Customs Wharf were almost completed.

### Gold Coast.

The gross revenue in 1910 of the Coomassie line was £253,328, as against £185,409 in 1909; this striking result was due to unexampled activity in the mining industry and to abundant crops of cocoa, rubber and cola. The enormous agricultural and forest wealth of the Western Province and Ashanti has scarcely yet been touched, and awaits the extension of railways and construction of feeder lines. The recurrent expenditure was £84,709.

Mr. W. E. Smith, the General Manager, remarks as follows respecting the branch to Prestea and Broomassie:—

"The engineering difficulties have been numerous, and the rainfall is probably the heaviest experienced in any part of the Colony. The cost of maintenance for a few years will probably be heavy. The total length of the branch is 20 miles and the approved estimate was £160,000. When the accounts are finally closed it seems unlikely that the actual expenditure will be more than a hundred pounds or so in excess of the estimate. Considering the number of unforeseen difficulties and enforced delays the resident engineer has had to contend with, and bearing in mind that from the period rail-head reached the Ancobra he has been handling regularly large consignments of machinery, coal, timber, and general traffic for the Mines, to the serious interference at times with construction progress, I venture to express the opinion that this undertaking reflects the greatest possible credit upon Mr. Tower's organization, skill and resource, combined with an almost religious regard for the economics of administration and expenditure generally. The principal accounts connected with this construction have been controlled by open lines. This process has proved satisfactory in every respect, and I have no hesitation in saying that the departmental principle of carrying out construction work, as herein evidenced, leaves little if anything to be desired."

### Secoondce Harbour Works.

By August 22,875 cubic yards were deposited in the reclamation. Preparations for blocksetting on the breakwater were complete, and 335 blocks had been made.

A time table has been issued, showing departure from Secoondce at 7.0 a.m. and arrival at Coomassie at 5.30 p.m.

**Accra Harbour Works.**

By August the decking of the jetty was nearly complete and commencement was made with the laying of rails. The work was begun of removing sand above low water between the jetty and the breakwater.

---

**East Africa : Jinja-Kakindu Railway.**

The Jinja-Kakindu Railway has progressed very satisfactorily, and will be finished by the end of the year. There are very good prospects of extensive cotton growing in the Choja region. On Lake Victoria Nyanza the downwards tonnage carried has increased from 7,457 in 1907, to 15,268 in 1910, and to 19,347 for the financial year 1910-11. The bulk of the increase is from Uganda, and not from German ports. The financial results provide 11 per cent. on the capital outlay. It is anticipated that, if a market can be secured, which depends largely on increased steamer accommodation on the lakes, Uganda and the Nyanza Province will export yearly 60,000 to 80,000 bales of ginned cotton and 4,000 to 5,000 tons of cotton seed, making an increase of traffic on the Uganda Railway of about £25,000.

---

**Central Africa.**

The development of Central Africa is of considerable interest to us and to France, Belgium and Portugal, and many eyes are turned to the district which suddenly became the pivot of railway and commercial enterprise in the heart of the dark continent. According to recent estimates, the Katanga copper belts are the richest in the world, and whether this is true or not it is certain that they are exceptionally fine, and Katanga is the objective of four lines. In a district where the political conditions are so diverse, the railways are not constructed simply on the principle of taking the shortest line to their destination, but are affected by territorial considerations. Two of the lines start from the Belgian port Matadi, but even the shorter is much longer and more inconvenient than that from Benquella, which is Portuguese. The results of the latter line are of good omen for similar enterprises. It carried 1,000 tons in 1905 ; 21,000 in 1909 ; and 32,000 in the first nine months of 1910.

---

**Ceylon : Mannar Extension.**

In July there remained 30 bays of the North Pier and 25 of the South Pier to finish, and this would take about 60 weeks ; allowing further time for the steelwork of the head and for small fittings it seemed likely that the date of completion would be about April,

1913. The rest of the railway will, it is anticipated, be finished about the end of 1912.

Rail-head in July was moving towards Chettykulam, and it is expected that the bridge at Kal Aar will be completed before the end of the year.

---

### **Singapore Railway.**

The gross earnings in 1910 were \$297,327, an increase of \$63,534; the working expenses were \$175,386, an increase of \$9,738. The through traffic with Johore and F.M.S. was suspended for about a month owing to landslips in Johore. The results are very satisfactory, and further increase of through traffic is anticipated.

---

### **Johore State Railway.**

The mileage open for traffic at the end of 1910 was 120 miles 61 chains, and the average expenditure per mile was \$96,578.25. The gross revenue was \$196,454.82, and the working expenses \$218,859.23.

---

### **Tanjong Pagar Dock Works.**

The Lagoon Wet Dock and Main Wharf Reconstruction Works were taken over by Messrs. Topham, Jones and Railton, Ltd., in July.

The reconstruction works have made good progress, and in June 872 men were at work.

---

### **Tadang Java-Kuala Selangor Railway.**

The work was commenced in April, and, by the end of June, out of a total of 381,128 cubic yards of earthworks in the whole line, 19,536 had been executed. The number of bridges and culverts provided for in the estimates is 66.

---

### **Gemas-Kuala Semantan.**

By the end of June the rails were linked in for a length of 75 miles.

---

### **Semantan-Kuala Tembiling.**

At the same time the rails on this line were linked in for 16½ miles, and the clearing completed for 41.

## MEDICAL NOTES.

**Annals of Tropical Medicine and Parasitology, Vol. V., No. 2.**  
(*Liverpool University Press.*)

THIS number contains articles on the Papataci flies of Malta, human trypanosomiasis in the Gambia, suppression of urine in black-water fever, and beri-beri. Sleeping sickness has been known in the Gambia for some years, but cases have not been very common. The natives say that it has been in the country for two or three generations, and Professors Todd and Wolbach compute that at least 0·8 of the whole population are now infected. It seems likely that the cultivation of rice in the swamps near the river encourages the spread of the disease, as the glossina palpalis haunts such places. The Foulahs, who are pastoral, are less liable to the disease than the riparian workers. It is suggested that the growing of rice in such places should be forbidden. The article on beri-beri gives Schumann's observations, the conclusion being that in the majority of cases the disease is due to a long deficiency of organic phosphorus in the diet, causing deep-seated lesions which take a long time to cure. The valuable work done by Fraser and Stanton is recognised. The writers confirm from their own researches the unfavourable influence of polished and steamed rice, and speak of the protective influence of whole rice. The discussion of the disease bears upon the "standard bread" question which has so profoundly agitated English households. In the fine English white bread the phosphorus is removed with the bran. Pigeons fed upon it became ill and died in 15 to 20 days, showing marked degenerative changes in their peripheral nerves. On whole-meal bread they flourished. Thus probably a whole cycle of diseases, such as rickets, have a similar etiology to that of beri-beri. "It may be objected that our white bread is baked with yeast and so the missing organic phosphates are compensated for, but the amount of yeast used is very small and probably insufficient (Holst's pigeons died on yeast bread towards the end of three months; more slowly, it is true, than on bread baked with baking powder (average 40 days) but none the less surely). And it

must further be remembered, that much of the bread now sold is made with baking powder and not with yeast, and so a further factor making for deficiency is introduced. Failures of absorption, bacterial infections, and other internal disorders no doubt play their part as in tropical beri-beri, but it may well be that success of the present agitation for a whole-meal bread will have a wide reaching effect on the betterment of the physique of our nation, in lowering our death-rate and in lightening the overcrowding of our hospitals."

---

**The Etiology of Beri-Beri**, by H. FRASER, M.D., and A. T. STANTON, M.D. (Studies from the Institute for Medical Research. F.M.S., No. 12.)

The Malay Peninsula has long been known as an "endemic focus" of beri-beri, and the Government have greatly interested themselves in the investigation of the disease. Five years ago the task of defining the etiological factors was assigned to the authors, and this book sums up their work. Their conclusion, arrived at after numerous experiments on fowls, is that beri-beri has an intimate connection with the consumption of a diet of which white polished rice forms the staple. Unpolished or parboiled rice does not cause the disease. The reason is that white polished rice is wanting in some substance of high physiological importance, and this substance is supplied by the meal or polishings which are removed from such white rice in the course of milling.

---

**Sleeping Sickness Bureau**: Bulletin No. 28, Vol. III. (*Royal Society.*)

The medical authorities are not yet in complete accord as to the use of arsenophenylglycin. Dr. Hodges, P.M.O., observes:—

"The two reports, made at an interval of only four months, are instructive when compared, and show once again the difficulty in appraising the positive value of any drug in sleeping sickness until a considerable interval has elapsed since treatment.

"The most that can be said at present is that arsenophenylglycin appears to show no superiority over several other drugs unless in the treatment of early cases; that experience in the treatment of early cases in Uganda has not yet been sufficient to allow of a decided opinion being formed as to its value; that the drug seems to be considerably less toxic than other arsenical preparations which have been tried, and that further experience in the treatment of early cases is to be desired, especially by single full doses."

Dr. Van Someren, who treated 42 persons in February near Lake Edward, takes a rather more favourable view.

"I have no doubt that in arsenophenylglycin we have the most useful and potent drug yet put forward for the treatment of

## MEDICAL NOTES.

**Annals of Tropical Medicine and Parasitology**, Vol. V., No. 2.  
(*Liverpool University Press.*)

THIS number contains articles on the Papataci flies of Malta, human trypanosomiasis in the Gambia, suppression of urine in black-water fever, and beri-beri. Sleeping sickness has been known in the Gambia for some years, but cases have not been very common. The natives say that it has been in the country for two or three generations, and Professors Todd and Wolbach compute that at least 0·8 of the whole population are now infected. It seems likely that the cultivation of rice in the swamps near the river encourages the spread of the disease, as the *glossina palpalis* haunts such places. The Foulahs, who are pastoral, are less liable to the disease than the riparian workers. It is suggested that the growing of rice in such places should be forbidden. The article on beri-beri gives Schumann's observations, the conclusion being that in the majority of cases the disease is due to a long deficiency of organic phosphorus in the diet, causing deep-seated lesions which take a long time to cure. The valuable work done by Fraser and Stanton is recognised. The writers confirm from their own researches the unfavourable influence of polished and steamed rice, and speak of the protective influence of whole rice. **The Etiology of Beri-Beri**, by H. FRASER, M.D., and A. T. STANTON, M.D. (Studies from the Institute for Medical Research. F.M.S., No. 12.)

The Malay Peninsula has long been known as an "endemic focus" of beri-beri, and the Government have greatly interested themselves in the investigation of the disease. Five years ago the task of defining the etiological factors was assigned to the authors, and this book sums up their work. Their conclusion, arrived at after numerous experiments on fowls, is that beri-beri has an intimate connection with the consumption of a diet of which white polished rice forms the staple. Unpolished or parboiled rice does not cause the disease. The reason is that white polished rice is wanting in some substance of high physiological importance, and this substance is supplied by the meal or polishings which are removed from such white rice in the course of milling.

---

**Sleeping Sickness Bureau**: Bulletin No. 28, Vol. III. (*Royal Society.*)

The medical authorities are not yet in complete accord as to the use of arsenophenylglycin. Dr. Hodges, P.M.O., observes:—

"The two reports, made at an interval of only four months, are instructive when compared, and show once again the difficulty in appraising the positive value of any drug in sleeping sickness until a considerable interval has elapsed since treatment.

"The most that can be said at present is that arsenophenylglycin appears to show no superiority over several other drugs unless in the treatment of early cases; that experience in the treatment of early cases in Uganda has not yet been sufficient to allow of a decided opinion being formed as to its value; that the drug seems to be considerably less toxic than other arsenical preparations which have been tried, and that further experience in the treatment of early cases is to be desired, especially by single full doses."

Dr. Van Someren, who treated 42 persons in February near Lake Edward, takes a rather more favourable view.

"I have no doubt that in arsenophenylglycin we have the most useful and potent drug yet put forward for the treatment of

trypanosomiasis, and though it cannot effect miracles any more than any other drug, still in 'A' cases I feel sure that it is of the greatest utility, and it is to be regretted that it was not obtainable when camps were first started. It has many advantages over hitherto used drugs, the chief to my mind, when dealing with natives, being that only one injection is given. Repeated injections cannot be recommended in face of experience elsewhere. It ought to be given in every case of human trypanosomiasis in an initial heavy injection as giving the patient the best chance of recovery."

The *Bulletin* sums up the case as follows:—

"When one compares the Report on arsenophenylglycoïn from Uganda with that from the neighbouring territory of German East Africa (see *Bulletin* No. 25, p. 119) one is struck by the frequency of fatal results attributed to the drug in one country and the relative absence of even unpleasant symptoms in the other, though the doses do not seem dissimilar. A possible explanation is that the cases in German territory were more advanced than was supposed or previous treatment had been overlooked. The therapeutic results, however, in Uganda cannot be considered satisfactory. The dose given was perhaps scarcely large enough: a glance at v. RAVEN'S most recent table shows that in his cases 2 to 3·6 gm. was usually given (in two doses). But the poor results are best explained by the small number of early cases available. Arsenophenylglycoïn seems no better than any other trypanocide, according to some it is inferior to atoxyl, in cases which are advanced or have relapsed under treatment. The lesson seems to be that the drug must be used early and in combination with one or more others. In view of all the reports one cannot but think that Van Someren's suggested dose, 5·0 gm., is a dangerous one."

While the treatment of the disease remains an unsolved problem, it is encouraging to find indications that it is not increasing but rather decreasing. Dr. A. D. Milne considers that it is not now raging in the East Africa Protectorate as formerly. He thinks that the acme of the disease was reached about the years 1904-6, and since then the number of cases has steadily declined. The first account we have of the disease in that region is Dr. C. Christy's Preliminary Report dated October, 1902, and published in the *Sleeping Sickness Reports of the Royal Society* (No. 2, pp. 3-8). He wrote:—

"It seems pretty certain that the disease is spreading Eastwards. Until I visited Southern Kavirondo it was not known to have spread beyond Usoga, but I found it in its worst form all along the lake shore as far as Kisumu, though less prevalent as I neared that place. Beyond Kisumu, and along the south of Kavirondo Bay, I met with no cases, though a very thickly populated district, till I had passed Homa Bay, and reached Kasagunga and Lusinga Island.

Here I again met with the disease, some 10 per cent. or more of the population being infected. The configuration of the map of this district would suggest that the disease, after reaching Uyoma promontory in South Kavirondo, has jumped the mouth of Kavirondo Bay and gone on spreading Southwards along the East shores of the lake. . . . .

"In Kavirondo, from what I could gather, the disease was not known earlier than 11 months back, and, in Lusinga Island and Kissingere district, 5 months only seemed to be the duration of the epidemic."

The *Bulletin* observes that examination of the map illustrating Dr. Christy's paper shows very much the same distribution of sleeping sickness in 1902 as in 1910. If the disease attacked every one and was invariably fatal, the inhabitants of these areas should have been nearly, if not quite, wiped out, but not only is this not the case, but it is alleged that the population is increasing. The evidence perhaps is not very conclusive, but if no vigorous measures of prevention are undertaken it should be possible in a year or two to say definitely. It seems probable that in Kavirondo as on the Gold Coast a state of equilibrium is establishing itself, and sleeping sickness will become less and less obtrusive. The suspicion arises that nature may be doing better for the Kavirondo than the Administration of Uganda for the inhabitants of that country; for, owing to the continued infectivity of the fly in the abandoned zone, demonstrated by the experiments of the Sleeping Sickness Commission, no one would venture to allow the evicted natives of Uganda to return to the lake shore. In any case East Africa serves as an admirable "control" to the experiments in neighbouring countries, and it will conduce most to knowledge if the Administration continues to let things be.

---

### Health in the Gambia.

A general improvement in this Colony calls attention to the precautions taken. It is said that the practice of sleeping in mosquito-proof rooms or under mosquito curtains is not only invariable among the Europeans, but is being adopted by some of the more educated natives. "All Government officials are provided with mosquito-proof cubicles and also with separate mosquito-proof shelters, in which they can sit and work or read during the day. This latter provision is probably the cause of the smaller number of days spent by European officials on the sick list on account of malaria during the past year and of the general improvement in their health.

"A considerable advance in the number of tanks for the storage of drinking water, obtained from the roofs of houses, was made in the

past year. In addition to extra tanks supplied to Government quarters and the provision of the large Acera pattern tank, holding 10,000 gallons, for some quarters, a portion of the aforementioned grant of £1,000 was expended in the importation of thirty-five 400 gallons tanks, which have been issued to certain persons in the town who are refunding the cost by instalments.

"The public wells are gradually being fitted with Jonets Water Elevators, which have proved a great success, as they are very efficient in preventing pollution of the water, and, further, they render the wells fly-proof. Six new wells have been sunk in Bathurst during the year."

---

### Cholera.

A memorandum suitable for the guidance of Europeans in out-stations has been prepared by Dr. J. D. Gimlette, Kelantan. The treatment of the disease and the precautions to be taken to prevent it spreading are clearly explained.

---

### Prevention of Malaria in Rice Growing Districts.

The Journal of the Royal Society of Arts states that as a remedy for Malaria in the rice-growing districts bordering on the Po, the rearing of fish is said to have given good results. This region, which covers an area of about 200,000 hectares (nearly half a million acres), is more or less unhealthy. The young carp are turned out into the flooded fields towards the end of June, and greedily devour the larvæ of the insect life which appear to be a cause of the disease. The cost of the young fish does not exceed four to five francs per hectare (1s. 4d. to 1s. 9d. per acre). It is stated also that the crops are improved by the rearing of the carp to the extent of four to five quintals of rice per hectare (two to two and a-half cwts. per acre).

A special preparation of petroleum is being put on the market under the name of "mosquito oil," for spreading over pools where mosquitos and other insects germinate. It is said to have a much lower specific gravity than water, and will remain on the surface for a considerable period, thus effectually preventing germination.

---

The Judges appointed to examine and report on the exhibits at the Festival of Empire have awarded a Grand Prix to Messrs. Newton, Chambers & Co., Ltd., for their Izol disinfectant preparations. The exhibit showed the many purposes—medical, veterinary, horticultural and domestic, for which Izol is prepared, and in this department apparently British manufacturers are quite up to date.

## COLONIAL STAMPS.

SINCE our last issue H.M. the King has signified his approval of the use for the stamps to be issued by the Crown Colonies and Protectorates of the portrait adopted by the Indian Government, but without the mantle, and with the crown raised above the head as in the stamps bearing the portrait of the late King.

The border of the stamps printed from the general keyplate will probably be entirely altered.

The engraving of the necessary key dies has been put in hand by Messrs. De la Rue & Co., but there is little hope that any of the new stamps will appear before March or April next, as the Government of India has recently extended its contract with Messrs. De la Rue & Co. for a further three years and is making heavy demands upon the resources of the firm in connection with new dies and plates for the Indian stamps.

The experiment which the Imperial Government is about to make in the issue of stamps of high value printed by the copper plate process will be watched with interest. It has been believed hitherto that such stamps offer temptation to the forger, but many experts say that while a poorly designed copper plate stamp is to the highest degree insecure a well and clearly designed one will present so striking a portrait that the public would readily recognise a lithographic reproduction. Another objection which has hitherto been raised against such stamps is that they are so permanent that a very large amount of cleaning can be done without seriously impairing their appearance. This view is, however, said to date from a time prior to the introduction of the present cancelling ink which is of so penetrating a character that it almost, and in some cases quite, permeates the stamp. The stamps which are to be printed by the copper plate process will not, we presume, be available for purposes requiring only pen cancellation.

---

The active Philatelic Society of British Guiana opens an Exhibition on the 7th October.

**SOUTHERN NIGERIA STAMPS.**—The Crown Agents for the Colonies have received information from the Government of the Southern Nigeria Protectorate of the loss of 60 sheets of 6d. Postage and Revenue Stamps of the current issue.

The sheets are numbered in the margin from 3379 to 3438.

If any sheet so numbered, or any whole sheets, should be offered for sale, the Crown Agents would be much obliged if notice were given to them at once, and if the name and address of the seller could be obtained.

**BRITISH HONDURAS** 25 cents stamps have been supplied for the first time in the colour appropriated to 1s. stamps on the Colonial colour scheme.

**ST. HELENA.**—1d. stamps of the large design have been supplied for the first time in the Postal Union colour and also on multiple watermarked paper, and 4d. and 6d. stamps of the small size for the first time in singly fugitive ink and on unsurfaced paper.

**ST. VINCENT.**—2d. stamps have now been supplied in all grey.

**SOMALILAND.**—The 12 annas stamps have been supplied for the first time on surfaced paper.

(Tune—" *Only a Pansy Blossom.*")

Stale as the pansy blossom,  
 Only a third class Clerk,  
 After a term of service  
 As musty as Noah's ark.  
 Lord, make me tranquil minded,  
 Happy whate'er befall,  
 Cheerful, and well contented  
 To be no class at all ;  
 And magnify the SERVICE  
 With clerks like me, O Lord,  
 Who keep, like the pansy blossom,  
 And look for no reward.

Splendid to be, at fifty,  
 Scheduled a third class Clerk,  
 Glory and laud and honour  
 Lie all within the mark ;  
 For blest is the broken spirit,  
 Blessed the contrite heart,  
 Adversity hath its uses,  
 Misfortune its better part,  
 Ambition is sweet when withered,  
 Romantic when, if you please,  
 Preserved, like the pansy blossom,  
 To call up memories.

Mirage-like loometh pension,  
 That quitance for days unblest,  
 (As the wicked cease from troubling  
 And the weary are at rest)  
 And, that the end may brighten  
 A past all dreary and dark,  
 Whereas I am aged sixty,  
 A white-haired, worn, third class Clerk,  
 Stale as the pansy blossom  
 (But scarcely as meet for show)  
 Let my corpse be laid, in honour,  
 Next a defunct *Hi Her Ho.*

J. W. DAVIDSON,  
*Fiji.*

## RECENT TRANSFERS AND PROMOTIONS MADE BY THE SECRETARY OF STATE.

- Sir P. C. SMYLY (Chief Justice, Sierra Leone), Chief Justice, Gold Coast.
- Mr. G. K. T. PURCELL (Senior Puisne Judge, Gold Coast), Chief Justice, Sierra Leone.
- Mr. D. T. TUDOR (Attorney-General, Grenada and St. Vincent), Chief Justice, Bahamas.
- Mr. H. R. WALLIS, C.M.G. (Government Secretary, Nyasaland), Chief Secretary to Government, Uganda.
- Mr. H. A. SMALLWOOD, (Treasurer, St. Lucia), Treasurer, East Africa Protectorate.
- Dr. R. DENMAN (Health Officer, Federated Malay States), Director of Medical and Health Department, Mauritius.
- Mr. L. L. KERR (Deputy Inspector-General of Police, British Guiana), Inspector-General of Police, Mauritius.
- Mr. W. T. PORTER (Magistrate, East Africa Protectorate), District Judge, Cyprus.
- Mr. H. J. F. HOLME (2nd Clerk, Colonial Secretary's Office, Antigua), Chief Clerk in Secretariat, Southern Nigeria.
- Mr. J. L. WHITTY (Assistant Treasurer, Somaliland), 2nd Assistant Accountant in Treasury, Ceylon.
- Dr. R. P. COCKIN (District Medical Officer, Cyprus), Resident Surgeon, Colonial Hospital and Bacteriologist, Grenada.
- Captain E. B. LESSE (Company Commander, Gold Coast Regiment, West African Frontier Force), Travelling Commissioner, 3rd Grade, Gambia.
- Captain P. H. SHORT, D.S.O. (Company Commander, Northern Nigeria Regiment, West African Frontier Force), Assistant District Commissioner, Northern Territories, Gold Coast.
- Mr. E. C. LANE (Divisional Engineer, Public Works Department, Cyprus), Engineer of Roads, Gold Coast.
- Mr. P. C. LAWRENCE (late of Department of Posts and Telegraphs, Transvaal), Postmaster, Nyasaland.
- Mr. L. A. HARCOURT (Chief Clerk in Post Office, East Africa Protectorate), Postmaster, Nyasaland.

---

## EDITORIAL NOTES.

THE appointment of H.R.H. the Duke of Connaught to be Governor-General of Canada makes a new departure in our Colonial history. At no remote period it was considered that the relations of a Governor with the Secretary of State were incompatible with the position of a member of the Royal Family. Since then those relations have in the case of the Dominions undergone a substantial change, and the possibility of a controversy between the Secretary of State and a Governor-General is now, to say the least, remote. The last definite hold which this country retained over the great Colonies when they were granted self-governing powers was the reservation by the Governor of Acts dealing with certain specified subjects, but in the case of Canada any difficulties of this kind would probably be arranged in a different way. The Governor-General is not a Viceroy, and is technically the officer to execute the specific powers with which his commission clothes him; but it need hardly be said that his real value nowadays lies in fields not contemplated by the formal documents, and the appointment of the Duke of Connaught has been warmly welcomed and appreciated.

The result of the Canadian elections in September was not only remarkable for the administrative change which it involved,

but was specially distinguished from ordinary political contests by a great manifestation of national feeling. The general view in this country has been that the Canadians, as it has been put by Mr. Faithfull Begg, Treasurer of the London Chamber of Commerce, believed that they were at the parting of the ways; "at the end of one road they saw, or believed they saw, the Stars and Stripes floating, at the end of the other the Union Jack: regardless of all other considerations, regardless of a dazzling vista of material gain, highly coloured, no doubt, but none the less alluring, they deliberately decided in favour of the loftier idea of Imperial unity." It may be questioned, however, whether the ideas of commercial association with Great Britain and with the United States were so sharply contrasted in the Canadian mind as all this implies. It is easy to make the mistake of attributing to other people the point of view which we take ourselves. The strongest force which influenced the elections was the belief of the Canadians in their own country and the determination to work out their own salvation. Intimately connected with this is the railway policy, which in Canada is always influential and is bound up with the union and the national sentiment. The possibility that the produce of the West might be diverted to American lines is enough to raise a great wave of opposition.

---

The Empire Club of Canada gives opportunities not only to Canadians but to distinguished visitors from this country to discuss subjects with which they are specially acquainted, and a recent volume, edited by Mr. J. Castell Hopkins, of Toronto, contains a number of addresses on Canada's various problems and questions affecting the Empire. One of the most interesting of these topics is the Hudson's Bay Route between Great Britain and Western Canada. The great grain-growing area of Canada is from 1,000 to 2,000 miles nearer to Hudson's Bay than to Montreal, and from both these places the distance is practically the same to Liverpool. It is necessary in order to realize this to bear in mind the shape of the earth at these latitudes. The construction of a railway of some 400 miles to connect Hudson's Bay with the Prairie Provinces would therefore materially lessen the cost of transport, and would greatly strengthen the trade with Great Britain, which in this way would be provided with a very advantageous access to Western Canada. The Bay never freezes over, but the chief difficulty is that in the Straits there are icebergs at all times of the year and navigation is therefore dangerous. No doubt fast traffic would be out of the question, but for cargo there is much to be said for the route. It would

certainly help greatly to keep the West British, as labourers could be taken over at low cost for the harvesting in summer and many would no doubt remain. There is already a congestion in freight during the harvest time, and when this gets worse the demand for another route will become stronger.

---

The most interesting part of the Franco-German agreement, from our particular point of view, is the cession to France of the "Duck's Beak" between the Ceari and the Logone and the grant of enclaves on the Benue and Mayokiti. The significance of these acquirements is that they improve the means of communication with the basin of Lake Tchad. There are two routes to the French Central Africa. One is the Congo from Matadi. From this port the Belgian railway conveys to Stanley Pool, and from there it is necessary to go up the Congo and the Ubangi to Fort Sibut; after this the journey is by land to the Ceari and by that river to Fort Larry. To accomplish this journey with merchandise eight to nine months are necessary, and often a year. The cost of transport is put at 1,327 francs *par tonne*, without reckoning the duty of 10 per cent. *ad valorem*. An officer travelling with only necessary baggage can, with good luck, do it in ninety days. The other route is by the Benue through British territory, and by the Logone and the Ceari through the northern point of the German Cameroons, the "Duck's Beak." The cost of transport by this route is 826 francs *par tonne* and there is no duty to pay. Eight months are required, and more if the goods exceed 100 tons. An officer can travel in ten days less than by the first route, but the expense is 4,900 francs, 450 more. The cession of the "Duck's Beak" will enable the French to effect a much-wanted improvement in the means of communication, and it is to be hoped that they will find the facilities afforded in the British territory good enough to make this route preferable to that *via* the Congo. Up to the present, notwithstanding its length and cost, the latter has been used most.

---

After Morocco and the ancillary questions came Tripoli. The Tripolitan territory historically extends to the borders of Senegal, Nigeria, the Cameroons and the French Congo. It is the home of the caravan, and ancient routes lead from it to various parts of the interior. It has long been in this way the gate of the Sahara, but now one great field is practically cut off by the Egyptian railway and another is threatened by the Kano railway. There still remains a great hinterland which is traded with in the old way, but the business does not appear to be flourishing. The only definite limit of this territory to the south is that

indicated in the Anglo-French agreement of 1899 as the northern extremity of the French zone, an arrangement against which, it should be added, the Turkish Government protested. To many parts of the great desert country the Turkish troops have never penetrated, and the field is held by the Senoussi, whose policy is to keep out Turk and Christian alike.

---

The recommendations of Admiral Sir R. Henderson, K.C.B., as regards the naval forces of the Commonwealth have been published in Australia. The Admiral observes that, once the command of the sea is lost by the Empire, no local system of defence, naval or military, could secure Australia's autonomy, and she would be the prey of the strongest maritime power. The primary object of an Australian navy, therefore, should be the immediate support of the Empire's naval forces in their determination to retain the command of the sea. The secondary object should be the protection of ports and shipping from raids and invasions by hostile ships and cruisers. The Admiral does not discuss the probabilities of such raids, but it is fairly certain that, under the conditions of modern warfare, the objects of both belligerents would be to concentrate their forces at the points where they would be most effective for offence or defence. The great cost of operations and enormous economical losses caused by a state of war will compel quick issues, and the roving missions which have characterised old struggles will be obsolete. It is, however, necessary to contemplate the case of the Empire's sea supremacy not being sufficiently established to prevent an invasion at some point on a large scale, or the destruction of commerce, and for this purpose local forces are required, particularly in the case of Australia, whose over-sea commerce is the life-blood of her prosperity. The first step, the building of the "Fleet Unit" has been decided on, viz., one armoured cruiser, three protected cruisers, six torpedo boat destroyers, and three submarines, but the "Completed Fleet," recommended by the Admiral as the goal to be attained, would go far beyond this, consisting of fifty-two vessels. He allows a period of twenty-two years for the realization of this project, and strongly urges that a Board should be constituted, on the lines of the Admiralty, and having responsibility as a whole.

---

Some noteworthy facts may be gathered from the Financial Statement made in August by the Treasurer of Queensland. One was that the Colony was able to borrow in the London market at a lower rate than was offered to it by the Commonwealth. There has been a steady flow of immigrants, and land settlement has continued

at a high rate. The Sugar industry, which represents nearly £2,250,000 in value to the State, has been generally successful; the production during the previous year amounted to 210,756 tons, nearly equal to the 240,000 consumed annually in Australia. The productiveness of the soil in some districts is very great. Fiji, however, is threatening Queensland's banana trade in the Southern states, and is likely to compete in citron fruits, pineapples, and the like. The fruit export to the rest of the Commonwealth is now much less than it used to be a few years ago. Fiji's success in these lines need, however, hardly be grudged, as the dairying is making magnificent strides. The growth of the industry in the Eastern States of Australia is one of the economic marvels of the time. Its prosperity is due to the depth of alluvial soil, the richness of the grass, and the mildness of the climate. In this country we have a soil which is comparatively shallow, grass which, however abundant, is, for feeding purposes, poor and chill, and a climate which necessitates the housing of cattle and the liberal use of winter foods. It is not surprising that, with his advantages, the Australian grower is able to compete successfully in the markets of this country. The meat, however, is said to be decidedly inferior in quality to that from the Argentine, where practically it is all the produce of stock topped off, if not entirely grazed, on alfalfa (lucerne).

---

In South Africa the imports rose from £29,842,463 in 1909, to £40,105,532 in 1910, a very remarkable increase, of which this country appears to have had a good share. Deducting specie, the value of the goods imported was £37,914,439, of which the British share was 71 per cent., while the two principal competitors, Germany and the United States, contributed less than 17 per cent. Mr. R. Sothern Holland, His Majesty's Trade Commissioner for the Union of South Africa, points out that, even of this amount, much, in the case of Germany, has been secured, not by the ordinary exertions and plain competition of the manufacturers, but by financial arrangements, under which it has been a condition of contract that machinery and the like should be purchased in Germany. The "Victoria Falls" affair is a well-known case of this kind, and by itself contributed nearly £700,000 to the German imports. The position of British trade, therefore, is highly satisfactory, but in making comparisons it is only fair to admit that the 3 per cent. preference has a good deal to do with this result.

---

The Orange Free State census returns show that the whites have increased by 22·96 per cent. and the blacks 43·67. The disproportion is the more significant as the Free State was not originally a

black man's country. When the Voortrekkers came in, in 1836, the country was practically uninhabited. There was a clear field for both races. But the blacks show a rate of increase of two to one, and if this were to go on long Professor Brown's theory that South Africa will be black in a century would come near realization. An ominous fact is that the black race has triumphed in past epochs. The white races have invaded Africa time after time, and have penetrated far into the interior. What became of them is more or less of a mystery, but they disappeared. It is not likely that they left the continent: they were absorbed, probably in considerable numbers, by the indigenous races. All over the world climatic characteristics seem to fix the local type, as was suggested in our last number, and in the long run this type tends to prevail. It is argued in South Africa that the remedy lies in immigration, and the facts are used to support the proposal for state-aided immigration. This addition of white blood from outside would, of course, assist the white race in the struggle for the present, but, clearly, it could not affect the position permanently, unless the forces which have hitherto assimilated exotic breeds to the native type can be counteracted. Undoubtedly it is a sound instinct in such cases to endeavour to keep the white race pure. When once the barrier has been broken down the local type must win. In former ages there was no such doctrine; fusion was common, and the imported variety disappeared. In South Africa there is a strong feeling on the subject, and though the blacks will increase and multiply the established superiority of the modern white race will prevent history being repeated in this respect. On the other hand it is clear that the industries are largely falling into the hands of the natives. Apart from their numbers, education is making a remarkable change in their efficiency. The working men of white race do not in fact show up well against them. They object to performing the rough manual work which is considered to be Kaffir's work. In consequence large numbers fall into poverty and idleness. Unless this fault can be cured there is no particular advantage in encouraging the immigration of working men from Europe into South Africa.

In the Cape there has not been much discrimination between white and coloured for railway work, and most of the work which does not require special skill is done by natives. In the Transvaal and Orange Free State it is the policy to substitute white men for work previously done by natives: this has been carried so far that over 3,000 men are now employed on such work. This is of course expensive, as the difference of pay is about 2s. a day; and in other respects the results are disappointing. The chief justification of the policy is that it provides work for a large number of men for whom it would be difficult to make provision in any other way, but it

seems regrettable that the administration should be obliged to have to come to the assistance of so many white workers. Such circumstances go far to explain why an active immigration policy has not been adopted.

---

An investigation of the life history of the tsetse fly has been made by the Natal and Zululand Game Protection Association. The report does not countenance the theory that the fly can be got rid of by clearing out game in an infected area. This theory assumes that game are necessary to the fly, but there is evidence to show that it can also live on the blood of reptilia and on certain vegetable juices such as that of sugar cane. Apparently it is attracted by vegetation of a certain character. Further, the fly is very migratory, and the removal of game would not be likely to prevent domestic cattle being attacked eventually. The Association pins its faith to the ability of the expert to produce immunising sera. Its report comes at an opportune time, now that the Colonial Office commission which is to enquire into the subject of sleeping sickness is commencing its work in Nyasaland. Meanwhile the Sleeping Sickness Bureau (Bulletin, Vol. 3, No. 30) has also attacked the subject, and cites observations tending to show that the presence of game, either large or small, has no well-defined relationship to the presence of the fly.

---

In Nyasaland in 1910-11 the revenue was a record one. The production of cotton, tobacco and rubber has substantially increased, while coffee, once the staple industry, has been gradually abandoned. The prospects are very favourable, especially for cotton. Nyasaland Upland maintains its position as the highest-priced Upland in the world. The annual report states that, as regards native labour, the Government has steadily pursued the policy of discouraging the emigration of natives to other territories by every just and lawful means in its power, being confident, in view of the rapid increase of agricultural industry in the Protectorate itself, and the ample opportunities of local employment which now exist, that such emigration must eventually be detrimental not only to the interests of local planters and others, but likewise to those of the native community, in whose case the larger wages obtainable in South Africa must be discounted by the prejudicial effect produced by intercourse with more sophisticated centres upon their simplicity of character, upon their habits of life, and upon the lot of their wives and families remaining behind. While, however, the Protectorate Government discourages emigration for the above reasons as far as it legitimately can, it recognises that natives who have formed a

settled determination to quit Nyasaland must be allowed to do so, and to such natives passes are issued accordingly. The number of passes so issued during the year under review amounted to 4,386.

A proposal has been set on foot to organise in the Protectorate a subordinate native civil service, the advantages of which, more especially by way of security of tenure, periodical increments of salary, and a moderate provision for old age, will, it is hoped, if the project is fulfilled, tend to attract and retain in Government employ an adequate staff of trained and intelligent native clerks. Of the native scholars now annually turned out by the missionary schools, the greater proportion, including the most capable and enterprising, leave the Protectorate almost as soon as they quit school, in order to avail themselves of the more attractive conditions and wider field offered by the South African Colonies.

The depredations committed by buffaloes and many kinds of antelopes upon both European and native crops, and the probability that the presence of wild animals may attract tsetse fly, has led to a systematic revision of the game laws of this Protectorate, and to a considerable relaxation of the restrictions which have hitherto been enforced with regard to hunting generally.

The inadequacy of the communications has been felt more strongly owing to the increase of exports and a persistent diminution in the water of the Lower Shire River between Villa Bocage, the head of the permanent fairway of the river, and Port Herald, where the Shire Highlands railway line commences. These two circumstances occurring in coincidence with each other have resulted in a very serious congestion of traffic during the dry season, when the river steamers cannot reach Port Herald, and must militate strongly against the natural tendency of a young and promising country to enlarge its activities. A still graver obstacle is now threatened or rather has been placed already in the way of local enterprise by the spread of tsetse fly, and the consequent closing of many important roads against all forms of animal transport. The last highway to be thus barred is the road between Blantyre, the chief commercial centre of the country, and Zomba, the administrative capital. Fortunately the macadamisation of this road was begun some 2½ years ago, and now extends for 23 miles, viz., more than half its length, so that motor vehicles and other mechanical means of transport can ply along that distance. This, the only piece of metalled road in the Protectorate, other than township roads, was commenced on account of the impossibility of driving ox-waggons along ordinary unmade tracks during the rainy season from November to March. The spread of tsetse fly adds a new and still more cogent reason for increasing the mileage of metalled ways, and it is indeed only thus that the many promising agricultural settlements now

existing in different parts of the Shire Highlands can hope for a safe and regular means of access to the railway line.

---

In a very different part of the world an eloquent plea is being put forward in favour of an animal sanctuary. The Laurentians claim the title of the "Everlasting Hills." They are in fact the only part of the visible earth which was present when life was born. Most of Labrador is a rocky tableland, but it is rich in interesting fauna. The country seems ideal for a sanctuary, for the population is so sparse that there is not one person for every 20,000 acres. It contains a hundred Saquenays, wild cañons, great lakes and waterfalls. The argument for a reserve in such a place is very strong, for the animals are not dangerous as they are in the tropics. At present the waste of life from wanton destruction threatens to end in the extinction of everything that is valuable.

---

What Lancashire chiefly requires from the Colonies is a greater and steadier supply of the cotton which is suitable for fine yarns. There has been much bitter discussion of the market manipulations which have affected American prices, but Egyptian prices have fluctuated more. This is due to the limited field of supply, and recently endeavours have been made to use long staple Upland for fine yarns. This kind is not so strong as the best Egyptian cotton, but in other respects it is as good, and improvements of machinery have made it possible to produce mercerised goods from it which can hardly be distinguished from those made from Egyptian cotton. This fact opens up an excellent prospect for planters in such places as Nyasaland, where long staple Upland of excellent quality is grown. The production per acre is much greater in many cases in Egypt, but there the rent of agricultural land averages £8 per acre, and manual labour is 1s. a day—very much higher than in Nyasaland. The industry is rapidly increasing in popularity with the natives, and is removing the inducement to emigrate for work to South Africa. The development will therefore have important social as well as economical results, and has no doubt facilitated the policy of the Nyasaland Government against recruitment for South Africa.

---

In Fiji the revenue for 1910 was the highest recorded during the last five years, largely owing to the enhanced price of copra. The Colonial Sugar Refining Company has extended its operations and it will be interesting to see how their policy will be affected

by the movements in Queensland. The green fruit trade was retarded by the effects of the hurricane, but it revived considerably, and greater facilities have been provided for export. The growth of this trade should affect the question of improved communication with Canada. The immigration of East Indians continues steadily, 3,879 coming in during the year, and an impetus is now given to their introduction by the prohibition of Polynesian immigration. The Government had still for disposal all but 18,000 of the 150,000 acres handed to it by the natives for settlement by lease. During the year the alienation of native land by lease continued steadily, mostly of small areas to East Indians, and for short leases of from five to ten years. The success of this class in getting land from the natives is one proof of its adroitness.

---

The industrial progress of the South Sea Islands does not attract much attention here, as the trade is with Australia in the first place, but it is noteworthy. Not very long ago their chief and generally only value was in the deposits of phosphates, and in fact a great number of them were brought under the British flag by the grant of licences to work these. A vast amount of discussion took place from time to time as to how the Crown could secure a fair rent or royalty, and, considering that, as a rule, no one but the discoverer knew anything about the value of the deposits, and supervision was hardly practicable, the problem was a difficult one; but one good and far-sighted provision was made whenever practicable by requiring the licensee to plant coco-nut trees. To-day the coco-nut industry is the mainstay of the Pacific. Its growth is illustrated by the issue of an excellently got-up handbook, published at Tulagi, in the British Solomon Islands. These islands were for a long time exceedingly troublesome, as numerous murders of white men were committed by the natives, in particular of Bishop Pattison in 1871 and Commodore Goodenough in 1875, and perhaps some of natives by white men; but though some cases were brought to Fiji for trial before the High Commissioner's Court, no conviction was ever obtained, as it was impossible to secure the attendance of witnesses. The only remedy was for a man-of-war to "visit" the islands. In 1893, as a result of an arrangement with Germany for partitioning this part of the world, the Southern Solomons were placed under a British protectorate. In 1900 the Northern Solomons were transferred by treaty from Germany to Great Britain. The plantations of coco-nut palms owned by white men now cover 18,000 acres, not much of which has yet come into bearing. Cotton and rubber are also being grown. Labour is

cheap, being from £6 per annum to £26 for exceptional men, but the supply will soon be absorbed by the growth of plantations.

---

The quick temper and revengeful spirit which characterise many parts of the Mediterranean have inspired many themes of literature and music, but from the point of view of an administration, which has no soul for romance, they cause a good deal of trouble. In Cyprus there has been an increase of cases of murder and manslaughter, and the Chief Justice has pointed out the traits in the character of the villager which, to some extent, explain the prevalence of this class of crime. The majority of the inhabitants of Cyprus live in villages, and are as a rule poor, while their habitations are for the most part comfortless and insanitary. Their pursuits are almost entirely pastoral or agricultural. These people are very sensitive and ready to take offence. Any insult rankles, and their minds seem to brood over any slight, real or imaginary, however small, until it has assumed proportions which, for their self-esteem, they consider they must revenge by murder. There are men in some of these villages who, for a small reward, say £10, will murder a man against whom they have no grievance, or whom they have never seen before. In many cases if an inhabitant is obnoxious to the community, they will have him killed by common agreement. They are very quick tempered, and many homicides occur in brawls, in cafés, and weddings, where men are under the influence of drink. Without reflection a knife is drawn, and their natural impulse is to kill. "I have tried many murderers in this island," writes the Chief Justice, "and I cannot recall one who was sorry for his victim or showed remorse for his crime. As a rule a murderer boasts of his crime. It is a source of pride to himself, and gives him power over his neighbours."

---

The Legislature declines to pass any law effectually preventing the carrying of dagger knives, and strongly opposes the prohibition of carrying fire-arms. Under the Ottoman Penal Code the only punishment for intentional killing without premeditation is fifteen years' imprisonment, which is practically cut down to eleven years and three months by the rules for the remission of sentences, and this period does not appear to be a very strong deterrent. In recent years the village and other elections have led to many crimes of violence, and it is necessary to admit that a liberal policy, designed to encourage the villages to carry out improvements themselves, has stirred up factious feelings and animosities which lead to bloodshed. Nor does it appear that compensation

for these evils can at present be found in the efficiency of the local councils. The annual report observes that : "The Cypriot peasant—in common with the inhabitants of many other countries—wishes to enjoy all the advantages of legislation without incurring any of its duties or cost, and labours under the idea that Government is endowed with unlimited funds, and that Government officials will always step in and relieve him of whatever is burdensome. Government, on the other hand, endeavours to foster initiative and local enterprise and responsibility and to avoid the paralysing grip of the dead hand of bureaucracy. Its efforts are, however, continually thwarted by the habit of dependence on the central government, engrained doubtless, in the Cypriot by centuries of despotic rule."

---

In the annual report for Barbados it is shown, by a sort of elimination of other causes, that the increasing prosperity of the island is largely due to the visitors who stay in it. The sugar crop of 1910, though good and realizing good prices, was not superior to its predecessors to such an extent as to account for a record revenue. Nor is there any other commercial cause, while on the other hand the break in the main line connection of the R.M.S.P.L., and the loss of the transshipment service must have caused a severe financial loss. There can be little doubt that the attractions of the West Indies to tourists and visitors are becoming more and more important and appreciated: but they might be better known, and when that is done, the islands will have, to use Mr. Burdon's words, a "valuable source of wealth and revenue."

---

The census report of Grenada shows that, while there is an increase of 3,312 on the figures of 1901, the rate of progress of previous decades has been by no means maintained, and the cause of the shrinkage is the extraordinary rush of labour to Central and South America. In the last ten years about 22,000 labourers have sailed away. "This abnormal emigration from the Colony of its labouring people is regrettable, especially because the loss thus sustained is not likely ever to be recovered. As a class, the places vacated by these people cannot, or will not, be filled by the succeeding generation, who are known to have cultivated views rather different from their parents as to the manliness of all honest labour. The recognition of the moral of this factor having, however, resulted in active steps by the Government in the way of facilities for the settlement of the remaining people upon holdings of their own at home, will, it is hoped, tend to check, to

some extent at least, the tendency both in Grenada and Carriacou to seek for betterment abroad, since recouping by immigration is absolutely out of the question." It can hardly, however, be said that Grenada is badly off for population, as the density is 502 to the square mile. About 13,000 of the emigrants came back, presumably with some savings in their pockets. The coolies, as such, have disappeared: Europeans, Africans and East Indians have dwindled and at the present rate will soon leave the field entirely to the natives. The compiler pays a tribute to the virtues of the East Indians, who are thrifty and shrewd and have greatly improved their status.

---

In more primitive communities the difficulties of census taking have to be solved by drastic methods. Thus in the Gambia Protectorate the people are in such ignorance as to their ages that there was nothing for it but to divide them into two sections—of those over and those under fifteen years. Questions about infirmities are naturally resented and the answers are not to be relied on. In the Gambia the classification of education was into "good," "slight" and "nil"; and the task must have been considerably simplified by the fact that 140,000 out of 146,000 were placed in the third division.

---

The taking of the census in Brunei was naturally attended with difficulty, as not only are the natives shy, but, as the report plaintively observes, "the idea of scheduled enumeration is one that is as yet wholly outside their capacity." To add to these difficulties the headmen are unable to count. However, thanks to the energetic help given by the Sultan, the work was accomplished in a fairly satisfactory manner. The population of Brunei Town is now 9,967. In former times it was reputed to reach 120,000, and at the beginning of the eighteenth century it was estimated at 70,000. Slavery and small-pox seem to have been the chief scourges. Now, however, that the tide has begun to turn, the fact that the country has been able to support a large population encourages the hope that Brunei may again see better times.

---

In Hong Kong in 1910 a welcome increase was shown in British ocean shipping of 4·8 per cent. in tonnage, being rather more than that of foreign shipping. The total British tonnage was 4,041,557, out of a total of 8,112,985, the German and Japanese being the only large rivals. 111,058 emigrants left Hong Kong during the year, this being a large increase due to the demands of the rubber plantations in the Malay States; but 149,564 returned, a fact which goes to show that the Chinaman

does not wish to stay permanently abroad. Increasing numbers of Chinese show themselves desirous of an English education, and the new University, the gift of Sir Hormusjee Mody, will probably be open by the middle of this year. All the opium divans were closed on the 1st March, 1910, and the Home Treasury made the Colony a grant of £9,000 on account of a loss incurred in respect of opium revenue.

---

The ideas and customs of the Chinese are of continual interest to Europeans, as they represent a civilization which, whatever its defects, possesses a remarkable power of resistance and may by sheer weight of numbers eventually affect other territories. In Wei-hai-wei there is a Chinese population of about 147,000, a number sufficiently large to permit of examination of its characteristics. In this possession the population per square mile is 510, or rather above the mean density of the great plains of China. This is, for agricultural land, a very high figure, and must nearly approach the maximum which the land will support. The birth rate is abnormally large. At present infant mortality is also high, but it is clear that if by better knowledge this could be kept down there would be a great increase of population. A noticeable feature is the solidarity of the family. It is a common object for as many persons as possible to live together without dividing up the family property. The report on the recent census shows that there are many large undivided families at Wei-hai-wei, the largest being that of a widow with a family of sixty-six, though this excellent lady has not attained the object of the highest ambition, which is to house five generations under one roof. No doubt this custom has much to do with the conservative character of the Chinese and the strength of family connections, against which alien influences beat in vain. If a Chinaman seems to change his views, it is highly probable that this is only a temporary adaptation under stress of circumstances. The census officer mentions that four years ago he was informed that in a certain village there were thirteen Catholic worshippers, but on going there he found that, the native priest having left, all the other twelve had reverted to their ancient persuasion, which is a sort of ancestor worship and is really more a system of customary observances than a religion.

---

One difference between the West and the Far East is that in the former, speaking generally, the males at birth are less numerous than the females, while in the latter the females are in the minority. In Wei-hai-wei there are 893 females to 1,000 men. The difference, applied to vast territories, encourages the

emigration of men. It has been suggested that the disproportion is apparent only in far Eastern countries, and may be due to the seclusion of women, but the case of Wei-hai-wei does not support this, as there is no such seclusion there. One little habit goes the other way; it is common for a Chinese mother to give a son the name of a girl, apparently to cheat the Fates, for it is a common and true saying that a girl is easier to rear. There are some other customs which are calculated to trick the enumerator. Thus a Chinese child just born is reckoned to be one year old, and as soon as it has entered on a new year it is two; so that it may be two years old when (European reckoning) it is a few days old. However, the year of birth is faithfully recorded, because the Chinese divide the year into cycles of twelve, each represented by a different animal, and all the people born in one year say they belong to the class of the corresponding animal. Thus the Chinese year representing 1876 was a year of the rat, and all born in that year or in any year arrived at by an addition of twelve or a multiple of twelve, belong to the class rat. The other animals are the ox, tiger, hare, dragon, snake, horse, sheep, monkey, fowl, dog and pig. Everyone has to remember his class for the purposes of betrothals, fortune telling, or choosing lucky days.

---

The work of administration in countries where there is a large native population is made difficult by the fact that the European ideal of life is one thing, and that of the natives another. The latter is what nature has made it. The bounty of a tropical climate does not stimulate work, and the idea of industrial productiveness is exotic. It follows that, as Sir Sidney Olivier observed in his paper laid before the Universal Races Congress, "African peoples generally are not at all suited by temperament or talent for that kind of industrial position as wage-workers under capital into which the proletariats of industrial European countries have come, nor does it appear to me at all desirable that they should, if they can avoid it, pass into that position or acquire in all respects the characteristics of the European wage-worker; but under present circumstances it appears that their powers of production cannot be quickly increased except under organised education by employers of the advanced or industrial race."

From their unwillingness to work, from an European standard, follow such devices as the hut tax and the *corvée*. The hut tax serves two purposes—it brings in revenue and it compels the native to do some work over and above what is necessary for his rudimentary wants. It may of course be abused, as may be the practice of compelling tribes to make roads and such works. However, Sir Charles Dilke, who was a keen critic of such matters, and reviewed

the cases, did not appear to condemn the *corvée* altogether so long as it is reasonably managed. He was more severe against the possible abuses of indentured labour, which no doubt is open to the objection that it takes the native from his home and generally from his family, and that full protection is difficult.

---

The difficulty of obtaining the conviction by a white jury of a white man who has killed a native has been much discussed recently, and there is a considerable body of opinion in South Africa that the present machinery is unsatisfactory. It may be frankly recognised that the trial of such cases places a very heavy burden on the jurymen in countries where the native population is very large, and a possible source of danger, and when there is a natural desire in the white community to stand by its own members. The jury system was not invented for such cases. It does not, however, follow that, because jurymen acquit the prisoner, they desire that he should go unpunished. They cannot bring themselves to give a verdict which necessarily entails the punishment contemplated by law, but they may have no particular objection to someone else in a responsible position doing so. The Rhodesian Agricultural Union has adopted a resolution that it views with the gravest concern the result of trial by jury in certain cases where Europeans and Natives have been in conflict, and recommending legislation substituting a tribunal of a judge and two magistrates or native commissioners for a jury, in cases where the High Commissioner is of opinion that justice would be best served by that course. It has been suggested that a better course would be to define the cases for such trial by statute, or to leave it to the High Court to decide, so as to remove the question entirely from the political to the legal arena. Many years ago it was found in Fiji that it was impossible to get a white man convicted by a jury, and other provision was made for the trial of such cases.

---

The reports recently issued on the results of the mineral surveys of Southern Nigeria and Nyasaland do not disclose any striking discovery, but countries which are so well off in the products of the soil can afford to do without mining. The present prosperity of Southern Nigeria is indicated by the trade and revenue returns, and there is abundant indication that the vast possibilities of the country are only beginning to be realised. The Sierra Leone annual report points out that the quantity of oil exported is small in comparison with the quantity of kernels exported, from which it is inferred that there is much waste in the extraction of oil. The remedy for this is the installation of central palm oil factories, and this will no doubt be adopted eventually wherever there is a large

palm tree area and good transport. Methods of conservation will well repay study in this and other matters. In the old days of tribal wars the forests had intervals of rest which enabled them to get over destructive ways of farming, but now the results in many parts are disastrous; the trees are cut down to make room for crops, and when the humus has been used up it is not re-made, and eventually the land becomes pure savannah. In Sierra Leone ninety-nine per cent. of the rain forests have been destroyed by the natives in their wasteful methods. The consequence is that the rainfall is lessened, and the usual native crops are seriously interfered with.

**BLACK AND WHITE IN SOUTH AFRICA.**

**Inter-Racial Problems**, Edited by G. SPILLER. (*P. S. King & Son*, 7s. 6d.)

**Black and White in South-East Africa.** By M. S. EVANS, C.M.G. (*Longmans, Green & Co.*, 6s. nett.)

The British Electorate rules over many millions of subject races, but it is not in contact with them. It knows little of these peoples and has no pronounced racial prejudices or aversions, and has no occasion to be on its guard against a large alien element in its midst. It is therefore largely in sympathy with the doctrine of equal rights, nor is this feeling by any means confined to Great Britain. The papers laid before the Universal Races Congress show that there is a widespread body of thinkers who lay stress on the brotherhood of man and bring in much scientific research to prove that the resemblances between all races of mankind are great and the differences small, the conclusion being that all barriers should and will be broken down with a view to mankind becoming one great family. Thus we find elaborate arguments that the human race is of monogenetic origin; and that though various types have been evolved these are unstable, and there is no hereditary superiority of one type over another. The physical investigation begins with the Neanderthal man, and it is shown that the nearest living representative of this type of "*homo primigenius*" of Western Europe is the modern black Australian native. It is inferred from such facts that "there is only one species of man"; and the corollary is added by Ratzel that "the variations are numerous, but do not go deep." This school goes on to contend that the intellectual, moral and physical differences have been brought about by privation and plenty, and other accidental causes of unequal conditions, and concludes that "an impartial investigator would be inclined to look upon the various important peoples of the world as, to all intents and purposes, essentially equal in intellect, enterprise, morality and physique." If an uncivilized man of a race not markedly degraded could be put wholly in the place of a European, it is urged that

he would quickly throw off his old civilization, such as it was, and assimilate the new. "Races show nothing but skin-deep differences. Differences of language, of religion, of manners and customs, are nothing but accidental modalities attendant on the respective historical evolution in the past—in no way sufficiently powerful to efface the substratum common to all humanity, and in no way tending to hinder any co-operative effort in the fulfilment of the mission common to mankind in general."

From a scientific point of view evidence is accumulating that the physical characteristics which distinguish races, such as the shape of the head and the character of the hair, are not so stable as used to be believed, but are rapidly influenced by a change of environment. It is in fact not the race but the locality which in the long run fixes the type, nor do the most successful races show the highest physical evolution in all respects. All have become adapted to their surroundings under the law of the survival of the fittest, and just as the physical differences on close examination are found to be comparatively superficial and changeable, so far no doubt the variations in character and intellect are not really so deep as used to be popularly supposed. The differences of necessity and opportunity account for most of the distinctions. Uncivilized races may be indolent, but generally they are fully as active as their circumstances require. The view, therefore, that the lower races mark a transition stage in the evolution of man is now generally discarded. It is obvious enough that some countries are much more backward than others; but if it is recognized that human differences are not fundamental and that it is a mistake to judge any race by its static condition instead of allowing for dynamic movements, the inordinate pride of race which has placed a great gulf between white and coloured nations is discouraged.

Nationalism first arises where nature gives fixed boundaries and a sense of security. It was first developed in Greece and Italy, which are protected by the sea and mountains, and in modern times the insular position of England gradually brought about a national life, the type of which has been exported far and wide. In Africa the remarkable lack of natural boundaries has prevented evolution of this kind. In large countries again the manifestations of nature are on a vast scale; floods and earthquakes make man humble, and it is not in such lands that one would expect the formation of the individualism which is at the root of Western civilization and which requires freedom for its development. The native in countries where life is insecure has felt it necessary to protect himself, as much as he can according to his lights, by a mass of social regulations. He is in fact hide-bound by customs, the origin of which he has forgotten. The difference between

his position and that of the European is enormous. But it by no means follows that there is any great difference of thinking power. But when all this is admitted, the fact remains that, from a practical point of view, men have to be taken as they are, and the distinctions, however they arose, and however accidental, have a powerful effect socially and politically. Arguments drawn from the geological ages have no effect on this point. There is, on the modern facts, little reason to suppose that the progress of coloured races in education and morality will tend to destroy racial prejudice. It is futile to argue that their assimilation to European standards will make them acceptable to white societies when it is clear that this advance aggravates instead of diminishes the hostility. The argument assumes a nobility of character which is, in fact, mostly conspicuous by its absence. The greatest illustration of the subject is given by the United States, and a very interesting statement of the position there is given by Dr. Bu Bois in Mr. Spiller's volume. He shows "that there has grown up a Negro world in America which has its own economic and social life, its churches, schools, and newspapers; its literature, public opinion, and ideals. This life is largely unnoticed and unknown even in America, and travellers miss it almost entirely. The average American in the past made, at least, pretence of excusing the discrimination against Negroes on the ground of their ignorance and poverty and their tendencies to crime and disease. While the mass is still poor and unlettered, it is admitted by all to-day that the Negro is rapidly developing a larger and larger class of intelligent property-holding men of Negro descent; notwithstanding this more and more race lines are being drawn which involve the treatment of civilized men in an uncivilized manner. The argument of those who uphold this discrimination is based primarily on race. They claim that the inherent characteristics of the Negro race show its essential inferiority and the impossibility of incorporating its descendants into the American nation. They admit that there are exceptions to the rule of inferiority, but claim that these but prove the rule. They say that amalgamation of the races would be fatal to civilization and they advocate therefore a strict caste system for Negroes, segregating them by occupations and privileges, and to some extent by dwelling place, to the end that they (*a*) submit permanently to an inferior position, or (*b*) die out, or (*c*) migrate.

"This philosophy the thinking Negroes and a large number of white friends vigorously combat. They claim that the racial differences between white and black in the United States offer no essential barrier to the races living together on terms of mutual respect and helpfulness. They deny, on the one hand, that the large amalgamation of the races already accomplished has produced

degenerates, in spite of the unhappy character of these unions; on the other hand, they deny any desire to lose the identity of either race through intermarriage. They claim that it should be possible for a civilized black man to be treated as an American citizen without harm to the Republic, and that the modern world must learn to treat coloured races as equals if it expects to advance.

"They claim that the Negro race in America has more than vindicated its ability to assimilate modern culture. Negro blood has furnished thousands of soldiers to defend the flag in every war in which the United States has been engaged. They are a most important part of the economic strength of the nation, and they have furnished a number of men of ability in politics, literature, and art, as for instance, Banneker, the mathematician; Phillis Wheatley, the poet; Lemuel Haynes, the theologian; Ira Aldridge, the actor; Frederick Douglass, the orator; H. O. Tanner, the artist; B. T. Washington, the educator; Granville Woods, the inventor; Kelly Miller, the writer; Rosamond Johnson and Will Cook, the musical composers; Dunbar, the poet; and Chestnut, the novelist. Many other Americans, whose Negro blood has not been openly acknowledged, have reached high distinction. The Negroes claim, therefore, that a discrimination which was originally based on certain social conditions is rapidly becoming a persecution based simply on race prejudice, and that no republic built on caste can survive.

"At the meeting of two such diametrically opposed arguments it was natural that counsels of compromise should appear, and it was also natural that a nation whose economic triumphs have been so noticeable as those of the United States should seek an economic solution to the race question. More and more in the last twenty years the business men's solution of the race problem has been the development of the resources of the South. Coincident with the rise of this policy came the prominence of Mr. B. T. Washington. Mr. Washington was convinced that race prejudice in America was so strong and the economic position of the freedmen's sons so weak that the Negro must give up or postpone his ambitions for full citizenship and bend all his energies to industrial efficiency and the accumulation of wealth. Mr. Washington's idea was that eventually when the dark man was thoroughly established in the industries and had accumulated wealth, he could demand further rights and privileges. This philosophy has become very popular in the United States, both among whites and blacks.

"The white South hastened to welcome this philosophy. They thought it would take the Negro out of politics, tend to stop agitation, make the Negro a satisfied labourer, and eventually convince him that he could never be recognized as the equal of the white man. The North began to give large sums for industrial

training, and hoped in this way to get rid of a serious social problem.

"From the beginning of this campaign, however, a large class of Negroes and many whites feared this programme. They not only regarded it as a programme which was a dangerous compromise, but they insisted that to stop fighting the essential wrong of race prejudice just at the time was to encourage it.

"This was precisely what happened. Mr. Washington's programme was announced at the Atlanta Exposition in 1896. Since that time four States have disfranchised Negroes, dozens of cities and towns have separated the races on street cars, 1,250 Negroes have been publicly lynched without trial, and serious race riots have taken place in nearly every Southern State and several Northern States, Negro public school education has suffered a set back, and many private schools have been forced to retrench severely or to close. On the whole, race prejudice has, during the last fifteen years, enormously increased.

"This has been coincident with the rapid and substantial advance of Negroes in wealth, education, and morality, and the two movements of race prejudice and Negro advance have led to an anomalous and unfortunate situation. Moreover, many careful thinkers insist that, under the circumstances, the 'business men's' solution of the race problem is bound to make trouble; if the Negroes become good cheap labourers, warranted not to strike or complain, they will arouse all the latent prejudice of the white working men whose wages they bring down."

From this it would appear that the hostility of the whites is chiefly based on economical grounds, and is the same in principle as that shown in other places where the working man resents the intrusion of any emigrant who will compete for his work. The logical result of this attitude is the segregation of the coloured race as far as possible, and if the clash of the two elements does in fact produce a feeling of hate and a state of disorder there is much to be said in favour of the policy as, at any rate, better than mob violence. In the United States this solution, though frequently discussed, is made practically impossible by the large blending of the two communities in industry which has taken place. In South Africa the conditions of life have not been so far fixed as to put the discussion out of court, and the main contention of Mr. Maurice Evans is that a substantial increase of segregation is the proper remedy for the native difficulty in that country. We do not find in this volume, sympathetic as the writer is with the natives, any trace of the doctrine that racial differences are slight and can be easily extinguished. On the contrary, Sir Matthew Nathan, who contributes an impressive preface in general approval of Mr. Evans' object, remarks that the underlying idea of his

work is that there are essential mental and spiritual, as there are obvious physical differences between the Abantu and the European, and that it will be more advantageous to both races if the natives are consciously developed on lines indicated by their characteristics, than on the assumption that their intelligence and natures are those of white men. This idea seems to imply that there is a fundamental difference between the two natures, so that one mode of education is suitable to the black and another to the white. But Mr. Evans' pages would, we think, be searched in vain for proof of these propositions. The white race in South Africa has to maintain its dignity before the natives, and the trouble is that many members of it fail to do this. Ordinary domestic servants from England, for instance, do not appear to feel that there is any particular difference between themselves and the native article, and this is considered in South Africa as a vital objection to their employment. Higher up the scale the intellectual difference is of course obvious, but at this point the question of training and opportunities comes in. No doubt the primary education of the natives should be something very different from that imparted in the board schools of this country. It should be based on the conditions and requirements of the place. For that matter the same policy is being suggested for the agricultural districts of this country, and we are gradually coming round to the view that the boy or girl is best developed by being interested in what lies before them. Methods of education are in fact still *sub judice*, but whatever kind is selected for natives the lines followed would be European, and would be based on the belief that, however different the customs are, the intelligence and nature of the natives are much the same in character as those of white men. The trouble is, in fact, not that it is difficult to educate natives, or that it is necessary to manufacture any distinguishing method for them, but that as fast as they are educated they compete with the whites; in other words, it is not that European education fails, but that it succeeds. The trained black man, Mr. Evans remarks, may make life more difficult for the white worker in trades and handicrafts. The result is to intensify race prejudice. Mr. Evans urges a policy of segregation in order to keep the industrial and social life of the two communities as far as possible apart and so reduce racial hostility. Another object is to escape from the franchise difficulty. In the Cape Colony no distinction was made when responsible Government was granted between black and white, but later on an educational and property qualification was introduced, with the effect of keeping down the native voters to a comparatively small figure—about 14,000 mixed and 8,000 black out of a population of nearly a million and a half. In Natal, practically, and in

the Transvaal and the Orange Free State openly, the native is for this purpose put aside. The Earl of Selborne suggested that the solution of the problem might be found in a "civilization test," a native to be admitted to the franchise on proof that by his general standard of living and conduct he was a civilized man. This is eminently reasonable if the object is to bring the races closer together. But this is just what the white population as a whole wishes to avoid, nor are the natives themselves at all desirous of it. Lord Selborne said of the Basutos, "the one thing they most desire is to be left alone." Their spirit is very much like that of the Turkish Cadi, who, Lord Sanderson recently related, wrote to Sir Henry Layard in reply to a request for statistics: "My illustrious Friend and Joy of my Liver, the thing that thou askest is both difficult and useless," and added, "Of a truth thou hast spoken many words and there is no harm done, for the speaker is one and the listener is another. After the fashion of thy people thou hast wandered from one place to another, until thou art happy and contented in none. We (praise be to God) were born here and never desire to quit it. Is it possible then that the idea of a general intercourse between mankind should make any impression on our understanding? God forbid!"

The many evil results of a superficial contact with civilization are obvious enough. On the other side, the presence of a large native population has effects which permeate the whole life of the white community and which prevent the growth of a class of white workers, such as forms the foundation of society in progressive countries. "The class which in European countries, the other British Colonies and the United States, must live hard and work hard, whose livelihood depends on labour which is an imperative discipline, which tightens the fibres, and hardens the muscles, does not exist in South East Africa. Men of this class do come to the country, often unaware of the special conditions here, quite prepared to toil in the way they have been accustomed to do all their lives, but they never do so in South East Africa. Even if they desired so to do, the place and opportunity is not open to them, the custom of the country forbids it, and although they may take off their coats and roll up their shirt sleeves, it is simply force of habit, not to labour as before, but to supervise the black man. Their hard hands become soft, their muscles flaccid, as compared with their peers in the lands they have left. It matters not whence they came, Norway, Germany, England, Scotland, Ireland, Australia, Canada, New Zealand: we have had them all and all fall under the spell."

It can therefore be readily understood that to many students of the question segregation for the mass of natives is the only

remedy. It is not of course suggested that it should be a hard and fast policy; the mines and the farms must have labourers, and some of the natives acquire a liking for emancipation from tribal rule and the freer life of the white settlements. The principal difficulty is to find the land in areas large enough. This might be overcome by reducing the excessive wastefulness of present agricultural methods. The object, as set out by Mr. Evans, is admirable. It is to make "the black man's land one attractive to him, freeing him thus from the irritation and overlordship of individual whites, and giving him every opportunity for personal and race development." A practical importance has been given to the idea by its having been adopted, in principle, by the South African Native Affairs Commission. The only doubt that we suggest is whether any artificial arrangements of this kind can last long, in view, firstly, of the sacrifices which would be required from both sides; and, secondly, of the strong influences which are permanently at work to make each race useful to the other. The social situation is not what it is in the United States. The natives have not borne the stigma of a servile race. In the oldest colony the different classes of the population have settled down amicably to a common life. It is not so in Natal, but Natal is young. How the Cape strikes a Natalian is vividly described by Mr. Evans. "The mixed coloured population of that city and neighbourhood is a feature that deeply impresses him. He sees a mixture of races to which he is quite unaccustomed. Hottentot, Bushman, Mozambique black, Malay, and other peoples from the Far East, liberated slaves from West and East, Abantu and European all fused, in varying proportions, to make the coloured Cape people of to-day. At one end of the scale he sees men and women almost white, well educated, well spoken, well dressed, courteous and restrained in manner, and at the other end of this colour scale some whom he considers inferior to the ordinary native or Indian coolie of his home. He hears that it is quite a common thing for the European immigrant introduced for railway and mechanical work to marry, even to prefer to marry, women of colour, and is told that at the other end of the scale there is reinforcement from the black side. He sees a toleration of colour and a social admixture to which he is quite unaccustomed; it is evident in the streets, on the tramcars, in the railway stations, public offices, and in places of entertainment. Should he take a walk in Plein Street, on a fine Saturday evening, he will witness a sight impossible in an Eastern town such as Durban or Pietermaritzburg. The street is crowded, footway and roadway alike full of strollers, all shades and all colours, but generally speaking, all neatly dressed and all well behaved. As a rule whites and coloured people keep apart and do not mix, but there are very

many exceptions; he will, for instance, not infrequently see cases corroborative of the miscegenation between the races of which he has been informed. Young white men will be seen walking with well-dressed coloured girls, and an older European may often be seen with coloured wife and children of varying shades, taking the air, and gazing in the shop windows. The doors of a bioscope entertainment are open, and the crowd waiting admission and jostling each other as they get tickets, includes representatives of every colour, from the light-haired fair complexioned Scandinavian sailor, or English workmen, to the sooty-black of the Shangaan, and if he enters the overcrowded room and braves the foetid atmosphere, he will find no distinction made, all and any colour occupy the same seats, cheek by jowl, and sometimes on each other's knees."

It may reasonably be asked whether such results are not inevitable in the long run. It may be conceded that there is much to be said for the policy of segregation for those natives who desire to dwell apart, provided the restrictions are not onerous; but present indications point to the native coming more actively into the field of European labour. At present every white worker requires two natives to help him, the proportion of European labour in Cape Province being one-third, and it is a general experience that young coloured men are keen to learn trades. The necessities of the European and the ambitions of the native article tend to cause larger and larger numbers to dwell side by side.

## REVIEWS AND NOTICES.

**The Great Plateau of Northern Rhodesia: being some Impressions of the Tanganyika Plateau.**—By CULLEN GOULDSBURY, of the British South Africa Company's Administration, and HUBERT SHEANE, F.R.A.I., of the Company's Service (*Edward Arnold*. 16s. net.)

The Great Plateau lies on the backbone of Africa, varying in height from four to six thousand feet above the sea, and begirt by the four great lakes of southern Central Africa. It is the altitude of these thousands of square miles which created the hope that they would become the home of emigrants from our crowded isles. This was Mr. Rhodes' aspiration, and clearly this was a very different country from the malarial swamps and rivers of other parts of Africa. Whether the nerves of the white man will stand the tropical sunshine remains to be seen, and perhaps there is not so much confidence now as there was a few years ago. So far there is a mere handful of white men and women in this territory. There are no big movements or vital questions, but quietly the work of administration goes on. The present volume gives a picture of the life led by the small band of workers. In a way it is a lotus-life. It is not troubled by tourists, or public works, or any form of modernity. It is only reached from outside by the native carrier. There is no Dutch element here, and there has been no native rising. There is nothing much to trouble about, but, at the same time, the man who lives in such a primitive wilderness has always the feeling that he is in the grip of elemental forces. The writers point out how this fashions the ideas of the inhabitants. Everywhere there is a suggestion of infinite space, of utter, vast loneliness. Here and there are little patches of human life, and around the inscrutable silence of the virgin land, where great beasts move noiselessly in the twilight, and every twig and blade teems with insect life.

“And so, to one who knows the land and its majesty, what might otherwise appear mere pagan superstition becomes natural, necessary, inevitable. The religion of the people—if, by such a

term one may designate the network of custom and belief with which their lives are ensnared—has been evolved under this stupendous weight of Nature's influence. Man, here, has no false views as to his capabilities. He is a mere atom in the everlasting scheme—a pawn in the game of the great gods. What wonder, then, that he should seek, by any means that may occur to him, to propitiate these unknown forces which rule the air and the land and the deeps beneath? Fetishes, spirit-worship, the propitiation of ancestors—what are they but the natural instinct to stand well with the powers that hold him in their hands?

“It has become traditional to invest the native of Africa with the attributes of a good-natured, happy child. Smiles, laughter, neglectfulness, carelessness of what the morrow may bring—these are, it would seem, the signs by which we may know him. But is it really so?

“Watch the face of the adult native in repose. Surely in the dark eyes there is a kind of unconscious sadness? Are there not lines upon the forehead and about the mouth that seem to argue an incessant anxiety, unrecognised, perhaps unfelt, yet none the less existent? May it not be that he, too, feels that pressure of the illimitable spaces—knows that Nature rules, and that it is futile to kick against the pricks?”

The operation of this feeling is shown in the respect for law, the severity of punishment for infringements of it, and the corporate responsibility for illegal acts. Every precaution that can be taken is taken. The accused is invariably considered guilty until proved innocent. Property and personal rights count for little as such: the gravity of an offence is not that it is a crime causing damage, but that it is a sin against religion and morality. Nor to the native man is verbal evidence much to be relied on. He knows well enough that lying and collusion are easy. Hence the practice of the ordeal and the arts of the medicine man. The advent of white man's law is therefore attended with some difficulties, and the position of the Native Commissioner is no sinecure; but the task is facilitated by the quiet and contentment of the country, and most of the dissensions now relate to the eternal feminine. The natives practise polygamy, but in practice women are well protected. “Divorce is an easy matter, and the native woman's parents are only too ready to take her back with open arms. While, if their son-in-law is not attentive to them, and does not work in their gardens, they will take the initiative themselves and remove their daughter. Among the majority of tribes, indeed, it was imperative for him to move into the parents' village, where his mother-in-law would be at hand to keep him up to the mark. The Wemba mother-in-law is always ready to take up the cudgels on behalf of her daughter—and, indeed, she

possesses, in a sense, the virtue and advantage of immortality, since on the decease of the true mother her sister succeeds to the title and exacts the same respect from her son-in-law. The fierceness of the Wemba woman is proverbial. On several occasions one of the writers has been awakened in the middle of the night by a much-bitten husband, who has plaintively asked that he may be placed in gaol until morning, as the only safe place from his wife, who was pursuing him like an avenging fury."

The social habits and customary law of such a country will have a great influence on the religious question. Paganism is doomed, but how far Christianity or Islam will prevail is a matter on which opinions differ. At present in Africa things are tending toward Mohammedanism. Polygamy has something to do with this, but, perhaps, the more solid reason is that the Koran doctrine is that religions must be suited to the peoples, and the Mohammedan system is to graft on the native worship.

The writers give a lucid description of the natives' ideas and habits, and a detailed account of the life of the white official, including his domestic requirements, which would be appreciated by all who dwell in similar circumstances. The country will not be a lotus-land much longer. The railway approaches. When it arrives, the whole situation will change. The white population will rapidly grow, for the soil is rich and labour is plentiful. The bugbear is Sleeping Sickness, but in countries where this is of long standing the mortality is nothing like that caused by cholera and plague in India. The terrible visitation in Uganda has alarmed the world, but on the Plateau the bulk of the population is away from the lakes.

---

**Secret Service in South Africa.**—By DOUGLAS BLACKBURN and CAPT. W. WAITHMAN CADDELL (*Cassell & Co.*, 10s. 6d. net).

The "Secret Service" of this entertaining book includes all the subjects which had to be dealt with in a more or less secret manner in South Africa, in the 'eighties and 'nineties, such as the illicit liquor trade, illicit gold and diamond buying, the "Third Rand," the Jameson Raid, and the Boer preparations for war. There is no doubt that the writers had abundant opportunities for seeing how things went on under the surface, and as rogues and vagabonds swarmed through this period, and conspiracy, of one kind and another, was always in the air, they have no lack of material. How far it is all true it would be hard to say, but the narratives are given so circumstantially that they wear a strong appearance of credibility. The illicit liquor trade is described as based on a system of wholesale bribery. As is generally the case when the traffic is

against the law, the drink sold to the natives was of atrocious quality. The natives in fact preferred this sort. They would not pay for liquor that did not show speedy effects, and such tonics as sulphate of copper, alum, cayenne pepper and green chili were added to supply the demand for a drink that would bite. It was a poor sample, it is explained, that would not raise a blister on a saddle within an hour. The price for an ordinary tot was anything from sixpence to half-a-crown, and two tots had to be enough for the desired effect. The profits were of course enormous. There was also, it may be added, a good deal of hard drinking among the whites, except the Boers. Another field for rascality was the illicit labour business. The writers observe that the general public does not grasp the vital fact that, despite the existence of a teeming native population, only a very small percentage of the males will, or need work. From their communal system and the fewness of their wants they are born to a fairly easy livelihood. As time went on the supply fell far short of the demand created by the striking advance of the Rand, and abuses began to occur, with the result that Natal prohibited recruiting for the Rand. Then the "illioits" made their appearance, and added the variation of wholesale robbery of the unfortunate "boys." It is satisfactory to find that the worst evils were put down; the remedy used was the lash, and it seems to have been effectual. There was no extradition from the Transvaal, and this immunity led to the selection of that country by a number of undesirables who reflected no credit on their country of origin. Frequently they took Kaffir wives and became social outcasts. In the higher realm of Transvaal politics, the stories told of President Kruger, the corruption of the Third Rand, the Jameson Raid, and the Boer preparations for war, will certainly secure the attention of the reader. On the whole, the picture is far from being a pleasant one from any aspect. There was an immense amount of trickery and corruption, and from this arose a spirit of unrest and conspiracy which naturally led to social confusion and prepared the ground for war. The book, like Mr. Hyatt's "Off the Main Track," is a valedictory review of a past state of things, but the period is still fresh in memory, and full of interest, and such a collection of circumstantial narratives about important events is rare indeed.

---

**John Boyes, King of the Wa-Kikuyu, written by himself**  
(Methuen & Co., Ltd., 12s. 6d nett).

This book relates a career which reminds one of the travels of Gulliver and the adventures of Robinson Crusoe, with the difference that it is a story founded on fact, and has taken place in our own time. The author began life, as might have been expected, by

running away from home and going to sea, and in due course found himself at Durban. With a scent for favourable opportunities, which was evidently instinctive throughout life, he arrived at Bulawayo at the time of the Matabele campaign, and duly joined the Matabeleland Mounted Police. This episode over, he got to Zanzibar and from thence to Mombasa, where he was received with scant courtesy, and advised to leave the country. It need hardly be observed that Mr. Boyes did not accept the advice, and as the Uganda railway was being built he decided to organise a transport service, for which, in fact, there was plenty of room. The officials, it appears, tried to stop him—a fact which, he remarks, may have been due to there being no organized administration in the country, but was “peculiarly consistent with the Downing Street policy which prevails pretty well throughout our African dependencies, and which seems to be based on the principle that—in the eyes of Colonial Office officials—a native is more to be considered than three white men.” We always like to quote any lay criticisms of official policy, and it may perhaps be conceded that the authorities might have known that Mr. Boyes could take sufficient care of himself. At any rate, if the above equation represents the official belief, Mr. Boyes was never under any such delusion himself. He presented himself calmly to the Kikuyus, and ingratiated himself with them by helping them to defeat their enemies. He established his position as a Medicine Man by the ingenious use of Eno’s fruit salts, which the natives would come in crowds to watch him drink, saying that the white man could drink boiling water. He organised the natives on sound military principles. Previously they had observed no sort of formation in their attacks, but simply made a mad rush at the enemy. Mr. Boyes taught them to keep together, forming a line with their shields together, and to select their ground. These classic methods succeeded *à merveille*. Out of many instances we quote the following to show how Mr. Boyes won position and fame. “A large body of warriors came boldly on, never thinking that we were waiting for them, and no doubt expecting the same easy victory that they had had on previous raids. But a big surprise was in store for them. Owing to the narrowness of the path, they could only approach in single file, and we waited until they had almost reached the top before letting them know we were there. I had given strict orders that no man was to make a move, or utter a sound, until I gave the signal by firing my rifle. Coming steadily on, they had got close upon us when I fired, and my rifle-men opened on them at once, while the bowmen followed the volley up with a flight of poisoned arrows. The invaders were taken completely by surprise, and before they could recover themselves the Kikuyu warriors swept down on them with swords and spears. Bolting in a mad panic, they were hotly pursued down the

mountain-side, suffering severely in their flight. Arriving at the river, they found that the bridge was gone, and many of them jumped into the stream, of whom some got safely across, but a good many were drowned on the way. At least fifty had been killed, and many wounded, and these I gave orders were not to be killed, but brought in as prisoners, of whom, when all were collected, we had a very large number, so that the victory was altogether complete, while my force had suffered only very slight loss." It appears, however, that it is necessary, in order to maintain kingship in such circumstances, to add other feats to those of war. Mr. Boyes' accomplishment was his gift of swallowing native poisons, if not with relish at any rate with impunity. "My thorough defeat of their sworn enemies, the Masai, had given me a great reputation among them, which was increased by their belief that it was impossible to kill me, a belief which had been strengthened by my defying the witch doctors to poison me, and swallowing, in their presence, samples of what they considered their most deadly poisons without any ill effects. In consequence of the reputation I had thus gained my word was law, and I advised them that it would be greatly to their advantage to stop quarrelling and fighting among themselves, which advice I backed by severely punishing any one I caught quarrelling. With regard to my singular immunity from the effects of the poisons of the native witch doctors, it is, perhaps, difficult to find a satisfactory explanation. Whenever I met a witch doctor I always insisted on sampling any poisons he might have with him, which were always prepared with honey, and appeared to me to be a mixture of honey and the ashes of burnt herbs—a black, sticky mess—and though not, perhaps, the most appetising morsel one could choose, yet not so unpleasant to the taste as to be objectionable. But, in spite of the opportunities thus offered them to get rid of the one man in the country whom they both hated and feared, I never felt the slightest ill-effects from these experiments." Not many men, we imagine, would care to run the risk. It is regrettable to have to add that, in due course, the Protectorate authorities sent officers to arrest Mr. Boyes. Not only had he levied war, but in all expeditions his men carried the Union Jack. Mr. Boyes argued that he could not very well fly the Russian flag or any other except that of his own country, but we presume that this view of the matter was not accepted. Finally he was brought to Mombasa and tried for "dacoity," but we are pleased to find that he was acquitted, and left the court-house, as the judge said, without a stain on his character. Probably he did good service, however irregular the way, in preparing the country for the advent of the white race. His courage and resource were splendid, and no doubt greatly impressed the natives. The book itself is full of interest from beginning to end.

**Java, Sumatra, and the other Islands of the Dutch East Indies.** — By A. CABATON, translated and with a preface by BERNARD MIALL (*T. Fisher Unwin*, 10s. 6d. net).

The Dutch East Indies not only constitute one of the finest colonial possessions of Europe, but are clearly destined to play an important part in the racial struggle in the East. Java alone is more thickly populated and wealthier than Cuba, to which it is often compared, and all Central America together. Its productiveness has been developed by Holland with remarkable patience and sagacity. Not much has been written on the subject, and the present work is by a Frenchman. No doubt the Dutch have succeeded in keeping the possessions more to themselves, so far as other Europeans are concerned, than has been the case elsewhere. But the Botanical Institute has a world-wide fame, and is indeed without a rival. A budget of agriculture amounting to £600,000, devoted to the introduction of new crops and the improvement of those in existence, testifies to the thoroughness with which the yield of the soil is studied. The natives, who number nearly 30,000,000, are not all Javanese, as there are considerable numbers of Malays, Sundanese and Madurese, but they form the immense majority, and their gentle and sociable character has greatly facilitated the work of the Dutch. In Sumatra the almost interminable Achinese war still lingers, but there a different race, probably of Hindu origin, is encountered. The Javanese are probably the most prolific race in the world, and though at present they are lacking in energy, at any rate, in the eyes of European employers, there are signs that they see the value of Western civilization, and are beginning to demand opportunities of acquiring it. The author remarks that the Javanese aristocracy are far from crying "Java for the Javanese," because, at the present moment, such a cry would be a piece of fatuous vanity. What they do cry is "Give us light!—light under the maternal ægis of Holland." He is quite clear that the administration by the Dutch has been vastly for the good of the country. Two characteristics of it stand out, both showing that it was not designed to interfere unduly. One is that no attempt was made to encourage proselytism. The zeal of the missionaries in early days was carefully checked; the authorities preserve a wholly neutral attitude in religious questions. Another is that no attempt has been made to impose the Dutch language. Possibly this was due in the last two centuries to the idea that the dignity of the rulers would be best preserved by keeping the language to themselves. The official language is Malay, which owes this position to its greater facility and its wide diffusion in the East. There is now, however, a cry for education in Dutch, and for a scheme of education which would extend to scholarships, bringing the best students to the schools of Holland. This

movement is now, it is said, well afoot, and no doubt, if a road is provided to the summit, the education of the Javanese will be greatly improved from the beginning.

As to the political development of the country, the following remarks may be cited from the conclusion, as British administration is of much the same character:—"Even though the moral and intellectual qualities of the people of the Indian Archipelago, and of the Javanese and Malays in particular, may justify their hope of a freer future, it is very difficult to imagine that a common destiny could be shared by races so different, and ranking so unequally on the scale of civilization, without either cohesion or unity. With all these peoples the political sense is very rudimentary. The Malays and Javanese were able to rise from the anarchical conception of semi-barbarous tribes always at war to that of a host of autocracies, brutal and conquering powers; but not to the idea of a nationality, or even of a federation of states united by ethnological or linguistic affinities. This mental disability, which delivered them up to the Europeans, renders them still incapable of gaining freedom except at the cost of falling back into anarchy.

"Thus the European theory that 'the natives should be left to arrange matters between themselves' is simply puerile. The only way in which people 'arrange' matters in any part of the world—but especially in the Far East—is, as history shows, by crushing the weak. The natives of Indo-China 'arranged matters' by subjecting the Shans and the Cambodians to the brutal tyranny of the Annamites; the people of the Indian Archipelago 'arranged matters' by means of Malay and Achinese invasions, chronic piracy, head-hunting, ritual murders, incessant warfare and depopulation, and mental degeneration on every side. To pretend that a European domination, even with its regrettable blunders and failures of justice, is not for the good of such peoples, is to deny the past, to deny the petition of the victims in favour of the complaint of the privileged despoiled of their privileges."

**Nigeria: its Peoples and its Problems.**—By E. D. MOREL  
(*Smith, Elder & Co.*, 10s 6d. net).

This volume gives a collection of very interesting articles which appeared in the *Times*, with one on cotton which appeared in the *Manchester Guardian*. Mr. Morel was a keen and appreciative observer of all that was to be seen on his travels, and his description of the scenes through which he passed are always vivid and picturesque. He has also thought much about native life and ideas, and there is a touch of spirituality in his treatment of the problems which gives a high tone to his discussions. It is easy to understand that to such a spectator the policy of the West African adminis-

trations may seem a thing of shreds and patches. He sees the results, but not the great practical difficulties which have beset every important step. He criticises, for instance, the adoption of a narrow gauge for the Baro-Kano railway. There is no reply to his criticism, except that if the narrow gauge had not been accepted the railway would not have been built at all. The leading feature of the work is the consideration given to the native, with whose future Mr. Morel is genuinely concerned. We gather that his solution is a technical education which will not anglicize the native, but leave him to develop in his own way. The same idea is being put forward by other writers, all of whom are sensible of the fact that the breaking down of native restraints is mischievous in many ways. But we do not find any attempt to wrestle with the points that great numbers of natives, West Africans not the least, do not want to be, and are not fitted to be, artisans: that great numbers, living as they do, cheek by jowl with whites, must and will be educated generally on European methods: and that, putting aside technical education, which is the same for everybody, and religious education, which is not in question, no one has shown how the native is to be developed on his own natural lines, whatever they may be, and in such a way that he will not be infected with "Anglicization." But whatever may be thought of such questions, Mr. Morel's treatment is always suggestive, and his ideal uniformly high.

"By Flood and Field." — By A. SEAREY (*George Robertson & Co., Australia.* 5s. 3d.)

The interest in the Northern Territory, a domain of 340,096,000 acres, is growing in Australia, and this book of the experiences of a real pioneer will stimulate it. Apparently there is no lack of rich country and fine scenery. "A turn of the head, and the eye would rest, say, on a series of lagoons where beautiful lotus-lilies slept on the mirror-waters, and water-fowl revelled in the comfort of their translucent realm. A glance in yet another direction would discover vistas of superbly-rich valleys, musical with the murmur of water-falls and the song of birds; and beyond these again the great winding rivers with their fringes of giant trees. Around us were kangaroos, mobs of wild cattle and untamed horses, sometimes feeding quietly, as if they knew nothing of fear; at other times starting and staring at us before stampeding across the plain." Perhaps our sportsmen will presently be tempted to investigate a region which lends itself so readily to adventure. The instinct for sport is, no doubt, well represented there already, judging from the following story:—"They bury men up there casually. When the coffin arrived at the grave-side, on one occasion, it was found that a wild cat had taken possession. A terrier showed fight, after the nature of his kind. One old gentleman remarked: 'I'm sure Dick

(the dead man) won't mind waiting a bit. Indade, it's himself would like to be standing up to see the fun, God bless him!" The fun started. "Both animals had their backers, and numerous bets were made by the crowd as it raged round the grave. The contest was short, sharp, decisive, the cat 'going under,' but not until it had inflicted severe punishment on its adversary. The dog was then hoisted out of the grave, the fellows immediately became fittingly solemn, and the burial of poor old Dick was proceeded with."

---

**Behind the Ranges. Parenthesis of Travel.**—By F. G. AFLALO  
(*Martin Secher.* 10s. 6d. net).

Mr. Aflalo discusses the commonplaces of travel, the ordinary experiences of boat and train, cakes and ale, the pleasures and the discomforts of long journeys. He does not affect to have many serious things to say, but his topics are those which interest the majority, and there is a good deal of experience behind his comments. Travelling may be said to have begun with the pious pilgrimages of medieval times, and though, no doubt, somewhat vulgarised now by being made easy for everybody, it has a greater educational influence on the world than is generally realised. Mr. Aflalo's pleasant pages will help the old traveller to enjoy his experiences again.

---

**The Irrigation of Mesopotamia, with Plates in Portfolio.**—  
By SIR W. WILLCOCKS, K.C.M.G. (*E. & F. N. Spon, Ltd.* 20s. net).

An irrigation scheme by so well-known an authority as Sir W. Willcocks has an interest for other countries which have similar problems. Mesopotamia is an old example of irrigation. The giant banks of old canals and the ruins of ancient towns are met constantly. In classical times the country was studded with "a vast number of great cities," and these depended for existence on irrigation. The soil lent itself to the work, as it contains a large amount of lime, and is therefore much easier to work than clay soils, such as Egypt has. The ancient method was to build up one bank of a river against inundation, and to allow the floods to go over the other. Thus at Bagdad the right bank of the Tigris was protected by massive dykes and canal banks, within which clustered the rich gardens and orchards of the town, while on the other side the waters fell down a depression. It is impossible to improve on this method in the like circumstances, but if it is desired to keep up irrigation throughout the year it is necessary to have barrages, with canals above them, which are capable of maintaining flood levels throughout the year. It is of course not safe to build barrages or regulators on sand, and therefore hard ground must be sought. This was understood in early times, for it is related that the first public work which Alexander the Great undertook in Babylonia was the con-

struction of a new head on solid ground for the Hindia branch of the Euphrates; before this the annual closing was a work of extraordinary difficulty, and 10,000 men were required for the work. This was, therefore, good engineering up to a point, but the weak part of the ancient system was that all the canals took off without weir, and gradually they silted up and were obliterated. When once the process of choking has begun the end is near. So long as canals remain deep enough to carry off water with velocity all is well; but as they silt up they take only the crests of the rises of the rivers, and these are extraordinarily full of deposit. Slack water is comparatively free from sediment, and the object of modern practice is to force the heavy current to the other side while taking the slack into the canals. In some cases the muddy flood waters can be taken across canals by iron pipes of the "Acme" class. Having got the canals as they should be, the next step is to provide for drainage, irrigation without drainage being apt to be mischievous.

Sir W. Willcocks estimates that, allowing reasonable rents, there would be a return of 9 per cent. on the cost of the works. An ample allowance appears to be made for the cost, for, as he observes, in a country liable to floods such as Noah experienced, he can recommend no economy when facing the question of inundation. It is anticipated that both sugar and cotton could be grown with success.

Certainly recent experience seems to show that very costly schemes of this kind may prove exceedingly profitable. It is said that, after the completion of the Assouan dam, the value of land was enhanced by 1000 per cent., and in New South Wales irrigation sent up the value from 20s. an acre to £80.

---

### Report of the Government Entomologist of the Uganda Protectorate. (*Government Press, Uganda.*)

Mr. C. C. Gowdey carefully describes the insects which are injurious to various products and the means of holding them in check. The insects mostly injurious to coffee are the Mediterranean Fruit Fly and the Coffee Beetle. As regards the first, it is stated that in only two stages of the life-history of this insect are there any vulnerable points at which we can direct our forces with any hope of success in the destruction of the pest. These two stages are the larval and adult. When the eggs have been deposited they are at once beyond our control. The larvæ are secure until the mature fruit fall from the trees. The puparia are quite safe under the ground unless we resort to the unsatisfactorily means of turning over all the soil in the immediate vicinity of the trees. The adults can be induced through their inordinate attention of sweets to eat poisoned baits.

Destruction of fallen fruit.—The fallen fruit should be collected carefully at least once daily, and preferably twice, to prevent the fully grown maggots from escaping from the fallen fruit into the ground to pupate. This measure seems very simple; but this procedure often fails, because it needs systematic effort.

The cultivated fruit can be destroyed (1) by burial, in which case it should be covered by two feet of soil; (2) incineration, and (3) by covering the fruit with water allowing fermentation to take place, which will cause the death of the maggots.

Netting.—The method of covering the trees with netting to prevent the oviposition of eggs is quite a practical method. As the fruit are usually stung within a fortnight of picking, safety can be insured by keeping the trees under the netting for from three to four weeks. But whether or not the expense of protecting the fruit in this way is justifiable must depend wholly on local conditions.

Poisoned Bait. Although it has long been known that the flies are great feeders, that they die quickly if unable to obtain food, and that they are readily attracted by any sweet stuff, the question of poisoned baits has not received the consideration it deserves. They are readily attracted by treacle containing an arsenical poison.

Kerosene has been used with great success in West Australia. The oil attracts the adults and they are killed as soon as they come into contact with the oil. The experiments were carried out by placing tins containing the oil on the forks of the trees. Other oils, such as benzine, turpentine and naphtha, are claimed to act in a similar way to kerosene, but they evaporate even more rapidly than kerosene.

The coffee beetle is extremely difficult to control, as it is protected for the greater part of its life. The affected beans, which are easy to find, should be picked and destroyed, so that the insect will in some stage or other be destroyed.

The fly which attacks cacao is attracted by any sweet substance, so the poisoned bait method of treatment, whereby a solution of attractive sweetness is made the carrier of a poison which will destroy the flies, was devised. The following formula was adopted as being the most economical and the most effective:—

Sugar	...	...	3 lbs.
Arsenate of lead	...	...	$\frac{1}{4}$ "
Water	...	...	5 gallons.

The most convenient way of applying the bait is by means of a garden syringe with a very fine nozzle. The liquid must be kept well stirred each time the syringe is filled. The spray should be forced up over the tree, thus enabling it in descending to be evenly distributed over the leaves. A thick film is not desirable, as the lead settles to the bottom of the leaf and is not removed by the flies.

The conditions under which the trial of the bait was made were very severe, because many of the cacao pods were in the stage of ripeness attractive to the flies and there were many flies about, many of them trying to deposit their eggs.

An experiment was made on a small scale with a decoction of the foliage of an Apocynaceous plant, *Halophton cimicidum*, obtained from Mexico through the kindness of Dr. L. O. Howard, Chief of the Bureau of Entomology, United States Department of Agriculture. The decoctions were sweetened and used as a spray, but the quantity of foliage received was so small as to make positive deduction as to the value of the experiment impossible. The plants grow wild in Mexico and decoctions have been used against the Mexican Orange Fruit Fly, *Trypeta ludens*, Loew, with very satisfactory results. The preparation is made by boiling two pounds of the plant in three gallons of water for about two hours, straining this decoction and then adding about two pounds of sugar.

All infested pods should be destroyed, either by incineration or by burial. In the latter case the fruit should be covered by at least two feet of soil.

For the past year Cotton Stainers have proved themselves to be the most injurious and wide-spread pest on cotton.

These insects are so named from the fact that they stain the fibre with their excrement and with the juices of their bodies, which are crushed during picking and ginning operations.

There is really no satisfactory, practical method for controlling this insect when it has once become wide-spread. On small areas good results can be obtained by shaking the insects into tins containing a little oil, as is done over large areas in the case of the large *Dysdercus* species.

This pest enters into its dormant period in a very casual manner, concealing itself under any rubbish or in any crevice it may find. The most satisfactory method, therefore, of combating this pest is either to remove the quarters suitable for the passing of the dormant period, or by using these places as traps to be destroyed with the insects they conceal.

Frequent complaints are received of the damage that "White Ants" do to rubber plants. Enquiries invariably reveal that "ant-hills" have either been allowed to remain in the fields or in the vicinity. The "ant-hills" should obviously be removed as the initial step to the control of these insects.

Fatal results in few cases have been caused by the application of tar or kerosene oil to the stems of these trees. The former, in particular, is a very dangerous substance to apply to living tissue, and the latter should only be used when diluted with water and dilution can only be effected by emulsification. Kerosene is certainly a doubtful remedy. Soaking pieces of sacking in a sugar solution

to which an arsenical poison has been added and wrapping the sacking around the trees near the soil has proved fairly successful.

The palm weevil is found in practically all the species of palms in Uganda. The badly attacked trees which are beyond treatment should be destroyed. All wounds on the soft parts of the stem should be dressed with a mixture of tar and clay. Premature removal of old branches should be avoided, as this exposes tender places on the stems, which are very attractive to the beetle.

---

**West Indian Bulletin:** Vol. XI., No. 4.

This number reviews broadly the work of the Imperial Department of Agriculture in the past and indicates some of the problems of the future.

In the nineties, Sir W. T. Thiselton-Dyer remarks, the West Indies had sunk from prosperity to poverty, and he heard it publicly stated in the City of London that annexation to the United States was the only remedy. But in 1898 the Imperial Department of Agriculture was established, and its first object was to improve the sugar content of the cane. This was done with so much success that "a moribund industry has been given a new lease of life by bringing scientific method to bear upon it." It may be added that it is well to remember, when comparisons are made between old and recent times, that in the palmy days of slave labour the price of sugar ranged as high as £100 per ton, and that sugar was cultivated to an extent that became impossible when competition set in. In the *Bulletin* the present good position of the industry is attributed to the improvement of methods. "The Antigua Handbook" (Waterlow & Sons Ltd.) recently issued, explains how antiquated and wasteful methods were persisted in, and how both cultivation and manufacture have been improved, and how the Brussels Convention gave a stability to the enterprise which encouraged the formation of up-to-date works.

---

**The Agricultural and Forest Products of British West Africa.**—By G. C. DUDGEON. (*John Murray*, 5s. net).

Arrangements have been made for the publication of a series of handbooks on the tropical commercial products of West Africa, under the editorship of Professor Dunstan, of the Imperial Institute. This volume is the first of the series. The author is Inspector-General of Agriculture in Egypt, and was lately Inspector of Agriculture for West Africa. The book deals with each colony separately, and gives a full account of its staple products. The descriptions are clearly written, and some good maps and illustrations accompany them.

---

It is a common reproach that Colonial reports are issued long after the period to which they relate, and we have noticed with sympathetic interest that the same charge is brought against the French Colonial Office. "1909"—says a Paris paper—"et déjà l'année 1911 est presque achevée si bien que tous les chiffres ont un petit parfum de vétusté qui vous fait vous demander pourquoi en seconer la poussière?" There is, however, a publication which is a marvel of promptness. This is the Trade Statistical Abstract of Southern Nigeria, giving a great mass of figures about imports for the six months ending 30th June, and promising the further publication of figures within two months of the period recorded. Such a collection of figures has a formidable appearance, but we trust that it will be consulted by merchants who wish to know exactly what the local demand amounts to.

## BUSINESS NOTES.

WHENEVER the price of a tropical article goes up, there is a general hunt for more specimens of it or new ways of producing it. Rubber held the field for a long time, but the latest fashionable subject of exploitation has been oil-seeds and oil. We have long endeavoured to preach the commercial virtues of the cocoanut, and present values must be very gratifying to the fortunate possessors of the article. The difficulty is the seven years of waiting, after planting, but crops can be sown in the meantime. In the South Seas it is often possible to combine the collection of phosphates with this industry, and the rise in the value of copra will incidentally lead to the working of many places for guano where this alone would not be remunerative. West Africa is able to produce good copra and cocoa-nut oil, in districts which are not too damp, but at present the oil-palm brooks no rival. There is a strong demand for examples of castor oil, cotton and other seeds, and as these may be used for different purposes according to their nature—*i.e.*, as lubricants, as food-stuffs, or as manures—the demand is sure to be permanent. A great number of products are being tested for the production of volatile oils, but minute examination is necessary before their market values are established. Tanning materials are much sought after, and there are numerous enquiries about timber.

The highest price for copra in the London market is obtained by the Ceylon product: this was quoted recently at £26 17s. 6d. per ton, while F.M.S. fetched £23, and Singapore, Zanzibar and Manila a little less. African copra was quoted in Liverpool at £18 10s. 0d. for fine quality: this is equal in appearance to the best Ceylon grades, but contains a higher percentage of free acids.

---

### The Survey of the Empire.

The annual report of the Colonial Survey Committee gives the following review of the work done in Africa in 1910:—

*Topographical Surveys.*—A total of about 54,000 square miles has been topographically surveyed in British Africa. The most important areas are :—

South Africa—

Cape of Good Hope	...	...	12,630 sq. miles.
Orange Free State	...	...	12,596 " "
Transvaal	...	...	7,900 " "
East Africa	...	...	12,250 " "
Uganda	...	...	4,115 " "
S. Nigeria	...	...	2,579 " "

*General Maps.*—Northern and Southern Nigeria.—A general map on a scale of  $\frac{1}{2000000}$  with an index to place names, has been published.

*Rough Surveys and Explorations* have been carried out in the Anglo-Egyptian Sudan, Northern Nigeria, East Africa, and Sierra Leone.

*Geodesy.*—The computations for the geographical co-ordinates of the stations of the arc of meridian in Uganda have been completed. The report on the work of the party employed on this work is in course of preparation.

*Cadastral Surveys* have been in progress in East Africa, the Gold Coast, Northern and Southern Nigeria, and Uganda.

*Boundary Commissions* :—

- (i.) An agreement was signed at Brussels on the 14th May, 1910, dealing with the Eastern frontier of the Congo, and with the Anglo-German frontier between Uganda and German East Africa, west of Lake Victoria.

A boundary commission has been appointed to delimit this frontier from Nkabwe to Sabinio, and also the Anglo-German frontier to the East of Sabinio. The commission left England in December, 1910, reached Nkabwe in February, 1911, and is now at work.

- (ii.) The Commissioners employed on the boundary between Nigeria and the Kameruns, extending from Yola to the Cross River, have agreed upon a definite boundary, which, however, has not yet been formally sanctioned by the two Governments. The African General Service medal has been granted to the troops engaged in the fighting which took place in the Sonkwala Valley during the course of the delimitation of the boundary.

A general report on the work of this commission has been published, together with a report on the geographical features of the country through which the boundary passes.

- (iii.) The boundary between Nigeria and the French Sudan stretching from the Niger to Lake Chad, has been ratified since the close of the year under review."

### The Production and Prevention of Rain by Gun Firing.

An enquiry has recently been received from a colonial government on this subject. The suggestion that it is possible to influence the weather by bombardment is an old one. In countries where stress of weather is felt in the form of drought the process has been put forward as a means of inducing rainfall; in others, where serious damage is done by hailstorms, the power of inducing the clouds to shed their moisture in the form of rain is claimed for it, and more recently it has been advocated as a means of dispelling fog.

Experiments, having for their object the production of rain by explosion, have been carried out extensively, particularly in America and Australia, where Governments and private persons have supplied the necessary funds. Recent official trials are those made in August, 1907, at Oamaru in New Zealand. An account of the experiments, drafted by the Government Meteorologists, was printed by order of the New Zealand House of Representatives. (Return to an Order of the House of Representatives, dated the 13th of November, 1907.) Three extensive sets of experiments were made, but in no case could any interference with natural phenomena be traced. If rain fell, it fell over an area of many thousands of square miles in consequence of the passage of a cyclonic depression, and it was not specially heavy near the scene of the experiment. The general conclusion arrived at is that the experiments afforded no evidence that precipitation was induced, or in any way influenced by the explosions.

Perhaps the most exhaustive series of experiments on "weather shooting" have been made in Austria and Italy, as the result of an agitation by wine growers and others anxious for the safety of their crops. After much inconclusive discussion in the public press, an international conference of experts was invited by the Austrian Government to meet in Graz in 1902. The conclusion arrived at was that there was probably no effect attributable to the shooting, but the evidence was not sufficiently clear to justify the categorical statement that the ineffectiveness had been proved.

Further trials under careful conditions were, therefore, made in Austria and in Italy under Government Commissions. The immediate object in view was the prevention of hailstorms, but the experiments actually amounted to an exhaustive test of the efficacy of weather shooting generally. The result was summed up in the *Meteorologische Zeitschrift* :—

"Hereby the matter is disposed of, not only among scientific men, but also among all objectively minded persons among agriculturalists. The failures at Windisch-Freistritz and Castello franco, and the ineffectiveness of rockets and bombs, as demonstrated by the Italian experiments, entitle us to say, 'Hereby the end of weather shooting is sealed!'"

The notion that concussion might affect rainfall goes back at least to the middle ages, when the ringing of church bells was thought to be effective. Upon the introduction of fire-arms these were brought in as an aid to controlling the weather, sometimes with the addition of pellets made of the remains of candles preserved from the celebration of Candlemas. As new methods of producing concussion are developed the older ones are disregarded. The power of the church bell is now transferred to heavy ordnance. But there is no evidence either of a practical or theoretical character that heavy ordnance is more effective than a church bell, or that either has the smallest effect upon clouds or rainfall. We can easily detect the effect of the smoke of London and other great cities in intercepting a good deal of sunshine, but we cannot say that even that affects the amount of rainfall.

On the theoretical side it may be pointed out that the energy involved in producing rainfall is enormous. The heat liberated in the condensation of a rainfall of one-tenth inch over an area of one square mile is the equivalent of the energy that would be produced by an engine of ten million horse power in half-an-hour. The energy expended in the heaviest cannonade that man can produce must be puny compared with so vast an expenditure of power. An effect could only be expected if the atmosphere were in a state resembling that of a loaded gun, and the explosion provided the analogous of pulling the trigger. There are no grounds for supposing that the atmosphere is in a state of unstable equilibrium such as this suggestion demands. The only instances where we have any evidence of instability are those afforded by violent thunder squalls, but even then we have no reason for supposing that we could influence the course of the phenomena by explosives.

### Oils—Classification for Tariff Purposes.

The two usual methods of using Petroleum as a source of power are:—

(1) Crude or fuel oil with the more volatile spirit removed. Such oils are used as a boiler fuel for the generation of steam.

(2) Volatile oils, the product of fractional distillation. Such oils are applicable for direct use in internal combustion engines.

The first class might be permitted to be imported provided the oil has a flash point above 150 degrees F. (Abel's Test). At the same time a declaration might be required that the oil is for fuel purposes only and not for refining. Oil of this class could not be used for illuminating purposes, and refining could hardly be carried out without the knowledge of the Government.

As to (2), some oil can be used both for illumination and for internal combustion engines, so that it would be difficult to tax them for the former purpose and exempt them for the latter. Such oils are however less valuable than the more volatile oils and a duty would not be much of a hardship on power purposes. In these cases the applicability for illuminating purposes is very limited, and in practice is confined to power work. Such oil might be imported duty free if of a specific gravity of .750 or under (at 60° F.) In permitting importation of these volatile oils it is necessary to make stringent regulations to provide for their safe storage, conveyance and use.

---

### The Soy Bean.

The extraordinary growth of the demand for the soy bean has been one of the most remarkable features of recent agriculture. It has for centuries been produced in great quantities in Manchuria and Japan, but only a small proportion of the oil was extracted and its possibilities escaped notice elsewhere. The first large shipment to England was in March, 1909, and a great demand rose up immediately. In the following season the requirements were estimated at over a million tons, representing a business of nearly £8,000,000. In China and Japan the beans are an important form of food, being used in some form at almost every meal. The edible oil, which amounts to 15 to 20 per cent. of the seed, makes them highly nutritious, and they are very rich in proteids and bone-forming matter. They have a low-proportion of starch and are therefore very valuable from a medical point of view, and likely to be used for many food preparations. At present they are used mostly as a food for cattle, and as such have given remarkably good results. They also make an excellent fertilizer as an organic manure. There will probably be a market for them for this purpose in Australia, where, as the trees are evergreen, the humus is not so plentiful as where there are deciduous trees. It is perhaps hardly likely that our colonies could compete with China in the production, except for the fact that the yield of all crops is increased when they follow soy beans. When the crop is harvested the pod can be ploughed into the soil and becomes a valuable fertilizer. Any soil that will grow maize is suitable, provided that the soil is not acid in reaction. The young plants require dry weather but can stand slight frosts. There have been many failures, largely owing to the fact that imported seeds are sweated in transit and such seeds are very liable to lose their germinative powers in this way. The industry, however, is established in the United States, and

is likely to grow in Australia and South Africa. The longer cultivation is tried the better, as by growing for several years the bacteria, which are necessary for growth, are established. In the near future it seems likely that the oil of the bean can be used for the making of soap. It is claimed that by new machinery a very fine quality of oil can be obtained. If so, an enormous field is opened up, for soap makers are finding the supply of tallow short and are anxiously looking out for another material.

---

### Cotton Growing.

An article in the *Agricultural Journal* of the South African Union recommends the use of the disc plough, as it leaves the land perfectly flat and broken down and not so much surface is exposed to the sun, therefore evaporation is considerably less than with land ploughed with the ordinary mould-board plough. It mentions the Robinson six-furrow, stump-jump disc ploughs as one of the best on the market at the present time, it being very heavy and well constructed, and the stump-jumping arrangements acting perfectly. Very few breakages occur. Other makes have been found too light for the work and will not stand up against it in heavy and compact soils. These disc ploughs are set to cut a 6-inch wide furrow, as they do better work and plough deeper and take less pulling set at this width than at any other. A span of fourteen oxen is required for these six-furrow ploughs.

As soon as the rains set in the planters dress down the land with, first, a disc harrow and then tine harrows, and roll if necessary to get a fine seed bed; then drill in the cotton seed, the rows being set to 40 feet apart.

They like the new Bradley two-row planter, fitted with interchangeable cotton-seed and mealie planting arrangements, also fitted to drill in artificial manures at the same time.

Should the land be good and suitable the cotton plants must be thinned out to 3 feet between the plants in the row. This should be done when the plants are, say, some 6 inches high. If the land were in good order and moist at the time of sowing, the seed will sprout at once and be up in about five days, and ready for thinning in from ten to fourteen days from drilling. As soon as any weeds begin to show put the hoes in at once, or after rains. As soon as the land will bear it put the hoes in to break up the crust of the soil and thus prevent evaporation. This preserves the soil moisture, and cotton will by these means stand a drought from six weeks to two months. From time to time it is advisable to hand-hoe the weeds between the plants and out up any missed by the horse-hoes, for it must be borne in

mind that a cotton field must be as free from weeds as possible, for firstly, to grow weeds is a waste of manure and of soil moisture required for the cotton; and, secondly, the dried leaves and trash from the weeds are likely to get mixed up in the raw cotton when the bolls burst and damage the sample.

As soon as the cotton plants begin to flower and the young bolls form all work must cease in the field, otherwise great damage might occur, the flowers and young bolls being easily knocked off. In about four to five months after drilling the bolls will begin to burst and ripen off, the raw cotton showing in round white balls. These should be picked as soon as they have dried off and hang well down out of the pods.

Coarse, white linen or cotton apron bags, slung round the neck, are used by the pickers so as to leave both hands free for picking. These bags are emptied at either side of the field into long wooden trays with bottoms made of  $\frac{1}{2}$ -inch wire netting, or on to sail cloths or wagon covers, and the contents spread out evenly to dry in the sun. The cotton takes about a day or a day and a half to dry, and care should be taken to cover up these trays or sail covers at night to prevent the dew or rain wetting the raw cotton. The raw cotton should then be packed in wool-bales and taken to the factory for ginning.

The pickers must not start work in the morning until the dew is off and the cotton quite dry. The same applies of course after a shower of rain.

The trays used are 12 feet long and 3 feet wide at the bottoms, which are covered with  $\frac{1}{2}$ -inch wire netting. The sides are 18 inches high, sloping out to 4 feet at the top, and are placed on trestles 2 feet high. The trays are very much better than sail cloths, etc., as the netting allows the air to draw up through the cotton, and also permits any dust, dirt, and insects to fall through. These trays are very easy to make. They may be made out of floor boards and ordinary 3 feet wide wire netting, with a few cross-bars at the bottom to hold up the netting.

The cotton is trodden into the wool bales in exactly the same way as wool is packed, only great care must be taken to see that the cotton is thoroughly dry before baling, otherwise it will heat and go afire, There is hardly any material that heats and goes afire so quickly as raw cotton. Being very inflammable, care must be taken if any lights are used about it.

As soon as the picking is over it is advisable to at once cut down the bushes and burn them on the land so as to destroy all insects, etc., and lightly plough the land in readiness for deep ploughing for the mealie crop. Cotton is one of the best rotation crops for mealies, as it helps to clean the land and also enriches it with humus.

**Tobacco.**

The Victoria Journal of Agriculture states that as tobacco is needed for many different purposes, and as special types are required for each, pure seed of every variety used is of great importance so that the characteristics valued in each may be preserved. These can only be maintained by systematic selection and great care in preventing cross-fertilization, except where cross-breeding is intended with a view to improvement in shape, vigour, and quality.

Tobacco, if not carefully watched, has a tendency to lose its type under certain circumstances. Where different varieties are grown within a few miles of one another, cross-fertilization is common, owing to the pollen being carried by bees and other insects, or the wind. The result is that, where no care is taken to prevent inoculation, a type is soon lost, and it is found impossible to maintain the qualities required in the different tobaccos.

Even without cross-fertilization, a variety planted in a soil and climate not suitable will, in three years, lose its useful characteristics altogether and a fresh importation of seed be found advisable.

During the last ten years it has been clearly proved that cross-breeding, with knowledge, has been the means of producing tobacco with better colour, texture, and burn, in addition to heavier yields. Judicious seed selection will also control the same results.

The tobacco plant is self-fertile; consequently, no cross-fertilization is necessary, provided the plant is holding the type required. The vitality of the seed is wonderful, considering its diminutive size—from 300,000 to 400,000 seeds to an ounce. A single plant will, in some varieties, produce this quantity, about 70 per cent. being fertile. The life of tobacco seed is from 10 to 20 years, when properly cared for; though after 10 years a smaller proportion will germinate, and the older the seed the slower the germination.

An experienced grower will, in a good season, save enough seed to last him for ten years. There is less risk in this way of deterioration than if the seed be saved in every succeeding year. Care must always be taken that the plants selected are acclimatized at least one year, if grown from imported seeds.

In selecting plants for seed bearing, the grower should have in his mind the following ideals:—

1. A vigorous healthy plant with a tendency to early maturity. This means less risk from frost, and a shorter growing period which will entail less working expense. The quicker tobacco is grown, especially for wrapper leaf, the better the quality. Some of the best leaf, from the time it is transplanted to the harvesting stage, is only 12 weeks in the ground; heavier plug tobaccos will be from 16 to 20 weeks. The seed from a vigorous plant, grown in a season clean in respect to fungus and other diseases, will naturally produce plants less liable to disease.

2. Size, number, and shape of leaves must also be considered. These objects will depend on the purpose for which they are grown, and the quality of the soil in which they are produced. The size for heavy plug types can hardly be too large, leaves of this kind being sometimes as much as 39 ins. in length and 24 ins. wide. But where such large leaf is grown, it is well to endeavour to keep the size of the midrib as small as possible. The lateral veins should not be too large or prominent and should be even distances apart. If they appear close together, it is indicative of the seed running out, and such plants should be avoided. For sigar and plug filler size is of no great consequence, except in so far as heavy yields are concerned.

The number of leaves will depend chiefly on the quality of the soil used ; a rich soil will develop a larger number than a poor soil, so that no hard and fast rule can be laid down here, but each grower must use his own judgment, according to the conditions he is working under. In a rich sandy loam, on which heavy plug leaf is being produced, a strong plant will mature from 20 to 25 leaves. In choosing a seed plant from such a crop, not less than 20 leaves, exclusive of the four top and four bottom leaves, should be selected. Where, however, a poorer soil is in use, from 10 to 15 leaves will be found sufficient for the plant to mature. It is better to err on the side of having rather too few, than too many leaves, so that each may be properly developed and of as nearly as possible uniform size.

Where more leaves are grown than the plant can produce to their full size, extra labour in handling during the stripping and classing will be required, and a poorer quality obtained. If, however, a thinner textured leaf is the object for sigar wrapper purposes, then a greater number of leaves can be left on with advantage. Wrapper leaf is grown not so much for its smoking qualities, as for appearance, and comprises only a small proportion of the sigar or plug when manufactured. It must always be remembered that the middle leaves, from the fourth at the bottom to the sixth from the top of the plant, are the best.

As a general rule, the wider the leaf, in proportion to the length, the greater the amount of usable material is present, with a smaller percentage of waste in the shape of midrib, which comprises from 24 per cent. to 30 per cent. of the whole weight. It is only natural, therefore, that buyers should prefer a wide leaf. The heart shape of the Hester and Hycó varieties is very popular.

3. Consideration should also be given to the easy working qualities in some plants, as compared with others. Plants which grow the leaves close together on the stalk, and which have a quantity of frill round the butt of the leaf, are not so easily suckered as those which have the leaves further apart, neither do they cure so well in the shed, as the leaves are more covered one with the other, and consequently do not get the air so readily, or evenly.

The first desideratum then is to select healthy, vigorous plants, true to whatever type is required. As soon as the flower bud appears, in order to prevent cross-fertilization, tie a square of cheese cloth or paper bag over the top to prevent access of insects or pollen from other plants before the flower makes its appearance. Only the centre bunch of buds or pods should be reserved; all lower branches bearing flowers should be removed, also the top five or six leaves, with the object of growing only so much seed of heavy, virile qualities as the plants can mature. As the plants grow, the bags should be removed from time to time and tied loosely round the stem.

As the plant ripens, the seed pods turn brown; the leaves can then be stripped and cured and the stalk cut 2 to 3 feet below the pods, and hung with the tops down in a dry situation in the shed. The bags are left on and will catch any seed which may shell; if they are removed, such seeds, being so small, would not easily be recovered.

During the growth and before putting them in the shed, it is well to examine the plants for a small green caterpillar which is given to attacking the pods and rendering them useless. The seed plants should also be hung where mice cannot attack them.

Five or six plants are sufficient to save for seed under ordinary circumstances, but it is wise to choose twice or three times that number and label each plant according to its variety, etc. Then as they mature, make a final selection of those best fitted to produce the largest yield of the most valuable class of tobacco desired. All suckers should be kept down; many growers go so far as to remove, from time to time, the weaker capsules or buds on the bunch in order to send all the strength possible into those left.

Do not be disappointed if the leaves taken from the seed plants are not as good quality as those taken from topped plants. They are never so good, owing to the fact that the effort to mature the seed has robbed the leaves of some of their virtues.

When the seed pods have all turned brown, and are thoroughly dry, the seed can be thrashed out by rubbing the pods between the palms of the hands over a sheet of paper. The seed should then be put through a fine sieve and the fine chaff blown away. Each pod should contain from 1,000 to 4,000 seeds. When thoroughly dry, the seed should be placed in Mason, or other jars, and the lid screwed tightly down. Each jar should be labelled with the variety and date of saving, and kept in a dry situation. Blowing machines are used for separating the light seed from the heavy. The latter is just as desirable in tobacco as any other crop.

Tobacco seed weighs 35 lbs. per bushel. One farm in America produces from 100 to 125 bushels per annum, the yield per acre being about 4 bushels.

To test the vitality of tobacco seed, sow thinly on a piece of dark woollen cloth and moisten the whole, then fold the cloth and keep in

a warm situation and moisten with warm water from time to time. In nine days the sprouts will show if the seed is good. A further test is to drop a little seed on a hot piece of tin or iron; if good, the seed will pop; if dead, will burn. An experienced man can tell by rubbing the seed on the palm of the hand; if too old the seed will crumble, but if good will roll without breaking.

The world production of tobacco is not keeping pace with the increase in consumption, and therefore values have of late years been steadily increasing. It was estimated recently in America that supplies had fallen 20 per cent. behind the demand. Manufacturers, both in England and America, complain that, owing to the short supplies, it is not possible to age the tobacco to the same extent as formerly. The prospect of a new country for a tobacco industry is therefore encouraging.

It must always be borne in mind, however, that popular tastes for tobacco incline to lighter types than previously; and, in order to obtain these, lighter soils must be used for growing and the varieties suited to them adopted. There will naturally always be a certain amount of heavy tobacco smoked, but the tendency is towards the lighter kinds.

---

### Cocoa-Palms.

The improvements in the extraction of the oil from the nuts have greatly added to their value, and the cultivation of these trees promises to become more and more remunerative. The United States Consul at Pernambuco, where the cocoa-palm grows most luxuriantly, states that the nut is first planted in its natural state in hull and fibre. At the expiration of about twelve months, or when the plant has reached a height of about three feet, it is transplanted and set out in rows about forty feet apart. If cultivated and irrigated the tree will produce at the end of five years, otherwise it will require about ten years to produce. Although the rainfall within the coast region averages about eighty inches per annum, it all occurs during the months of the rainy season, and often when it is of no service to certain vegetation. The summers are hot and dry, and young plants and trees need to be irrigated. There are two cocoa-nut markets in the city of Pernambuco, one for the green and the other for the mature or dried nuts. The green nuts, which are picked at about the end of five months, and before the real meat of the nut has begun to form inside, are composed entirely of water, which forms one of the principal and most popular beverages of the neighbourhood. The water is non-alcoholic, and when iced is converted into a most savoury refrigerant. Its action is diuretic. When the nut is partially mature the inside is sometimes extracted, and by the use of sugar and some other ingredients is converted into a

popular confection. The meat of the dried or ripe nut is used exclusively for food, being usually seasoned and mixed with different provisions for flavouring purposes. The owner of one of the large plantations in Pernambuco has recently stated that he averaged about four shillings net profit per annum from each tree.

### Coffee Cultivation.

The Cape Government Agriculturist has supplied the following memoranda on the subject:—

There are two varieties of coffee grown, viz., *Coffee Arabica* and *C. Liberica*, commonly called Arabian or Common Coffee and Liberian respectively. The latter is of higher flavour and aroma, and is gradually becoming more popular with growers.

*Origin and where procurable.*—It originated, as its name implies, in Arabia, and is now grown in most tropical countries, but chiefly in the West Indies and South America. The seed is obtainable at the Royal Palm Nurseries Oneco, Florida, U.S.A.

*Weight per bushel.*—A bushel of ripe berries will produce about 10 lb. of marketable coffee.

*Suitable soil.*—Coffee thrives on a variety of soils, but a deep rich soil with plenty of humus gives the best results. Clay soils are also suitable. It should be well hilled and drained. A gravelly soil and sub-soil, if virgin, will produce shrubs till about four years, when the trees begin to decline and finally die, due to the greater tendency for the washing out for the plant foods in light soils. The best soil is virgin bush or forest land.

*Climate.*—Coffee prefers a humid atmosphere where it gets from 50 to 200 inches of rain per annum, but it has been grown with less, an altitude from 1,500 to 2,500 feet above sea level, and an average temperature of 60° with the absence of frost. Severe frost kills coffee.

*Preparation of soil.*—In preparing the land the ground should first be cleared, then well ploughed, and allowed to lie for some time. During the period it is fallowed it should be well cultivated to bring it to as fine a condition as possible.

*Selection of site.*—In selecting a site for coffee a place should be chosen which is protected from the prevailing and cold winds. If this is not obtainable screens should be planted of some quick-growing tree, such as Lombardy Poplar and Japanese Privet.

*Seed-beds: Locality and preparation.*—In preparing the seed-bed it should be put into a shady spot, and the ground, preferably of a sandy nature, well worked to bring it to a fine tilth. The beds are best laid out four feet wide, with a path between so as to facilitate weeding and watering.

*Planting seeds.*—The bed should be well watered the evening previous to sowing. The seeds are pressed lightly into the soil about two inches apart each way. The bed should then be sprinkled freely with wood ash and again watered. A cover should be used to protect the young seedlings from the noonday sun. A screen run on wires about three feet above the bed is found very effectual. This should be removed gradually, until finally the young plants are exposed to the sun. This method gives good, strong plants, and prevents succulent growth. One bushel of parchment coffee (seed with inner skin attached) will yield about 30,000 plants, which are about enough to plant thirty-five acres, giving a good margin for accidents. When the first round leaves show, which is about ten weeks from the time of planting the seed, the young plants should be transplanted into nursery beds, which are similar to the seed-beds. Only those plants should be transplanted that have a straight, well-developed taproot. This taproot is cut to about four inches long, and care must be taken to prevent the roots being exposed to the sun. In setting out, care must be exercised that the plant is not put deeper than it stood in the seed-bed, also that it is planted straight. The plants are set out about six inches all ways. These beds should be watered after transplanting and kept moist when weather is dry.

*Transplanting.*—The plantation must be carefully marked out where the plants are to stand, and a distance of eight to nine feet between the rows all ways is considered best. This allows of cultivation with light machinery to keep down the weeds, and thus save hand hoeing. A hole is made about two feet square, and the subsoil placed on one side. When planting, only the surface soil is placed back in the hole, the necessary amount being collected round the hole, and the subsoil takes its place. The young plants should be strong. The time for transplanting is during the rainy season, September or October, about twelve months after the seed has been sown. When the ground is ready great care must be exercised in keeping the roots of the transplants protected from the sun, and again to keep the plant upright and not put it too deep in the soil. Only upright-growing plants should be used. When planting is finished put a small branch on the sunny side, which will greatly help the young plant making a start. All misses must be replanted to get a uniform plantation. If any side-shoots should have grown on these transplants they must be carefully removed, and the single stem only left.

*Training and pruning.*—This is a very important point, for on this depends the facility of gathering the future crops. If any laterals should grow out, they are pinched back, and any superfluous branches removed. When the plant has reached about five feet in

height it should be topped, and never allowed to grow higher. It will then grow laterally and subsequently meet the other bush. Subsequent attention is necessary to remove dead wood, and at the beginning of the growing season to remove water shoots, which grow inside the bush, so as to keep it open to allow free access of light.

*The age of bearing.*—Under ordinary circumstances the shrubs will come into bearing at three years old, and in their sixth will be in full bearing. With ordinary care and attention they will keep in bearing for many years. They have been known to bear annually for twenty years in Australia.

*Crop.*—Each shrub bears from 3 to 5 lb. berries, and an acre will produce about 5 cwt. upwards of marketable coffee according to the strength of the shrubs and fertility of soil.

*Gathering.*—The berries are ripe and ready to pick when they turn red or nearly purple. If left after this they drop. There are two ways of gathering:—(1) To place a sheet under the shrub and shake the shrub, but this method is not recommended, as it tends to loosen and bruise the surface roots; (2) to pick by hand into baskets, which takes longer, but is the best in the long run. A person can pick 100 to 150 lb. a day, which will yield 12 to 18 lb. marketable coffee. The berries have a tendency to get smaller the nearer they are to the tip of the branch, and some growers grade in the picking by putting those berries at the tip in one basket, the middle ones in the next, and the base ones in the third basket.

*Treatment.*—After gathering, the berries are subjected to one of two treatments:—(1) They are dried immediately and put through hullers to extract the bean; (2) they are pulped immediately they are picked by machinery to remove the outer skin. They are then put in tanks and allowed to ferment for about thirty hours to remove the saccharine matter, after which they are subject to a washing process and put on trays or floors in the sun and allowed to dry to the point of storing safely. They are then put in drying drawers or trays and put out to dry every day and taken in at night. If rain threatens they are put under cover again. During this process the berries are constantly turned. As soon as the coffee is dry, that is when it is brittle enough to break between the teeth, it is either hulled or left in the parchment. It is hulled and polished by the merchants who buy the coffee.

*Enemies.*—It is subject to a few insect pests and fungi diseases, which all go down before treatment.

The world's production in 1906 was 16,741,215 bags of 132 lb. each.

*References.*—"Cyclopedia of American Agriculture"; "New South Wales Agricultural Gazette."

**Cotton Gins.**

The Single Acting Macarthy Rolling Gin has been recommended for either Sea Island or Marie Galanti cotton. The Gins cost about £39 each with spares and packing. A hand press, packing bales 200 lbs. weight, costs also about £25. An oil engine to work gins, with spares, costs £154; this may be a Crossley 12 b.h.p. horizontal oil engine, complete with all pipes, 24 ins. dia. × 10 ins. face driving pulley, six water tanks, foundation bolts, etc.; this engine can be used with either refined or crude oil but when the latter is being burnt the power would be reduced by 15 per cent.; it will drive five gins using refined oil, and four when using crude. A gin without spares costs about £24, and a small engine, Crossley N N N Type 7½ b.h.p., about £90.

---

**Soapstone (talc).**

This stone, the name of which is often misapplied, is being found useful for many purposes, and is being extensively quarried in South Australia. It is chiefly produced in the United States, and probably it will be found and worked in many other districts when its uses are better known. An Adelaide paper states that in every respect the substance resembles nothing else so strongly as it does a piece of discoloured soap, and anybody on handling a sample for the first time might easily mistake it for a scentless "compound companion of the bath." Soapstone in its original state has this peculiarity—it exists in a single huge block. There are no seams as in most other stone deposits. Consequently, owing to the fact that explosives would hopelessly shatter the body, the quarrying has to be done by means of crowbars and wedges. With the aid of these instruments, the material, which spits away from the main bulk as "true as a hair," is carefully dislodged, and then cut to the size and shape desired—from 1 in. to 2 ft. in thickness—with cross and hand saws. The quarry is on the side of a hill, and it is estimated that about 2,000 tons have been removed, and that there are 30,000 tons in sight. The reef can be traced for a mile, but its depth is unknown, the width varying from 15 to 20 ft. In the Commonwealth the substance is chiefly used for lining cooking stoves, grates, steam boilers, bakers' ovens and fruit evaporators, and for firebricks. The soapstone which cannot be worked up into saleable blocks is broken down to a 2 or 3-in. gauge and put through a chalk mill driven by an oil engine. After the material has been properly crushed, it passes through a series of sieves of a gradually diminishing mesh, and finally is silk dressed. The result, it is claimed, is a product equal to the best imported French chalk, and commanding a ready sale in the States and elsewhere. Most of the ground substance is used in the manufacture of paper of various kinds, especially building paper.

It finds application also in the manufacture of moulded rubber forms and as foundry facings and paints. It readily absorbs grease and is used to remove spots from silk and to bleach cotton goods. On account of its slipperiness, one of its most important properties, it is widely used to lessen friction, and for this purpose it is dusted into gloves and shoes and blown into conduits to ease the introduction of electric wires or other conductors. One of its widest applications is in toilet powders, most of which are made from high-grade talc imported from Europe. Laundry tubs, griddles, foot warmers, and many other similar utensils are manufactured from soapstone. The higher grades of massive talc, free from flaws, are sawed up to make pencils or crayons, French chalk, gas tips, and other special articles.

---

### Cooling of living rooms.

A method has been adopted at Kalgoorlie, Western Australia, of reducing the temperature of a living room by having the sides constructed of double walls of wire netting packed with charcoal through which water drips and absorbs heat by evaporation. A reduction of 30 or more degrees Fahr. has been obtained, and the adoption of the system may be very useful in other parts which have a dry hot climate.

A memorandum forwarded by the Governor of Western Australia gives the following details:

The minimum theoretical temperature that can be obtained by this method of cooling is that of the wet bulb temperature of the locality where it is to be erected. In practice the results are generally 5 to 10 Fahr. higher.

In humid climates, such as in the tropics near sea level, the effect will be inappreciable, while in dry climates, such as Kalgoorlie, Western Australia, 40 of a depression theoretical and 30 actual is not uncommon.

The room to be cooled may be of any size and any construction provided the walls consist of charcoal filled into suitable frames, and retained there by wire netting of small mesh, half-inch for preference, and provided the outside of the roof is covered with an absorbent material, such as cocoanut matting or blanketing.

The roof should preferably be hipped on the four sides, when an ordinary garden rose fixed to the opening will supply all the water necessary to keep the absorbent covering damp. This will keep the roof at wet bulb temperature, and if the space between the ceiling and roof is made as air-tight as practicable the mass of air imprisoned there will also be cool and keep the ceiling cool.

The best results are obtained when the cool chamber is quite detached from other buildings, so that no matter what direction the wind comes from, it will always blow through wet charcoal. It is

never necessary to keep more than two walls to windward wet, and therefore the gutter which distributes the water to the charcoal may be divided into two portions, each provided with a separate source of supply, the one to windward being turned on in accordance with the direction of the wind.

As it is not convenient to have water trickling over the door and window it is best to select the side of the building that is normally coolest for them and place them side by side so as not to break into the cooling walls more than is necessary. The window should be air tight and not arranged to open, ample ventilation being provided by the porous walls.

In a sketch which is merely intended to illustrate the essential points, the roof is represented as being supported on eight posts, four corner, and four intermediate. Into each of the bays thus formed is introduced a frame consisting of four studs and a top and bottom plate all three inches by two inches.

When the frame is made half-inch mesh wire netting is tacked to one side of it, and it is laid flat on the ground of floor. Charcoal is then filled into each panel, varying in size from a cubic inch to two or three cubic inches, levelled off and held in position by more wire netting being tacked over it. To prevent undue bulging, the two walls of wire netting may be tied together at suitable intervals by copper wire. Before fitting the charcoal panels between the posts, it is necessary to nail galvanized sheet iron on the floor flanged on the inside edge about two inches high, and about one foot inside from the wall, the other edge being bent down outside. This forms a shallow gutter to catch the drip and carry it outside. The charcoal walls are then placed in position on top of the sheet iron and secured to the front adjoining posts. In the sketch seven frames are shown filled with charcoal, the eighth bay being reserved for door and window. When the charcoal panels are secured in position a gutter is run round the walls inside and about six inches from ceiling, closed at the end and divided into two sections as already explained, and two half-inch water pipes connected through a tap one to each or a hose pipe will serve the same purpose, and over the edge of the gutter next to the wall is hung a strip of blanket one edge rushing into the bottom of the gutter, the other hanging over the gutter so as to rest on the top of the charcoal.

The outer edge should be scolloped, so as to form a large number of points, at each of which a drop will trickle down as soon as water has been let into the gutter, the blanket acting as a syphon to carry it over the edge of the gutter.

In order to allow of the blanket being placed on top of the charcoal the inner wire netting is stopped about three inches short of the top and a two inches by one inch batten cut into the studs at that height permits of it being fastened.

Should the black walls of the room be objected to on æsthetic grounds, the objection may be overcome by nailing three by one battens horizontally on the inside wall at suitable intervals and tacking thereto sheets of perforated zinc which can be painted any desired colour and decorated to suit individual tastes.

Where electric power is available a considerable benefit will be obtained by installing an electric fan for use when there is no wind. The effect will be to whirl the air of the room round against the wet charcoal walls, and obtain artificially the same result as if a breeze were blowing through the walls.

The two absolutely essential conditions for success are (1) keep the walls uniformly wet, and (2) admit no air except through the charcoal.

---

### Marine Motors.

British enterprise in this line is very desirable, as continental makers were prominent at the start. Messrs. Thornycroft have listed several new and improved types, particularly an engine, in which the cylinder dimensions are  $8\frac{1}{2}$  ins. diameter by 12 ins. stroke, and the set is designed to develop 100 B.H.P. at about 500 R.P.M., or 120 B.H.P. at about 600 R.P.M. on ordinary paraffin lamp oil. If supplied purely as a petrol engine, the power will be 120 B.H.P. on petrol at about 500 R.P.M. The system of sight feed lubrication adopted successfully in the "C" type engines has been embodied in this type. This provides for the drips being visible from the driving position so that immediate attention is drawn to stoppage occurring in any of the lubricating channels. The engine is governed by a powerful governor which operates on the inlet valves by varying the lift to suit the power required. The valves are arranged on one side of the engine and are operated from one camshaft. The cylinders are cast together in pairs, and ample provision is made for cleaning the jackets. Large doors are also provided in the crankcase through which pistons and connecting rods can be removed if desired. The control is effected entirely by one hand lever acting on the governor springs. This system simplifies the manœuvring of the engine considerably. Ignition is by high tension Magneto, but duplicate plug holes are provided so that, if necessary, a duplicate system of ignition may be installed. The starting system is one which has been devised specially for this type of engine and has many features of interest. This and other type engines are now being constructed to Board of Trade and Lloyds requirements. This is a noteworthy advance as there has been very great

difficulty hitherto in fulfilling the requirements of both the Board of Trade and Lloyds.

---

### Wireless Telegraphy.

The service of Berbera and Aden was opened to the public on 15 December, 1910, 6d. per word being charged. The chief source of revenue is from messages exchanged with ships, and these are mostly for the Aden station to be transmitted over the cable system. The stations are staffed by Telegraphists and engine drivers seconded from the Indian Telegraph Department, with a European superintendent. The service is a success.

---

### Turin Exhibition.

Two "Grands Prix" have been secured by Messrs. Merryweather and Sons' exhibit at Turin. This firm was entrusted with the fire protection of the British Section, and in addition to a firemain and hydrant system, served by two powerful stationary steam fire engines, their exhibit of motor, horse and hand draught fire engines was also available in case of fire. Foremost among the exhibits, and a recipient of one of the "Grands Prix," is a petrol automobile "Hatfield," engine of a pumping capacity of 380 gallons per minute. When tested this engine threw powerful jets over the roof of the British Section, and its value in the event of a fire would be enormous. The disaster at the Brussels Exhibition taught a lesson by which the Turin authorities have profited, with the result that the fire protective arrangements at the Italian Exhibition were of the most exhaustive character.

---

### Transvaal Coals.

It is an important question in the Transvaal whether it is possible to establish a steel industry. There would be great opportunities if steel could be produced, and the chief question is whether the local coal could produce a good coke suitable for metallurgical requirements. To test this a number of samples were sent to Messrs. Bell Bros., Ltd., of Middlesbrough, who undertook to carry out the experiments. The result showed that none of the coals produced what can be considered first-class blast furnace coke, though those from the Coronation, Oogies, Tavistock and Premier Collieries give medium strong cokes low in sulphur.

**Tin.**

It has been said that tin is so little known to prospectors that in Rhodesia they have walked over outcrops for years without seeing them. A more technical way of putting it is that cassiterite does not attract the mineralogist by any special crystallographic or chemical characteristics. Prospectors for this valuable mineral will be much helped if they read the articles, which began in October, in the *Mining Journal*, by J. B. Scrivenor, Government Geologist in the Malay States.

## RAILWAY AND HARBOUR NOTES.

### Australia's Railway Problem.

It appears likely that the question of a uniform gauge will at last be taken in hand. New South Wales has 3,643 miles of the "world's gauge" or 4 ft. 8½ ins., Victoria, 3,383 of 5 ft. 3 in. gauge, and the other States, 7,710 miles of 3 ft. 6 in. gauge. Victoria adopted the gauge which was used in Ireland and is nearly the same as that (5 ft. 6 ins.) used for the principal lines of India. At that time the wider gauge was advocated because there was a need for more powerful locomotives, and makers did not think that the 4 ft. 8½ in. gauge would give room enough. The difficulty was solved by American engineers, who put the locomotive cylinders outside the wheels, and widened the firebox and grate by using a pair of low wheels beneath. It is easier to reduce the larger gauge to the smaller than *vice versa*, and if unification is decided on probably the standard size would be adopted. The Australian Consulting Engineer says that there never was any real necessity for the perpetration of the 3 ft. 6 in. gauge. This was adopted under the impression that great economy would result, but this, Mr. Deane says, was a mistake. Modern locomotives admit of sharp curves, so that one main reason which used to be given for narrow gauges in rough country does not at any rate apply now. The cheapening of cost was not more than £300 per mile, and was at the expense of stability.

---

### Lagos Railway.

The journey between Lagos and Minna Junction will be done by the boat trains in 30 hours. The carriages are of the clerestory type, with electric lights and fans, lavatories and baths. A restaurant car is put on the boat trains, and a rest house is provided at Ibadan. The first class fare from Lagos to Minna is £4 14s. 0d., with a supplement of £1 10s. 0d. for the sleeping cars on the boat trains. At mile 45 the traveller will encounter

the first belt of the oil palm trees, the source of the wealth of the country. At 60 miles the branch to Abeokuta is reached, a place of granitic formation, where the curious may see under one rock a species of cave-dwellers, but a larger subject of study is the model native government, which has shown great enterprise. At 93 miles a forest reserve of 25 square miles is struck, and the plantations here are interesting to the student of forestry.

An order has been placed with Messrs. Swan, Hunter and Wigham Richardson for a galvanized floating dock capable of docking vessels up to 5,000 tons dead weight. The contract price is £57,750, which includes delivery and mooring at Lagos. The dock is to be of the double-sided self-docking type known as the "Sectional Pontoon" type, consisting of two parallel side walls and six similar pontoons attached to the side walls.

#### World's Record in Telescopic Tracklaying.

The *Royal Engineers' Journal* records the fact that this record was achieved on the Baro-Kano Railway on the 8th of March last year. The record to be beaten was one of 5 miles, made by Messrs. Pauling, in Rhodesia.  $6\frac{1}{2}$  miles were laid between 5.50 a.m. and 6.40 p.m.; a further  $\frac{1}{4}$  mile had been laid out but could not be linked up owing to darkness coming on and all the gang being tired out. 1,622 natives were employed and 17 Europeans. The weight of rails and sleepers handled was over 900 tons. The feat is remarkable evidence of the working powers of the natives when properly led.

#### Accra Harbour Works.

Apprehension has been expressed in the Legislative Council as to the present condition of the harbour, as it appears that the depth of water has been reduced, notwithstanding that sand has been pumped out. Under the circumstances the use of the jetty is difficult, and investigation of the subject seems necessary, but probably the situation will be improved by dredging.

#### Seccondée Harbour Works.

In September the heavy swell prevented foundation work near the gap in the reef, and the extension of the breakwater made little progress; advantage however has been taken of occasions of fine weather to close this gap with concrete. The stepped retaining wall was completed and will be of great advantage to the harbour.

#### Accra-Akwapim.

The time for completion has been extended to the 1st of April to allow the contractors time for the repair of damage caused by

floods. The Contractors will continue to work the line, paying the Government 50 per cent. of the gross receipts and the hire of any rolling stock lent to them.

---

#### Sierra Leone.

The gross revenue in 1910 was £101,610, an increase of £17,381. This is a record, and is nearly double the revenue of five years ago. The profit on the working of the main and branch lines represented  $3\frac{1}{2}$  per cent. on the capital expenditure, but there is a loss on the mountain railway of £1,734. The trial use of wood fuel and Crown Patent Fuel was not a success. An astonishing theft of keys goes on, nearly 20,000 having been abstracted in two years.

---

#### Ceylon.

The sea coast duplication works have progressed satisfactorily. The deviation on the north side of the Kilani bank has been opened for traffic for single line.

---

#### Ratnapura Extension.

It is expected that passenger and mail traffic will be opened as far as Kuruwita and goods as far as Ratnapura this month, but as the high banks near the latter place will have hardly settled enough for fast passenger traffic the last seven miles may not be opened for passenger traffic till the middle of March.

---

#### Mannar.

It is understood that the South Indian Railway do not expect to have the piers ready before July, 1913 and the line as a whole before July, 1914. The work on the Ceylon side is believed to be at least twelve months ahead of the work on the Indian connection, a result largely due to the use of steam cranes.

---

#### Malay States.

The Semantan-Kuala-Tembeling rails at the end of September were linked for 27 miles, and the Padang, Java-Kuala Selangor rails for  $2\frac{1}{2}$  miles.

---

#### Uganda.

The report for 1910-11 shows a very satisfactory year's working. There is an advance of work all round, and it has been done more economically than ever before. The increase is due greatly to the low rates for maize and beans for export, and Mr. Currie is confident that the practice of quoting low rates for export of country produce could be further extended with advantage both to the country and to the railway. A branch of about

30 miles is being constructed from Nairobi to the Thika River, and will open up one of the best parts of the highlands. The proposed substitution of oil for wood fuel on the steamers is mentioned; since the report steps have been taken to ascertain how oil can best be obtained for the requirements.

---

### Jinja-Kakindu.

By October the earthwork left only 12 miles to be completed, and these, it was expected, would be finished by the end of the month. The rails had reached mile 30. A good supply of labour has been maintained, between 4,000 and 5,000 men being employed. It is hoped that when the line is opened the jemadars of all the maintenance gangs will be Africans.

---

It has been decided to provide additional vessels for service on Lake Kioga. They will consist of a stern-wheeler, three 100 ton lighters, and four spoon-dredgers.

---

### Trinidad.

On the 29th of September the first sod of the Tabaquita-Rio Claro Line was cut by the Governor in the presence of a large company comprising the members of the Legislative Council, the heads of departments, and the representatives of the Church, the Law Courts, the Chamber of Commerce, the Agricultural Society and Board of Agriculture.

---

The extension from San Fernando to Siparia has been staked out by Mr. H. R. Marwood. Interference with the Public Recreation Ground has been avoided by taking the route along the foreshore. This will necessitate a sea-wall, in connection with which it is proposed to extend the wharf wall at San Fernando. The line at about  $1\frac{1}{4}$  mile from that town enters a district devoted to sugar plantation, which is intersected by many tramways chiefly used for the conveyance of canes to the factories and to the ports of shipment, and as far as possible the line follows these tramways. The railway crosses the Oropouche Lagoon and the Carampo River and then follows the Coura River to its source. After crossing the watershed 16 miles from San Fernando it descends to the site proposed for the station at Siparia.

No curve is sharper than 10 chains in radius and the gradients appear to have been generally well laid out.

---

### Refrigerator Wagons.

There is little occasion for these in Europe, and the United States have done most of the experimenting. The South Africa

Railway Magazine gives a useful account of the methods. There are two principal types, the Beef Car and the Fruit and Produce Car. These two types differ in several respects, the former having closed ice tanks to give a dry atmosphere, which is necessary for the proper handling of meat, while the latter has the icebox with slatted front, the air coming in direct contact with the refrigerant which almost invariably is ice. The Beef Car has generally a heavier insulation and a heavier framing, as the meat is hung from the roof, and it is often shorter than the Produce Car.

*Ice Tanks.*—The Fruit and Produce Cars which are used to carry dairy products, fruit, vegetables, cured meats, etc., are equipped with an icebox at each end of the car of varying construction. Some makers adopt the slatted front while others again construct a solid bulkhead, in some cases well insulated. There seems a distinct advantage in the latest method of having a collapsible icebox which can be folded up against and secured to the end of the car when the weather conditions are such that refrigeration is unnecessary. The increase in loading space thus secured is stated to be about 15 per cent. The capacities of these ice boxes vary from 4,000 lbs. to 11,000 lbs. of ice per car, while the total cubic contents are 10 to 11·6 per cent of the capacity of the car.

The Refrigerator Beef Car which is used for carrying fresh dressed meat is equipped with four ice tanks at each end of the car, the four tanks giving a greater cooling area than one of larger capacity. These are generally made of galvanised iron and are of the closed type to prevent the air carrying moisture to the foodstuffs. The capacity of these tanks is much less than that of the ice boxes in the Fruit Car, being only about 5·2 per cent. of the cubic contents of the car and carrying 5,000 lbs. of ice, salt being mixed with the ice to further lower the temperature. The smaller quantity of ice required for the Beef Car is due to the fact that the meat is loaded in a pre-cooled condition, while this is seldom the case with the load of the Produce Car.

The draining of the meltage from the ice boxes in the Produce Cars is done through traps to prevent loss of cold air. In the case of the Beef Car where salt is mixed with the ice serious objections are raised to the draining of the brine over the roadbed causing increased expenditure in maintaining rails, bridges, signal equipment, etc. Further, it has been proved by tests carried out by a Committee appointed by the Master Car Builders' Association that the greatest amount of refrigeration is obtained by retaining the brine in the tanks and only draining at icing stations. The following is the recommendation made by the said Committee:—"All salt water drippings should be retained in the ice tanks and drained off only at the icing stations. The mechanism for handling drain valves

should be simple and positive and so designed as to ensure closing the valves before hatch-plugs can be returned to their places."

*Insulation.*—The question of insulation has been thoroughly investigated of late, as it is increasingly realised that a very large proportion of the refrigeration is absorbed in taking up the heat that leaks in through the body of the car. It is estimated, after careful calculation, that in the average cold storage building 70 per cent. of the refrigeration applied is used to remove the heat which leaks in through insulated walls, and as this amount must be even greater in a less insulated refrigerator car the advantage gained by having good insulation is at once seen.

The following is a comparative table showing the thickness of different materials required to give the same insulation:—

Linofelt ... ..	3.25 inches.
Hairfelt ... ..	4.70 "
Granulated Cork ... ..	6.54 "
Best Slagwool ... ..	7.27 "
Soft Mill Shavings ... ..	8.00 "
Sheathing and Air-spaces ... ..	9.15 "

### Travelling Cranes.

Overhead wiring over a goods yard is objectionable as the wires are very much in the way of operations when lengthy articles are being handled. A live rail is also objectionable as where there is much traffic it is likely to cause serious and even fatal accidents. A conduit system avoids these defects. It is important to provide proper drainage for it. Messrs. Preece, Cardew and Snell have observed in a recent case that if travelling is only occasional a series of plug boxes can be arranged, connection from which to the crane would be made by means of armoured flexible cable. This system is in use at Dover Harbour for the cranes working the cross-channel traffic.

An Imperial Edict issued in China last June states that "the state ownership of railways is essential for the efficient administration of the railway policy, but much more so for the relieving of the people's distress." This is excellent doctrine, and there is to be no mistake about carrying it out. Perhaps the instructions given are too drastic for general imitation, but in their way they are a good model for the repression of objectors.

"The Director-General of the Canton-Hankow and Szechuan-Hankow Railways is hereby commanded to proceed with all speed to his post and to act in conjunction with the Viceroy and the Governor of the said provinces in conformity to the suggestions

above enumerated. He shall execute his duties with genuine earnestness especially with regard to his investigations of the sums realised under the different forms of collection. The Throne has very carefully considered every point of this matter, and is acting with extreme liberality and at great sacrifice. After the adoption of the present measures, if there be still incorrigible persons who utilise the name of railway affairs in the hope of inciting and creating disturbances, the ringleaders shall be instantly arrested by the said Viceroy and the Governor, and punished according to the severest law, without the least mitigation or mercy, so as to preserve public order."

## MEDICAL NOTES.

## Sleeping Sickness.

The Gambia Protectorate Medical Officer suggests that the disease is on the wane there, and that this is due to the natives having acquired some degree of immunity. "Several facts," he says, "seem to point this way. Tsetse flies of all sorts abound in the Gambia, a country which is merely the banks of a tropical river, and which consists for at least half its area of the alluvium and swamp which fringe such a river. Here there is every environment favourable to the life and increase of these flies. Cases, few in number though, do occur every year, so that foci of possible infection are present, and practically everywhere we have the Tsetse to carry the infection. Human carriers too would always be numerous, for travellers are many, some for trade, others for agricultural purposes; these being the hundreds of 'Strange farmers' who come in every year for the rains to plant ground-nuts in British territory. As peace and prosperity prevail everywhere there is absolutely nothing to hinder frequent intercourse between all parts of the Protectorate and of the surrounding portions of French Territory. This intercourse is large and widely spread, and means continual coming and going, for our river is still, as it has been for a century or more, the main highway from the sea to the Soudan and the interior, so that nearly all the produce of, and nearly all the imports for the neighbouring countries, as well as our own, are carried to or from our river, which provides easy water transport to Europe. With such frequent movement, therefore, from one end of the country to the other, there must be every facility for the spread of Sleeping Sickness, as there are so many places where travellers in our territory must meet with Tsetse flies—in many places indeed it would be impossible even to take the shortest journey without passing through a Tsetse haunt.

"How is it then that under these conditions, instead of one case here and there, we do not see one case followed by others infected from it, till by now the terrible state of affairs which prevails elsewhere has been reached, if our people are not more or less immune

to the disease, having acquired this immunity in the days when Sleeping Sickness was much more prevalent than at present?"

The explanation, however, of the fact that the Gambia does not show such terrible effects as have been experienced in Uganda, may be that the Gambia natives are of better physique and better fed, and are therefore better fitted to resist disease. Also the towns are better situated than in the cases in Uganda where the disease has been prevalent, as nearly all are at a considerable distance from the river, and are surrounded by a clearing of cultivated land. It is said that tsetse flies never live in such towns. Dr. Hopkinson mentions that the natives thoroughly believe in Kola as "good medicine," and observes that it is undoubtedly a wonderful stimulant and antidote to fatigue. Whatever may be the virtues of this product, it seems highly probable, in view of the fact that a considerable want of food has occurred in some of the worst districts, that good nourishment has a good deal to do with keeping the disease down. On the other hand, the theory that immunity may be acquired is supported by the case of cattle in the Gambia which are infected by trypanosomiasis but are fit and well and are now spreading to districts where they could not thrive formerly. Also it is significant that in Europeans the disease is more rapid; they appear rarely to live till the real sleeping stage is reached. It is possible, of course, that both good physique and acquired immunity contribute to the diminution of the disease, and in any case it is happily clear that things are much better than they were.

"Native tradition asserts that in earlier times the disease was much more prevalent in the Gambia than it is now, and whole districts, now desirable dwelling-places, are said to have been uninhabitable. In the Protectorate, this particularly applies to Nianija, which in former days bore such evil name that its inhabitants were few or non-existent, but is now a rich and fairly thickly populated country inhabited mainly by Turankos, a branch of the Foulah race and a prosperous people, who are the owners of large quantities of cattle. Accounts too of the slave-trade and the frequent awful mortality among the slave-gangs and slave-ship cargoes from this disease, all provide additional evidence to show in those days sleeping sickness was a much commoner disease in the Gambia, one of the chief centres of the export trade in slaves, than it is now."

---

### **Malarial Fever.**

The last medical report of the Gold Coast states that the curve for Malaria begins to rise slowly after the rains set in and reaches its greatest height in August. There is then a fall, and a second but smaller rise in October, followed by another fall. The prevalence of the disease is in direct proportion to the anopheline rate.

It does not begin to rise until some time after the commencement of the rains, because there has not yet been time for any great number of mosquitoes to be bred and become infected. During the heavy rains, moreover, stagnant pools suited to the habits of the anopheles are less numerous and constantly being flushed out by flood water, and it is, therefore, only when the rainfall is decreasing and these pools remain for longer periods that the great rise in the malarial rate takes place.

---

**The Anopheline Mosquito.**

A little book on this topic, published by Mr. John Murray, price 6d., has been written for use in schools by Mr. R. C. Daughish, of Barberton, assisted by Dr. Stephens, of the Liverpool School of Tropical Medicine. It puts the facts in a plain way suitable for children, and, as the subject is eminently fit for inclusion in the elementary education of the countries affected, it is to be hoped that a wide use will be made of it.

---

## COLONIAL STAMPS.

THE first stamps with the portrait of H.M. the King to be issued by a Crown Colony will be despatched in the middle of January. They will be from the general keyplate which we may call for convenience the Nyasaland type, as that Protectorate was the first to use it. The difference between this keyplate and the well-known one generally referred to by philatelists as the De La Rue type (apart from its appearance) is that the former necessitates the employment of a border plate, whereas the latter is used with an overprint plate. The border plate must be at least as large as the keyplate, as the border has to be printed first, whereas the overprint plate, as its name denotes, is printed from after the impression has been produced upon the paper by means of the keyplate. The method adopted is that if, for instance, a 120-set keyplate is used, the paper with 120 impressions may be cut in half, and the overprint applied to the 60-set sheets. A border plate costs more than an overprint plate.

With regard to the appearance of the two sorts of keyplate it may be observed that the Nyasaland type, carrying a larger head and crown, leaves no room for the name of the issuing country at the top of the stamp. The positions each side of the crown are well adapted for containing the denomination of the stamp in figures, while the name of the Colony can only appear at the foot of the stamp. In the case of the De La Rue type of keyplate the crown and head are so small that when they are centred there is plenty of room for the name of the Colony at the top,

Representations have been received from at least one Colonial Government to the effect that the value shows up much more clearly if it is printed in solid colour on a background which is the colour of the paper used. It is intended to adopt this suggestion when new plates are manufactured, except where this would result in the second colour being insufficiently conspicuous, in which case it would be better to have the figure in white on an absolutely solid ground of colour.

There is only one type of general keyplate for the production of large-sized stamps, and it is one which requires the use of border plates. The name of the issuing country can be inserted either at the top or the bottom of the stamp.

“Chats on Postage Stamps,” by Mr. F. Melville, is a volume which is sure of a welcome by philatelists of all kinds. It is well got up and illustrated, and contains matter of interest, not only for beginners, but even for the apparently decreasing minority who have not yet begun. Forming a part, as it does, of a series dealing with such subjects as Old China, Old Furniture, Old Prints, and Miniatures, it seems at first sight to make a definite claim for Stamp Collecting to an equal place with the collecting of the treasures of art in all its branches; but chapter vii. gives a clue to a very deep-seated difference between this and the other hobbies of which the series treats. The value of stamps, which is the measure of the extent to which they are sought after, does not depend in the slightest degree upon their beauty, or their place in the history of a particular art, *i.e.*, miniature colour printing, but upon rarity, and the stamp which has been defaced with the crudest overprint, is worth many times as much as the same stamp, or a stamp of far better execution, design, and beauty, which is not similarly defaced. This is the chief reason why stamp collecting can never make good a claim, which is often seriously put forward, to the position of an art or a science. It is a thing apart, which Mr. Melville describes as “a world-wide Freemasonry and an open sesame to the fellowship and hospitality of collectors everywhere.”

ANTIGUA.—2d., 3d. and 2s. stamps (arms design) are being supplied on surfaced paper. They have not previously been supplied on multiple watermark paper.

BRUNEI.—30 cents. and \$1 stamps have been supplied in similar colours to those in which the stamps of the same values for the Straits Settlements Government are printed. The remainder of the issue will shortly follow suit, with the exception of the 2 cents., which will remain as at present. Special single colour printing plates will be employed for all values except the 2 cents., 30 cents., and \$1 values.

GOLD COAST.—2s. and £1 stamps have been supplied for the first time on surfaced paper; 5s. and 10s. stamps for the first time in the new colours and on surfaced paper.

JAMAICA.—Books of stamps will shortly be supplied with advertisements printed on the interleaves.

MALTA.—4d. stamps have been supplied in the new colours.

ST. HELENA.—4d. and 6d. stamps have been supplied on surfaced paper, as they used to be before the last supply was sent out.

STRAITS SETTLEMENTS.—4 cents. and 10 cents. stamps have been supplied on surfaced paper. The colour of the former has reverted practically to what it used to be.

TRENGGANU.—Two further values have been supplied, *i.e.*, \$5 green centre and purple border, and \$25 carmine centre and green border. Both stamps are of the large size and are on surfaced paper.

## RECENT TRANSFERS AND PROMOTIONS MADE BY THE SECRETARY OF STATE.

- Mr. CLAUD SEVERN (Secretary to High Commissioner, Malay States, and Private Secretary to Governor, Straits Settlements), Colonial Secretary, Hong Kong.
- Mr. A. EARNSHAW (Puisne Judge, Gold Coast), Puisne Judge, British Guiana.
- Mr. L. E. HAWTAYNE (Stipendiary Magistrate, British Guiana), Puisne Judge, Gold Coast.
- Mr. G. O'D. WALTON (Police Magistrate, Barbados), Magistrate, St. Kitts.
- Mr. W. A. MILLER, A.M.I.C.E. (Colonial Engineer and Surveyor-General, Dominica), Commissioner of Works, Fiji.
- Dr. J. LUNN (Medical Officer, West African Medical Staff), Inspecting Officer, Medical Department, Ceylon.
- Dr. E. LANGLEY HUNT, C.M.G. (Medical Officer, West African Medical Staff), Inspecting Officer, Medical Department, Ceylon.
- Dr. F. L. NORRIS (Chief Government Medical Officer, Antigua), Chief Medical Officer, Bahamas.
- Mr. K. R. CHATFIELD (Temporary Assistant Engineer, Public Works Department, Northern Nigeria), Engineer of Roads, Gold Coast.
- Mr. CHARLES O'FARRELL (late Sergeant, Transvaal Town Police), Assistant Superintendent of Police, Gambia.
- Mr. W. RANSLEY (late Preventive Inspector, Customs Department, Sierra Leone), Inspector of Produce, Customs Department, Southern Nigeria.
- Mr. H. R. BILTCLIFFE (Sergeant-Major of Police and Constabulary, Bahamas), Gaoler, Gold Coast.
- Mr. J. CONCANNON (Sergeant-Major of Police, St. Vincent), Gaoler, Gold Coast.

## OFFICIALS ON LEAVE OF ABSENCE IN THIS COUNTRY WITH DATE OF EXPIRATION OF LEAVE.

—

This List is compiled from the Leave Certificates sent to the Crown Agents for the Colonies. The Editors will be glad to receive notice of any other cases of Colonial Officials on Long Leave.

## EDITORIAL NOTES.

The first annual report of the High Commissioner of Australia is written in the clear and frank style characteristic of Sir G. H. Reid. His aim is to advertise Australia's attractions. "Publicity—publicity—publicity—is the beginning and the end of Australia's needs in every part of the world, but especially in the older and more crowded communities inhabited by the white races, a definition which is beginning, in my mind, to include even the United States of America." That the United States are now pouring out men and capital wherever an inducement is found requires no proof, and Canada benefits greatly by the opportunities which she is able to offer to her neighbour. She has also from her topographical position the first pull on the British emigrant. As Sir G. H. Reid says:

"There are many obvious reasons for the hitherto marked difference between the attractiveness of Canada and that of Australia in the eyes of British emigrants. In the first place, the extremely short, as compared with the extremely long, distance. They can couple with their choice of Canada swift, cheap transit, and the easier chance of returning to their native land. The choice of Australia seems like perpetual exile to the Antipodes. Then the very expensive advertising campaign conducted by the

Canadian Government for a number of years has been strongly reinforced by liberal outlays on the part of railway as well as shipping companies.

"The present state of affairs in London in relation to Australia in which the Commonwealth has so much to do with the work of attracting emigrants, and nothing to do with its results, in the shape of emigration, which are divided amongst agencies of six distinct Governments, affords another marked contrast between Canada and Australia. The friendly spirit and good understanding which prevails between the six Agents-General and myself greatly relieves a situation which would otherwise be manifestly difficult, if not absolutely absurd."

Not much progress can be looked for in the matter of emigration to Australia until the States and the Federal Government agree as to the policy to be pursued and the way it is to be carried out, and for the present it is doubtful whether so much will be done as Sir G. H. Reid would like to see.

There is no lack of emigrants, but there is a shortage of shipping accommodation, and shipowners cannot be expected to make satisfactory provision until a definite policy is adopted.

---

Sir G. H. Reid blames the British Press for the "astounding ignorance which prevails in this country about the Australian Continent." He considers that there is a ludicrous want of proportion shown in the long notices of insignificant phases of insignificant affairs in "petty European States" as compared with the rare and brief notices of the affairs of the Commonwealth.

From a purely Imperial point of view there is force in this, and we trust that the general interest in colonial affairs will grow; but there is no getting away from the fact that with the ordinary reader the nearness of a scene of action increase his interest and distance tends to repel it. We should hesitate to speculate which of the continental countries, of which so much is written, come under the head of the "petty European States" referred to by Sir G. H. Reid, but at any rate they are places which are constantly visited by Englishmen, and which are largely associated with the history and literature of this country. Something must be allowed for the numerous claims which are made upon the attention of the British public. Sir G. H. Reid observes of London that "perhaps that which most lifts it above every other centre is the range of its interests, more or less intimately associated as they are with the concerns of every nation and every port." With such demands upon it, it can hardly be expected that the press here, concerned as it is almost entirely with the

movement of the immediate present, can afford much space for the descriptive matter which is likely to interest the emigrant or the capitalist. Such people must be approached more directly, as Canadian methods show. It is evident, however, that newspapers of all classes are giving more and more attention to news from the colonies.

---

The new Commonwealth office, the building of which has been commenced, will certainly do much to make Australia loom larger in the eyes of the British public. A freehold was secured from the London County Council at a cost of £370,000, including the Victoria building, and it is intended to spend £220,000 on the construction, which will occupy about two-and-a-half years. The material will be Portland stone. A leading feature will be a broad entrance and spacious hall, which will help to make the building one of the sights of London.

---

There have been negotiations for an improved service between Australia and Canada, and probably this will result in an important contribution to the "All-Red" route. The Pacific slope offers an excellent market to Australia. The advantage which the Australian producer has here, as in Europe, is that his season is the winter of the North. He is already supplying large quantities of meat to Manilla, and his exports to the North American continent are sure to grow rapidly. Up to the present London has been the dominant centre of consumption and distribution of Australia's meat, fruit and dairy produce, and has practically settled the world's prices for these goods. With the expansion of the industry to other markets these prices will tend upwards.

---

When "deferred traffic" was accepted at lower rates on the cable lines at the beginning of the year there was some misgiving whether the concession would not take away a substantial part of the revenue from the ordinary traffic. So far the results on the Pacific cable have shown that no such loss occurs. There has been a substantial amount of "deferred" business, but it is all new, except in press messages. The case is another example of the fact that reductions in charges to suit special cases may be made profitably.

---

In the Northern Territory of Australia the policy of the land regulations, which are now under consideration, reflects the idea of a "White Australia." The aim is to create a cattle-raising country in preference to any attempt to establish tropical agriculture. Huge

leasehold areas will be granted to pastoralists, and some of the holdings may embrace 3,000 or 4,000 square miles. The system of land development will be to interpose between the great pastoral holdings and the market which will be created by the erection of freezing works, smaller areas, with a limit of about 100 square miles. The idea is that these smaller areas shall be used with the aid of fodder cultivation for the fattening of store cattle drawn from the grading leases, and it is hoped that the result will be increased profit to the breeder, coupled with substantial benefit to the fatterer. Several large ranchers from Arizona are prepared to invest considerable sums in pastoral leases, and arrangements are in train to secure tenants for the fattening farms from among the British farmers experienced in the industry. At the same time experimental work will be carried on in agriculture with special attention to fodder crops in order that the policy of development may be inaugurated. A powerful plant is being provided for the cleaning of the land.

---

“The Australian aboriginal is not nearly such a low type of man as he is generally believed to be.” This is the judgment of Dr. Eric Mjöberg, who has conducted a Swedish scientific expedition to the north of Western Australia, and it will be welcomed by the anthropologists who find a close resemblance between the native Australian type and the primitive man of Europe. “The skull indicates a low type, but it is not quite right to come to a strict conclusion on the form of the skull. They can learn to read and speak and write English perfectly. The mission boy is able to learn all the accomplishments of a white man. He becomes proficient in music, and can learn to do mostly anything. The trouble with the Australian aboriginal is that he has developed in a special direction. His whole skill lies in tracking and hunting. He is a splendid tracker and hunter. In their wild state we found them perfect physical types. Along the routes where there were stations the blacks were poor specimens, and showed signs of physical deterioration. The main cause of this deterioration is their not being allowed to go naked. It is absolutely wrong to clothe them. They are not used to it, having gone without clothes in that hot climate for centuries, and they develop chest trouble, ending in consumption and death. The whole country inland from Derby is fever-laden, and the civilised natives get it acutely, many of them dying. The native in his wild state is more or less immune to it.” The specialisation has gone on so long that it is difficult or perhaps impossible for the native to adapt himself to new conditions. But it came about naturally from the life which he had to lead, and is not a proof that the type would not have progressed under circumstances more favourable to mental development.

The railways in South Africa will soon require grain elevators on a large scale, and the American systems are being studied. They are wanted for maize, which is destined to become the staple agricultural product of the country. This is the most important of all crops, wherever it can be grown. No other gives such an enormous yield of both grain and fodder, or can be grown more easily or cheaply. It is the maize industry more than anything else that has led to the growth of the meat-packing business in Chicago and Kansas City, which are in the heart of the maize belt. The United States grow maize over an area which is more than one-third of the Union of South Africa, and the crop, which is worth £330,000,000 on the farm, is used for a great number of industrial as well as feeding purposes. It is essentially a dry-land crop, and is therefore more suitable for South Africa than wheat. It is said that the most profitable method of disposing of maize grain is to send it to market on four legs, that is, to turn it into a second product before selling, such as beef, pork, milk, butter, etc. It is highly digestible, easily masticated, and the fodder is one of the cheapest and most valuable of stock foods. Its many uses as a raw material of manufacture make it a great asset in other ways. In time, when the South African farmers have studied its cultivation better, vast districts will probably be devoted to it, and great cities, as in America, will live on its products.

The British territory of Walfisch Bay has attracted a good deal of attention from an international point of view, and is one of those places which regularly come up for mention from time to time in this connection. The country itself is probably the most desolate in the South African Union. It consists practically of nothing but shifting sand-dunes. With one exception no vegetation of any kind exists. The south-western wind covers everything with sand. An account of the district given in the Agricultural Journal of the Union states that there is no drinking water in the whole district; a few water holes may be found here and there, yielding a brackish nauseating fluid, but even these give out frequently. At the bay settlement a Government condensing station supplies the necessary drinking water. The district is about twenty-seven miles by forty and has only a few white inhabitants at the bay. The native population, mostly Hottentots, number about 800, and are the poorest people in the Union. Their habitats in the desert consists of a few sticks put into the sandhills and covered over with old sacks. The poorest hovels of the Natal coolies are palaces in comparison. The Hottentots are being steadily decimated by tuberculosis. A few are engaged at the Government works at the bay, others go to the neighbouring German town, Swakopmund, the rest live on fish caught in the bay and on the Narrah fruit.

The Narrah or Narra is one of the most interesting products of nature. For the inhabitants of the territory of Walfisch Bay it is of the utmost importance, being practically their only food. A failure of the narra season would inevitably mean death from starvation for hundreds. The plant—if such it can be called—belongs to the species of cucurbitaceae or pumpkins, but unlike all pumpkins or melons it is leafless. The leaves are crippled in their first formation and from their centres shoot out, always in pairs, long and very sharp thorns. And this is the very protection needed against animals devouring the fruit. A kind Providence seems to have given the plant specially to the poor inhabitants of the desert, and thus protected and preserved it for them only. The root is not unlike a bramble-bush root and goes 40, 50, and 60 feet down through the sand-dunes until it strikes moist ground. A further protection was needed against the terrible sandstorms raging almost daily and forming immense chains of sand-dunes. For that purpose the plant was given a marvellous power of growth. No matter how often the stem may be covered with sand, its growth always outstrips the sand and the stem remains “top-dog” and pierces through. If it had leaves like the pumpkin or melon, the sand would weigh them down and with them the stem, which would then be irretrievably lost and perish. Nature is performing thus one of its wonders in preserving the stem leafless, and with it the only means of yielding the only food for the wretched dwellers in the desert. It is marvellously nutritious, a veritable wonder of the desert.

---

The difficulty of census taking was particularly great in the Federated Malay States, largely in consequence of the babel of tongues which prevails. Schedules were filled up in fifteen different languages, to say nothing of three which defied identification. The usual treatment of figures is inapplicable to these territories, where 60 per cent. of the population is migratory and movements depend largely on non-local causes; thus a wave of immigration may be due to a bad harvest in South China. However, a great increase has occurred in the last decade, the census figures being now 1,036,999, as against 678,595 in 1901. Even this rate of increase (52·8) is less than that of the previous decade (62·1). The increase in the last decade is, of course, mostly due to rubber. The increase of Chinese, though remarkable enough, is dwarfed by that of Indians. There is ample room for more, for the population is still only about one-fourth that of Ceylon, which is of almost the same area. A distinction in favour of Indian immigrants is that they show no marked disinclination to bring their families, whereas the Chinese do, and no section of them profess that it is not allowable.

The spread of Mahommedanism in Africa is exciting wide attention, and we notice from a recent report that the German officials in East Africa are concerned over it. It appears to be considered that the movement is not fundamentally due to any religious feeling, but simply to the physical fact that the period of lactation in such countries is often for two or even three years, and that by tribal custom co-habitation between husband and wife during this period is forbidden. The result is the practice of polygamy, at any rate so far as the prohibited period is concerned. The erring native, if he has been converted to Christianity, is then expelled from the mission, and betakes himself to the more convenient fold of Islam. There is another reason for the popularity of the latter faith. The negro becomes the equal, in the religious ceremonies, of the most important personages among his new co-religionists. In the Christian church, it is said, he does not get this impression; the white man always seems to him to have a higher place, and he himself is relegated to the second position.

---

The recent developments in Nyasaland are highly creditable to both the official and the unofficial classes of the community, which have worked well together and with admirable spirit. But the country is now approaching the limit of cultivation unless the transport is extended. An extension towards Zomba and the Lake is urgently required, and at Port Herald there is sometimes a veritable block of produce and much stuff has been destroyed. A great amount of rich country will be available when communications are improved. The success of cotton in this country is a very satisfactory feature. With more experience and care a greater yield per acre will no doubt be secured. The Director of Agriculture believes that with selection and pedigree breeding the strength of the Upland cotton could be so much improved that it will reap in a greater degree the high prices paid for superior Egyptian cotton.

---

The arrangements for the extension of the Shire Highlands Railway to Beira invite attention to the general scheme of railway enterprise in Central Africa. The line from Port Herald to Blantyre is but a short one of 115 miles, and constitutes a portage along a difficult part of the Shire river. The Mozambique Company is preparing to construct a line from the frontier to the coast at Beira, and when this is done the benefit to Nyasaland will be very great. The Mozambique Company has a territory of 300,000 square miles, and paid a dividend of 5 per cent. in 1910. From the Northern end of Lake Nyasa a line will no doubt eventually be laid over the 250 miles which separate it from Lake Tanganyika. The latter water

is now nearly connected with the Atlantic, via the Congo. Along the Congo three portages have been constructed: the first from Matadé, at the head of the estuary, to Leopoldville, the second from Stanleyville to Ponthierville, and the third from Kindu to Kongolo. This last point is only 187 miles from Lake Tanganyika, and the Congo Lakes Company is now constructing a railway over this stretch. In this way communication may eventually be established between the Indian and the Atlantic oceans. But the route from Beira will not be the first to reach Lake Tanganyika from the east. This achievement will fall to the German line from Bar-es-Salaam to Kigoma on the Lake, which is well advanced and is expected to be opened in 1914. The richness of the tropical produce of Central Africa is the attraction for these railways from east and west. The continuation of the lines from the south has been due to the minerals of Katanga, but there is no present indication of any scheme to bridge the distance between this country and Lake Tanganyika. Katanga in fact will be tapped by the Benguella Railway in a way which puts the "Cape to Cairo" idea out of court for a long time.

---

The revenue of the East Africa Protectorate in 1910-11 amounted to £609,586, an increase of £106,546 over that of the previous year. A pleasing feature in the returns is that the exports of the Protectorate's produce showed an advance of no less than 45 per cent. The greatest increase was in copra, and it is to be hoped that the extensions of this industry will be carried on, as there is nothing artificial or transient in the rise of prices for fats of all kinds. It must, however, be recognised that the exports from German East Africa through our Protectorate exceed those from the Protectorate itself, and that in 1910-11 these showed an increase of 70 per cent. The prosperity of the German colony is thus a very great help to the Uganda Railway, and it is to be hoped that it will continue to be so, but the realisation of the German railway schemes will make a great difference.

---

There have been many complaints that the development of British East Africa has been retarded by the inability of the authorities to issue titles to land as fast as they are wanted. This is a result of the Government ownership of land. The Government claims generally on the coast all waste land, whether it has been cultivated in the past or not, but it does not know, until it has made an examination, what comes under this claim, and thus transactions have to be suspended. A Land Titles ordinance was passed in 1910 which set up an arbitration board to deal with a district of particular importance. But an enormous amount of work remains to be done.

It appears that there were in 1911 over 1½ million acres of "arrears" which the Survey Department had been asked to survey for settlers and the Administration, without including the surveys required at the coast for the registration of titles. One can only sympathise with the small and hard-working staff which has to face this mountain of work, under pressure from many quarters. It was calculated that the field-work of this would take the present staff some four years from March, 1911. Eventually all purchasers from the Government will benefit by acquiring an indisputable title.

---

In Uganda in 1910-11 there was a phenomenal expansion of the export trade. The increase in domestic exports over the previous years is greater than the total export of five years ago. The greatest increase was in cotton, the value of which was £168,620 as against £60,000 in the previous year. The Jinja railway will now help materially to swell the returns. Great attention is given to agriculture in the schools for native boys, the sons of chiefs, and in this way the natives will be instructed how to develop their own lands. It is satisfactory to find that in 1910-11 deaths from sleeping sickness continued to decrease in numbers, and fresh infections were rarely met with. The report states that practically no inquiries were received from persons outside Uganda and East Africa for land. The local demand amongst those having a knowledge of the country and its possibilities has, however, increased rapidly, and all pieces of Crown land in what are regarded as good planting districts have been taken up almost as soon as they became available by the operations of the Survey Department. Planters of a very desirable type, some having come from home, some from East Africa, but the majority men having a personal acquaintance with the country through Government service, and recognising its possibilities, have taken up land and are energetically developing it to qualify for a freehold. One estate only, that of the Kivuvu Rubber Company, is as yet approaching the dividend stage. Rubber, coffee, and cocoa have been planted on the estate, and all reports regarding these typical products are of a most favourable character.

---

The Game Warden of the East Africa Protectorate does not agree with the opinion commonly held that the present standard of sport cannot be continued for more than a few years, but thinks that under properly organised protection the magnificent stock of game at present existing will last for many years. No doubt the game is a very valuable asset. "The Big Game Hunter, far from decreasing, is becoming more numerous every year and will continue to do so, and the demand for this shooting

is likely to increase steadily, as the game in other parts of Africa becomes exterminated. It is, therefore, undoubtedly wise policy to preserve as strictly as possible the *unsettled areas* which constitute the shooting grounds not only near the railway line but also in the furthest outlying districts. Other branch lines must eventually be constructed which will bring these areas, at present inaccessible, within easy reach of sportsmen." It seems likely that the hunt for ivory will soon exterminate the elephant in every part of Africa except our own possessions, and this consideration supports the suggestion that trade in ivory should be regulated more severely.

---

The export of cocoa from the Gold Coast now exceeds that from San Thomé, and a notable feature of it is that it is the result of native industry and small plantations. Usually in such countries the work of planting is left to the women, but here the men do it. The neighbourhood of an old white settlement has had its effect, and the men value money as the means of buying the productions of civilization. The result is seen in a higher standard of living, greater intelligence and good methods. An indication of the care taken is the increasing sale of spraying machines. There is abundance of land available, but the quantity of labour will not go much further, and in this matter the extension of the railway will be a substantial help by setting free men who are engaged in the heavy work of carrying. No doubt on the whole a better article is produced on the big San Thomé plantations under European management, but we may be thankful that on the Gold Coast the industry remains in the hands of the natives, who are in every way directly benefited by it.

---

In Northern Nigeria the cessation of punitive expeditions testifies to the soundness of the principles on which the administration is carried on, and in particular to the prudence shown in the methods of taxation. In each native State a Treasury known as a "Beit-el-Mal" is established. The mode of assessment is varied to suit the character of the place. If there is a strong native authority, a village is assessed at a lump sum, and the apportionment of the amounts to be paid by individuals is left to the village head and his council. Where the society is less organised so that the work of apportionment could not be effectively performed by the natives, there is a fixed tax per caput. This is the case in the pagan districts. In the Emirate of Borneo a combination of the two methods is adopted, part of

the tax being in the form of a fixed rate per caput and part being collected by the headman according to the property of the individual. The taxes collected in each native unit are divided into four parts. Two of these form the Government share. The other two are paid into the "Beit-el-Mal." One of these goes to the Emir and his officials and thus covers local works, education and the administration of justice; the other is divided among the district and village heads in proportion to the rents and taxes for the collection of which they are responsible. The funds administered by the "Beit-el-Mal" in 1910-11 amounted to over £200,000.

---

The appointment of Sir Frederick Lugard as Governor of both Northern and Southern Nigeria comes at a very opportune time, as it is very difficult to settle the railway policy as between the Lagos and the Niger route unless there is one authority for both possessions. The union of the two administrations will no doubt follow in no long time, but the appointment of the Governor meets the immediate requirements and makes it possible to consider the scheme of amalgamation deliberately. No great difficulty was experienced in effecting the union of Southern Nigeria and Lagos, though the result has been to throw more responsibility on the Provincial Commissioners.

It does not often happen in our annals that a governor returns to a possession in the acquisition of which he has played a great part. The memory of the trying time when British and French troops faced each other in this territory is still recent, and Sir Frederick Lugard had a heavy task during this period and in inaugurating the administration of the country. He will see great changes now, but they, including the Baro-Kano Railway, have been the developments of his policy.

---

An interesting report has been written by Mr. E. T. Grannum on the trade statistics of Barbados for the period 1896-1910. The colony benefits to the extent of £64,000 a year from remittances from emigrants to Panama. The banana industry is kept back by the want of cold storage transport, and it is to be hoped that this will be provided. It is observed that cotton is indigenous, but the cultivation ceased to be remunerative when sugar realised £20 per ton and upwards, and no attention was paid to it until the Civil War in the United States stopped the exportation of the article from the Southern States. Then, owing to the cotton famine in Lancashire, the cultivation of the plant again received attention until the cessation of hostilities caused the blockade of the Southern ports to be raised

and the exportation from them to be resumed. From this time until 1902-3 the cultivation was discontinued. In 1902 and 1903 at the instigation and with the hearty co-operation of Sir Daniel Morris, the Imperial Commissioner of Agriculture, who, accompanied by Mr. John R. Bovell, had previously made a tour through the Southern States with the object of acquiring information on the subject and of selecting the best kind of seed, the cultivation was again resumed and continued steadily until the present time, with results which have placed cotton amongst the staple products of the Island. The total value of cotton shipped for the eight years 1903-10, is £275,743, the largest crop being in 1907, when the value of the cotton shipped was £83,362.

---

Grenada in 1910-11 attained a record revenue of £81,413. Substantial improvement was due to the measures taken for the suppression of smuggling. Very noticeable is the increase of trade with Canada, the figures rising from £7,943 in 1909 to £22,722. Cocoa is the staple product, and there is a large export to the United States and to France. The Land Settlement scheme in Carriacou has been a great success, and is being introduced in the Island of Grenada. The peasant proprietary of the colony is holding its own. It is to be hoped that it will extend its industries, as the devotion to cocoa is too great to be prudent.

---

In Jamaica steady if uneventful progress has gone on. The most noticeable industrial feature is the extension of the area devoted to bananas. As a result of the increased production of fruit and minor products a greater import occurs of flour and bread. The reductions of customs charges effected in 1910 led to considerably increased importation—thus the abolition of duty on wire fencing resulted in an increase of 118·9 per cent. In the classification of real property the largest number of holdings is of those which are valued at not over £20, showing the extent of the peasant proprietorate. The *Castilloa* rubber has given promising results. British shipping remains largely predominant, claiming a tonnage of 291,694 against 70,763 foreign. A surplus of £200,000 was anticipated for the financial year 1911-12, and proposals have been under consideration for a fast steamship service with Halifax, connecting there with a fast line to England. This scheme may fit well into the negotiations which have been going on, largely under Canadian auspices, for an improved "All-Red" route across the Atlantic and the Pacific.

The suggestion has been made by the Governor that before the Panama canal is opened Kingston should be made a free port.

It has been reported that an American syndicate is prepared to spend a large sum on the improvement of the harbour on this condition, but no definite proposal has been made.

---

A law has come into force in British Honduras, the object of which is to limit the extent to which labourers can become indebted to their employers. It is ancient history that the indebtedness of a labourer to his employer may set up a relation which is extremely objectionable, and where whatever indebtedness there is is substantially to the employer it is necessary to regulate the transactions to prevent the hold which the employer has from being abused. From the 1st April, 1911, it became illegal to advance more than two month's wages, and from the 1st April, 1912, one and a-half month's wages. Provision is made preventing a labourer from increasing his indebtedness to his employer during the term of his engagement. If a labourer is in debt to his employer he is entitled to receive in cash one-third of the wages earned so that he may be at liberty to purchase what he wants from any vendor he chooses. While the labourer is in debt to his employer at least half of his earnings must be applied to reducing the debt. The employer has to provide the labourer with a pass-book in which every transaction between the employer and labourer must be entered at the time.

---

In Bechuanaland, following advice given by Mr. E. B. Sargant, School Committees have been formed on which the Government, the Missions, and the people are all represented. The Resident Commissioner reports that these Committees consist of the Assistant Commissioner, as Chairman; the resident Missionary as Honorary Secretary; the Chief, and a member elected by the tribe. In each case the people have voluntarily taxed themselves to provide funds, the amount being collected by the Paramount Chiefs simultaneously with the collection of the Government hut tax. It is worthy of note that in each case the tribes when discussing the matter in their "kgotlas" unanimously resolved to request the Government to receive and hold the money produced by the tax. What the outcome of the experiment is likely to be it is impossible at present to say. It marks a distinct advance in the Protectorate, representing as it does the first step, however small a one, in the direction of local self-government. Interest in the matter is keen; whether it will last or gradually fade the future will show.

---

The state ownership of railways has been the subject of an interesting discussion organised by the Royal Economic Society.

Delegates attended from Germany, Belgium and France, and it appears that in the two former countries the state ownership is considered to be successful, while in France there are complaints that it works badly. In this country the opinions expressed were adverse to the idea, though the trend of circumstances in its direction was recognised. The addresses were somewhat vague and inconclusive, and no attempt was made to formulate general principles. It may, however, be deduced from general experience that the principle of state ownership is most in favour when it is the interest and policy of the country to stimulate the export trade. In Germany and Belgium the railways are used with the special object of granting low through rates in conjunction with the maritime trade. Generally speaking, the British colonies which have state railway systems have also been influenced by this motive, the lines having been built to feed the ports with produce for export. In such a country as the United States, where the home trade is enormous as compared with the foreign, the inducement to adopt the system is less. On the whole the tendency is towards state ownership, especially where there is little misgiving about the ability of the Government to control the staff. Where, as Professor Beaulieu stated was the case in France, unreasonable demands may be apprehended, there is no doubt some element of weakness in the system. On this point some remarks in the last South African railway report may be quoted.

“In a large Government department like the railway, which has to consider the claims of men in so many different grades, there is always a danger of concessions being gradually increased without due regard to their value; and unless the tendency on the part of the staff to press for greater privileges is carefully noted, and restrained where necessary, it will reflect on the financial results, which will compare unfavourably with those of railways in other parts of the world. At the present time it costs the Administration approximately £100,000 for annual vacation leave alone, apart from any other privileges to which the staff are entitled.

“I am in favour of privileges being accorded on a reasonably liberal basis to sections of the staff who are likely to remain in the service, as pension, leave of absence and other facilities have a salutary effect in promoting a feeling of satisfaction amongst the men. But what I fear is, that unless the Administration places some check on the constant demand for increased privileges of all kinds, the inevitable result will be that the whole position will have to be reconsidered. Pensions and gratuities especially should be confined to the permanent staff.

“As a whole, the scale of remuneration of the railway staff in South Africa is very high, compared with the rates of pay pre-

vailing on railways in other countries, and this is probably responsible for the tendency to dwell too much upon minor grievances, sometimes largely assumed, and generally much exaggerated. No one will say that cases of hardship do not exist, and it is the earnest endeavour of the Administration to check these and to remove legitimate grievances. In the case of a very large section of the daily-paid staff the scales of pay, taken in conjunction with travelling concessions and other benefits, e.g., pensions on retirement, provide terms of employment more generous than are obtainable outside the service. In fact, the agitation for re-employment on the part of those who have left the service voluntarily or at the instance of the Administration is a constant source of trouble."

In South Africa, however, the railway men are encouraged by the preference given by the Government in favour of white as against black labour. The Crown Colonies are as free as any places can be from difficulties of this sort.

---

The coal strike had the effect of stimulating the press to study the colonial examples of methods of preventing or dealing with strikes, and the British public should now be more or less familiar with the Australian and New Zealand arrangements for settling trade disputes without interruptions of industry. But, in considering whether these methods could be transplanted to this country, it is desirable to bear in mind that the Australasian measures are the work of labour ministries. When the working man is such a power in the land as he is in Australasia, he has more faith in parliamentary institutions and the efficiency of law than when he occupies a comparatively minor place in the administrative scheme. He is more disposed to let his claims be settled by legislative arrangements than by strikes. The New Zealander accepts a law which renders him liable to a fine for abetting a strike, not merely because the employer is also liable to a much larger fine for a lock-out, but because he relies on the Government and its instruments. It would presumably take a good deal of suffering and persuasion to induce the working classes of this country to entrust the same power to the Government. It is, however, a hopeful sign that the advance of democracy, which is inevitable in all progressive countries, tends in Australasia to substitute faith in parliament for deadlocks. There is no doubt in Australia as elsewhere much industrial "unrest," which means chiefly that a better education is training the masses to take a higher view of life, and occasionally an unruly section may rebel against the law, but on the whole it is clear that the parliamentary methods have, to say the least, a great influence in preserving

industrial tranquility. There are no signs, to take the other interest, that capital suffers materially from these arrangements. There are, as may be expected, complaints, but on the whole employers appear to accept the position with remarkable equanimity. Some of this is no doubt due to the great natural resources of the country and some to the protection of manufactures, but much results from the comparative freedom from anxiety about strikes. It is not without reason that here and everywhere else the one protecting provision that every contractor insists on is the strike clause, and if this danger were eliminated his business could be conducted much more securely.

---

Officials and others who wish to visit the Crown Agents' Office will before very long have to search for it in a locality which, while not lacking in dignity, is a little further away from the Colonial Office and West End resorts. Notice has been given that the Government propose to acquire Whitehall Gardens for new Government Offices. Recent legislation has largely increased the number of civil servants, and room must be found for them. In the neighbourhood of the large Government Offices, Whitehall Gardens are the only available vineyard on which the Office of Works can cast covetous eyes, and no doubt the site lends itself to a great building scheme. Many people will regret the disappearance of the historic house in which Peel died, but such memories cannot resist the tide of change, which has already transformed the character of the neighbourhood. The National Club, which, as the resort of many dignitaries of the Church, has long contributed an ecclesiastical character to the locality, will be another victim. Apparently the Banqueting Hall and Gwydyr House will not be touched, so that the Whitehall front will remain as now. The Crown Agents' Office will be removed to one of the London County Council sites fronting the Thames just beyond the Houses of Parliament. It is to be hoped that the change will not cause any diminution in the visits of colonial officers. The advantage of personal discussions is greatly appreciated.

## A GERMAN VIEW OF NEW ZEALAND.

New Zealand : The Country and the People.—BY MAX  
HERZ, M.D. (*T. Werner Laurie*, 12s. 6d. net.)

THE politics of New Zealand have an interest for every part of the Empire, from the youngest and least developed territories to the oldest and most organised, on account of the directness with which all the problems of administration are attacked. The Dominion is the acknowledged laboratory of experimental legislation. The work of treating human ills is there based on a wide spread confidence in the power of law. The New Zealand elector is not troubled by any of those doubts as to the efficiency of parliamentary schemes which it is, or at any rate was till lately, the academical custom to set before the rising youth of this country. Why should he be? He has a clear field. The ground is not cumbered with the failures of his forefathers. He knows what he wants, as for that matter most of us do in any place, but he has the rare advantage of being able to try some method of his own of getting it. There is, therefore, no sickly hue of irresolution about the proceedings of the New Zealand legislature. It is better to act than to theorise, and after all if a law is found unsatisfactory, all that has to be done is to alter it. Everything is plastic, and the needs of the day sway the popular vote. It is recognised that it is experience that teaches, but the quickest way of getting the experience is to go straight at the problem and try a scheme.

The political work is simplified by the fact that it practically all turns on economical questions which directly concern the public. The Dominion is free to take its own course. It is not troubled with foreign politics. It has no Northern Territory, and the native trouble is permanently settled. There are no internal divisions save those of money; the country is one family. The first evidence of this is that every woman, married or single, at twenty-one enjoys the franchise. The bill which carried this act

was passed by a small majority and with no great confidence. But the policy was thought worth a trial, and certainly seems now to be established. Its strength lies largely in the fact that it seems to have had no particular effect either one way or the other. There is no handle against it. The only obvious difference that can be noted is that since the franchise was granted to women there has been a substantial increase in the number of electors who exercise their right to vote. Previously it was about 60 per cent., now it is about 80. Probably domestic discussions, now that woman is personally interested, have stirred up the lethargic voter. This is so much to the good. But it is generally believed that the new franchise has not altered the balance. It is noted that the woman in most cases votes the same as her husband or brothers, and the inference is drawn that she simply doubles the vote. No doubt this is largely the case, but it may be doubted whether feminine influence is not really greater than is supposed. A woman may vote with her nearest male belonging, but she may have converted him first to her own way of thinking. The identity of opinion does not mean that the man has had it all his own way. The theory that the women's vote simply doubles the men's implies that either the intellectual character of women is an exact replica of that of men, which is obviously untrue, or that the women defer entirely to the men, which is exceedingly improbable, in New Zealand as in other civilised countries. The fact is that it is impossible to bring into an electorate a large new class without having some result due to this force. The popular opinion, which largely prevails in Australia as well as in New Zealand, that the admission of women has had no particular effect is due to the circumstance that nothing revolutionary has happened. While any political project is under discussion, there is inevitably a great amount of exaggeration on both sides, and this is specially true of the women's rights question; on the one hand, the advocates of the concession are tempted to dilate on the injustice and brutality of the present laws, which a gentler influence would render sympathetic and benign, and on the other its opponents dread the unpractical character and illogical methods which they ascribe to women reformers. At this stage of the matter, the controversy is between one sex and the other, and largely turns on a question of intellectual comparison. But when once the vote has been granted, the sex question, if New Zealand experience can be relied on, disappears. There is no movement on the part of the new voters to amend the scheme of things generally, but there may be a real, if latent, influence. "Of real influence upon legislation, justice and administration," says Dr. Herz, "there is

none." This strong conclusion is come to because the expected has not happened. If what we anticipate as a natural result does not come to pass, we are apt to ignore any other result. It is true that no situation arises in which one sex is banded against the other, and it is easy to see, especially in the light of some experience, that the political and social divisions of the world are not founded on the sex, but on the family and the class. But in some matters on which men are largely divided, there is a preponderating opinion amongst women which, when they possess the vote, may suffice to turn the scale. Thus it cannot be doubted that it is their influence which carried the liquor law, that is what is now the Licensing Amendment Act of 1910. The striking feature of the last settlement of this subject is that the moderate man, with his ideas of tinkering at the problem by reducing the number of licensed houses here and there, was put aside by both parties. Both the brewers and the abstainers agreed at a conference that the real issue should be that of National Prohibition. Every three years the voters have the right of saying whether there shall be local and also whether there shall be national prohibition. A majority of three-fifths is required to carry prohibition. Probably the brewers doubted whether so drastic a measure as prohibition would be much adopted, and in any case they preferred to take the chance to the certain losses which they would sustain if all the strength of the agitation went towards terminating individual licenses. However, the movement is all in the direction of prohibition. At every election some more districts are closed. The curious feature is that the drink bill all this time does not decrease. In the towns, at any rate, there is a good deal of drinking at bars, and it is said that the English custom of "shouting" has been brought to perfection. Drinking, however, as a pastime, is practically confined to men, and the influence which is gradually establishing prohibition is largely traceable to women voters.

In Australia it is generally believed that the women strengthen the Labour vote. There the process can be seen clearly as the Liberals and Labour are distinct parties. In New Zealand so far this separation has not come to pass. But there is reason to think that on the whole the vote supports Labour. There are no particular signs that in the higher circles of society the average woman prizes the vote or has given herself any special mission in politics, and her usual habits and tastes do not fit easily into the roughness of political agitation. The ladies of New Zealand remain what they were. But in the lower ranks the working woman appreciates and uses the vote because she has the practical object of endeavouring to better her position. It was anticipated by

some that the women would to some extent support the clergy in the matter of religious education—an idea which prevails in other countries. But this has not happened. The women have not set up a distinct party in this or other subjects.

The New Zealand legislation in which lookers-on are most interested is that which deals with labour troubles. The Act for the settlement of all differences between employer and workman by arbitration was passed in 1894. The prime object of such a policy is to prevent the paralysis of trade. The object can only be effected by giving the workman protection, and in practice this often means supporting demands for higher wages. But in New Zealand as elsewhere strikes occur, not for higher wages, but on points which seem inconsiderable in comparison with a stoppage of industry. Out of three great strikes which led to further legislation only one arose out of a demand for an increase of wages. The fact that these strikes occurred, notwithstanding the Arbitration Act, was considered to show, not that the scheme should be abandoned, but that it should be strengthened. In 1908 a further Act was passed which made both employers and workers liable to fines for striking, instigating a strike, or locking-out. It is noteworthy that the fines increase when industries are concerned which are necessary to the public, i.e., such articles as gas, milk, meat, coal or the working of railways or tramways. A union may be fined for supporting a strike. All this shows a determination to deal strongly with the mischief. Doubts may be felt whether the machinery would stand a great strain, but to say the least it is effective to most ordinary occasions. The economic position is excellent. There is no poverty in New Zealand, and the average wealth per caput is estimated at £280. This does not suggest that capital and industry have suffered from the restraints placed upon them.

Dr. Herz appears to regard the politics of New Zealand with mixed admiration and distrust. The whole law-making, he says, is indicative of a lust for experimenting, but he admits that everything is done in a businesslike manner. "Is a law found proven and workable, well and good? If not, it is soon altered or abolished." He thinks, however, that much is done without proper reasons. Thus he cannot see any occasion for the liquor legislation. The only explanation that he can suggest is that the New Zealander regards the law as a "Sunday School Teacher." "The confessors of this unbreakable faith went searching around the globe for reformatory laws, with which their country-men were to be changed into angels, whether they wanted or not, and hit upon the Prohibition Laws in America. These the diggers of the moral gold brought home to bear upon their

neighbours." No doubt the attempts made under Anglo-Saxon influences to deal legislatively with intemperance present something of a mystery to the German mind. Dr. Herz does not believe that drunkenness can be combated by laws, and very naturally instances the case of Germany, "where the exemption of liquor, which is almost harmless when compared with the strong whiskies and beers, is decreasing." His own remedy is to make life less dull. "To show the people higher aims, a better reality, to let culture and art enter every vein of public life, for I maintain that anyone who has filled his heart with the joy which Rembrandt and Titian, Bach, Beethoven, Wagner, Shakespeare, and Goethe, the Venus of Milo, the Winged Victory of Samothrace, and Mona Lisa can give, who has drunk from the cups of culture and wisdom, will keep away from bars and maids and drinks, without the help of a law." We cite this list of purifying influences with respect, but it is necessary to admit that they do not go far in such countries as New Zealand. The reason may be given in Dr. Herz' own words: "It must be remembered that nearly all came from the poorer citizen and peasant classes, whose burden of dull toil left them neither time nor opportunity to develop a higher culture, or deepen the æsthetic feelings. The people who came out here had to work, and to work hard. They had to wrestle with the soil, to clear the bush, to plough and to harvest, and to wage a battle of life and death with blood-thirsty Maoris." Such work makes a practical and virile race, and the New Zealander, braced by this training, faces the administrative problems with an abundance of buoyancy and optimism. Dr. Herz considers that he is a Philistine—"a shocking Philistine and Bœotian in matters of art." It may be admitted that German idealism cannot be at once transplanted to such a soil. National culture is the work of ages, and politics are concerned only with the actual facts and human nature as it is.

Dr. Herz observes that the political war in New Zealand is over purely material interests—higher wages and shorter hours. This is hardly peculiar to the Dominion, as this is the root question everywhere where the masses have votes. But he freely acknowledges that "to a German it is really refreshing to see how objectively the elections are fought here. There are no personal calumnies and offences, no washing of dirty linen in public, and no candidates need fear that he will emerge from the contest with mud clinging to his character. Fair play is the supreme law." Despite the devotion to "material interests," there is no doubt that there is a family feeling among the New Zealanders, which goes far to temper the austerities of political warfare. Despite

the freedom of talk, and nowhere are questions more freely discussed than in New Zealand, and the exuberance of legislation, the fact remains that there has been little disturbance of industry. The mental culture will come. "Always," to quote Dr. Herz' words, "when hunger has been stilled, art has come into blossom. Here, too, men will rise who will be the teachers of the people, and will lead the yearning masses in the right channels." In the meantime it is satisfactory to know that in the opinion of Dr. Herz the New Zealander leads "a right comfortable life."

A German view of New Zealand would hardly be complete without a reference to the defence question. Dr. Herz mentions the training in shooting. "This sort of Army will always raise a smile on German lips." No doubt it must seem very insufficient to the German citizen. "The rifle shooting of schoolboys, the volunteers, the forts at Auckland, Wellington, and Dunedin, the Defence Council, and even the big guns in Albert Park, will be insufficient, and will fail—fail miserably, when there is a real foe to be kept out. Something more is needed—above all, universal training, which, in imitation of Germany's example, will have to be introduced sooner or later." Pending this happy consummation it can only be hoped that the "real foe" will not get there. Whatever may be thought of this matter, every reader of Dr. Herz' book will enjoy a brightly written and suggestive description of the land and the manners of the New Zealanders.

## THE DEFENCE OF SOUTH AFRICA.

The Union of South Africa is recognising the fact that self-government brings with it the obligation of making provision for self-defence. At present such provision on the part of the Union is conspicuously lacking, and a country which has seen so much warfare cannot feel satisfied with the position. The comparative smallness of the white population as compared with the native creates a special incentive to give the young men a military training, and on the whole the habits of life are fairly favourable for the purpose. The defence scheme, which has been under consideration and for which a bill has been prepared, contemplates a system resembling that of this country in that it would provide both a permanent or paid professional force and a citizen force which would be called upon in case of necessity. The latter force, however, would be on a much wider basis than our voluntary army.

The principle of compulsory and universal service between the ages of seventeen and sixty, to provide for very grave emergencies, is adopted. It is not, however, proposed to train the whole population. Such a course would embrace a greater number than it is reasonable to expect would be required, would impose too heavy a financial burden, and would probably not result in efficiency. The solution adopted is to require from every able-bodied person the proper knowledge of how to use a rifle, as a minimum. After this every citizen has the option of undergoing a certain course of training for four years, or of making an annual payment of £1 a year for twenty-four years; and if a ballot is necessary to obtain the force undergoing the four years' course he takes his chance of being drawn.

The period of training is to be carried out between the ages of seventeen and twenty-five, and in general will be as follows:—

(a) The course will start with an efficiency recruit training. Recruits will perform as many day and night drills as may be necessary to fit them for the ranks.

(b) After the recruit course the whole force will annually undergo a period of continuous training varying from eight to fifteen days in the different arms, and will fire an annual course of musketry.

(c) The time of year at which the continuous training will take place will be arranged in each locality with special regard to the seasons and general convenience.

(d) Mounted troops will perform almost the whole of their training continuously in camps, but trained men of other arms will have to perform a certain number of day drills throughout the year.

(e) Certain days only will be set apart for day drills and will be arranged so as to ensure a full attendance of the unit concerned on each occasion.

The defence requirements are stated as follows:—

(1) A trained citizen force of such numbers and so organized that a formidable and effective army can be put into the field before any danger can seriously menace the peace of South Africa. This force should constitute the First Line of Defence.

(2) Trained citizen reserves capable of heavily reinforcing the first line.

(3) A national reserve of all able-bodied citizens to meet an extremity.

It is, however, necessary in South Africa to supplement the first line in two important particulars: (a) by providing for a small nucleus of permanent forces, and (b) by making special provision for the defence of defending South African ports.

(a) A small permanent paid force is required for three purposes:—

Firstly, to provide a small but highly efficient and easily mobilized body of troops, which, without any dislocation of public and private business, can be rapidly moved to any spot where violence and disorder is threatened. This can be organized from the present mounted police forces into regiments called the South African Mounted Riflemen. They should continue to do police duty in time of peace, but should also be trained for military purposes.

Secondly, to furnish a highly efficient professional body of South Africans who will form the permanent administrative and instructional staff of the citizen forces. This is practically a new but a most important feature in South African defence.

Thirdly, to furnish a small number of complete units of artillery, an arm which depends for its utility in war on the maintenance of the highest standard of military efficiency.

With a small number of these permanent artillery units trained to the highest standard, it is hoped to form a nucleus by intimate association with which a satisfactory standard of efficiency can be reached in artillery units of the citizen forces. The artillery batteries will be incorporated in the South African Mounted Riflemen in the same way as the present organization of the Cape Mounted Riflemen provides for a battery of artillery.

(b) While the main defence of the South African coast line and the security of the South African shipping routes must necessarily rest with the maintenance of sea-power by the British Navy, provision must be made for the military defence of the most important of the Union harbours. For this purpose it is necessary to have a special force (the Coast Garrison Force) whose duty it will be to provide adequately for coast defence.

A weak point in such defence schemes is frequently the difficulty of providing competent officers. In South Africa there is at present available much valuable material for the purpose, and the establishment is contemplated of a South African Military College. A special class of instruction for six months will be instituted at once for the education of officers.

The first line will have a territorial organization, and a force of 20,000 to 25,000 men is contemplated, though probably this number will only be gradually attained. An interesting feature of the scheme is the modified ballot system. It is hoped that it will not be necessary to resort to compulsion in order to obtain the force, but the possibility of this is provided for. The objection to a ballot system is that it is haphazard, and accordingly the registering officer is to make up three rolls in each district in order to discriminate.

In the first class, or on the first provisional roll, he will place those who should find no difficulty in undergoing four years' training in the Active Citizen Force, e.g. men receiving a good salary or earning an adequate income, and able to get away for regular or occasional holidays.

On the second roll he will place those who will find it less easy to undergo that training, e.g. men drawing small salaries or making a bare living, with few opportunities for getting away, or having special domestic ties.

On the third roll he will place those who will find a real difficulty in giving up the time required for the training, e.g. daily paid artisans and labourers.

These rolls having been framed for a district, the shortage of numbers in that district to be made good by ballot is

notified by the Government, and after that notification a local revising court is appointed to revise the rolls and hear objections. When those objections are disposed of, the rolls become final, and in June the ballot is held by drawing from the rolls in sequence, first exhausting the numbers on the first roll, then the second roll, and finally the third roll.

An important provision is one requiring every employer to give all proper facilities to his employees for carrying out the prescribed training or service in a Rifle Association. Any failure to do so, or any attempt to penalize an employee or any person seeking employment from carrying out such training, will constitute an offence. This protection is of great value, as though no doubt it can be evaded in individual cases it will be effective where members are concerned.

It is evidently expected that the first line will be recruited primarily from the higher classes of the community. This is inevitable when the force is unpaid and no capitation grants are made. It is believed that the additional demand on Union revenues will not exceed £300,000 a year. For this additional outlay it is hoped that it will be possible not only to organize a citizen army at least three times the size of the present militia and volunteer forces and more highly trained and efficient, but in addition to secure a permanent striking force of about 2,500 mounted riflemen, a permanent artillery force of the highest standard, an adequate system of coastal defence, and finally a military college in which a sound technical training will be given to the future military leaders of South Africa.

The scheme so far as it puts the labouring class in the background would hardly command itself to countries when that class is the most numerous. But in South Africa the natives to a very great extent fill the room of that class, and the daily paid white labourers are a comparatively small section. With reference to the conditions of South Africa the scheme appears to have been carefully thought out, and it is to be hoped that the high results aimed at will be attained.

With this scheme may be compared that of New Zealand, where the principle of compulsory military training was adopted in 1909, and where the progress of the movement now admits of some examination. In the first instance the limits of age were 12 to 21, but in 1910 the latter was extended to 25 in order to meet Lord Kitchener's scheme. A certain amount of recalcitancy has been shown, as was to be expected; but at the most the proportion of defaulters does not exceed 25 per cent., and this will no doubt be reduced as the scheme is put into regular working order. The strength of the force is likely soon to reach 30,000, which is 10,000 above the proportion indicated in Lord Kitchener's report. The general support given to the scheme is of good omen.

## PENSION SCHEMES FOR CIVIL SERVANTS.

The conditions on which Civil Servants in Great Britain may retire with pensions have now reached what appears to be a final stage, so far as this may be said of human institutions, but this state of stability has only been arrived at after a vast amount of discussion and repeated legislation. Past controversies in such matters are lightly forgotten when a settlement has been attained, but they retain a considerable interest for countries which have not attained to the same point. It has always been difficult to fix any principle in the matter, and the history of the legislative efforts shows a singular absence of any continuous policy. In fact, each successive enactment seems to have been passed to annul its predecessor. The first Act which granted pensions on retirement was in 1810, and was framed in a liberal spirit. But before long it came to be thought that the privilege was too great, and in 1822 another Act was passed making it necessary for civil servants to contribute. This arrangement had a short life, and in 1824 the provision for contributions was repealed and the contributions which had been collected were returned. This generous spirit lasted till 1829, when the contributing principle was restored, the amount being  $2\frac{1}{2}$  per cent. on salaries up to a certain limit and 5 per cent. above it. This went on till 1859, when free pensions were granted, being one-sixtieth of the final salary for every year of service, not exceeding forty-sixtieths. The settlement on this footing remained undisturbed till lately, but the subject was frequently discussed. For a time the pensions were looked upon as a gift by the State which could only be gratefully accepted. The men already in office were of course directly benefited by the abandonment of the contribution. But as time went on and new men came in, the belief arose that the pension had an effect on the amount of salary paid to them, and was therefore in effect "deferred pay." It was, we believe, officially maintained that pensions were not "deferred pay," and this was correct in the sense that in fixing rates of

salary it was not the practice to base the sum in any case on what appeared to be a reasonable salary and then to lower it according to the value of the pension right; but in a larger sense, as the attraction to the service consisted in not merely the salary but the salary plus the pension, men were in fact obtained for a smaller salary than would have been the case if there had been no pension. In other words, whatever may have been the intention of the Treasury, the normal economical rule applied and the pension became part of the consideration offered to and accepted by the civil servant, and affected the amount of the other part of the consideration. That this was not merely theoretical but practical was shown by cases in which a higher rate of remuneration had to be paid when no pension was granted than was paid for the same class of work where one was granted. It may indeed be argued that, generally speaking, it is cheaper, provided the work to be done is of a permanent character, to grant salaries plus pensions than to grant salaries alone. The moral influence of the expectation of a pension is very great, apart from its purely economical value. A higher standard of integrity and conscientiousness is secured, for the State is virtually holding something back which will be forfeited by misconduct. But as this view grew that pensions were "deferred pay," two objections began to be felt to the system on which they were granted. One was that civil servants could themselves do better with the amount of their contributions than the State could, and the other that it was unjust that the whole of the amount should be forfeited by death or resignation before the age of retirement. These arguments resulted in the Superannuation Act of 1909, which provides for the payment of a year's salary on death whilst still in the service, for a cash payment on retirement of one-thirtieth of a year's salary for each year of service, and on the other hand for the reduction of the pension from one-sixtieth to one-eightieth for each year of service. This arrangement secures a possible provision for widows and orphans whether an officer (after five years' service) dies in harness or after retirement. There is, it is true, no obligation on the employé to leave the money in either case to his widow and children, and no doubt it was considered that any attempt to secure it to them would be too great an interference with domestic arrangements. The option of coming into the scheme has been generally accepted by present members of the service, and it is clear therefore that the desirability of having a provision in case of death has been widely appreciated.

In this way therefore the civil service pension is recognised as a deferred annuity corresponding more or less to the difference between the salary received and the salary which would be payable if there had been no pension. From this point of view the

system is really a contributory one, and it is so regarded in the report prepared for the United States Government by Mr. H. D. Brown (61st Congress, 2nd session, Senate Document, No. 290 of 1910). It is interesting to compare the experiences of that prolific hive of state systems, New Zealand. There pensions, without contributions, was granted in 1858. In 1871 they were abolished, but one month's pay was granted for each year of service. In 1886 a retirement fund was established, and in 1893 compulsory insurance was substituted. Both systems worked unsatisfactorily, and in 1908 an Act was passed setting up a contributory system, and providing for a pension on the British scale plus an annual allowance to widows and young children. This arrangement has given general satisfaction, and the press, though recognizing that a heavy charge would be laid on the revenue, was favourable to it. Here the contributory character of the system is open, but there is no material difference in principle between this and the British arrangement, except as regards the provision for widows and orphans.

This last provision is required to cover completely the requirements of the civil servant, and in the recently granted power of election and in the Widows' and Orphans' Fund established in several colonies the consideration is recognised. It must be admitted, however, that the case for such provision is not on all fours with that of ordinary pensions for the life of civil servants. Such pensions are really necessary to keep the service efficient. Without them many men would remain in office when long past the power to be of useful service, and in the government service of this or any country it would be impossible to prevent this. It is this difficulty which has brought up the question in the United States. Mr. Brown states: "There is one problem of the service, however, that the law (Civil Service Law) has not solved, and that is the problem of superannuation. Without provision for retirement of the aged officeholder a law which in practical operation insures him a permanent tenure of office works an injustice to the Government, since it permits the retention in the service of many who have outlived their usefulness. It is true that the law does specifically provide for the removal of the incompetent on the proper record of the existence of incompetency, but such a provision has proved to be inadequate where incompetency is the result of old age. The majority of executive officials are undoubtedly too tender-hearted to dismiss a subordinate whose only faults are attributed to his weight of years. The result is that he is allowed to remain, quite unfit to perform his duties, practically a pensioner, and the work he is unable to do is divided among the younger clerks. . . . Many of them are

past 80, and nonagenarians have occasionally been on the Government pay roll. Paralytics are sometimes brought to office in wheeled chairs, and it frequently happens that a wife or child escorts the head of the house to his desk each day."

These are no doubt extreme cases, but it is clear that government servants in large numbers remain on in the United States long after their efficiency has been seriously impaired. It may be suggested that there should be, as in this country, a compulsory age for retirement, with provision for extensions in instances where they are plainly desirable, but it is difficult to carry out this system when it would lead to severe hardship in great numbers of cases. The result is that in the United States the country pays as much and very likely a great deal more in the shape of salaries to employees who have outlived their usefulness than it would if it granted pensions. It has thus all the cost of pensions, with the inevitable defects of a vicious system. It is these considerations which prompted President Taft's observation on the subject in his congressional message in 1909, in the course of which he observed: "Every reform directed toward improvement in the average efficiency of Government employees must depend on the ability of the executive to eliminate from Government service those who are inefficient from any cause, and as the degree of efficiency in all the departments is much lessened by the retention of old employees who have outlived their energy and usefulness, it is indispensable to any proper system of economy that provision be made so that their separation from the service shall be easy and inevitable. It is impossible to make such provision unless there is adopted a plan of civil pensions." . . . "We can not, in view of the advancing prices of living, hope to save money by a reduction in the standard of salaries paid. Indeed, if any change is made in that regard, an increase rather than a decrease will be necessary; and the only means of economy will be in reducing the number of employees and in obtaining a greater average of efficiency from those retained in the service."

Mr. Brown's proposal for the United States contemplates a deduction of from about 4 to 11 per cent., to be invested at  $3\frac{1}{2}$  per cent., from each payment of salary, without any contribution from the State, the accumulated amount to be paid over on retirement, or invested in a Government annuity. This would be similar to the Retirement Fund in Canada, where there is no superannuation measure. The objection to such schemes is that probably the civil servant could get a higher interest on his savings or has to pay more for anything he borrows; thus he may be paying 6 per cent. on a mortgage, and it is not pleasant to do this when he is putting by money which earns only  $3\frac{1}{2}$  per cent. The "Civilian"

at Ottawa, which has discussed the subject in the interests of the Civil Service of the Dominion, objects to the arrangement on this ground. The objection is not felt so much if the State contributes, and, as the State in the long run really pays the same whether the employé nominally pays the whole or part, there seems no occasion to have an invidious system, at any rate for new-comers.

In British Guiana the Widows' and Orphans' Fund was established as early as 1873, when a superannuation fund, which had been in existence since 1860, was applied in this way. An abatement was made from salaries of 4 per cent., and the generous rate of 6 per cent. interest was allowed to the fund. Since then scales have been established fixing the amounts of pensions, and the pensions have been made chargeable on the revenues of the colony. A larger provision can now be secured by submitting to an abatement of 5 per cent. The system has been adopted in several Crown Colonies, and is undoubtedly well suited to places where climatic conditions increase the ordinary perils of life and makes insurance expensive.

## REVIEWS AND NOTICES.

**Through Timbuctoo and across the Great Sahara.**—By CAPT. A. H. W. HAYWOOD, F.R.G.S., Royal Artillery. (*Seeley, Service & Co.* 16s. net.)

Captain Haywood spent a six months' leave in crossing from Freetown to Algiers, via Timbuctoo and Gao, and it is matter for regret that this difficult and interesting journey was hurried by the time limit. A very full and varied record of experiences and observations, however, resulted. Some account is given of Sierra Leone, but this is familiar ground, and the real interest begins when French territory is reached. It is always useful to compare the ways of similar peoples, and it may be noted that Captain Haywood was struck by two points—the presence of French women, the wives of officials and traders, in places remote from civilisation, and the universal practice of keeping gardens wherever there are any French. Both customs deserve imitation. In the Bend of the Niger the author had some good sport, and there is evidently a district here that will afford opportunities to the big game hunter for a long time to come. After this he made for Timbuotoo. This historic city is interesting, not so much on its own account, as because it is intimately connected with the explorations of Africa in the last century. Major Laing was killed near it, and Barth and René Caillé visited it. At one time it was the capital of a great black empire, the most powerful in West Africa till the Moorish invasion of 1482. The Moors drove the native races out, mostly to the Bend of the Niger, and were themselves, in the seventeenth century, expelled by the Tuaregs. The city was the centre of the traffic in slaves in this part of Africa, and was, no doubt, a much bigger place than it is now. Probably the Niger flowed past it. One reason for the change is that the desert has crept up to it. This advance is always going on. There is reason to believe that the Sahara has not always been an arid waste. There is an Arab tradition that in olden times certain oases were

islands in an inland sea, and there is a marked depression in the desert which countenances this. "When all the 'oueds' flowed," Captain Haywood observes, "as presumably they must at one time have done, the Adrar must have been a well-watered land, as must also the whole region between the Niger and the Ifora country." There are not wanting remains which show that there was once a large settled population where now the barren waste rules. As in many other hot and sandy countries, the sand remains the ultimate victor, and its triumph is certain when once the trees are doomed. The author concludes from his experiences that it will be impracticable to carry on the Algerian railway system across the Sahara. The project is still frequently discussed in France, not merely with the view of reaching the Niger, but in order to make Algiers the principal northern terminus of the lines which are working their way to the centre of Africa, but the engineering difficulties and the unproductiveness of the country for so vast a stretch make it somewhat of a chimæra for the present. However, the dry atmosphere has one advantage; it is healthy. At Timbuctoo "sickness of any sort is uncommon, and the natives are said to be remarkable for their longevity." The inhabitants of the desert take their character from it. They are very unsociable, and only welcome the approach of the stranger for the sake of loot. Even when sleeping in the Sahara, Captain Haywood remarks, it behoves the traveller to have one eye open. The only way, in fact, in which the denizen of such a country can live is by robbing the caravans which have to pass through it, and the modern Tuareg has been admirably evolved for this purpose. His animal, the camel, shares his sulky disposition. This was discovered in Egypt by Tommy Atkins, as has been explained in Mr. Rudyard Kipling's verse, and Captain Haywood's account may be quoted for closer description. "The camel never seems really happy unless he is absolutely left to himself. Far away from mankind and unobserved, he eats and eats until he is gorged, and then lies down to sleep. If man is at hand he will never eat as well as when by himself, and the presence of a human being seems to have a strange effect on him. . . . When near a man he constantly seems to sulk and not to make the best of himself. I have known camels in the Sahara, who had not had anything to eat for several days, refuse their food after being ill-treated, seemingly preferring to die than to accept any favour from the person who has beaten them." He is, in short, a sad animal, and takes no enjoyment in life. His strong point is his hump. This is his reserve, and when he is on the march he draws on it regularly, so that it steadily decreases in size.

At Insalah, some 936 miles from Gao, French civilisation is struck, this place being important as the junction of caravan routes going north, south and west. The French have done wonders here with artesian wells, but still the sand gains.

Altogether, Captain Haywood travelled 3,758 miles across Africa, 1,560 of which were through the Sahara, and is heartily to be congratulated on the success of his enterprise, and the very clear account which he has given of it.

---

**The Tailed Head-hunters of Nigeria:** An account of an official's seven years' experiences in the Northern Nigerian Pagan belt, and a description of the manners, habits and customs of the native tribes.—By MAJOR A. J. N. TREMEARNE, F.R.G.S., F.R.A.I. (*Seeley, Service & Co.* 16s. net.)

Major Tremearne is a noted anthropologist and in this work he has collected new materials of exceptional interest. The book has a wider range than the first part of the above title would imply, as the writer draws freely upon his personal experiences of life in various parts of Nigeria, and discusses many matters which will attract readers who have no particular taste for heads or tails customs. Many will, no doubt, read with a sympathy born of experience the remarks that "the discomfort and the amount of filth one eats are responsible for many more deaths and invalidings than is the infamous mosquito, and were it possible to give each man a two-roomed brick house to himself (something like those allotted to black clerks), and to encourage him to bring out wife or sister to look after it, there would not be the same necessity to work out wonderful schemes of soaking the ground—or himself, I forget which—in kerozene. Doubtless much can be done in cantonments by following rules laid down by the medical authorities, but it is quite impossible to keep a grass roofed and windowless mud hut mosquito-proof for very long, and I have yet to meet the official who can afford to fill up the holes in his compound with kerozene when it costs perhaps £2 a tin! Nor has any one in Northern Nigeria the chance to retire under mosquito curtains at sundown every night—the only time available for recreation is between 4 p.m. and 7 p.m., and even were one never to go out to dinner, he would often have work of some kind to do in the evening. Still, the local Government does its best for the officials, and the medical staff is a body composed of able and conscientious men (and having once been a medical student myself, I can sympathise with their aims, even though I may think their recommendations in some cases impracticable), for on the whole the doctors and nurses have worked wonders in West Africa. The

Colonial Office, too, is quite as anxious to improve the conditions, and, after all, most who go to West Africa expect a certain amount of discomfort and hardship."

A contribution may also be quoted to the ethical question of the nature of a black man's gratitude. "I remember at Sierra Leone receiving presents of bananas from a private of the West African Regiment who was always on the spot asking if he could not do something or other for me. I wanted to pay him for the fruit, but he refused to accept anything, saying that I was his father and mother and a few other people, and that his gifts were made solely on account of his natural love and affection for me. I was very much pleased to find a contradiction to the arguments of some of the officers who (having had more experience of the Coast) said that there was no such thing as gratitude in the negro's nature, but after a few days the man asked me when he was going to get his stripe, and I remembered that there was a vacancy for a lance-corporal. He did not get it, poor fellow—such disinterested concern for my wants seemed worthy of a better reward—but I paid him the full market price for what he had given me, and, strange to say, my relationship as father, mother, protector and a few other people seemed before long to have entirely faded from his mind."

There are head-hunters in several other countries, such as the Dyaks, but the West African tribes, which are fond of tails as well as heads, may now be unique, though the practice was at one time widespread. It is the married women who prize the tail, which is made of a palm fibre, very tightly drawn together and bound with string; usually it is decorated with beads. It is related of one tribe that they have tails about six inches long, for which they have to dig holes when they sit down, but this inconvenient length is exceptional. Major Tremearne recalls the cases in medieval Europe where legends describing certain races as having tails were believed in; in fact at one time it was widely believed on the continent that Englishmen possessed this mark of the beast. Bishop Bayle wrote that "an Englishman now cannot travayle in an other land, by way of merchandysse or any other honest occupyng, but it is most contumotiously thrown in his tethe that all Englishmen have tailes," and the legend was so persistent that until lately Devonians believed that Cornishmen had tails, and at Bannockburn the Scots are said to have sung songs about the tailed Englishmen. This idea seems to have had an ecclesiastical origin, but where the tail is really assumed it is either of phallic origin, or, more likely, an imitation of the animals. Major Tremearne's instances will probably not endure much longer. They are taken from districts in the neighbourhood of the newly

exploited tin districts, and the discovery of these base minerals will, it may be regretfully admitted, "soon render the people useless anthropologically."

The book, as might be expected, contains excellent chapters on the customs and superstitions of the natives. There is an account of food and drink, in which it is stated that "Of meats there are the small rat and mouse, and bat, all of which are said to be very good in soup," but probably this is meant to apply only to native tastes. There is also a chapter on music and dancing, and a praiseworthy attempt is made to reproduce some characteristic tunes. Native songs are, it is said, usually sad and have a "haunting note" in the melody. It will no doubt interest musicians to trace this note in the scores given. The book is in fact a wonderful collection of observations and studies, and a review can only lightly indicate the mass of material dealt with. It can certainly be read and re-read with profit by everyone interested in the country. Those officials who have not hitherto met the new Governor will be specially interested to read of him that "his knowledge of the details of every department was astonishing; and although he expected every official to do two men's work on half-a-man's pay, he set the example himself by covering an amount of ground that would keep six ordinary persons occupied even in a healthy country."

---

**Through Polynesia and Papua wanderings with a camera in Southern Seas.**—By F. BURNETT. (*Francis Griffiths*. 12s. 6d. net.)

Mr. Burnett, who is an expert describer of travel experiences, gives an observant and up-to-date account in this book of Tahiti, the Cook Islands, the Solomons, and New Guinea. The South Sea islands are in many respects rapidly changing, and the advent of the Panama canal will accentuate the process, but the climate and scenery will always retain their original attractiveness. Nor is there lacking the charm of a mysterious past. In various parts, notably at Easter Island, there are the monuments of a megalithic race, which, whatever it was, was certainly not the latter day Polynesian. There is a similarity between these giant sculptures and the cromlechs of Western Europe which indicates a common origin, though how the creators of the art divided is a matter of speculation. The sculptures found in the ruined cities of Central America support the theory that the islands were once larger and more closely connected with the American as well as the Asiatic continent.

Mr. Burnett is not an ordinary traveller, as he has studied the islands well and has views of his own on their administration. In particular he directs his criticisms against two bodies—the missionaries and the British officials. In many cases the missions have added to their legitimate functions commercial transactions which are in any case open to criticism and which in some cases have resulted in abuses. As regards the administration, Mr. Burnett severely arraigns the procedure of certain punitive expeditions, in which he alleges, the native “boys” employed committed brutal outrages. He attacks the officials for “monumental ignorance,” and in particular indicts them for not providing in the Solomons any hospital or government medical officer, though there was in 1909 a revenue of £10,603. No doubt it is good for any administration to be criticised, but in weighing the results of the administration it is only fair to bear in mind that the Solomon Islands are a peculiarly difficult place to govern. As Mr. Burnett explains, the Malaita native is “an unique specimen of humanity. He is ferocious and sometimes cruel. . . . He is a genial murderer. Hatred or malice towards his victims does not enter into his composition. Killing with him is merely a form of diversion, on a par with chewing betel nut and indulging in feasts.” Mr. Burnett, on the other hand, is fully satisfied with the administration of New Guinea, where he considers the white population is receiving good value for its contribution to the exchequer.

---

**The British West Indies: Their History, Resources and Progress.**—By ALGERNON E. ASPINALL. (*Sir Isaac Pitman & Sons, Limited.* 7s. 6d. net.)

No better qualified writer of an account of the West Indies for the “All Red” series could have been found than the able and energetic secretary of the West Indies Committee, and it goes without saying that such a volume will be thoroughly up-to-date in its facts and reasonable in its comments. The history of the group has often been told in recent compilations, and has certainly strong claims to attention, if only because it was in West Indian waters that the British navy achieved some of its most brilliant feats and British enterprise laid the foundation of the modern empire. Mr. Aspinall, however, has been well advised not to burden his work with too detailed a description of past events, but to devote most of his space to the existing features of the islands, and any one who wishes to understand the present position of their resources and products will find the facts fully and

clearly set out. Thus a connected explanation is given of the pitch lake and oil developments in Trinidad, in the course of which a well-merited tribute is paid to Mr. Randolph Rust, to whose energy and confidence the present position of the oil industry is in no small measure due. The last chapter is devoted to the question of federation, and despite the attractions of the idea Mr. Aspinall finally concludes that political federation is impracticable, though, as intimated in his preface, he is in favour of greater uniformity in all matters that concern the West Indies. The difficulty is to secure such uniformity without federation, and in considering the problem it must not be forgotten that attempts to carry federation have within recent memory been attended by strong opposition and serious disturbances. In all the varied matters treated of by Mr. Aspinall we only notice one omission. Jamaica, he remarks, has the great advantage of being the West Indian colony selected by the trustees of Mr. Rhodes to benefit from the scholarship scheme. The privilege was also given to Bermuda.

---

**Unification : United West Indies.** — By JOSEPH RIPPON.  
(*Waterlow & Sons Ltd.*)

This is a collection of papers, including those contributed to this Journal by Dr. G. B. Mason, Mr. R. H. McCarthy and Mr. Rippon himself, dealing with proposals to unify the administration of the West Indies. Mr. Rippon, whose energy in stimulating discussion of the subject is well known, has done useful work in collecting these materials. He observes in his preface that "the trend of opinion in the colonies, upon which everything depends, is gradually towards a simple and economical way to provide for unification, so as to deal as a whole with commercial arrangements and other matters, such as judiciary, codification of laws, etc., most advantageously. In fact there seems to be no doubt that unification is being gradually and satisfactorily reached, as conferences of delegates from all the Islands and the United Kingdom have been held on various subjects at Trinidad and Barbados, and this should lead to the appointment, jointly by all the Legislatures, of a permanent Secretariat (of, say, two persons), whose duty would be to preserve records, to maintain continuity and activity, and to summon Conferences on subjects demanding consideration; the delegates to such Conferences, to be appointed by the Legislatures, would naturally be selected with a view of their qualification to discuss them." This seems to be a reasonable ideal, and is similar to the arrangement made by the Imperial Conference. It is no doubt

important that the present constitutions should not be interfered with, a point on which Mr. C. Gideon Murray has laid stress, but this is consistent with much concerted action, and, academically speaking, it would appear possible to specify certain subjects of common interest with which a Federal Council or Conference, or whatever it might be called, could deal. The main object is to further commerce, and in such a matter union is strength. It is, however, clear that the movement must come from the Islands themselves.

---

**Report on Economic Entomology.**—By F. P. JEPSON, Government Entomologist, Fiji.

Fiji probably enjoys a larger insect fauna than most countries similarly situated, and it was no doubt high time that an expert should be employed to report on the mischief. Insects are kept down by crop rotation, but this system is not much practised in Fiji. Another prevention is clean cultivation. Mr. Jepson observes: "That clean cultivation is one of the most important factors in the control of insect pests is an established fact of scientific agriculture. Unfortunately this is not as commonly practised in this Colony as it should be. It is not an uncommon thing to see refuse lying about plantations which should have been destroyed long before. Decaying refuse forms a refuge and breeding ground for all manner of insect pests. I have seen lying about plantations heaps of banana suckers which have been discarded as unfit for planting, owing to their being infested with borer. Such a heap constitutes a nursery where the borers can multiply, and from which they are distributed in their thousands all over the neighbouring plantations. It is most important that such discarded suckers should be destroyed. They are difficult to burn, but burying deeply between layers of lime should prove fatal to any insect fauna which they contain. As soon as a crop has been harvested any refuse in connection with the crop should be at once collected and destroyed, as it is in such refuse that many insects pass the time which elapses between the harvesting of one crop and the planting of the succeeding one. In all cases the remains of a diseased crop should be destroyed at once, and on no account should they be allowed to lie about on the ground."

Mr. Jepson states that mosquitoes never appear to bite the ankles through white stockings or socks. It is worth while to try this precaution. Dilute carbolic acid (3 per cent.) applied to mosquito bites is said to give instant relief. A very effective house trap is a box lined with dark green thick paper and exposed with the lid

open during the night on the verandah; in the morning the lid is closed and a few cc. of benzine introduced through a line in it. In this way a large bag of dead mosquitoes was regularly obtained.

A very clear account is given of insects injurious to man and crops.

---

#### **Southern Nigeria Handbook, 1912.**

This has been well revised and is a model of what such a handbook should be. It contains a detailed description of the waterways and means of transport which should be useful to traders, and is not, we think, obtainable elsewhere. Each district is separately described and the means of communication specified.

---

#### **Southern Nigeria Survey : First Annual Report. (W. & A. K. Johnson, Ltd.)**

The difficulties of a survey in such a country are very great, as a vast swamp and mangrove forest are and a dense forest belt have to be dealt with. The report explains how these difficulties were successfully grappled with, 4,640 square miles of major and minor triangulations were executed, at a cost working out at 9s. 10d. per square mile.

---

#### **The Grenada Handbook, Directory and Almanac for 1912.— By the COLONIAL SECRETARY. (Wyman & Sons, Ltd.)**

This Handbook gives all the usual information and comprises a very good history, which, however, would gain much in interest by being continued beyond the year 1906. It is to be hoped that the attractions of this favoured island will become better known among tourists.

---

#### **Kanuri Readings, with Vocabulary.—By P. ASKELL BENTON. (Henry Frowde, Oxford University Press. 6s. net.)**

This book contains several Kanuri stories, which are well selected for the purpose, with both word for word equivalents and translations, so that the work of understanding the language is made as easy as possible. There are some facsimiles of Kanuri writing. A compilation of this kind is no easy matter, and credit should be given to the officials who undertake such work. We trust that Mr. Benton may be encouraged to proceed with some of the smaller dialects of the Central Soudan.

**Hausa Sayings and Folk-Lore: with a vocabulary of new words.**—By R. S. FLETCHER, 5th Fusiliers. (*Henry Frowde, Oxford University Press.* 3s. 6d. net.)

This book contains a collection of popular Hausa sayings. Most of them have familiar equivalents in English, and no doubt the simple wisdom of the world is largely the same everywhere. The difference is in the style. In Hausa the reflection is generally expressed with reference to a particular form of illustration, and very frequently it is in the shape of an animal story, characteristic of a period when man saw little difference between himself and the brute. There is also an explanation of the meaning of gestures, which probably originated at a time when speech was undeveloped. The writer observes that "too much attention can hardly be paid to the proverbs, saws and riddles in common use. Properly used they add enormously to conversational effect, especially if introduced allusively." The present collection is certainly very interesting, and the author's comments on the sayings are always clear and to the point.

---

### **Rubber and Gutta Percha.**

The Imperial Institute has issued a large number of reports on samples from the Colonies (Cd. 6022, price 9d.). It appears that in the wet zone of Southern Nigeria, Para rubber can be produced equal to that from Ceylon or Malaya. The same may be said of Dominica. Ceará trees do not give so good a yield, but can be grown in dry situations where Para does not thrive. They would do well for instance in the dry regions of East Africa. The best mode of coagulating the latex in this case seems to be by simply adding water. There are many observations on the subject of coagulation, but definite conclusions have not yet been reached and await further evidence. As to the use of Para seed as a source of oil the following remarks are made:—

"Lastly reference may be made to the investigations conducted at the Imperial Institute into the value of the seeds of the Para rubber tree as a source of oil, as to which reports are included in the present series. It is now some years ago since the oil contained in these seeds was first investigated as to its composition and uses at the Imperial Institute. It was shown that the kernel of this seed, which is easily removed from the thin shell, contains nearly half its weight of oil. This oil was found closely to resemble linseed oil in its composition and properties, falling into the class of drying oils, which are used in the manufacture of paints, of linoleum, and of other materials. It was shown that this oil would command about the same value as linseed oil, and that there would be a considerable demand for it as

a substitute for linseed oil. At first the matter did not seem to be of much immediate importance. Rubber was commanding a high price, and the planter was not inclined to devote attention to a bye-product. Moreover large quantities of seed were not then available, and all seeds were readily taken up at high prices for planting purposes. With the maturing of large rubber plantations all over the world the need for seed for planting is rapidly diminishing, and an enormous quantity of seeds is becoming available. At the same time the fall in the price of rubber and the circumstance that the cost of labour in the plantations will certainly increase has caused the planter to consider the question of finding a market for the seeds. The present time is favourable for the production of rubber seed oil, since it now will command a higher price than that originally quoted, owing to the scarcity and consequent greater value of linseed oil. The reports on this subject which are included in the "Appendix" summarise the present position of the question. The residue or cake left after expression of the oil would be of value as a manure and also possibly as a feeding stuff for animals, and trials on this subject have now been instituted by the Imperial Institute, whilst the question of the cost of collecting the seeds, and the possibility of expressing the oil on the spot, are engaging the attention of rubber planters in several Colonies."

---

**Report on the Forests of Sierra Leone.**—By C. E. LANE POOLE.  
(*Waterlow & Sons.*)

This report gives a lucid description of tropical forests. There are two distinct forms, the Rain Forest and the Savannah Forest. Rain Forest is the name given to the characteristic tropical dense forest. It is recognizable by the height of the trees, reaching a hundred feet and over. The bark is thin as a rule, and offers no special protection against extremes of temperature. Lianes link up the trees one with another, while the branches and stems are covered with epiphytes.

Climbing figs are met with, and these entirely envelope the stems of their hosts. The base of certain species is enlarged into buttresses, while others are provided with prop-roots. The former is typical in the two Beles (*Piptadenia*), while excellent examples of the latter may be seen in the Screw Pine (*Pandanus Candelebrum*) and Cork-wood (*Musanga Smithii*). The shade is dense, and there is little or no wind felt in the heart of the Rain Forest.

A very large number of the trees are provided with the typical hygrophilous leaf with its "dripping point" and hydathodes which aid the plant in excreting water. The dripping that takes

place in the early mornings in the forest is due to this cause, though it is frequently erroneously ascribed to dew. Deciduous trees are the exception in the Rain Forest, and the few that lose their leaves do so only for a short time.

Savannah Forests are open woodlands, the trees standing at a distance from each other, while the intervening space is covered with grass and other herbaceous plants. The trees are tropophytes; they lose their leaves in the dry season, while their stems are covered with a thick protecting bark, which not only enables the tree to combat a long dry season, but actually to resist the fires that yearly rage through the part of the country where these forests occur. There are few evergreen xerophytes, but the vegetation is for the most part tropophilous. The height of the Savannah Forest rarely exceeds 30 feet, except in the case of single trees of the species *Adansonia digitata*, known to the natives as the monkey bread tree. Lianes are entirely absent in the Savannah Forest, and the trunks and branches of the trees are bare of ferns and epiphytes.

Mr. Lane Poole explains how greatly the country has suffered from the destruction of forests. This is a common evil, but Sierra Leone has suffered especially. He states that ninety-nine per cent. of the Rain Forests have been destroyed by the natives in their wasteful method of farming. In the past, tribal wars were of common occurrence, and it was difficult for the native to devote his whole attention to farming, so that the forests were given a sufficient interval of rest to enable them to grow up again. With the cessation of tribal wars, and the growth of peaceful prosperity, and the increase of the population, the farming rotation—the interval between two successive farming operations on the same forest area—has been reduced from nine to five, and even to four years.

When virgin Rain Forest is felled for farming purpose, there is always sufficient natural regeneration to re-establish the forest; but the forest that grows up differs from the virgin forest, in being composed of those species which are most favoured, such as trees that have heavy seeds or winged seeds, or seeds that are carried by birds, or trees that bear annually abundance of seed.

With the felling of the virgin forest there is a decrease of the relative humidity, and those trees that are inclined to be tropophilous, or those that are to a slight degree xerophilous, have a great advantage over the typical hygrophilous tree of the Rain Forest.

Ultimately under this process the grassland overcomes the woodland, and the Rain Forests in the end become pure Savannah. Once the conversion has been effected the relative humidity, moisture, precipitation and climate generally will be so altered and the soil will be so impoverished that the resulting Savannah country

will not support the same agricultural crops. The conversion from an agricultural to pastoral country will be followed by an exodus of a large number of the inhabitants.

The remedy is to form forest reserves, and the solution of the problem will be helped by the introduction of economic trees, such as cocoa and rubber. The difficulty is that the natives like to raise rice and other food crops, and it is this which has led to the destruction of the bush ; but it is clear that this practice should be checked, and the teaching of better agricultural methods will, no doubt, go far to effect this.

---

#### **Gold Coast Concessions.**

A collection of ordinances and regulations governing the grant of concessions in the Gold Coast has been printed and is published by Messrs. Wyman and Sons (1s.).

## BUSINESS NOTES.

The third Congress of the International Association of Tropical Agriculturists will be held in London next year, and in 1914 a Cotton and Fibre Exhibition and a Rubber Exhibition are to take place. A vigorous plea has been published by Mr. S. Simpson for the establishment of a lectureship in this country of tropical agriculture. A great amount of material is available and is rapidly growing, but it cannot be said that there is at present satisfactory provision for the instruction of young men who are ready to go out to the colonies and take up agricultural work. The increasing importance of tropical produce makes the question an important one. "Great Britain," Mr. Simpson observes, "has willingly sent millions of money to develop estates in her own colonies and dependencies. She has also taken a foremost part in providing money and men in the territories of other powers. But up to the present time little has been done to provide facilities for training the men who are to conduct those over-seas operations.

"In the past this has meant great wastage, and much unnecessary loss. Absolute failure has been the result in many cases due entirely to lack of knowledge, whilst in others partial success only has been attained, owing to the cropping and treatment being unsuited to the prevailing conditions.

"The world's demands are rapidly increasing for every kind of produce, and with this increasing demand, there is a strong tendency for prices to rise permanently to a higher level.

"With our tremendous interests involved, every effort should be made to spread knowledge concerning the cultivation of these various crops which mean so much to mankind in general, and to this country with its ever expanding commerce, in particular."

---

**Tin.**—In 1911, the F.M.S. output of tin increased by about 400 tons, rather contrary to general anticipation. In June, a record price was reached in London, and no doubt the rise had an effect in stimulating the production, which in Malaya is more

than usually sensitive to changes of price, owing to the fact that there are other industries to which labour can turn if mining becomes less remunerative. The average price in 1911 was only a little above that in 1910, but a result of the record price was that the London Metal Exchange revised the form of the tin contract to bring it into harmony with the changed conditions of production. The revision is calculated to bring down the average price, a fact to be remembered in making comparisons. The Bauchi Railway and recent discoveries will cause a substantial increase in the Northern Nigeria export, which was about 1,387 tons in 1911, but this production will have to be largely increased to affect the price, the world's production being about 114,000 tons. Tin is rather peculiar in that for most purposes it forms only a small part of the article to which it goes; thus the price does not affect the demand so much as in the case of other metals, and movements depend on the state of the engineering industries. Recently steel and iron prices have been generally advanced by 5 to 10 per cent. and the rebate system has been introduced, but the prospects, subject to strikes, are good, and on the whole it seems likely that the demand will keep the price of tin up to a fairly high level. In Malaya there has been an increase of Chinese immigration and a further increase of the output is likely. In Nigeria it has been calculated that with the help of the railway the cost of transport from the mine to England will be under £20 per ton, and that with proper plant the whole cost of production and freight would be under £50, a very low figure with a market price of about £200 per ton.

---

### Prospecting for Tin.

In the Rhodesian Mining Review some compact suggestions have been made to help prospectors. The general rule is that granite contacts should be kept to. Though no possibilities should be overlooked, it is better to keep inside the schist boundaries than outside the margin of the granite. Greisen may occur in both situations, but the tin-bearing stuff is more apt to be permanent when it occurs in dikes or lodes among the schists.

Cassiterite, the only important ore of tin, is an inconspicuous mineral usually black or brown in colour, and very difficult to detect in weathered rock services, though its grains or crystals tend to stick out, owing to its resistance to alteration. What should be sought in the first instance, perhaps, are dikes containing lithiamica (lepidolite), the striking pink or mauve colour of which is very conspicuous on a newly broken surface of rock. The tin

does not necessarily occur in the lepidolite-bearing rocks, but these are seldom far off. What should be done is to examine the beds of all the neighbouring streams, etc., by the pan, or perhaps even better by the sieve, for the heavy black grains of cassiterite; then try to trace them to their source, always working upstream and uphill. Outcrops of greisen (that is to say rocks made up chiefly of quartz and white or pink mica) should not be neglected, but the stream of deposits and rubble provide samples from much wider areas. Specimens of tin ores and tin-bearing rocks should be carefully studied.

Cassiterite is hard enough to scratch glass, and is extremely heavy—much heavier than pyrites or magnetite, though not quite as heavy as wolfram. Its colour is generally black or brown, and though reddish, yellowish and grey varieties are sometimes seen, these last are distinctly rare. The colour of the fine powder of even dark specimens is comparatively light, usually grey, and sometimes almost white. The streak may be obtained by rubbing on corundum, as the mineral is too hard to be tested on an ordinary piece of porcelain. It is nearly white. Before the blowpipe on charcoal metallic tin may be obtained, using cyanide as a flux, but the test is not much use save on actual pieces of pure cassiterite. Two or three times as much cyanide as ore should be used. Much the best test is with zinc and hydrochloric acid. For this purpose a fragment of the supposed ore, or some grain from the tail obtained by panning, are placed upon a small piece of zinc foil or sheet, say an inch square. If a fragment from a specimen is used it should be scrubbed clean with water; grains from panning are usually clean enough. The zinc is somewhat hollowed, so as to retain a few drops of liquid. A couple of drops of hydrochloric acid (say half acid and half water) are then allowed to fall upon the ore as it lies on the zinc. Brisk effervescence takes place; when this has subsided the grains can be seen (if they are really cassiterite) to have a rather dull coating of metallic tin, similar to that on ordinary galvanised iron. A lens may be used if the grains are small, but the naked eye is usually sufficient.

---

### Rubber.

In Malaya more country was devoted to rubber in the last year, and it is computed that in 1916 the yield in the Far East alone will equal the present consumption of the world. Every possible place is now being exploited for the production of the product. There are undoubtedly strong points about it. The cultivation in proper places is remarkably free from the vicissitudes which beset

other tropical products ; the work is fairly easy and healthy, and the demand is sure to expand. The danger to the producer is that the price may again fall, and the prospects are that it will eventually. The cause of this will of course be the increase of cultivation in a number of places ; thus a French journal claims that Cochin-China will become a serious rival to the British and Dutch possessions, as shortly there will be 8,000,000 Heveas planted. On the other hand it is clear from the differences in the prices obtained that the manufacture varies greatly, and is much inferior in some cases to others in the same neighbourhood ; much further study in fact is required before the best results are generally obtained, and no doubt also the mechanical appliances will be improved.

---

A clear, and on the whole encouraging account is given in "Grenier's Rubber Annual, 1911," of the position of Malayan Companies, many of which would be able to give good dividends at much lower prices. The complaint, however, is expressed that Mincing Lane has captured the trade and is a "veritable plague spot." It is feared that a fall to 2s. 6d. a pound or even 2s. is inevitable, and the opinion is put forward that the explanation is that Mincing Lane is "throttling" the industry. However, since the writing of the Annual the price has moved upwards and the immediate prospects are fairly favourable, whatever may happen later on. By this time the artificial element in the movement has evaporated, and the commodity has settled down to a value dependent on actual supply and demand.

---

### Tea.

It is reported that the last coffee field in Ceylon, one of about forty-eight acres, has been converted into a tea plantation. The enormous development of the tea industry began from about 1884, and in the first instance was due to the failure of coffee. Latterly the progress has been arrested by the competition of rubber, and a very large area which has hitherto been devoted to rubber and tea simultaneously will, in future, be limited to the former. This, it is calculated, will reduce the production of Ceylon tea by 16,000,000 lbs. This will be to the benefit of India, where tea is the most prosperous industry, and where its rival, rubber, is not meeting with any great success.

Australia has given notice, with reference to the importation of tea, of which it takes a great quantity from Ceylon, that there is a fine of £500 for the introduction of any objectionable insect, and it appears that the ordinary Ceylon tea-chest is made of wood

(Tel-kekuna) which harbours great quantities of insects. In this country apparently we are not so particular.

---

### Tobacco.

This product advances steadily in price and the value of Turkish leaf tobacco in particular has gone up abnormally. There is a demand which is sure to bring new sources of supply forward. Types vary with different soil and climates, and it is an advantage to any district to produce a uniform type which establishes a market value. The popular taste trends towards the lighter aromatic kinds, and these can only be grown on soils that are not very dark and rich, for the richer the soil the greater the nicotine and the more rank the tobacco.

---

### Sterilizing Tobacco Seed-Beds.

It has been proven that a faster and healthier growth of seedlings is secured on properly sterilized soil. The reasons for this are due to the fact that after the soil has been heated it is dryer and can be worked into a better seed-bed, and because subjecting the soil to high temperatures helps to bring the plant food contained therein into a soluble condition so that it is readily available. Russell and Hutchinson, in an exhaustive series of experiments, have shown that when soil is heated to 98° C. and then moistened with water there is a rapid increase of ammonia in it, and also that the total amount in it, and also that the total amount of available nitrogen is increased by heating the soil to 91° C. If the soil is sterilized by burning wood, cotton stalks, or trash on it, plant food, such as potash salts, is left in the ashes of the burnt material. When these ashes are mixed with the soil all the plant food they contain, being in a water soluble form, is readily available for the young plants. Another good reason for sterilizing seed-beds is to kill the spores of parasitic fungi and to destroy weed and grass seeds usually lodged in the surface soil. If weeds and grass are allowed to grow in the seed-beds the young seedlings will certainly suffer.

There is a difference of opinion as to the methods, and the South African Agricultural Journal gives an account of experiments conducted by the Government experts with the view of ascertaining how the best results are obtained. Five methods were used:—

(1) *Open Fire Method.*—By this method the soil is sterilized by simply burning wood or other waste material on the top of it, thus providing sufficient heat to destroy weed seeds to a depth of 2 or 3 inches.

(2) *Boiling Water Process.*—When this process is used the seed-bed must first be properly prepared, then boiling water poured on it until the soil is wet 3 or 4 inches deep. In three or four days the operation must be repeated. After the second application of boiling water, do not sow the seed until the bed has dried out properly and the surface has been worked into condition.

(3) *Steaming Process.*—When this process is used the seed-bed is first prepared, and then a specially constructed steam-tight box of any convenient size is inverted over a portion of the bed. The steam is then conducted by means of an iron pipe, into the box, and each portion of the bed steamed for fifteen minutes. The bed should then be allowed to dry properly before the seeds are sown.

(4) *Roasting Process.*—In this method the soil for the seed-bed is dug up and placed in a large receptacle, where it is heated until the soil attains a temperature of approximately 212° F.; the soil is then returned to the place from which it was removed. In America a machine is manufactured and sold, under the name of the “Wyatt Tobacco-Bed Burner,” which is a patent movable device especially designed for this sterilization work. The machine is constructed throughout of heavy sheet iron with adjustable wheel carriage, so that two men can move it. The soil pan over the furnace is 3 feet wide, 9 feet long, and 4 inches deep. The machine is placed at one end, in the middle of the strip of land to be used for seed-beds, and a fire of wood, brush, mealie stalks, or cotton stalks kept going under the front end of the furnace. A block of soil 3 feet wide, 9 feet long, and 3 inches deep, alongside the machine, is shovelled up and placed in the pan and baked for one hour. During the roasting process the soil is turned over two or three times with a long-handled shovel. When the soil is thoroughly roasted it is returned to its original place and another similar block from the other side is treated in a like manner. By this time the block of soil covered by the machine is also sterilized, and the machine can be pushed forward another 9 feet. Thus it will be seen that at each setting of the machine a space of 9 feet square is sterilized. Under ordinary circumstances two men can sterilize 40 to 50 square yards in one day. If a dry soil is being treated less time will be required for each operation, and consequently more ground can be covered in a day; while on the other hand, when dealing with a very wet soil a longer time will be required for each operation. In South Africa the principal advantage of the roasting method of sterilization would be the economical use of fuel.

(5) The fifth square was left untreated.

(6) *Formalin Treatment.*—When formalin is used as the sterilizing agent, the soil is first properly prepared and the seed-bed is then treated with formalin which has been properly diluted with water. One-half of the solution is applied, then after three days the

remaining half is added. After the second application three days are allowed to elapse, when the soil is again worked up and prepared for seeding.

#### COMPARATIVE RESULTS.

1. Open fire method.
2. Boiling water treatment.
3. Steaming process.
4. Roasting process.
5. Check or untreated plot.
6. Formalin treatment.

The open fire method of sterilizing gave the best results. The roasting process came second, and was almost as good as the open fire method. The steaming process came third, but was not quite as good as the roasting process. The formalin treatment came fourth, and was almost as good as the steaming process. The boiling water gave the poorest results of all, and was but little better than the check or untreated plot.

---

#### Flue-cured Tobacco.

The tobacco most in demand is that of the yellow or bright leaf, to produce which curing by heat is required. If the climate at the time is hot and dry, yellow leaf results from air-curing, but if the weather is very damp the leaf becomes dark. Thus the planter is at the mercy of the elements. To make the process certain flue-curing is necessary; this is largely practised in the United States, and might with considerable advantage be more widely adopted in the colonies, especially as the expense is not great. The flue-curing shed should be small, say, 16 ft. square by 20 high, as it should be filled in one day. It should be divided into four rooms, each of which contains five tiers; these will hold 480 laths, each carrying seven plants, or 3,360 in all. The shed can be filled three times a month. The furnace should be 5 ft. long, 2 ft. 6 ins. wide, and 2 ft. 9 ins. high; the flue should be 12 ins. in diameter, and should extend round the inside of the shed about 2 ft. from the wall. Full details of construction and management have been given in the South African Agricultural Journal.

---

#### Tobacco under Tents.

A great amount of tobacco is now being grown in America for cigars under cover. The object is to produce a wrapper leaf of thin texture and sound quality. A desirable subtropical effect is

insured by means of the enclosure inasmuch as it causes a moist condition of atmosphere combined with a more regular temperature. This makes for a greater rapidity of growth and more delicate flavour. Further, owing to the crop being enclosed with cheese cloth, the damage likely to ensue from the ravages of insect pests and wind is minimized. Sun spots are also avoided.

Yields vary from 1,000 lbs. to 1,400 lbs. per acre of cured leaf, and values from 2s. to 16s. per lb., averaging a return per acre of from £75 to £200, according to the proportion of high grade leaf in the crop.

According to the Journal of Agriculture, Victoria, experiments in that State have proved that leaf of better texture can be grown by this method, but so far the cost of covering the field would not be compensated for at the prices offered by manufacturers for the local product. Later on, when Victorian leaf gets a reputation for being high class, growing tobacco under these conditions may become more general, especially as it makes the industry possible in places where growing in the open field is not advisable.

The structure for the cover is made 9 ft. high and covered on the top and sides with cheese cloth. The frame can be built of poles of any diameter from 4 to 8 ins., and placed 12 ins. apart, with battens or galvanized wire stretched across the top to support the cloth and to prevent sagging. The widths of cheese cloth should be sewn together and sewn to the battens or wires. The whole cost will be from £60 to £80 per acre; though, where timber is plentiful and the owner's labour available, the cost will be lower. A cheap quality hessian will answer, but it is not as good as cheese cloth; it will have the effect of darkening the interior of the building which is detrimental to rapid growth. The life of the framework is from two to six years, according to the size and kind of posts used, and of the cheese cloth or hessian, two years.<sup>5</sup>

The report of a leading cigar manufacturing firm on Victorian tent-grown leaf is decidedly encouraging. It reads as follows:—

“They are the best samples of Australian cigar leaf we have ever had submitted to us. We would be prepared to purchase immediately a large quantity of such leaf at a price which we believe would be profitable to the producer, allowing for the extra cost of growing under cover.”

The harvesting of tent-grown leaf differs from that grown in the open, in that the evidences of maturity are not so plain, and if the crop is allowed to over-ripen the quality will suffer. A record of the dates of topping the plants should be kept, and the crop cut within eight weeks of the time the bud is removed; every additional day over that period the leaf will deteriorate in smoking and burning qualities.

### Cotton.

The report of the Department of Agriculture, British East Africa, points out that some 500,000 acres along the south bank of the Juba River could be made suitable for cotton growing if put under irrigation, and that this area would make an appreciable addition to the world's output. There have been some commercial propositions for the development of this territory, but little has come of them so far. In the German West African possessions some crops have been spoilt by drought, and the subject of irrigation is being considered. Most of the planters there combine rubber trees with cotton growing, and this method is increasing in favour. The industry, however, suffers in all such places from the competition of coffee, copra and rubber, the two former of which have gone steadily upwards in value.

An interesting account has appeared in the *Southern Nigeria Gazette* of the dealings in locally grown cotton. Cotton is brought into Sokoto Province and sold wholesale to brokers for rather more than 1d. per lb. The brokers sell to women spinners at a profit of about one shilling per 100 lbs. The article is then spun and woven in strips to make a cloth about 7 ft. by 6 ft. 6 ins., and about 6d. worth of cotton is required to make such a strip. This strip is sold for 4,000 cowries, or just over 2s. 2½d. It is then dyed, and as the profit on this process is very great it is sold for 7,000 cowries (3s. 4d.) to a trader. The trader takes it to French territory, where he exchanges it for three sheep, which on his return he sells to a Lagos-Sokoto trader for 10s. The sheep are taken to Lagos, a journey of 15 days to three weeks, and are sold for 7s. each. With the proceeds the trader buys kola nuts, which he brings back to Sokoto and sells for 39s., making after payment of his expenses a profit of 21s. on the round trip. Thus the original 6d. worth of cotton has in about two months been converted into 39s., and in the manufacture and exchange it is estimated that the persons engaged have earned an average of 8d. per day.

As in the case of many ancient caravan systems, the process is one of some complexity, and it will be interesting to see how modern methods will affect it. For present purposes it is clear that cotton in such districts has a good local market.

---

### The Fruit Trade.

The last season was remarkable for the high prices obtained for imported fruit, and growers in the colonies may well take encouragement from this fact. The reason is of course a greater demand, and this comes chiefly from Germany. In that country, it must be admitted, vendors got generally better prices than in this country; the explanation of this is, at any rate in part, a more

convenient system of marketing, the accommodation at Hamburg being much more convenient for intending buyers than it is at Covent Garden and other London markets. The trade has in fact outgrown the accommodation, and the natural solution will be to organise direct shipments to other distributing centres, such as Manchester and Hull. The demand is enormous, and fruit from any place will arrive in good condition provided (1) it is carefully picked, packed and handled (2) it is cooled before shipment (3) a low even temperature is maintained during transit.

---

### Preservation of Perishables.

Our Ottawa contemporary the "Civilian" in its January number gives an account of the dairy and cold storage branch of the department of agriculture, "one of the genuinely interesting branches of government service." Not only does the department, by lectures and papers, spread the knowledge of scientific processes, but also it watches the transport of the produce from the start to the finish. There is no lapse in the vigilance of the branch after the fruit, butter and cheese have been shipped. Agents are at work observing, noting and keeping tab even down there in the lightless holds, but the agents are not human—in intelligence, in perseverance, in constant attention to their duty they are, in fact, almost superhuman. These little agents are known to science as thermographs. Like seismographs, they record by drawing an ink line over the graduated circumference of a slowly unwinding roll of paper. Unlike the seismograph, by which the rumblings of the earth are chronicled, they keep record of temperature in such a way that one of them taken out of its box at the end of the journey across the ocean bears evidence of the temperature in which the Canadian consignments have been stored from the beginning to the end of the journey. It is one of the most important factors in the sound arrival of fruit at its destined ports that a proper temperature should be maintained. If, through fault of the steamship employees, this is not done, the fact becomes evident at once when the thermograph record is taken from the hold by one of the branch's agents at Liverpool, London or Glasgow. In such a case the shipper is apprised of the fact that he may make complaint and the steamship company is also informed so that necessary improvements in the cold storage system may be made.

The fruit safely arrived at its English or Scotch destination, the vigilance of the branch does not cease. At Liverpool, at London, at Glasgow and at Bristol are agents who meet the incoming ships, observe, record and report on the unloading of

Canadian cargoes, see that they are not let lie too long on wharves or in storage, and advise the shippers if there is any laxity in this respect. These agents, besides, keep the home office at Ottawa advised as to the markets for fruit and dairy produce in Great Britain and on the Continent.

---

In South Africa a peculiar form of chamber has been introduced, known as the Mederer Preserving Chamber, which appears to preserve produce partly by low temperature and partly by germ destruction. The chamber is built with an air space below, and the outer wall is made of absorbent, perforated brick, which is kept in a sodden state; inside this wall are three or four others, with air spaces between. It is argued that this arrangement creates an atmosphere changed with positive electricity and possessing germicidal properties.

Great economical changes are being caused by the preservation of perishables, and probably there will be a vast extension of arrangements for this object.

---

### **Importation of Oil.**

It is expensive to import oil in barrels as compared with supplies from tank steamers, but to get the advantage of the latter considerable quantities must be taken and there must be good anchorage for fairly large steamers. The same steamer can carry various products of petroleum, but not less than the contents of one tank will be discharged at any one port; the capacity of this can be put at from 600 to 1,000 tons; and a tank steamer will not visit a district unless it can dispose of a full cargo, which means several thousand tons. Discharge is best made direct into storage tanks from the ship lying alongside a deep water wharf; but if this cannot be done a floating life line can be used. The average draught of the large tank steamers belonging to the Shell Company, which come to Europe via the Cape, is 28 feet: the Anglo-American have one or two much smaller tankers, but the present tendency is towards the greater draught. At present there are not enough such vessels, but no doubt the deficiency will soon be made up. If the ship cannot get near the wharf, tank barges must be employed; they should be motor-driven and a convenient size is 200 tons. For the storage of fuel oil it is desirable to provide at least two 4,000 ton tanks at the place of discharge. For petroleum spirit tanks of about 300 tons capacity are sufficient, as in the tropics the loss due to evaporation is appreciable. Roughly speaking the cost of fuel oil in tankers is 40s. to 50s. o.i.f., and borneoline about £7 per ton. If importation in

bulk is impracticable, the most economical method is to ship in 50 gallon steel barrels, which when emptied into the storage tanks can be returned.

---

### Clayton Disinfector.

The machine supplied to the Port of London Sanitary Committee for the disinfection of vessels in the Thames is the Clayton Company's dilute gas machine, type "C"; in this instance the machine is erected on a barge on which is also placed a boiler to supply steam to drive the Clayton engine. Or this type, as supplied to several Crown Colonies, is fitted with two cylinder oil motors to drive the Clayton blower, and this arrangement, besides taking up less room, avoids the cost of a boiler and fittings. The extra cost of the oil engine as compared with the steam engine is £50, and, allowing £25 for the gunmetal rotary pump to supply circulating water to the cooler, the total cost of this type is £500 net.

---

### Bamboo Paper.

Experiments in making paper from bamboo seem to have been successful. Firms who have tried them, in Berkshire and Ireland, announce good results. It appears that  $2\frac{1}{4}$  tons of bamboo yield one ton of paper. Where this product is abundant, and there is an ample supply of water, the industry might very well be remunerative.

---

### Automatic Stamp Selling Machines.

These convenient machines are supplied at £12 12s. each, with a reduction on a quantity. They must be made specially to suit the exact dimensions of the stamps issued. Their life is said to be from 20 to 25 years. The necessary rolls of stamps can be made by hand if care is exercised, or a machine for the purpose can be bought for £8 8s., or they can be made up here for 3d. per roll of 1,200 stamps. The machine depends upon the perforation across the breadth of the stamp being accurate.

---

### Ant Destroyer.

An enquiry has been received about the "Universal Ant Destroyer." This machine is obtainable at Pretoria, and costs £4 5s., including one tin of poisonous mixture. It has been strongly recommended by government entomologists and other officials. It consists of a brazier to hold a small charcoal fire, on

which the mixture is sprinkled, and provided with a wire hose, the muzzle of which is inserted into the ant hole; by means of a pump the fumes are blown into the hole or ant heap.

---

### **Automatic Pistol.**

The Houndsditch crime has led to the adoption of an improved type of Webley automatic pistol for the use of the Metropolitan Police, and colonial enquiries have been received about the weapon. The new pistol is 6½ ins. long and weighs with the magazine 20 ozs. The recoil is largely absorbed by the moving parts, thus facilitating accurate shooting. The price for the 32 M.P. model is 35s.; cartridges, 47s. 6d. per 1,000. A semi-automatic target pistol is supplied for training purposes at 27s. 6d.

---

### **Ice Making.**

Ice making as a general rule is a continuous operation, as it is necessary to work night and day to allow time for the ice to grow, and to minimise the loss which is constantly occurring through the loss of heat. If only an ordinary day's work is done on the plant, about two hours will be wasted in overcoming the heat which it gains while standing idle, and the ice would not be thick enough to be satisfactory. The machine should at least be run for 12 hours at a time.

---

### **Steel and Iron.**

Numerous notices have been received of an advance in prices, from 5 to 10 per cent., for steel and iron goods. The rise is due to the increased cost of labour and raw materials, and is more or less general throughout the world. On the whole the colonies can hardly complain, as their products are benefiting greatly by the rise of prices. It is, speaking broadly, the increasing cost of agricultural products which is causing the demand for higher wages.

## RAILWAY AND HARBOUR NOTES.

### Australian Railways.

The bill for the construction of a railway from Kalgoorlie to Port Augusta was passed in December, thus at last deciding a scheme for which Western Australia has waited, not without some impatience, as the fruit of federation. The distance is about 1,063 miles, and the estimated cost £4,045,000. From the engineering point of view the important point is that the battle of the gauges, referred to in our last number, has been settled in favour of the 4 ft. 8½ ins gauge. This now becomes the standard of the continent, and the States other than New South Wales will have to undertake the conversion to it. It may be recalled that Earl Grey, then Secretary of State for the Colonies, shortly before constitutional government was granted to the Australian colonies, tried hard to induce them to adopt the standard gauge, and later on, when the Irish gauge of 5 ft. 3 ins. had been adopted in Victoria and South Australia, to accept this, so as to secure one gauge whatever it might be. He was, however, on the latter occasion too late, as New South Wales had ordered the material for the standard gauge. It was soon found that a serious blunder had been made in not having a uniform practice, and for some twenty years the matter has been frequently discussed, but it has taken a big scheme such as the Western Australian line to settle it. About 65·58 per cent. of the world's mileage is on the British gauge, which has a long lead over any other, the biggest contributor being the United States.

---

### White and Native Labour.

It is calculated that the increased cost to the South African Railway administration caused by the policy of employing white men as far as possible in preference to natives is £45,000 a year. It is admitted that it would be difficult to defend this on economical grounds; but it is justified because the practice finds

employment for a large body of men for whom it is difficult to make provision in other ways, and because it has a "general effect on the social conditions of the community." It is also hoped that the employment of white labour will lead to the creation in course of time "of a class of white labour equal to the European unskilled labourer." This does not seem a particularly high ideal, and suggests that the present character of the white labour leaves much to be desired. There is also a tendency "to agitate and continuously to apply pressure in every possible way for increased pay." The difficulty, the General Manager observes, will be to avoid an increase out of proportion to the value of the work performed. It can hardly be expected that an avowed policy of preference for white labour tends to improve the standard of work or to prevent agitation for higher wages.

---

### Southern Nigeria.

The building and equipment of the Forcados dockyard was practically complete by the end of 1910, and the slipway has been proceeded with. There are also schemes for water supply, lighting and a wet dock for repairing purposes. The town is growing rapidly and will probably become very important. The Transport Pier, recently completed, enables cargo steamers with heavy consignments to come alongside. The approach and the long T end form a smooth water basin for government craft. About 5,000 tons of coal and cargo were landed over this pier in 1910. A small public wharf is wanted for the use of trading firms and passengers. The machine shop is kept busy, and various stores have been brought from Akassa, which has been found to be a less convenient point.

At Calabar the dockyard has done good service, and a very creditable fact is that in 1910 there was no breakdown of any of the steam-driven vessels. A substantial amount of outside work was undertaken, and more could be done but for the difficulty of obtaining skilled labour. The Lagos youths prefer to apply for clerical posts rather than bind themselves for the necessary training period in engineering.

The Government runs a number of steamer services, which are increasingly patronised. The motor boats, of which there are some fifteen, have done well. The recent introduction of borneoline as a fuel, in place of paraffin, has made them more reliable and increased the speed. The cost of the light draught motor transport works out at 2s. 9½d. per mile—a very satisfactory figure, considering the dry season difficulties and the great wear and tear caused by the sand. Oil fuel has been tried on steam pinnaces, but

the cost per mile was found to average over 50 per cent. more than that of coal; but it is only right to consider that at present the freight and charges for oil amount to 120 per cent. of its price, and that if oil could be landed in bulk instead of in sealed drums this cost would be greatly reduced. The difficulty is that oil-carrying steamers are much too deep to enter such places as Forcados and Calabar, and at present the demand for such vessels exceeds the supply.

A scheme is under consideration for the utilisation of the Kwa Falls for electric lighting at Calabar.

---

### Lagos Railway.

In the half-year ending June, 1911, the net revenue was £61,068 as against £56,076 for the same period in 1910. Better results were expected for the second half. The passenger traffic is growing rapidly. A sliding scale was introduced by which rates rise or fall in sympathy with the price of palm kernels, the idea being that the railway should get some small share of the high prices recently prevailing. This arrangement has had good results, and has to some extent relieved the railway of the strain caused by the, as yet, unproductive "political" lines. The cotton season was again a failure.

In December the south and north slipways were finished, not without much hard work, as at the north slipway the main pulley came away from its foundations the first time the sleeping coach began to be hauled up and the trial came to an unsuccessful end. On the 28th of the month the special train taking the Governor to Kano was taken across and raised without a hitch.

---

### Lagos Harbour Works.

In the second half of last year the lineal advance of the East Mole was 761 feet, a satisfactory progress considering the demands for stone for the wharves. In all 280,242 tons of stone were despatched in the East Mole. By the end of December preparations were so far advanced as to make stone-tipping in the West Mole practicable at an early date. The total expenditure was about £285,000. Great changes are being produced at the entrance of the harbour by the advance of the works.

The erection of the Apapa Wharf proceeded satisfactorily. All the piles were screwed at the end of January. Reclamation at the back has been simultaneously carried on. The expenditure was about £13,600.

**Baro-Kano Railway.**

Merchants and others sending cargo to be taken up the Niger and to stations on the Baro-Kano Railway should consign the goods to the Government Transport Offices, Northern Nigeria Marine, Barutu, Southern Nigeria. Invoices should, if possible, be sent before shipment of the goods, to avoid any possibility of the cargo being held back by the Customs at Barutu, and warehouse rent being charged. The invoice should state clearly the destination of the goods.

The charges vary according to whether the river water is high or low, the high water period of course diminishing the higher up the river.

It is understood that the tariff is under revision.

---

**Baro-Kano Stations.**

The following are the stations on the Baro-Kano Railway, with the mileage:—Baro 0, Katcha 14, Badeggi 43, Eba 59, Katerigi 72, Shapa 97, Minna 111, She 130, Guni 147, Kogin Serikin Parva 169, Godani 186, Bakin Kasna 197, Kaduna 215, Rigaskikun 227, Birnin Yara 240, Dumbi 255, Zaria 266, Likoro 275, Girmi 287, Faiki 311, Rajin Gora 334, Kano City 352, Kano Cantonment 355.

---

**Accra-Akwapim.**

There has been an extraordinary development of traffic; a great cocoa traffic has taken place and a large import of goods has responded. During the height of the season 200 tons of cocoa were sent down daily. Since September the contractor has worked the line at 50 per cent. of the gross earnings, and the passenger rates have been reduced to 1d. per mile. It is expected that the extension to Komfrodua would increase the cocoa traffic by 50 per cent.

---

**Accra Railway Extension.**

The country between Mangoase and Coomassie has been explored by Mr. Mee, with results that indicate that the most suitable line would approximate to that suggested by him in 1910. It would be practicable with 1 in 80 gradient, 10 chain curves and comparatively light works. It is questionable whether the Kibbi mining area would justify a railway to it, but if so a branch of about 16 miles would reach it. The line to Coomassie

would be about 150 miles. The advent of a railway would greatly stimulate the cocoa industry, and there are extensive palm oil, rubber, kola and gum copal districts.

---

Mr. Tower has proceeded to the Gold Coast to report the estimated cost of a line from the present terminus to Komfrodua, to be similar to the Sekondi-Kamasi line.

---

#### **Accra Water Works.**

It has been decided to set up a small trial installation of the Puech-Chabal system of filtration. Excellent results have been obtained from this system at Paris, Marseilles, Suez, and other towns. The system comprises a pre-filter, which is a layer 2 ft. 7 ins. thick, consisting of coarse sand resting on a bed of gravel which is carried on a false bottom of perforated ferro-concrete slabs; this pre-filter is cleaned by air. There is also a sand filter, composed of fine gravel, 4 in., coarse sand, 8 in., and fine sand, 2 ft. 4 in. A Didelon regulator secures a uniform speed of flow. This filter should be covered in. As many cascades as possible are provided to aerate the water and bring the amount of dissolved oxygen in it to the point of saturation. The complete installation for the Accra Works, requiring five pre-filters, six sand filters, and works constructed of ferro-concrete, would probably amount to about £12,000.

---

The railway was finished in October, and good progress has been made with the excavation, which was principally in rock.

---

#### **Accra Harbour Works.**

In December good progress was made with the removal of sand, an appreciable difference in the level of the sand being noticeable all round the jetty. The pumping plant was subsequently overhauled, and since it was restarted a considerable decrease in the sand has been reported.

---

#### **Seccondée Harbour Works.**

By the end of January a length of 137 feet was completed on the breakwater. Both wing walls of jetty No. 3 were completed, 30,278 cubic yards had been tipped on the reclamation.

The survey for the water works railway was completed in December.

**Mauritius.**

The earnings in 1910 showed an increase of 14·31 per cent. A decrease in first class passengers is attributed to the number of private motor cars, which, at any rate, show increasing wealth. The total earnings were Rs. 2,761,529, against a working expenditure of 1,628,271, or 69·65 per cent. of the former. The net earnings represent 5·25 per cent. of the capital. These favourable results will facilitate much needed improvements.

---

**Nyasaland.**

The map of Central Africa has been likened to a huge market garden divided into allotments held by various tenants having no particular interests in common. Till lately the allotments had little connection with one another, and the railways were of a local character. This is gradually being altered by the extensions of the line. The latest instance of this is the scheme for the extension of the Shire Highlands Railway partly through Portuguese territory to the Zambesi and for the construction of a connected railway from the south side of that river to Beira. The great expansion of production in the Protectorate has made this work a necessity if progress is to be continued, and it is to be hoped that an extension will also be made in due course to Zomba and Lake Nyasa. This would mean a railway of about 440 miles, and steamer transport along the lake for 360 miles. The lake would, as experience elsewhere shows, be a magnificent feeder for the railway. The existing line is about 115 miles long, and the distance to the Zambesi is not much over 50. From the Zambesi to Beira is about 170 miles. The negotiations for the joint enterprise have been carried on for a considerable time, and both countries may congratulate themselves on their successful issue. An important feature of the arrangement is the recovery by the Protectorate of the lands to which the Railway Company was entitled under the original agreement, the proposal being that £180,000 should be paid for them to the British Central African Company to whom they have been assigned by the Railway Company. The Government will guarantee 4 per cent. interest for ten years on the capital required for the line to the Zambesi.

---

**Jinja-Kakindu.**

This double-barrelled name is now replaced by the name Busoga. The line was opened on New Year's Day before a large gathering. The total length is 61 miles; the construction was

accomplished in thirteen months, and the expenditure was within the estimate. This excellent start will no doubt be followed up by a good traffic and the development of a rich region.

---

### Singapore Harbour Works.

Good progress was made to the end of January with driving the temporary staying at the Johnson pier at the north end and with the temporary staging required for strengthening the existing wall at the south end. The work at the quarry has improved. At the inner south mole 21,534 tons of rubble were deposited during January. The average number of men employed was 103 Europeans and 1,819 natives.

---

### Federated Malay States.

On the Padang Java-Kuala Selangor line at the end of the year the rails were linked in for 11 miles.

On the Kedah Railway Extension to Alor Star location plans were completed for  $17\frac{1}{2}$  miles.

On the East Coast line a survey from Pahang-Kelantan Boundary northwards was carried for about 85 miles. Heavy country was not met with.

On the Semantan-Kuala Tembeling Railway the rails were linked in for  $34\frac{3}{4}$  miles.

It is expected that in six years through communication will be established from Singapore to Bangkok.

---

### Trinidad.

The Guaracara-Cipero junction line has been staked out. This line begins about 42 miles from Port of Spain on the Guaracara or Princes Town branch of the Trinidad Government Railway. It is contemplated to acquire the Cipero tramway to make a short connecting link on the outskirts of Princes Town between the Cipero and Guaracara lines, but the tramway does not appear to be very suitable for railway working as the curves are sharp. Much increased accommodation is proposed at Princes Town station, enabling sugar traffic to be handled more conveniently.

On the Tabaquite Rio Claro extension railway about 192 acres have to be expropriated, of which 54 were private property and the rest Crown lands; the cost was estimated at \$3,820. By the end of January 76 acres were cleared, and several buildings erected.

### St. George's Harbour, Bermuda.

The dredger "King George" commenced work in August, and in 111 days of work removed 13,250 tons of rock and 18,000 tons of mud, an average daily of 119 of the former and 162 of the latter. About one-fifth of the rock was very hard, and the removal of mud was hampered by large quantities of cedar roots. A rock drill and two tons of explosives have been ordered.

---

### Locomotives in South Africa.

Five Hendrie "D" engines, known as the Superheater "D" type, have been erected in the Durban shops; these locomotives are of the 4-8-2 type that have done such good work in the Natal Province, and also proved their worth during trials on the Germiston-Witbank section, but with their value as hauling elements enormously enhanced by the addition of the Schmidt Superheater. The addition of the superheater has introduced certain modifications which are unavoidable and which can be briefly described as follows:—

(1) The cylinder arrangement has been altered "in toto," piston valves being substituted for the original Richardson balanced type the admission has also been rearranged, the principle of outside admission being superseded by inside, thus avoiding the contact of highly superheated steam to the outer walls and valve spindle packing in the steam chests.

This deviation from the original design, of course necessitates radical alterations to the valve gear, and the layman can readily recognise the difference between an inside and outside admission engine by looking at the connection between the valve connecting rod and the compensating lever; in the first mentioned case the connection is above the valve spindle, and in the second below.

(2) The outside appearance of the engine is entirely changed by reason of the necessity of raising the foot-plate to clear the steam chest and motion generally, whilst at the front end the original levels are adhered to; this causes the straight line of the foot-plate to be broken forward of the cylinders and at the cab front plate, dipping down at these points to the levels adopted on the former editions of this class of engine.

---

### Mallet Engines.

It is stated by the General Manager of the South African Railways that it is not the use, as has been alleged, that these engines damage the track more than other types. Reports show

that in Natal the wheel flanges of the Mallet type of engine wear better than those of any other class, thus indicating that the friction between the flanges and the rail is less.

---

### Dredgers.

A large and powerful dredger has been constructed on the Clyde for the Natal Government. It contains arrangements which have not been long used, but which have worked satisfactorily. It is fitted with a steel spinal cutting arrangement, thus dispensing with lockets, and this reduction of top gear causes the craft to be more seaworthy in bad weather. It is also fitted with a "drag" or shoe arrangement, adapted specially for mud or light sand deposits, and this appliance is more economical in working than the bucket chain arrangement.

---

### Light Inspection Car.

A car constructed on motor bicycle lines has been brought out by the Humber Company. It weighs 224 lbs., and can easily be lifted by two men. The engine is  $2\frac{1}{2}$  h.p. and can drive the trolley at 20 miles an hour. The gauge is 3 ft. 6 ins., but the machine can easily be adapted to any other.

---

### Power Cars.

A motor car has been introduced in America designed to operate track and sleeper tools. The car is light and can be lifted by two men. The motor engine is applied to such work as boring the holes in new sleepers and driving in screwspikes.

---

### Piles in Swamps.

A new American practice which might be followed wherever the ground is swamp or sandy is to use two steel tubes, one inside the other, so that when driven sufficiently deep the inner tube can be withdrawn and concrete poured in and rammed so that it is forced out of the inner tube at the bottom to form a bullions mass, there securing a hold. The outer tube is then also withdrawn.

---

### Water Softening.

A water-softening process, originated in Germany and already in successful use on the Great Northern Railway in England, has recently been introduced into New York, and is arousing keen interest. The process has been installed on an experimental scale

at one of the Standard Oil Company's plants, and also at a point on the New York Central railroad. It appears to be successful. The process consists in allowing boiler-feed water to flow in a thin film down a steeply inclined aluminium plate, exposed to the full rays of the sun. No chemical change between top and bottom of the plate can be detected, but on evaporation in a boiler, the water thus treated forms an impalpable sediment instead of the usual hard scale, and not only this, but it will decompose any scale previously accumulated from untreated water. The causes of this phenomenon are obscure, but the aluminium plate and the sunshine seem to be essential elements. After treatment, the water can be stored over-night, or through a cloudy season, without loss of its virtues.

## MEDICAL NOTES.

### Consumption.

A Conference of Australian Medical Officers has reported on the measures which should be taken to combat this disease. They remark that there is some misunderstanding as to the conditions under which it is actually communicated. A large proportion of the public entertain entirely mistaken views on this subject. They appear to think that consumption is as likely to be "caught" as is smallpox or measles. This is an unfortunate but, it must be admitted, not an unnatural error. They are taught that consumption is communicable from man to man. The statement is true; but it is an exact statement of fact, no more. It says nothing as to the frequency with which it is so communicated, nor anything of the conditions under which this capability of being communicated takes effect—is made manifest by the infection of another person. The conditions are well known, are indispensable to effective infection, and are easily obviated. The fact is that the natural resistance of the normal man to this infection, his power to destroy it before it can hurt him when he has taken it into his body, is very great. Were it not so almost all men would die of consumption; for the infection is so widespread that almost all take it from time to time. But usually it is destroyed by the natural powers, so that we do not take the disease, although we have taken the infection. The conditions which enable the body to resist this infection are two, namely, the inherent power of destroying it (which almost all people possess), and smallness of the doses in which the infection is usually received. That which we successfully destroy when received in small quantities at long intervals would be too much for our powers were it massed and received in one dose, or were it received in small quantities frequently repeated during a long time. Now, consumptives constitute centres from which the infection is given off. But here we must discriminate: *some* consumptives give it off, but *some* only. Not all consumptives are infectious. No consumptive is infectious throughout the whole course of his disease. Many consumptives, it

may be said, are no danger to others. But it is admitted that, at some time or other in the course of their illness, most consumptives do become dangerous to others for a time at least. In what does this dangerousness consist? Only in the expectoration they give off. Their dangerousness is proportioned to the amount and virulence of their expectoration. Their capacity for causing harm is so proportioned; but the actual danger from them which others may consequently run depends entirely on the care they take of their expectoration. If they collect and destroy it, others are in no danger from them; but if they spit about carelessly, and soil their clothes, floors and handkerchiefs, and so forth, the danger to others is great, no doubt. It is in the power, then, of every consumptive to avoid danger to others; therefore, he has the grave duty of constantly conducting himself so as to avoid it. But those who are well have their obligations also. Habitual cleanliness of person, of habits, of feeding, and of air, especially while sleeping, go far towards avoiding the harm which otherwise might result from contact with careless consumptives, whose presence, be it noted, is not always known. Thus there is nothing mysterious about the infection of consumption. It took a long time to find out in what it consisted; but having been discovered, it is seen to be no mysterious thing, no invisible vapour, but a tangible material substance, easily managed with safety. A result of the practical application of this knowledge is that the members of the medical and nursing staffs of hospitals for consumptives, who are constantly exposed to infective patients, do not take the disease in any larger proportion than they would have taken it had they been living under the ordinary conditions of life. The reasons are that they cause the patients to behave carefully, and they act circumspectly themselves. Those who ignorantly magnify the danger from consumptives not merely cause them to be treated with a degree of hardship which in many known cases has amounted to inhuman cruelty, but assume an attitude which is by way of raising a very serious obstacle in the path of the better informed, who are endeavouring to diminish the prevalence of the disease, and to free the people from it, without causing hardship or even inconvenience to any person.

It follows that preventive measures, involving the administrative control of consumption, should include provision primarily for the education of the consumptive, and the awakening of a sense of responsibility in himself; and, secondly, for an intelligent demand on the part of the well that they shall be subjected to no needless risk because of the carelessness or apathy of the sick.

The more important of the measures recommended are:—

- (1) universal compulsory notification of all cases of consumption throughout the Commonwealth;

(2) facilities for the collection of detailed information—etiological, social, medical, hygienic, etc.—concerning each case of consumption, and the recording of such on a uniform plan ;

(3) legal power to regulate the home management of consumptives ;

(4) legal power to remove dangerous or infective consumptives into segregation ;

(5) legal power to detain such consumptives in segregation ;

(6) legal power to examine medically contacts and house-mates of consumptives ;

(7) adequate accommodation for advanced cases ;

(8) the establishment of sanatoria ; and

(9) financial assistance to the wives and families of necessitous consumptives admitted to hospitals or to sanatoria.

---

### Sleeping Sickness Bureau.

Bulletins Nos. 31 and 32 (Vol. 3) continue the record of observations and experiments. There is evidence that tsetse flies can live on the fluids of caterpillars, and this may be the explanation of the fact that there are swarms of flies in places when vertebrata are about or extremely few. If so, this is a further argument against the proposal to fight the disease by clearing off animals from certain areas.

It appears lately that the infection has come from the Congo, and that the main source is the native salt trade from Katwe ; steps are being taken to deal with this region.

Numerous experiments have been made to discover the animal sources of infection. It appears probable that pigs and poultry are not much susceptible. With the exception of one monkey, no evidence was obtained that the Lake-shore wild animals, birds and reptiles harbour the virus of sleeping sickness.

Several cases of trypanosomiasis have been discovered at Baro, and the infected persons have been deported. Europeans in such districts are warned not to wear "shorts."

An article on the subject of quinine remarks that the condition of the quinine molecule while circulating with the blood is unknown, and there are no convincing proofs of the mechanism by which these salts exert their well-known destructive action on the malarial parasite. Both malaria and quinine are harmful, but the latter is the lesser evil. The continued use of quinine produced in many persons some of the following evils : diminished activity of hearing, premature onset of presbyopia, mental depression, dyspepsia and skin affections. It appears that the whole of

a dose of a salt of quinine cannot be recovered from the excretion during the first twenty-four hours after administration, so that there is a cumulative action of the drug.

---

### Trypanosomiasis.

The Veterinary Bacteriologist in Nyasaland reports that three outbreaks of this disease have been encountered during 1910-11, two in Blantyre and one in Zomba District, and have caused very heavy mortality in the herds implicated. "Great difficulty has been experienced in locating the source or sources of infection and, admitting for the present that tsetse fly only transmits tsetse disease, in regard to the outbreaks now under consideration, we might say that tsetse fly has been conspicuous by its absence. In other countries where trypanosomiasis exists the source of infection in any given outbreak can as a rule be traced with very little difficulty, or at least the known transmitting agent of the disease (the tsetse fly) can usually be found, but not so with the outbreaks of the disease met with in Zomba and Blantyre Districts of Nyasaland, and one is almost forced to the belief that other than tsetse fly must be capable of transmitting the form of the disease we have got among stock in this country. In this connection it is scarcely necessary for me to mention the desirability of well conducted experiments being undertaken with a view to settling this point."

---

### Yaws.

The Surgeon-General of Trinidad has reported on the use of "Salversan" as shown by a series of 500 cases of injection. The results secured by this method of treatment of a hitherto almost intractable disease are very striking. After allowing an interval of seven weeks for subsequent observation from the date of injection of the last cases, with of course very much longer intervals in the other cases of the series, this report records a definite cure of 498 cases of Yaws (82 per cent. of which were obtained with only one injection) equal to a percentage rate of recovery of 99.6 and Dr. Alston expects to convert this into a 100 per cent. rate of recovery by the use of third re-injections in two cases that already display amelioration of their symptoms from previous injections. Such brilliant results seem to amply justify the conclusion formed by Strong in the Philippine Islands that Salversan is as important a specific for Yaws as Quinine is for Malarial.

**Leprosy.**

Dr. Minett, of British Guiana, has reported on the use of Nastin and benzoyl chloride, and came to the following conclusions:—

1. That Nastin has apparently very little beneficial effect on cases of Leprosy.

2. A solution of benzoyl chloride in oil shows a slightly higher percentage of improvement than Nastin.

3. Anæsthetic cases of Leprosy run a definite course, after which the disease seems to die out, leaving the patient no longer infective.

4. These cases recover sensation after a time in areas previously anæsthetic, and after self-amputation only scars remain. This is a natural process and takes place without any treatment whatever; it is not, apparently, influenced by either Nastin or benzoyl chloride.

5. Nodular cases do not tend to improve naturally as above, except in very rare instances; nor do they appear to be affected appreciably by either Nastin or benzoyl chloride.

6. The so-called destruction of bacilli is a natural process varying considerably, and does not appear to be influenced by Nastin or benzoyl chloride.

7. Variation in the amount of destruction of bacilli observed is of limited value as an indication of the effects of treatment.

8. Benzoyl chloride in petroleum oil is extremely valuable as a nasal spray or a paint for ulcerating surfaces. It quickly renders the discharge free from the presence of bacilli.

9. Its regular use for this purpose is strongly recommended in leper asylums.

---

**Annals of Tropical Medicine and Parasitology.** (Vol. V., No. 3, Liverpool University Press.)

This issue contains an interesting article on the merits of petroleum and other substances as larvicides. At present the substance in most general use as a larvicide is petroleum, which acts by forming a thin film on the surface of the water, thereby drowning the larvæ when they rise to the surface to breathe. In the case of enclosed bodies of water, such as wells and tanks, this usually acts admirably at first, but in the course of a short time the film, unless very thick, gets broken. This happens much more readily in pools or stagnant places on river banks where

mosquitoes breed. The film of petroleum in these cases soon gets broken or blown to one side sufficiently to allow the mosquitoes to lay their eggs, and the larvæ to develop into mosquitoes. Moreover, the presence of grass or weeds on the banks of these pools prevents the formation of an unbroken film over the whole surface, and this permits the reproductive processes to go on more or less uninterruptedly. What is wanted is a solid substance which will be effective in the form of an extremely dilute solution. Good results were obtained from "Sanitas-Okol," an emulsion prepared by the "Sanitas" Company. Potassium cyanide is very effective, but we should presume that it is put out of court for ordinary purposes by the fact that it is extremely poisonous.

---

#### "Millions."

The Windward Islands Medical Report devotes some space to the "Millions" fish, which Dr. Nicholls regards as a great asset in anti-malarial work, being "beautifully adapted as destroyers of mosquito larvæ. They are as efficacious as kerosene treatment and cost nothing when once established. But of course they have limitations, and should always be combined with drainage in certain localities. It is, of course, impossible to place 'Millions' in all the myriads of small pools, and in many of them they cannot compete against the mosquito larvæ, for the pools continually dry up to liquid mud, in which the fish will not live, but the larvæ are able to lie on the hot, wet surface for at least forty-eight hours, waiting, as it were for fresh rainfall, and in the rainy season few days pass without rain. That they can exist for the period of time stated on the surface of liquid mud I have repeatedly proved by actual experiment.

"Fortunately these unhealthy marsh lands can easily, and at a fairly cheap cost, be drained, either by cutting open drains, which can be stocked with fish and kept clean, or by sub-soil drainage,—the latter is not always possible. In two places where I was at first unable to establish 'Millions' on account of the presence of 'mud fish,' dragon-fly larvæ, and crustaceans, I killed out these denizens by poison, and then when fresh rains had washed away the poison, I was able to introduce the fish, which have since flourished there; the poison used was 'cyllin,' but obviously methods of this sort have great limitations, as the presence of cattle or the possibility of contaminating drinking water completely prohibit it; yet 'cyllin,' which gives the water a strong scent and a milky appearance, is not likely to be drunk by man or animal."

**Sierra Leone.**

The medical report for 1910 reports 13 diagnosed cases of yellow fever with 10 deaths and 11 suspicious cases with one death. It used to be held that the disease did not exist on the West Coast, and among the native population if it does occur it seems to be of a mild form. Probably it is of rare occurrence in epidemic form in the Sierra Leone Protectorate.

Only one diagnosed and three suspicious cases of sleeping sickness were reported.

A public supply of pipe water in such towns as Freetown will help greatly to keep off malarial and yellow fever, as private wells and water are the main source of mosquito larvæ.

---

**Nyasaland.**

The medical report for 1910-11 states that in this Protectorate what are classed as general diseases are not very common with the exception of rheumatism and perhaps neurasthenia. The former is probably largely accounted for by the damp climate and great changes of temperature more especially in the hills. There are few Europeans who escape an attack in one or other of its forms.

Amongst Indians and Natives it is extremely common and often difficult to shake off. Reference to the returns will show that it is much the commonest general disease amongst natives. The muscular type is most frequently encountered but sciatica and chronic joint affections also occur. Neurasthenia is a well recognized sequela of malaria and residence in hot damp relaxing climates; in some cases overwork and worry in connection with their official duties has had a part in the production of neurasthenia; and insufficient nutrition from badly cooked food is also a factor, and once a neurasthenic condition is produced is certainly a factor in maintaining it. We cannot alter climatic conditions but the others, overwork and worry and malnutrition, are being largely eliminated.

The native does suffer from a type of neurasthenia, but not to the same extent as Europeans.

---

**Report of the Advisory Committee for the Tropical Diseases Research Fund. (Cd. 6024: 2s. 6d.)**

This paper contains reports from the Crown Colonies on the work done for the prevention of mosquito-borne diseases, and a number of valuable reports on work done in colonial laboratories.

### Mosquito Legislation.

The numerous facilities which Georgetown has offered for the harbouring of mosquitoes have been described in the last journal of the Liverpool School of Tropical Medicine. An ordinance has recently been passed to enforce measures for the destruction of mosquitoes, which are now recognised as carriers of infection of some of the most dangerous tropical diseases. This Ordinance requires owners and occupiers of houses to keep in repair all water tanks, gutters, and pipes, so that they will not breed mosquitoes, and to keep their premises free from all bottles, tins, and such like receptacles which may hold stagnant water and breed mosquitoes. The presence of mosquito larvæ in any water on any premises is to be evidence that this duty has been neglected, and subjects the offender to a penalty.

It can hardly be expected that this kind of legislation will be popular with natives who do not understand the reasons for its importance. Thus a notice has been issued in the Gold Coast with regard to the use of pumps to water tanks or the application of kerosene, which the "Gold Coast Leader" deplures in pathetic style.

"Say what you will, this campaign on the poor mosquitoes is a perfect nuisance and humbug to all but those interested in it, but it must be kept up, at all events to give employment to some people, and a chance to others to add to their laurels! This game has been going on for some years now, and will it be too much to say, we are where we were. Can the officers in the Mosquito Brigade conscientiously say, that there are less of these pests in the land now because of their Big Toms they have been firing at them ?

"To think that all this parade of arms against the poor creatures, will give us an extinction of mosquitoes in the country! Science is all right enough, and really performs wonders, but when wrongly applied it does far more harm and injury than we can think of because it will be working against Nature then. Are we to be told that this war against the mosquitoes must go on until we shall see little or nothing of them in our midst. If this is no delusion of the worst kind then we do not know what is; but the Powers that be are doing it, and they get the money too, and so the number of years to effect this, is of no consequence.

"Sanitary officers are seen here and there with enamelled soup ladles (in spite of a letter written by Dr. Beringer recently), entering into poor people's houses unceremoniously to see if they could find any mosquito larvæ in their water, and if any found, the poor women (always women) must be in court to be fined 5/- or 10/- or even a pound. For this reason some people would keep

no water at all in the house, unless wanted for immediate use and they have got to find it elsewhere."

It is to be hoped that the natives will learn from the examples of other places that the war against mosquitoes and malarial fever is not a medical fad, but can be made effective. Sanitary reform has always had a difficult task in combating ignorance, and the only remedy is to teach the reasons for the courses proposed.

---

### Opium.

An international convention has been entered into by all the principal powers to regulate the trade in and control the use of opium. Each power is to prevent the export of raw opium to countries which have prohibited its import, and the import and export of prepared opium is to be prohibited altogether as soon as possible. Medicinal opium, which includes morphine and cocaine, is to be confined to "medical and legitimate purposes."

## COLONIAL STAMPS.

The following notes and illustrations will, it is hoped, be an assistance to those who wish to understand the use of the key-plates, which Messrs. De La Rue & Co. provide, free of charge, for the use of all colonies which wish to take advantage of them.

The present Universal Key-plate System of stamp printing, which was originated by Messrs. De La Rue & Co., was first introduced in 1888. It was designed to meet the requirements of colonies ordering stamps in small quantities, and was intended to obviate the expense of special dies and plates being manufactured for each issue or denomination. The three key-plates, A, B, and C (the original of which contained the head of Queen Victoria) were then made. Any colony requiring a small issue of stamps was thereby only put to the expense of buying an overprint plate of the character shown. From the process of manufacture, which entails overprinting, it will be obvious that any stamps produced by this system, or any if its modifications, would come into the schedule of prices under the heading of two printings.

The stamps of the 1888 design met with greater approval, and came into more general use, than was at first contemplated. It was therefore thought desirable to improve the designs, which led to the production in 1908 of a new key-plate G, which required, not an overprint, but a border-plate to complete the design. The necessary border die's plate cost about 25 per cent. more than overprint die and plate. Simultaneously a receipt-size key-plate H was made, also requiring a border-plate. The border-plates, while greatly improving the appearance of the stamp, also gave scope for better effects in the combination of colours; but, for the reasons set forth in the following paragraphs, the 1908 designs have not replaced those of 1888 to any material extent.

On examining the character of the key-plates of the 1888 designs, it will be seen that separate key-plates exist for stamps of the three different characters, according as they are to be

used for Postage purposes only, for Revenue purposes only, or for Postage and Revenue combined. A colony ordering an overprint plate would, therefore, at will, be able to obtain stamps of either of these three characters without additional expense for dies or plates.

Since in the 1908 designs the distinction between Postage and Revenue, or the combination of these two, is effected by the engraving of the border-plate itself, it follows that, once a colony has ordered an issue from these plates, they would be bound to adhere to the character of stamps, whether for Postage or Revenue, in accordance with their original order, or to incur the expense of fresh dies and plates.

This has given rise to a demand for a stamp of improved design on the 1888 model, which entails the cheaper die for overprint plates (as against dies for border-plates required for the 1908 issue), and which could be used by any colony desiring a variation of design.

This requirement has been met by the design of stamp having key-plates D, E, and F. It will be observed that the "Postage" and "Postage and Revenue" stamps are almost indistinguishable. The reason for this is that no colony would have both series concurrently, though it might have either concurrently with distinctive stamps for Revenue purposes.

---

One point in connection with the Keyplate system of printing stamps is of particular interest. The greatest reduction of prices has been in connection with stamps printed at two operations, with the result that, unless a very large number of stamps of any one value are required, it is not worth while to have a special plate made. Thus, the overprint or border plates, once bought, will continue in use and would be equally serviceable if it were decided at any future time to alter the portrait of H.M. the King.

It is possible for any Colony to adopt all four designs by purchasing some plates to fit each type of keyplate, instead of all plates for one design. Thus,  $\frac{1}{2}$  to  $2\frac{1}{2}$  could be the new design, the next three values of the Nyasaland type, the next three the old D.L.R. type, and the highest values could be printed from the large Nyasaland type of keyplate.

The following new designs and varieties have appeared since our last issue:—

**BRUNEI.**—The 5, 8, 10, 25 and 50 cents value have now appeared in the new colours.

**CAYMAN ISLANDS.**— $\frac{1}{2}$ d., 2d., 2s., and 3s. postage and revenue stamps have been supplied from the old D.L.R. Keyplate, but

with the portrait of H.M. the King. The three last-named values are entirely new.

CYPRUS.—30 paras,  $\frac{1}{2}$ , 1, 4 and 6 piastre postage stamps with portrait of H.M. the King.

FIJI.— $\frac{1}{2}$ d. and 1s. postage and revenue stamps from the old D.L.R. Keyplate but with the new portrait have been despatched.

GILBERT AND ELLICE ISLANDS PROTECTORATE.—5d., 6d. and 1s. postage and revenue stamps from the old D.L.R. Keyplate, but with the portrait of H.M. the King.

MAURITIUS.—5 cents, 25 cents and 10 rupees postage and revenue stamps from the old D.L.R. Keyplate, but with the portrait of H.M. the King.

SEYCHELLES.—2, 3, 6 and 15 cents *postage* stamps from the old D.L.R. Keyplate, but with the portrait of H.M. the King. These are the first stamps printed from the new *postage* Keyplate.

SIERRA LEONE.—3d. postage and revenue stamp (King Edward's head) has now been supplied in singly fugitive ink on unsurfaced paper.

BAHAMAS.—We have been asked to call attention to the following notice which appeared in the Bahamas Official Gazette of the 17th February, 1912:—

“Bahamas postage stamps bearing the head of Her late Majesty Queen Victoria will be withdrawn from circulation on the 1st day of June, 1912. The remainders will be destroyed.”

## NORTHERN NIGERIA.

NOTE.—An instruction has been issued, that Europeans and officials of the native staff proceeding to Northern Nigeria will usually be informed before the arrival of the steamer at Lagos whether they should disembark there and complete the journey by rail or proceed to Burutu. They should produce their orders or other credentials, showing that they are Government servants, in Lagos at the offices of the Lagos Railway, or in Burutu at the office of the Assistant Marine Superintendent. The necessary arrangements will then be made for the resumption of their journey to Northern Nigeria.

**NEW RULES AS TO LEAVE, PENSION, &c.,  
IN HONG KONG.**

1. Subject to the necessities of the service, leave of absence on half salary may be granted to members of the permanent Government service after a period of four and a half year's resident service without any special grounds. It may be given before the expiration of that period in cases of serious indisposition or of urgent private affairs. In the absence of special grounds, the leave in such case must not exceed one-sixth of the officer's resident service; on special grounds it may exceed that period by six months.

2. The Governor will not in any case grant leave on half salary for a period of more than nine months at a time, but that period may be extended by the Secretary of State on the ground of ill-health or of urgent private affairs or for such other reasons as may appear to him to be sufficient. In exceptional cases extensions of leave without pay may be granted.

3. In addition to the above, vacation leave on full pay may be granted, if no inconvenience or expense is caused thereby, not exceeding three months during, and in respect of, any two consecutive years.

4. At the request of any officer who may be eligible for the grant of any period of leave on half salary, the Governor may commute the whole or any portion of such leave into one-half the period of leave with full salary, provided that the total period of commuted and uncommuted leave, together with any period of vacation leave that may be granted, does not exceed ten months at a time. No officer can claim as a right to commute his leave in this manner, the decision whether commutation can or cannot be allowed being wholly within the discretion of the Governor.

5. Officers attached to an educational institution are not entitled to vacation leave under the rule stated above in paragraph 3. When in the Colony they enjoy the ordinary vacations of the

institution to which they are attached. When taking long leave outside the Colony they may be allowed to draw full pay during the first three months of their leave unless a school vacation has immediately preceded the grant of leave, in which case full pay may be drawn during two months only. The remainder of the leave in either case is on half salary, and half pay only can be drawn during any school vacation falling within the period of an extension of leave.

6. The present rule as to superannuation is that in the case of ill-health an officer holding a pensionable appointment may be allowed to retire on a pension after ten full years' resident service; otherwise he must have attained the age of 55. For ten full years' resident service fifteen-sixtieths of the average annual salary of the retiring officer's fixed appointments for three years prior to retirement may be awarded, to which one-sixtieth may be added for each additional year's service; but no addition will be made in respect of any service beyond 35 years. For pension purposes absence on vacation leave counts as full service, and leave on half pay as half service.

7. A deduction of 4 per cent. is made from the salaries of all members of the permanent Government Service, as a contribution towards the provision of pensions for the widows and orphans of Government officers.

8. The currency of Hong Kong is based on the silver dollar. For purposes of payments in the Colony salaries fixed in sterling are converted into dollars at a rate fixed by the Government, and based upon the average exchange value of the dollar during the month ending on the fifteenth of the month for which salary is to be paid. At present, however, if the average exchange rate for any month exceeds 2s., sterling salaries are converted at 2s. to the dollar.

Sheffield Cutlery.

A Service for 12 persons **£12 10s.**

(Others £3 to £100.)

## "EMPIRE" or STERLING SILVER PLATE

SPOONS, FORKS, TABLE CUTLERY,  
AND OTHER HOUSEHOLD WARE.

"EMPIRE" PLATE is treble  
plated on pure Nickel Silver. The  
patterns are reproductions from fine  
old Silver models, and have all the  
beauty of line and form of the Silver  
of 150 years ago; apart from the Hall  
Mark no difference is visible.

As far back as the 1862 Exhibition,  
"Empire" Plate was awarded Prize  
Medals for Excellence of Manufacture,  
and it still retains that pre-eminence  
for which it was noted fifty years ago,  
whilst the prices are, quality con-  
sidered, strictly moderate, either for  
Cash, or on "The Times" System  
of Monthly Payments of £1.

# NO DISINFECTANT

is so EMINENTLY SUITABLE for the use of

THE TROPICAL SANITARIAN

as

**"SANITAS-OKOL"**  
(Emulsion),

"SANITAS-OKOL" has been largely adopted by Government Departments and Public Health Authorities throughout the Empire, and has been found the most suitable Disinfectant in every way. It can be used in all proportions and with all qualities of water, salt or fresh.

It has a high Guaranteed efficiency as a germicide, is non-toxic and non-corrosive, and retains, to a very marked extent, its efficiency in the presence of organic matter.

It is suited equally well for use by private persons as by Public Officials.

In addition to its germicidal character, it has marked value as a larvæcide and insecticide for use as a preventive measure against insect pests such as Flies, Fleas, Mosquitoes, and other disease carriers.

Special quotations given to Colonial Officials for large quantities.

AND

**A. J. HARDING,**

*Of the Colonial Office.*

"Whilst the 'Colonial Office List' is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring succinct and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts."—*Journal of the Royal Colonial Institute.*

\* \* \* \* \*

"The book is intended for educational purposes and is so attractively written, and contains such a fund of information, that it cannot fail to become popular."

## "EMPIRE" or STERLING SILVER PLATE

SPOONS, FORKS, TABLE CUTLERY, AND OTHER HOUSEHOLD WARE.

"EMPIRE" PLATE is treble plated on pure Nickel Silver. The patterns are reproductions from fine old Silver models, and have all the beauty of line and form of the Silver of 150 years ago; apart from the Hall Mark no difference is visible.

As far back as the 1862 Exhibition, "Empire" Plate was awarded Prize Medals for Excellence of Manufacture, and it still retains that pre-eminence for which it was noted fifty years ago, whilst the prices are, quality considered, strictly moderate, either for Cash, or on "The Times" System of Monthly Payments of £1.

"THE VILLA" Solid Oak Case, with Lift-out Trays, containing 110 pieces of "Empire" Plate and Sheffield Cutlery.

A Service for 12 persons from £12 10s.  
(Others £3 to £100.)

PRICE  
LISTS  
FREE.

No. 1, of Watches, Chains and Jewellery.

# LAGOS

# RAILWAY.

(SOUTHERN NIGERIA GOVERNMENT LINE.)

**QUICKEST, SHORTEST, and MOST COMFORTABLE route to the TINFIELDS of NORTHERN NIGERIA.**

A THROUGH rail service will be inaugurated in the current year from the Port of Lagos, the capital of Southern Nigeria, to Minna (the junction with the Baro-Kano Railway, the time occupied in transit being about 30 hours. The weekly mail train, which will connect with both the outward and homeward mail steamers at Lagos, will consist of saloon carriages provided with every modern convenience, including comfortable sleeping accommodation, lavatories, and bathrooms, and fitted throughout with electric light and fans. A restaurant car will be a special feature in connection with this train.

2. The route is *via* :—

Abeokuta (60 miles)  
Ibadan (123 miles)  
Oshogbo (186 miles)  
Ilorin (246 miles)

LAGOS LINE.

Jebba (306 miles)  
Zungeru (429 miles)  
Minna (467 miles)  
Rigachikun (585 miles)

the present nearest point of the Nigerian railway system to the Tin Mines of Bauchi.

3. At Lagos, passengers and their luggage, &c., are conveyed to and from the Ocean Liner by a tender which lands them conveniently at the Customs wharf. Arrangements will be made to convey them from the Landing Stage to Iddo Station, the present terminus of the Lagos Railway, where they may at once entrain. The saving in time by this route will be from 8 to 10 days on each journey, in comparison to the Niger River route *via* Forcados.

4. Due notice will be given of the date of commencement of this service.

5. For further particulars apply to the General Manager, Lagos Railway, Lagos, or in London to M. Y. Grant, Traffic Superintendent, Lagos Railway, c/o the Crown Agents for the Colonies, Whitehall Gardens, S.W.

# "HANDBOOK OF THE BRITISH COLONIAL EMPIRE."

BY

**W. H. MERCER, C.M.G.,**

*One of the Crown Agents for the Colonies ;*

AND

**A. J. HARDING,**

*Of the Colonial Office.*

---

"Whilst the 'Colonial Office List' is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring accurate and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts."

*Journal of the Royal Colonial Institute.*

\* \* \* \* \*

"The book is intended for educational purposes and is so attractively written, and contains such a fund of information, that it cannot fail to become popular."

"THE VILLA" Solid Oak Case, with Lift-out Trays,  
containing 110 pieces of "Empire" Plate and  
Sheffield Cutlery.

A Service for 12 persons from £12 10s.  
(Others £3 to £100.)

## "EMPIRE" ELECTRO or SILVER PLATE

SPOONS, FORKS, CUTLERY, AND  
OTHER HOUSEHOLD WARE.

"EMPIRE" PLATE is trebly  
plated on pure Nickel Silver. The  
patterns are reproductions from fine  
old Silver models, and have all the  
beauty of line and form of the Silver  
of 150 years ago; apart from the Hall  
Mark no difference is visible.

As far back as the 1862 Exhibition,  
"Empire" Plate was awarded Prize  
Medals for Excellence of Manufacture,  
and it still retains that pre-eminence  
for which it was noted fifty years ago,  
whilst the prices are, quality con-  
sidered, strictly moderate, either for  
Cash, or on "The Times" System  
of Monthly Payments of £1.

**LAGOS**

**RAILWAY.**

(SOUTHERN NIGERIA GOVERNMENT LINE.)

**QUICKEST, SHORTEST, and MOST COMFORTABLE route to the TINFIELDS of NORTHERN NIGERIA.**

A THROUGH rail service will be shortly inaugurated from the Port of Lagos, the capital of Southern Nigeria, to Minna (the junction with the Baro-Kano Railway, the time occupied in transit being about 30 hours. The weekly mail train, which will connect with both the outward and homeward mail steamers at Lagos, will consist of saloon carriages provided with every modern convenience, including comfortable sleeping accommodation, lavatories, and bathrooms, and fitted throughout with electric light and fans. A restaurant car will be a special feature in connection with this train.

2. The route is via:—

Abeokuta (60 miles)  
Ibadan (123 miles)  
Oshogbo (186 miles)  
Ilorin (246 miles)

LAGOS LINE.

Jebba (306 miles)  
Zungeru (429 miles)  
Minna (467 miles)  
Rigachikun (585 miles)

the present nearest point of the Nigerian railway system to the Tin Mines of Bauchi.

3. At Lagos, passengers and their luggage, &c., are conveyed to and from the Ocean Liner by a tender which lands them conveniently at the Customs wharf. Arrangements will be made to convey them from the Landing Stage to Iddo Station, the present terminus of the Lagos Railway, where they may at once entrain. The saving in time by this route will be from 8 to 10 days on each journey, in comparison to the Niger River route *via* Forcados.

4. Due notice will be given of the date of commencement of this service.

5. For further particulars apply to the General Manager, Lagos Railway, Lagos, or to the Crown Agents for the Colonies, Whitehall Gardens, S.W.

## CHALLINER'S PATENT WORLD & GIANT TYRES

are proving their remarkable wearing qualities daily on motor vans, lorries, buses, etc., from 1 to 12 tons. In use by all the largest British and Foreign Railway Companies. Send for particulars of them and also

(SOUTHERN NIGERIA GOVERNMENT LINE.)

**QUICKEST, SHORTEST, and MOST COMFORTABLE route to the TINFIELDS of NORTHERN NIGERIA.**

A THROUGH rail service will be shortly inaugurated from the Port of Lagos, the capital of Southern Nigeria, to Minna (the junction with the Baro-Kano Railway, the time occupied in transit being about 30 hours. The weekly mail train, which will connect with both the outward and homeward mail steamers at Lagos, will consist of saloon carriages provided with every modern convenience, including comfortable sleeping accommodation, lavatories, and bathrooms, and fitted throughout with electric light and fans. A restaurant car will be a special feature in connection with this train.

2. The route is *via* :—

Abeokuta (60 miles)  
Ibadan (123 miles)  
Oshogbo (186 miles)  
Ilorin (246 miles)

LAGOS LINE.

Jebba (306 miles)  
Zungeru (429 miles)  
Minna (467 miles)  
Rigachikun (585 miles)

the present nearest point of the Nigerian railway system to the Tin Mines of Bauchi.

3. At Lagos, passengers and their luggage, &c., are conveyed to and from the Ocean Liner by a tender which lands them conveniently at the Customs wharf. Arrangements will be made to convey them from the Landing Stage to Iddo Station, the present terminus of the Lagos Railway, where they may at once entrain. The saving in time by this route will be from 8 to 10 days on each journey, in comparison to the Niger River route *via* Forcados.

4. Due notice will be given of the date of commencement of this service.

5. For further particulars apply to the General Manager, Lagos Railway, Lagos, or to the Crown Agents for the Colonies, Whitehall Gardens, S.W.

## CHALLINER'S PATENT WORLD & GIANT TYRES

are proving their remarkable wearing qualities daily on motor vans, lorries, 'buses, etc., from 1 to 12 tons. In use by all the largest British and Foreign Railway Companies. Send for particulars of them and also

# "HANDBOOK OF THE BRITISH COLONIAL EMPIRE."

BY

**W. H. MERCER, C.M.G.,**

*One of the Crown Agents for the Colonies ;*

AND

**A. J. HARDING,**

*Of the Colonial Office.*

---

"Whilst the 'Colonial Office List' is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring succinct and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts."

*Journal of the Royal Colonial Institute.*

\* \* \* \* \*

"The book is intended for educational purposes and is so attractively written, and contains such a fund of information, that it cannot fail to become popular."

*Education.*

ROYAL DOULTON POTTERIES, LONDON, S.E.

**LAGOS**

**RAILWAY.**

(SOUTHERN NIGERIA GOVERNMENT LINE.)

**QUICKEST, SHORTEST, and MOST COMFORTABLE route  
to the TINFIELDS of NORTHERN NIGERIA.**

A THROUGH rail service is in operation from the Port of Lagos, the capital of Southern Nigeria, to Minna (the junction with the Baro-Kano Railway), the time occupied in transit being about 30 hours. The weekly mail train, which connects with both the outward and homeward mail steamers at Lagos, consists of saloon carriages provided with modern conveniences, including a restaurant car, comfortable sleeping accommodation, lavatories, and bathrooms, and fitted throughout with electric light and fans.

2. The route is *via* :—

Abeokuta (60 miles)  
Ibadan (123 miles)  
Oshogbo (186 miles)  
Ilorin (246 miles)

Jebba (306 miles)  
Zungeru (429 miles)  
Minna (467 miles)  
Rigachikun (585 miles)

Zaria (622 miles)

the present nearest point of the Nigerian railway system to the Tin Mines of Bauchi.

3. At Lagos, passengers and their luggage, &c., are conveyed to and from the Ocean Liner by a tender which lands them conveniently at the Customs wharf. Arrangements are made to convey them from the Landing Stage to Iddo Station, the present terminus of the Lagos Railway, where they may at once entrain. The saving in time by this route is from 8 to 10 days on each journey, in comparison to the Niger River route *via* Forcados.

4. For further particulars apply to the Traffic Superintendent, Lagos Railway, Lagos, or to the Crown Agents for the Colonies, Whitehall Gardens, London, S.W.

# "HANDBOOK OF THE BRITISH COLONIAL EMPIRE."

BY

**W. H. MERCER, C.M.G.,**

*One of the Crown Agents for the Colonies :*

AND

**A. J. HARDING,**

*Of the Colonial Office.*

---

"Whilst the 'Colonial Office List' is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring succinct and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts."

*Journal of the Royal Colonial Institute.*

\* \* \* \* \*

"The book is intended for educational purposes and is so attractively written, and contains such a fund of information, that it cannot fail to become popular."

THE TINFIELDS OF  
via THE LAGOS

NORTHERN NIGERIA.  
(STATE) RAILWAY.

1. An all rail route is now open for both goods and passenger traffic from the port of Lagos, the capital of Southern Nigeria, to Rahama, the present terminus of the BAUCHI Light Railway, a total distance of 712 miles. A weekly BOAT EXPRESS connects with both the outward and homeward MAIL STEAMERS at LAGOS, and consists of saloon carriages provided with modern conveniences, including a Restaurant Car, comfortable sleeping accommodation, lavatories and bathrooms, and fitted throughout with electric light and fans. The train runs through to Minna Junction (467 miles) in about 30 hours, and passengers tranship there to the Baro-Kano Railway.

2. At Lagos passengers and their luggage, etc., are conveyed to and from the Ocean Liner by a tender which lands them at Iddo Wharf, where the Boat Express is drawn up. All meals and refreshments can be had in the Restaurant Car throughout the journey to Minna. The saving in time by the all rail route is from 8 to 10 days on each journey in comparison with the old Niger River route via Forcados.

3. The passenger fares from Lagos to Rahama are as under:—

1st Class	... ..	£9 14 7
3rd .. (Servants only)	... ..	0 19 0

There is no restriction on the quantity of baggage which can be taken by passengers by the Boat Express.

The rates to Zaria are as under:—

First 2 cwts.	... ..	Free.
Next 20 ..	... ..	9s. 3d. per cwt.
.. 20 ..	... ..	13s. 6d. ..

Any baggage in excess of 2 tons 2 cwts. will be charged at excess luggage rates.

On the Bauchi Light Railway the luggage rates from Zaria to Rahama are:—

2 cwts.	... ..	Free.
Any baggage in excess of 2 cwts.	5s. 11d. per cwt.	

4. All goods are carried from Iddo (Lagos) to Zaria Rahama and Kano at the same rates as from Forcados by the river and rail route, and every facility is provided at Iddo for the handling of heavy and bulky articles of machinery, etc.

The rate per ton for machinery from Lagos to Rahama or from Forcados to Rahama is £18 3s. 5d. and for tin ore from Rahama to Lagos or Forcados £13 17s. 6d.

AND

**A. J. HARDING,**

*Of the Colonial Office.*

“ Whilst the ‘ Colonial Office List ’ is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring succinct and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts.”

*Journal of the Royal Colonial Institute.*

\* \* \* \* \*

“ The book is intended for educational purposes and is so attractively written, and contains such a fund of information, that it cannot fail to become popular.”

# THE COLONIAL OFFICE JOURNAL.

---

---

VOL. VI.

JULY, 1912.

No. 1.

---

---

[*This Journal, though published with the approval of the Secretary of State for the Colonies, is not official, and the Secretary of State is in no way responsible for the opinions expressed in it.*]

---

---

## EDITORIAL NOTES.

THE Secretary of State for the Colonies has appointed a Commission to inquire into the natural resources of the Dominions. It is anticipated that the travels of the Commission will take three years. Some complaints have been made that the Crown Colonies are not included in the scope of the reference and are therefore treated as negligible quantities. Such an inference is wholly unwarranted. The Colonial Office watches with particular interest and pride the progress of the Crown Colonies. But the object of the Commission is, we imagine, not so much to ascertain facts as to supply convenient means of discussion. Any facts which may be collected by such a body are already on record in the countless body of official and semi-official publications. But there is wanted in the intervals between the Imperial Conferences an organisation for the selection and discussion of commercial matters in which the self-governing colonies are interested, and this want the travelling Commission supplies. It is, in fact, part of the machinery of those Conferences, and stands apart *ab initio* from the Crown Colonies. The discussion of the questions of these possessions can be arranged much more readily and conveniently by direct methods. The machinery in this case works continually, and whatever criticism

Vol. VI., No. 1.

▲

may be directed to the results it cannot be said that there is any lack of attention to the subjects which call for consideration.

In emigration the most striking feature of last year was the increase of the number going to Australia. The departures rose from 35,813 in 1910 to 68,631. Those to Canada rose from 156,990 to 184,891, and to South Africa from 27,297 to 30,770. The United States figures fell from 132,192 to 121,829. For the first time in the history of this class of emigration, the number of persons sent out to Australia under the Unemployed Workmen Act, 1905, exceeded (being nearly double) the number sent to Canada. The competition of Australia therefore with Canada, which till lately was hardly appreciable, has now become strong, and no doubt the assisted passages which all the Australian States, except Tasmania, are now giving secure picked emigrants who are suitable for the particular purposes in view. The report of the Emigrants' Information Office states that the greater interest now being shewn by Australian Governments and people in immigration was evidenced by the large increase in the passenger movement from the United Kingdom to the Commonwealth. Everywhere there was a great demand for labour and a rush of emigrants to meet it. New South Wales, Queensland, Victoria, and Western Australia continued to give certain assistance towards the cost of passages, and South Australia revived the policy of assistance after a discontinuance for some thirty years. Tasmania alone among the State Governments adhered to the policy of giving no money assistance. The passenger accommodation on the vessels plying to Australia was insufficient to meet the demand, and in the latter part of the year immediate passages were very difficult to obtain.

Free passages were offered for a time by the Queensland Government to railway workers, as several hundreds of miles of new railways were being constructed. The free passages to Queensland for female servants and contract labourers were suspended at the end of the year. Victoria continued the assistance given to emigrants taking up Government irrigated farms. The New South Wales Government continued the plan of receiving boys from the United Kingdom for a short training in agricultural work on Government farms prior to their distribution for work on private farms.

The chief Government assistance given was to farm hands and female servants, but there were evident symptoms of a recognition of the demand for labour in other directions also. A Commission in New South Wales reported a distinct need for more labour of the artizan and mechanic class, and Victoria took action in the matter to the extent of offering assisted passages to a specified number of mechanics and female operatives, thus reintroducing a form of assisted immigration unknown for many years.

The ideal cloth for hard wear, sports and all out-door purposes; made in white, cream, khaki, drabs, and all other up to date shades. Remarkable for strength and lightness. Rainproofed.

In the case of assisted passages the difference in the cost of getting to Canada and to Australia is not substantial. But in business circles the distance of Australia still operates as a serious commercial disadvantage. It is hardly realised that there is a countervailing factor. In Australia the haulage of agricultural products to the ports practically does not extend beyond fifty miles, while in competing countries it runs into thousands of miles, and railway transport is a much more serious matter than sea carriage, the cost of which per mile diminishes rapidly with the distance. Thus Australia actually delivers her agricultural products into the London market at a lower rate than most of North America does. This explains the leaping figures of the exports of beef and mutton, fruit and wine, butter and cheese.

On the other hand the transportation difficulties of Canada are increasing every year. Here, not only are the haulages from the Middle West extremely long, but the work of the railways is cut short by the close of the navigation. It is calculated that not more than 40 per cent. of this year's crop will be removed before this period arrives. The lines are being rapidly increased, but the best relief will be given by the Panama Canal, which will divert a great amount of traffic to the Pacific coast.

---

The recent celebration in America of the memory of Champlain was a fitting tribute to one of the most able and attractive figures in the annals of colonisation. Champlain was not merely an explorer and a founder of colonies: he was the ideal Frenchman of high and chivalrous character. In French Canada he is revered as a good Catholic, and it has been a labour of love of several ecclesiastical historians to write of his career with close attention to this feature. He has become, in fact, to Quebec what Virgil's pious hero was to Rome. Apart from this, there is no doubt that Champlain had the genius of a coloniser. He was a geographer, a sailor, a naturalist, and a surveyor. His foresight was remarkable. He suggested the Panama Canal. He picked out from a vast expanse of territory the sites of Quebec, Montreal and Ottawa, and in a reconnaissance to the south of Acadia he marked the potential ports which are now Portland, Providence and Boston. He sketched out, as M. Hanotiaux has remarked, the future United States.

In particular he traced the natural road, by the lake to which his name was given, between the St. Lawrence and the modest settlement of New Amsterdam which became New York. Most important of all, he recognised the fertility of the country. There was no proof of this at the time, as the natives practised only the chase and fishing, and France at home utterly refused to believe

that regions which were covered with snow and ice in the winter, could be of any value for French settlers. Champlain, however, was fortunate enough to secure the support of Henry IV. and Richelieu; not that he got much from them, but their favour secured respect for his authority. He began his small settlement in the spirit of a missionary. He is reported to have said that "the conversion of an infidel is worth more than the conquest of a kingdom." Certainly he had a very strong sympathy with the Indians, whose life in winter was often extremely hard, though he was quite aware of their cruel and treacherous attributes. The influence which Champlain won over them has left traces down to the present day.

---

The increase of the exports of butter from Australia has been phenomenal. Fifteen years ago there was hardly enough for local consumption; in 1910-11 the export was 45,716 tons, treble the quantity of two years before. The taking up of this industry is largely due to the policy of the Government in providing irrigation on a great scale, as this removes the one danger which the Australian cattle-owner had to fear. Also the returns are quick, and therefore the industry is attractive to recent immigrants who want to make money more quickly than they would by planting or sowing. It is greatly in their favour that cattle diseases are comparatively rare in Australia, and the mildness of the climate which allows cattle to graze all the year round is an immense advantage. Co-operation is practised on a continually increasing scale and with much Government assistance. Machinery is so largely employed now in the making of butter that manual labour is almost abolished. These methods enable Australia to compete in the United Kingdom against Denmark and other continental countries, and as its supplies are still only about one-quarter of the total import there is ample room for a great development. Meantime, the Danes have one undeniable advantage—their butter is better.

---

In the Northern Territory of Australia nearly all the attempts to cultivate the land have ended in disastrous failures. In one case £20,000 was spent on a sugar plantation, which produced in one year seven tons of sugar and in the next five. Other enterprises in coffee, rubber, and other products have been similarly unfortunate. But this is not the fault of the land or the climate. There are hundreds of thousands of acres of land well suited for agricultural purposes and for stock raising within a reasonable distance of railway and water communication with Port Darwin. At present the land is simply a waste. The main cause of failure is want of knowledge and experience. Experimental gardens have been established, but in view of the policy of a white Australia the work is directed

so as to ascertain what products are fitted for European labour. In 1909 two farm hands and set of implements arrived in the Territory from Adelaide, whence they had been despatched by the Government, for the cultivation of an experimental plot of 12 acres near the Katherine. The instructions were that about one-third an acre each of wheat, oats, and barley should be planted each successive month for twelve months. The work carried out at this "experimental plot" was a complete failure, and could not have been otherwise, owing to the manner in which the experiments were carried out, and it was evident that those who were intrusted with the experiments were quite ignorant of any method or principle upon which to work. The value of this paltry effort was nothing whatever; and the work was ridiculed by those persons who happened to visit the "Experimental Farm."

---

It is hoped that this practically uninhabited country will become occupied by a thriving white population, but it must be admitted that only trifling progress has been made so far. The competition of countries which possess and use native labour is a serious difficulty for a territory to which the Restriction Act applies.

The mining industry has fared even worse than the agricultural. It is said that over a million has been spent, but everywhere from Port Darwin to Pine Creek there are decaying batteries and rusting machinery. There are patches of rich minerals, but except in rare cases they will not pay till there is railway communication. It is curious that in a country offering such safe opportunities as Australia does there has been so much speculation in the Northern Territory, but a gamble has always had attractions.

---

The Ready-made Farm idea which is being taken up in Canada is recent, but it clearly meets a want. The best immigrant is the farmer who has saved a few hundred pounds and is ready to move with his family to a place where he can employ his money profitably. But it is too much to expect that men of this class will settle on a trackless prairie where there are no buildings and the land has to be broken up. Some improvements on the natural face of things are required to make the situation attractive to men who do not want to go beyond the pale of civilization, and the C.P.R. with its usual adaptability is providing accordingly. It possesses 3,000,000 acres in one block, east of Calgary, and is spending over £5,000,000 in irrigating it. Here farms are being made of 80 acres, irrigated, ready to be taken up, and there is an enormous demand for them. Each has a cottage, barn and fencing, which cost £400, while the land, irrigated, costs £6 an acre, or, unirrigated, £3 12s. Ten years are allowed for payment, so that a small sum will put the buyer in

possession of a property where the roughest work is done. In the Eastern Provinces the provincial governments are providing ready-made farms or financing approved immigrants. Ready-made houses are also a feature of the "closer settlement" schemes in Australia.

---

The world generally is being much exercised at present by the increased "cost of living," and the newer countries are apparently feeling the pinch as much as the old. Our Ottawa contemporary, the "Civilian," states that the Dominion Department of labour has been engaged on the task of making an average of wholesale prices for the decade 1890-99, this average to be used as an "index number" for comparison with present prices. The "Civilian" observes that the report for 1911 does not bring much comfort to the salaried man. It breaks the news to him gently by opening with these words: "Wholesale prices in Canada reached during 1911 a general level higher probably than in any previous year within the present generation." The statisticians find that they have to go back to 1882-4 or possibly to 1892-3 to find a condition similar to that now prevailing.

And the latest returns to the Department, instead of affording any consolation, show that the advance was maintained during the present year. The prices according to these reports are 34 per cent. higher than the index number. Every group of articles but two showed an increase for the year over the index number; the two exceptions being silks (14 per cent.) and fuel and lighting (0.6 per cent.). The highest increase was furs (204 per cent.). Other great increases were lumber (65 per cent.), liquors and tobacco (51.2 per cent.), and hides and tallow (58.4 per cent.)

---

The battle of free trade and protection is fought, on much the usual lines, in the report of the South African Commission on trade and industries. The Government have taken no action on it during the present session, but will consider it during the recess. It is common ground that the cost of living is excessive, and that industries cannot thrive where the every-day requirements of living are expensive. It is recognised by all parties that another drawback is the immense size of the country, the want of a large consuming population and the great distances between markets, which make it almost impossible for any one factory to supply anything but a very limited area. This handicap also acts in another way, as it very often increases the cost of raw materials that are obtainable in the country to such an extent that it is cheaper to import them. It is further agreed that as long as the country continues to import so large a proportion of the necessities of life as it does at present they

will remain expensive and the successful establishment of industrial enterprise will be impossible because wages must in consequence be high. Thus of the bread consumed in South Africa two-thirds are imported, on which freight, customs duty, shipping and landing charges, and railway carriage have to be paid. Flour, which costs £7 10s. a ton in Australia, is sold in Johannesburg wholesale at £14 10s., and over and above this the margin between baker and consumer is enormous, the difference being about 150 per cent. In this country the cost of 4 lbs. of bread is from 4½d. to 5½d.; in South Africa it is 1s. The obvious remedy is to develop agriculture, and it is fully realised by the Commission that this is necessary before industry can be improved. But after this point the familiar controversial difficulties arise. It is quite possible to stimulate agriculture by protecting it, but only at the risk of still further increasing the cost of food. The Commission recommends that the customs duty on wheat be raised to 2s. per 100 lbs., but on the other hand that the preferential railway rate should be abolished, and in other cases the increases proposed are not important. The conflict of opinion does not become acute until the question of protection of manufactures is reached. On the one side it is claimed that it is in the best interests of the country as a whole that adequate protection should be given to industrial undertakings. This is said to be founded on "economic and national considerations," and it appears from instances given that these are different and that "economic" considerations may be sacrificed in favour of "national" considerations, as in the case of the duties recommended on wheat and flour. It is to be regretted that this distinction is not further explained, but apparently the idea is that some sacrifices of money may be made to increase the white population, and to find employment for it in the country as far as possible. The Commission recommends a number of substantial increases of duty, but there are two dissentient reports. All parties appear to agree that the development of agriculture is the predominant requirement, but at present mining is the principal industry, and this wants no protection but a reduction of working expenses. Mr. Martin observes that "Whilst the cost of living is so high—especially that of the white man with a family—the development of the country must necessarily be retarded. It is certain that no material reduction can be effected so long as the necessaries of life are heavily taxed as at present. The first consideration, therefore, should be a substantial cheapening of foodstuffs and other necessaries by the removal therefrom of all customs duties. This would undoubtedly result in a reduction in the cost of production, thereby enabling manufacture to be carried on more cheaply, and thus increase the opportunities for labour. The extension of the list of raw materials for manufacturing purposes to be admitted free of duty or at the

3 per cent. tariff, and particularly the reduction in railway rates on raw materials, would also immensely assist local industries in their competition against the imported article. Indeed, those manufacturing industries which under the present tariff do not enjoy special protection would be much better off than they are at present, and with perhaps two or three exceptions the industries whose protection under the present tariff it is proposed should be reduced would benefit to a greater extent than they would suffer."

There will no doubt be strong opposition from the mining interests to the recommendations, and in South Africa the "consumer" is a much more important element than he is in countries where manufactures are carried on on an extensive scale. It is calculated that the produce of the mines last year amounted to about £45,000,000, and besides this the other produce of the country is very small. It is difficult to see how the smaller part of the trade can be stimulated without injuring the larger. South Africa is the land of dear labour, and this is why she buys so much in foreign markets. But so long as she exports on a greater scale there is not much to complain of, and the exports, which were nearly all in the shape of raw materials, last year exceed the imports by some 50 per cent. The trouble is not so much economical as racial. The problem is to provide white men with work in a country where white men are tempted by the abundance of natives to despise work. But it will be an enormously difficult and costly task to provide manufactures in such a country to such an extent as to counteract the growing preponderance of the black element, and the last hope lies with development of agriculture on up-to-date methods.

---

The coal strike brought into the field the question of supplies for the Colonies from other countries. Australia is a large exporter, but in the matter of price the Transvaal was much lower and will probably in no long time be a formidable bidder for eastern orders. The annual production there is about five and a quarter million tons. Most of this is consumed locally, but the Colony will, as the output increases, probably capture much of the Indian and neighbouring market. The strike and its results are in favour of the companies engaged in the industry. India alone takes between three and four million tons annually.

---

In South Africa perhaps more than anywhere else it is important to give technical education to boys, because of the strong local idea that manual work is for the black man. If, as Mr. Malan observed at a conference held at Pretoria on technical education, this goes on, South Africa will gradually be training the native to do skilled as well as unskilled work and the white man will suffer. This process is in fact going on. Not only are considerable numbers of natives learning

skilled trades, but the ominous fact is making itself apparent that white boys are to a great extent taking up employment of the "blind alley" character. It is most difficult to obtain apprentices, as the boys on leaving school easily obtain posts which are well remunerated for the time but lead to no good position in life and give no good training. This mischief is a growing one in all civilized countries, but it is particularly serious where it has the effect of debasing the white race in comparison with the black. Fortunately, recent ideas on the education of the masses are all in favour of more practical methods than have hitherto been in vogue, with a view to the early development of certain centres of the brain, of manual dexterity, and of constructive faculty. One difficulty is that labour is so highly specialised that a young man is kept to one machine more or less permanently so that the commercial shop gives him no opportunity of understanding his trade generally. It does not pay his employer to divert him from a work on which he has become competent to another which he has still to learn. An apprentice or pupil is supposed to go through the works, but this system is breaking down everywhere, for the time-honoured method of taking a large premium and then leaving the pupil to do much as he likes is not applicable to modern conditions except in comparatively rare cases. The only way out is the technical school. It is satisfactory to find that a conference convened by Mr. Malan pronounced strongly in favour of "vocational" schools, in which indentured apprentices should spend at least the first two years of their apprenticeship, and attend technical classes for the remainder of the period. The scheme recommended comprises power to compel apprentices or pupils to go through the prescribed school course. As regards education generally, it is recommended that the instruction given shall be "adapted to environment," or in other words that textbooks on history, geography, botany, etc., should have local reference. This is undoubtedly sound and by no means superfluous advice, as a comparatively new country is apt to borrow the educational books of older countries for which alone they have been written.

---

The scheme for connecting a very large part of the Empire by wireless telegraphy will be a triumph of science and the realisation of an Imperial idea which seemed beyond hope a few years ago. An instance of the magnitude of the change is that London will, it is expected, be able to correspond with Pretoria via Aden, the messages going direct between the two last places, a distance of 2,450 miles. Canada and Australia have for a long time taken great interest in the subject of wireless telegraphy, and in Australia a circle of stations is being established round the coast. A similar scheme for communication with the Colonies is contemplated in France, and is likely to be actively taken up in connection with the budget of next year. It need hardly be said

that the starting point is the Eiffel Tower, an imposing monument which the British scheme lacks, and connection will be made with Cotonou, Pondichéry, Saigon, Djibouti, and eventually Martinique and New Caledonia. This system would embrace Hong-Kong and Singapore, and will help to make British communications more extensive. The scheme is estimated to cost 6,600,000 francs. It is partly stimulated by the approaching opening of the Panama Canal, and France hopes to speak to Tahiti, where great designs are on foot, via Martinique. Charges for wireless messages would be greatly lower than those over submarine cables, but probably the latter would not be seriously affected, as the wireless system cannot compete with them in speed, secrecy, accuracy and certainty. The business done would be nearly all new, as in the case of installations on board ships. A new cable is being laid by the Pacific Cable Board between Australia and New Zealand, and it is understood that the Australian wireless preparations are not meant for competition with the cables but for defence and emergencies.

---

The announcement of the wireless scheme had the effect of discouraging the proposal for a state trans-Atlantic cable. The object of this proposal is not so much to reduce the cost of telegraphy between this country and Canada as to reduce still further the cost of communication with Australia, which, however reasonable for the distance, is relatively high. The leasing of the British trans-Atlantic cables to United States companies naturally excited some misgivings, but whatever may be thought of this operation commercially the fact remains that all the cables land on British territory and the General Post Office, from which a licence has to be obtained, has complete control and is now exercising it as licences fall in by stipulating that it shall have control of the rates charged. This matter may therefore be put aside, and the project of a state cable considered on its merits. The difficulty is, as we have previously pointed out, that the collecting business is practically in the hands of the land telegraph companies which are now leagued with all the cables, and there would be little opening for a state cable except for the through traffic to Australasia, which would be very far from sufficient to support the line. The advent of another means of communicating with Australia, at rates of which there would be no reason to complain, will no doubt do much to prevent the further advocacy of the state cable.

---

The preparation of the return of lands in Crown Colonies and Protectorates must have caused a great amount of work. Probably,

the object was not so much to get a tabulation of the "assets" of all the Colonies as to have the conditions of alienation of native lands set out. The first question appears to present the alternatives of land being, or not being, vested in "private persons, or chiefs or corporations," but none of these heads cover the case of lands held by native tenure of the communal type. In Northern Nigeria, where the subject is of special interest at the present time, except as to some 40 acres held by the Niger Company, the Government recognises a kind of leasehold interest vested in every occupier, which is practically a non-transferable freehold subject to divestment in case of non-performance of statutory obligations; no proprietary rights are recognised, and land cannot be alienated by chiefs or tribes, all rights being vested in the Government as trustees for the natives. Areas may be granted by Government for prospecting and mining purposes under the Minerals Proclamation, 1910. An exclusive prospecting licence is tantamount to a lease for one year renewable annually up to three years, conditional on certain regulations as to *bonâ fide* prospecting being observed. The duration of a mining lease is 21 years, determinable in case of breach of regulation or of discontinuance of working, and renewable on certain conditions as to the exercise of *bonâ fide* mining operations for further periods of 21 years indefinitely. Exclusive prospecting licences and mining leases confer certain rights of user of the surface of the land covered by such licences or leases to the holders. They confer, however, no exclusive rights of user over the surface; that is to say, the holders are not entitled by virtue of such licences or leases to prevent others from using the surface of the land, except in so far as by such use the prospecting or mining operations of the holders may be interfered with.

In East Africa native chiefs, are, by a similar idea, considered as tenants under Government of the areas occupied by their people, but here when land is not occupied and not required by the natives the Government acts as the owner. In Nyasaland no chief or tribe is now recognised as the owner of any land. In the older possessions, such as Sierra Leone and the Gold Coast, the land is with comparatively small exceptions considered vested in the chiefs and tribal authorities, but conditions have been laid down by statutes governing the manner in which they can dispose of it. The first question in such cases is one of fact, viz., whether the land has native owners, or whether it can be regarded as unclaimed and so treated as the property of the Crown. This question was much discussed in the case of the Gold Coast when Sir W. Maxwell was Governor and the advent of the gold mining companies make it important to have a clear understanding of the matter; at one time it was thought that it would be possible to claim a great amount of land for the Crown, but investigation

showed that practically all land had native owners. The second question is one of policy, viz., how should the Government protect native owners from being made the victims of unconscionable or improvident bargains, or violation of customary laws, while providing for legitimate European enterprises. In the Gold Coast Colony a Concessions Court was set up, and all native concessions had to be validated by it. The later model, by vesting native lands in the Government as trustee, establishes control by the administration instead of by the courts; and it may be argued that in this way the land policy can be carried out with greater elasticity and adaptation to circumstances, than when it is dealt with judicially, or, in other words, under regulations which must be taken as they stand, and with little reference to the intention of the legislature, except so far as is shown therein. But it does not follow that the same freedom can safely be taken with an old Colony, where customs of sale have had time to grow, as with a new territory. We do not want the natives to be alarmed by the idea that the Government means to confiscate their land. Many of them are already very uneasy, as may be seen, for instance, from the following letter to the Lagos "Standard":—"Sir, the community seems confused and downcast with regard to the Government notices placarded constantly and without cessation on the lands question, and I fear the European merchants, too, are all looking over their books, for much of the trade of this Colony depends on what merchants call the rolling system, and it depends much on house and land security. Crowds of people attend the weekly Thursday meeting of the Auxiliary of the Anti-Slavery and Aborigines Protection Society; all other business is suspended, as the people will not listen to you, except you talk on the lands question. From time to time the same plaintive cry is heard: 'You the Creoles do beg the King (meaning his Majesty the King of England) to leave our lands to us, we never insult the King's authority. It is our very life that they want to take; what will we live by?' One could easily see how native idea runs through in all our actions, for the native idea is that the King has power to confiscate a citizen's landed property if he insults his authority or tries to be disloyal, and therefore the people see no reason for all talk about lands question so long as their loyalty to the Crown and Government remains unspottedly unimpeached. Heaven's grant us all a merciful ear. The land's expropriation ordinance is sickening enough. Why more worry?"

---

We are all familiar with the fact that the easiest way to rule native tribes is to do so through their chiefs, and it is frequently found that mischief results if the authority of the chief is weakened. Contact with the white race, however, has this effect, and the

question then arises how the traditional authority can be strengthened or replaced. The problem has been solved in Papua by a courageous measure. The annual report explains that there had to be a form of chieftainship, and, as the native himself was found wanting in this respect, the Government gave them chiefs, by dividing the Territory into Divisions and putting in charge of each a Resident Magistrate, and those Caucasian Resident Magistrates are at the present day the paramount chiefs who control, guide and care for the three or four hundred thousands of Papuan natives. It seems almost incredible to realize how naturally the people have accepted this substitution; how readily they give their obedience and respect to this re-incarnation of chieftainship, and accept the government, control, and leadership of a chief who is not of their own race or colour.

“The solution is simply that the love of respect and authority that was for decades becoming slowly deadened and decadent, to all appearances, was in reality only lying dormant, had become only a smouldering spark; and with the re-establishment of chieftainship with power and authority made manifest to them, that dormant respect, that smouldering spark of obedience has burst forth in all the power and vigour that must have characterised it in those bygone days when a Papuan chief was a power and influence in his own land.

The Resident Magistrate is the centre of the national life, and it is through his existence as a chief that each individual tribe is conscious of its own unity. It matters not to them that he is the chief of numerous other tribes. It is sufficient that they know he is the one that their individual tribe must obey, that they receive the same care and attention from him as if no other tribe existed. As a father is to a family, so is the Resident Magistrate to the tribes of his Division. They look to him as their final court of appeal. In reality, they have the right of appeal to higher authority, but they do not desire it. They are satisfied with the judgment of their chief—the Resident Magistrate. His word to them is law, and is obeyed without question. They know that his respect for the majority of their customs is as great as their own, and no change is made in the traditional customs of the tribe without his knowledge and sanction. He is the peacemaker in all domestic troubles and quarrels. In fact, he is the pivot on which their tribal life revolves. He is their strength, their safety, and their refuge, and without him they would be bewildered and lost, and their life chaotic.

On the face of this, it appears that the power of the Resident Magistrate in the minds of the natives is absolute, and, with the exception of the more civilised natives in the vicinity of the

towns, the natives believe his power is absolute, and they are quite content that it should be so, and it is a very rare occurrence where a native prefers to have his case taken to a higher authority than the Magistrate to be dealt with."

This is an admirable result. But before trying the same experiment elsewhere it would be advisable to consider whether the natives are as unsophisticated as they are apparently in Papua.

---

The most troublesome matter to the Papuan Magistrates is the remarkable number of sorcery cases. The Papuan, like many other natives of low civilisation, attributes natural processes to human action. If his friend dies, he believes that some one has murdered him by magical means. This leads to trouble and sometimes sets tribe against tribe. Fortunately a pig is satisfactory compensation for a murder, and the dispute may be peacefully settled. Most of such beliefs do little harm and unless the sorcerer is using his art deliberately to cause fear or extort presents the best policy perhaps is to ignore them as far as possible, so far as official action is concerned. Action by the Government is likely to be considered proof that the sorcerers actually committed the miraculous acts. Secondly, failure to convict would often have a bad effect, as evidence which no magistrate would think anything of might be absolutely conclusive to the native mind. The native lives in a world of spirits, and his actions and beliefs are influenced accordingly. Thus a curious story is told of the funeral of a middle-aged man. The body, wrapped up in native mats, was being carried to the grave. The mats were tied in position by three cords, one round the neck, one round the body, and one round the ankles. Just before reaching the burial ground there was a weak but indignant voice from the midst of the mats. The bearers were considerably astonished, and halted while the nearer relatives were consulted. (No relative takes any active part in a Trobriand funeral, it is all part and parcel of the Totem ceremony.) It was ultimately decided to bring the supposed corpse back to the house. Arrived there, the mats were unfastened, and pulled away from the man's face. He was raised to a sitting position, after which he asked for a banana. It was given to him, and he slowly ate it, and asked for another. He ate this also. He then made signs indicating that he wished to recline. This was done. After some little time he was examined again, and found to be dead. The delayed interment was accordingly resumed. This time the grave was reached without any unforeseen occurrence, and the body placed within it. The first handfuls of soil had been thrown upon the mats when there were again sounds of indignation from the midst of them. This time the bearers were considerably annoyed. What was the good of their having a decent funeral at all if each attempt was spoiled by the lack of consideration on the part of the

deceased? The general feeling was that the burial should be proceeded with. At this point the local policeman comes on the scene. Now the constable's sympathies were with the bearers and relatives, who had been put to such "shame." At the same time he pointed out to those assembled round the grave that, richly as the deceased deserved their anger, if the Government heard that they had buried a living man there would surely be trouble. The body was accordingly taken up and back again to the house. This time he had a drink of water, and altogether seemed more cheerful. Meanwhile a meeting of relatives and friends was taking place in a neighbouring house. After many expressions of regret, in which the feeling of their great shame was uppermost, the question which had to be solved was, "How long was this thing to be continued?" The unusualness of the occasion which caused the meeting left the majority without power to make suggestions, but finally it was arranged that a cord should next time be tightly wound round the throat. Twice the spirit of the man had attempted to get away, but had been prevented by the body. It was their duty to help the spirit. First, however, it was decided to consult the constable. He, much again to his regret, had to say that, if they used the rope for the purpose specified, the Government would be annoyed. Why it would be annoyed he could not exactly say, but he felt sure it would be. Better wait, was his advice. Later on word was brought to them that the sick man was again sinking. The funeral eventually took place the following day. They took the constable's advice, and awaited the convenience of the deceased. The idea in such a case is that the spirit wishes to go, but the body holds it back.

---

There is one intellectual quality which is seldom lacking among the populations which are expansively referred to as native races. This is fluency of speech. The paucity of the vocabularies has something to do with it, as with educated classes it is largely the embarrassment of choice that leads to halting and confused speech, but the chief cause is probably that the critical faculty is less advanced than among Europeans, so that the speaker proceeds in a style natural to him without inward questionings or fear of his audience. The last Basutoland report remarks that "it would seem that nervousness is a product of civilisation, for in this Council, whose members have only comparatively lately come into contact with European forms and procedure, every member speaks fluently and easily and it is practically unknown for a speaker to stammer, hesitate, or repeat himself unconsciously. The principal fault to be found with the debates is their tendency to drag on to undue lengths, and as a result it has been found that there is always business left unfinished at the close of the session." The tendency, therefore, to protracted talking is not a characteristic

of modern institutions. Any one who remembers the long-winded character of various ancient discourses which have unfortunately survived will appreciate this.

---

At a time when there is considerable effervescence in West Africa over the question of the native tenure of land, it is interesting to recall the fact that the present Prime Minister of this country has taken an important part in the matter. The occasion began by the introduction in the Gold Coast in 1894 of an ordinance to vest waste lands, forest lands and minerals in the Queen. This appeared to assume that there were waste and unowned lands in the Colony, but, when the question was gone into thoroughly, as it was, it was clearly established that there was no land without an owner, and that the traditions of ownership had been well kept. This bill therefore was not proceeded with, but in 1897 a Lands Ordinance was introduced, the main object of which was to prevent the improvident creation of interests in land; it was provided however that the Government should administer all "public land," and this proposal at once caused great opposition, with the result that petitions to the Queen in Council were settled by Mr. Asquith. Eventually a deputation of native kings and chiefs was received by Mr. Secretary Chamberlain, who explained that the main object, almost the sole object, was to protect the chiefs against the action of speculators, who, in many cases, got hold of the land for insufficient consideration and without regard to the various interests in the land. The bill was withdrawn and subsequently the Concessions Ordinance, 1900, was passed as a simply regulative measure for the protection of native owners against unreasonable transactions.

The Southern Nigeria Trade Statistical Abstract, No. 2, is like its predecessor, a remarkable instance of prompt and thorough work. An energetic department, which can issue its own report separately and get it printed and issued locally, secures an expedition which, it must be admitted, is by no means characteristic of the reports prepared with a view to presentation to Parliament, which have to run a long gauntlet before they are finally sanctioned for this august purpose. It is interesting to notice that, while the British Empire supplies Nigeria with commodities to the value of £4,200,000 a year, and foreign countries to the value of £1,500,000, the duties on British goods amount only to £320,000, while the foreign goods pay £1,122,000. This phenomenon is mostly due to the spirits from continental ports, which produce some £900,000. A careful discrimination can no doubt produce striking results without resorting to any formal preferential treatment. Thus it is observed: "The Customs Authorities have suggested that the duties on cotton goods should be removed, and

the revenue reimbursed by the imposition of a specific export duty or royalty on palm products as this produce is derived from the forests, and the removal of the cotton duties will tend to increase the demand for cotton goods in Northern Nigeria and set free the raw cotton for export, now used there uneconomically. The export duty on palm produce required for the purpose is small comparatively, and the position of Nigeria as a supplier of palm produce to the markets of the world so strong that the export trade will be in no way affected by the adoption of the proposal. If this proposal were accepted almost the whole of the goods supplied by the British Empire will be admitted free of duty into Nigeria while the bulk of exports taken by foreign countries will be liable to a small duty which will to some extent fall on those countries, as Nigeria is the largest supplier of palm produce in the market."

The inspection of produce, which is being adopted all over the world with satisfactory results, has been in the last few years rapidly extended in Southern Nigeria, where there are now 138 men employed at from £2 to £5 a month. The system maintains a standard of purity, and at the same time provides for instruction to the natives as to the preparation of the produce. One advantage of the large revenue from spirits and tobacco is that no foodstuffs are taxed except salt and kola nuts. The importation of sugar is curiously small, and as the natives become acquainted with this luxury a large market may be opened, from which it may be hoped that the West Indies will profit. Some day, perhaps we shall see the High Commissioner for all the West Indies conferring, under the watchful eye of the Colonial Office, with the High Commissioner for Nigeria with a view to reciprocal arrangements. With all deference to Canada, a population of eighteen millions (more or less) is well worth cultivating. It is unsatisfactory to find that Germany takes almost the whole of the palm kernels—valued at more than half the produce exported. It is estimated that over one hundred thousand persons are engaged in cracking kernels, and several times that number in preparing palm oil; some attempts have been made to invent machinery for both processes, but with no marked success, and effective machinery would be a great gain. A great impetus will be given to railway development, on which everything else hangs, if the discovery of coal at Udi results in a good yield. The deposits are reported to be extensive, and a survey from Udi to Onitsha, a distance of under 60 miles, is being made. For the present the most urgent want appears to be the extension of the railway from Iddo into Lagos. Alternative routes for this extension to the proposed new wharves at Wilmot Point have been under consideration. At Iddo there are no sheds and the place is not well suited for them, so that goods have to be unshipped into trucks.

This, with an increase of trade, will soon be found intolerable. The situation recalls the long discussion which went on when the construction of the railway was under consideration and opinions differed as to whether Lagos, Iddo or Ebute-Metta should be made the terminus. The commercial element largely favoured Lagos, and the shipping element Ebute-Metta, and eventually the island was settled upon in a spirit of compromise—with the usual result.

---

It is brought out in the report on the Sierra Leone census that the creoles, or descendants of liberated Africans who were brought into the Colony under the Slave-trade Abolition Acts, are decreasing seriously in numbers. The explanation appears to be that more vigorous races, at any rate for the purpose of agricultural labour, are coming into the Colony, which is a comparatively small area, from the Protectorate, and displacing the older inhabitants. It is pointed out that in the report of the Committee on Indian emigration it was shown that in many West Indian and other Colonies, where there is a considerable native population, whether indigenous or creole, who show a disinclination for agricultural labour, thus rendering the importation of immigrant labour an absolute necessity, indigenous or creole population has shown a tendency to diminish in numbers or to remain stationary, or perhaps to increase very slowly. In Sierra Leone we have a creole population who show a marked aversion to tilling the soil; we have also a considerable aboriginal population invading the Colony from the Protectorate, as the census report of 1901 and the table of birth-places in this report show, and settling upon and cultivating land once occupied by creoles. It is suggested that much the same process is going on in this Colony as is going on in other parts of the world, and that the principle to be deduced appears to be that when a nationality declines to cultivate the earth, the first industry of life, that nationality has a tendency to decrease.

One effect of the change has been to stop the strides made by Christianity; the Christian denominations show serious declines, while Mohammedanism has greatly increased.

---

The British and German possessions are very much bound up with one another, both historically and commercially. The products are similar, and the experience of one place is valuable to another. Even the Magadi Salt Lake, considered to be the peculiar and unique property of British East Africa, has, it appears, a counterpart in the German territory. These similarities lead to a great amount of exchange of information, and on both sides a remarkable friendliness has been shown. It would, in fact, be difficult to find another case where two nations in adjoining territories have

maintained such pleasant personal relations. There is, of course, some competition, but on the whole the spirit of combination is stronger; and this shows wisdom on both sides, for the real competition is not against one another, but against other parts of the world. One circumstance which tends to keep the two possessions in close touch is that the Germans have to pass by Mombasa on their way to and from German East Africa, and many officers go through British East Africa and make a stay at Nairobi or elsewhere. It is rather to be regretted that the practice is all on one side. No British Governor has gone on to Daressalam. When one does he will have to admit that the German capital is greatly more attractive than Mombasa. Our iron bungalows are poor things beside the German villas. This advantage might, perhaps, be conceded complacently if we kept level in trade, but here Germany is a long way ahead. Probably she secured the best territory in the deal of 1890. The hinterland of Mombasa is inferior to that of Daressalam, as the route passes through a waterless region. The interest taken in this country in Uganda was originally unconnected with commercial considerations; it was inspired by the missionaries, and the Uganda railway was decided upon largely under their influence and as an acceptance of the responsibilities created by the Brussels Conference of 1890. The really important place in the eighties was Zanzibar, and Great Britain was believed to have obtained a great advantage when the treaty of 1890, under which Heligoland was ceded, enabled her to establish a protectorate there. But it was well understood in Germany, where the Government showed no little foresight in the matter, that this importance of Zanzibar rested on a very insecure foundation. Zanzibar was excellent as a basis for slave raiding, but when that time-honoured custom was displaced it became clear that the trade was with the mainland and that it was a waste of time and money to go round by Zanzibar if ports on the Continent could be found. The growth of Mombasa and Daressalam is the result. So far Germany has directed herself mostly to the coast region, while Great Britain, able to reach the highlands by rail, and seeing in that country a magnificent opening for her own race, has somewhat postponed using her opportunities in her corresponding territory. One consequence of this difference is that each country can profit by the experiences of the other.

---

It is natural that a desire should be felt wherever there is an English community to encourage the employment of Englishmen, but it should be remembered that the more this is done the less attractive the service becomes to natives, as it leaves them less to look forward to in the way of promotion to superior posts. The Postmaster-General of East Africa and Uganda has remarked that local

political bodies who agitate for an increased proportion of European employees do not fully realise that the giving effect to their proposals must, at least at the outset, impair to a certain extent the efficiency of the public service in that Asiatics of good calibre will be unwilling to serve in a Department in which practically all the appointments with salaries above, say, £120 per annum are reserved for Europeans.

---

In April, a step which has been long looked for was reached by the signing of the agreement between representatives of Canada and the British West Indies for a mutual preference to one another's products and for corporation for improved steamship and telegraphic communication. The agreement is subject to the approval of the Secretary of State for the Colonies, and the Legislatures of the parties. The West Indian Colonies which have joined in the agreement are Trinidad, British Guiana, Barbados, St. Lucia, St. Kitts, Dominica, Montserrat, and Antigua. Provision is made for the inclusion of the others if they should elect to come in. At present the American millers command the supply of flour to the West Indies, and in this quarter opposition has been expressed to the scheme, but having regard to the policy of the United States themselves as to their own over-seas possessions it seems very unlikely that the Government would take objection to an arrangement confined to British possessions. The agreement will probably be the precursor of others, and whatever opinion may be held of its economic character there is a true spirit of unity in it. The success, however, of any reciprocal arrangement must depend largely on the improvement of means of communication, as the conference fully realised.

The prosperous position of Jamaica has enabled the Government to arrange for the repayment of the balance of the Imperial Earthquake Loan, which was made on the 8th July, 1908. Thus the last trace of that event may be said to be wiped away. As in other cases of the kind, a vastly improved city has risen from the ruins of Kingston, and the improvement is so great as to suggest the reflection that a catastrophe of this sort, if it could be confined to property, would be a boon in many places. What opportunities for municipal reform would be afforded by the engulfment of a few of our most active industrial quarters. Unfortunately the volcanic energies of these islands have exhausted their capacities for usefulness.

In Antigua in 1911-12 the assets showed a surplus of over £5,000 over the liabilities, and, considering that the annual expenditure of the Presidency exceeded the revenue in many recent years, the result is very encouraging, not merely as a local matter but as a definite proof of the increasing prosperity in the West Indies. The Central Sugar Factory has played a large part in the improvement, and out of an export worth £164,813 sugar represented

£132,225. Antigua is looking forward to the establishment of closer trade relation with Canada, as its large interest in sugar and fruit make it desirable to encourage reciprocal trade.

The opening of the Panama Canal will cause the Caribbean Sea to be crossed by new trade routes, but it seems still very uncertain how traffic will be carried on. Probably the lack of labour and the climatic conditions will handicap Colon and Panama severely, and the West Indies, with their good harbours and favourable situations, will have the advantage. On the route from New York and other Atlantic ports of North America, Jamaica has the best position. St. Thomas is on the track from Europe to the Pacific. When trade springs up between South America and Africa on the one side and the Pacific on the other, Curacao, with one of the best natural harbours of the West Indies, will come into prominence. No doubt many routes will be created, and all the West Indies lying on them will be benefited.

---

Malta is suffering from want of employment, due to the loss of its ship-building business, the reduction of the number of steamers which call for coal, and the reduction of the Imperial garrison. Malta never has been for centuries self-supporting in the sense that her own requirements have provided enough work. Much of the expenditure has been on objects in which the island itself had no direct interest, but which were connected with the policy of a foreign government. This kind of additional work is all very well while it lasts, but a nemesis follows when it is given up. "The cessation of the construction of public works by the Imperial Government, coupled with the sudden reduction of the Mediterranean fleet and the Malta garrison, has brought upon the industrial classes in Malta a crisis which they are almost helpless to meet. An ordinary commercial and financial crisis in an ordinary commercial and industrial population is a phenomenon which is expected to be, and in generally actually proves to be, of a temporary character. It is a disease which bears with it the seeds of its own cure. The crisis in Malta is of a different character. It is purely industrial; it does not consist in the temporary slackening of the demand for employment, but in the blotting out of a large measure of the employment of the people. Wages of workmen, skilled and unskilled, have been reduced by one-half from the highest rates payable during the period of inflation, while the population unemployed is much greater. At the same time the people of Malta, in common with other populations, have to face the general increase in cost of living." The ordinary remedy for such a state of things, especially when, as in Malta, it is coupled with a high birth-rate, would be emigration,

but for this the Maltese show no liking and the language they speak makes a difficulty. The Royal Commission made some recommendations, but not with much confidence, as a satisfactory solution can only be arrived at after much enquiry and negotiation. The problem should not be insoluble, as at a time when the Colonies generally are clamouring for labour a country which has much to spare is a rarity. The Commission recommended, *inter alia*, that the Imperial contribution towards the construction and maintenance of public works affecting the health and comfort of the military and naval forces should be increased, and the recent instructions by high authorities at Malta gives hope that the value attached to this naval base and the work to be given to the dockyard will help substantially.

---

There was an extraordinary increase in the import trade of Ceylon in 1910-11 which seems to have been largely due to a special way of doing business. The increase considerably exceeded the increase of exports, though this was large, and a striking feature was that the importation of the staple food, rice, increased by 42 per cent., or three times the rate of the increase of the population. A commercial change was taking place during the period which had no doubt much to do with these facts, viz., the adaptation of the "D/A" (document against acceptance) system in place of the "D/P" (document against payment). Under the "D/P" system, documents of title forwarded by exporters to bankers in Ceylon are handed to the local importers only upon immediate payment by them of the value of the goods. This system is, therefore, available only to those who have capital enough to redeem the documents as soon as the goods arrive. The importer without such capital is obliged to borrow the necessary money, often at ruinous rates of interest. Under the "D/A" system, on the other hand, if the drawee-importer's financial reputation is sound, though he may have little actual capital, he will nevertheless be able to obtain the documents of title by undertaking to meet the exporter's bill of exchange (together with a reasonable interest) within a fixed period. Owing to the stringency of the financial situation in 1908, and the consequent difficulties experienced by some importers in meeting their acceptances, the direct dealings of exporters with buyers on this system received a check, but there has grown in its place a healthy adaptation of it by big local indenting firms. Being on the spot, and having knowledge of local conditions and of the variations of the markets, these latter can watch the progress of those to whom they allow the concession of payment two, three, or four months after delivery, and can regulate the terms of their concession in

accordance with their knowledge. It is the facilities and encouragements allowed by this system, the safety of its liberal use by local firms of standing and experience, and the ease with which engagements under it can be met by local importers, that, according to a report by the Chief Appraiser of the Ceylon Customs, has largely enabled the extraordinary growth of trade. It will, no doubt, be extended in other Colonies as credit is established, but on the other side there is the danger of merchants being tempted by long credits to carry their business beyond a safe point, as has been for instance experienced lately in the East Africa Protectorate.

## TENDENCIES OF MODERN LEGISLATION.

THERE is a growing desire among civilised communities to put their houses in order. They do not put up with evident evils as inevitable. The triumphs of science have shown that innumerable things till lately deemed impossible are possible and even easy, and this education has set up a conviction that problems shall and can be solved. Where there is a general feeling of this character, State action follows naturally. The average individual may see clearly what is wrong and what sort of remedy is required, but he is conscious that by himself he is helpless. The employer is to a great extent as helpless as the employé. He cannot usually better the conditions of life among his people unless his rivals do the same. Co-operation by private arrangements is exceedingly difficult in any large district, and the labour of years may be upset any day by a single rebel. It is felt to be intolerable that conditions by which the great majority are ready to abide should be defeated in this way, and the next step is to protect them by law. Much as commercial men desire to reduce costs, a still more important object is to secure that they will not violently fluctuate. Thus a general arrangement which establishes a bed-rock for all relieves the employer from his principal care. It has been observed by the Premier of South Australia that Wages Boards have become so popular that it is now usually the employer who asks for the appointment, either as a means of securing industrial peace or for the purpose of protecting himself against unscrupulous competitors. When all producers are treated alike, the burdens of any conditions tending to increase costs will eventually be put on the general public. The weak point in such legislative schemes is, not that the employers rebel against them, but that the workers do so occasionally. So long as there is a great bulk of poverty in any country, this is inevitable, and the current tendency is in the direction of extending the control of the state to the fixing of minimum rate of wages, by whatever machinery this is done. It is generally accepted that the vast scale of modern organisations sets up problems which can only be dealt with by the community, and every big industrial turmoil brings us nearer to the settlement by the State of the essential questions on which tranquillity and security depends. The middle class in any country is the most

difficult to move and offers the strongest resistance to legislative change. But commercial developments are rendering this class less powerful. In proportion as trade is organised the number of employés increases in proportion to that of employers, and the line between the two classes grows sharper. There is less and less chance of the humble worker becoming a master or working independently. While this vastly increases the financial strength of the class on the top, it also produces an irresistible demand in democratic communities for legislative remedies for any grievances which are widely felt. In many leaders of men's minds the impulse has the force of a religion. The extension of Government activities has been largely due to ethical influences. At no distant time the abuses of private prisons, asylums and schools forced the hands of the authorities. In recent times the health of the nation has made it necessary to supply water and drainage, and the convenience of State action has been found so great that the movement for providing common necessities has steadily grown stronger. Now in proportion as politics are secularised the State takes over the spirit of the Churches in protecting the weak and upholding the moral character. It may be far from certain whether a measure prompted by ethical considerations will be effective for good, but there is a disposition to make the attempt, to learn the means by experience, and to judge the policy by its possibilities for good rather than by its shortcomings.

The doctrine of *laissez faire* has been defended on the philosophical grounds that law is an evil in so far as it curtails liberty, and that it creates effects which are not foreseen. In actual fact it originated from the conviction that State action was equivalent to class tyranny. It is easy to quote examples of such legislation. Practically all the statutes relating to labourers in the middle ages were framed with a view to the interests of the governing classes. Thus the Statute of Apprentices in the reign of Queen Elizabeth aimed at a sort of industrial slavery. Every artificer was to work at the trade to which he had been brought up, and no workman could leave his parish without a testimonial. The minimum day's work was approximately twelve hours. Unmarried women between twelve and forty could be ordered by a magistrate to serve in any way or for such wages as he thought fit. This statute was not finally repealed till 1875. It would be easy to multiply such cases. After these monuments of class legislation it is not surprising that the lower classes regarded law as an instrument of oppression. But these statutes were a special type, which disappears with a change of constitutional forces. Given fair play, the working classes of this and other countries do not now, and never did, believe in the principle of *laissez faire*. Democratic communities are notably ready to embark on more or less experimental legislation,

and so long as the immediate object is a clear gain they are not likely to be disturbed by doubts of ultimate effects. Moreover, the very bedrock of the doctrine of non-interference has been rudely disturbed by modern industrial methods. It used to be the first article of faith among orthodox economists that free competition made for the good of all, and might be relied on to cure ultimately the ills and wrongs of the social system. It is now seen that this view was based on an erroneous psychology. It was natural enough for the energetic manufacturers of past generations to look upon competition as the breath of life, and no one would doubt the many beneficial results of the combative spirit. But the world in general does not want to combat if it can help it; it realises the waste of unregulated competition, and is busily engaged in substituting other methods. Consolidation of interests is the leading note, the object being to abolish competition in each field of industry. The competition which is left, so far as this object is achieved, is not generally that between producers of the same things, but that between different economic classes. On the side of the capitalist, the great company, on the side of the labourer, the trade union, are devised to displace rivalry by amalgamation. Within these ranks there remains room for competition; the companies are at least as ready to encourage merit as small employers, and the desire to get on in life will always be a strong force among wage-earners. But the difference is that this sort of competition is not necessarily destructive. It is not, except in special cases, aimed against the existence of rival organisations, as are such methods as rate cutting and sweating. It is internal, and the primary object is to make a real improvement in the business. An example of success in this way is more likely to raise the standard of competitors than to crush them out of existence. On the other hand it is clear that competition alone does not remove common mischiefs or lead to an elevated form of life. The doctrine that the sacrifice of the weak is in the interests of the future of humanity has been discredited. The great mass of weak persons are weak because they have been sacrificed—not because they were incapable of better things, but because they were placed in surroundings which gave no chance of proper development. It is not a question between the strong and the weak, because all types are influenced for the worse by unwholesome conditions, but between healthy and unhealthy circumstances. Any improvement of these circumstances benefits humanity generally. It is almost superfluous to remark that when the conditions are bad the tendency of a race is downwards, and that a point is soon reached when it is clearly desirable to use the power of the State to isolate the vicious and diseased members of

the community. It would be idle to talk of the stimulating effect of competition among such classes. Degradation kills effort, and society finds it necessary to make rules which will prevent it by stopping practices which are opposed to a reasonable conception of life. This does not by any means militate against the sphere of individual action. "We are all socialists to-day" in the sense that State enterprise is more and more developed, but the vastness of individual enterprise has grown at least equally. Organisation, of which the State has a share, but only a share, has developed commerce to an extent that was not dreamt of in the past, and the part played by the State must be judged not in isolation but side by side with the vast expansion of private activity. There is a great gulf still between the field of State works, which have been almost entirely undertaken because private enterprise has not stepped in or has failed, and that of experimental socialism. In short, the functions of the State and the individual have grown together, and undertakings by the former which involve some displacement of private enterprise are balanced by the greater field which has been opened to the latter.

There is, however, a point at which private combination becomes injurious to the general interests, and that is when it seeks to establish monopolies and to control production in order to raise prices. The policy of some combines is one of unrelenting war against all competitors, and there is a real moral difference between an endeavour to get as much as possible by improving quality or reducing price and a systematic practice of crushing opposition by underselling for the time being or cutting off necessary assistance. The central control of a vast industry makes it possible to reduce the cost of administration, and this is so much to the good; but on the other hand the possession of a monopoly gives a great power over the employés, who cannot take their qualifications elsewhere and are therefore at the mercy of the trust. It is natural therefore that the working classes should everywhere regard the growth of the system with apprehension. A further evil is that it is within the power of the trusts to put up the price to an unreasonable extent. The doctrine of free competition in fact ends in these cases in no competition at all. A third evil is that an artificial and dangerous character is given to savings. When profits are made on a moderate scale and with a wide distribution through a community, the standard of life rises generally and the money saved is largely used in a natural and steady increase of local production. But when immense profits are absorbed by a few individuals, at the expense of the general community, the ordinary consumers have less money to put into the industries which they conduct and understand, while the participators in the trusts are compelled to send capital abroad for

investment and are tempted to embark into speculative undertakings. This evil attaches to any commercial system under which capital falls into comparatively few hands. In such cases large blocks of capital are continually being detached from the capital actively employed in the country, and follow the international demand wherever that may be. It may be seen in this country or anywhere else when capital becomes concentrated, but it is greatly intensified by the operations of big trusts. It is frequently argued that the great amount of capital which is sent abroad for investment indicates that opportunities for investment at home are lacking, and this is true in the sense that the few persons who own this capital cannot find sufficient opportunities at hand. But what prevents the local absorption is not a plethora of capital but its inadequate distribution. It is probable that if the gains in an industry passed to the whole body of workers, as in a genuine case of co-operation, they would, like a gentle rain, mostly remain on the ground, and be employed on local production to meet increased demands. All these things point to a State control of such systems. It must be recognised that the amalgamation of enterprises tends to greater economy and efficiency, and so long as the door is left open to competition this is to the advantage of the public. The mischief becomes serious when a virtual monopoly over a great space is secured, and it is to this point that the weapons of modern State action will be directed.

In Australia the "anti-trust" law enacts that:—"Every person who enters into a combination with other persons with the intent to restrain trade or commerce to the detriment of the public, or with intent to injure Australian industries by unfair competition, is liable to a penalty of £500. Contracts entered into in pursuance of such a combination are illegal and void. Competition is *prima facie* unfair when it implies an inadequate remuneration for labour, or a disorganisation of industry, or an increase of unemployment, or any system of rebates offered upon the condition of exclusive trading. Any person who endeavours to gain a monopoly in any trade or commerce with the intent of controlling prices to the detriment of the public is liable to a penalty of £500. Contracts entered into in pursuance of such a monopoly are illegal and void."

Much doubt has been expressed whether these provisions could be worked effectively, but the recent Coal Vend case is strong evidence that they can. There it was shown that forty colliery owners and shipowners had combined together to prevent competition and raise the prices of coal, and the revelation that such things are possible has had a profound effect on public opinion.

In 1911 a proposal to empower the Commonwealth Government to nationalise trusts was submitted to a referendum and rejected,

but this was apparently not so much due to opposition to the principle of public ownership in such cases as to the jealousy of the States as against the Federal Government. The general tendency in America is in the direction of further curtailing the powers of companies to acquire monopolies, and a proposal which has shown some favour is to limit their capital. The questions which the increase and concentration of capital create are likely in the future to prove a fertile field of legislative action.

It may easily be apprehended that the facility with which State action can be invoked may lead to extravagant demands and injudicious measures. But when demands for better treatment are made the workers rely largely on themselves and not on the State. To quote DR. JETHRO BROWN, of the *University of Adelaide*, whose recent work on the principles of legislation admirably sets out the ideas suggested by recent Australian movements.

“In Australia the organisation of workers of all classes has advanced with great rapidity, and the force of collective opinion among the workers is at times irresistible. At the present moment strikes are very frequent; and, whether legal or illegal, they are generally successful in leading to increased wages. While a powerful party in England are fighting for the Wages Board, an advanced wing of the Labour Party in Australia, where experience has been gained of the working of that institution, is speaking of it with contempt. A strike is much more exciting and picturesque; and it is proving a more immediately effective means of raising the rate of wages.” The Labour Party is pledged to favour constitutional methods, but there is always a body in such cases which does not look beyond the immediate occasion. When it is fully recognised that the Government provides means for settling disputes, the conclusion is near that there must be effective penalties for disobedience. This point has been reached in Australia, where fines are imposed for disobeying awards, and for these union funds are liable, and if they are insufficient a *pro rata* levy may be made on the members; in some cases there may be imprisonment for instigating a strike. In this country the latest scheme in this direction is that the workers concerned in the dispute should put up a sum of money as a security for obedience to an award, and it seems probable that a development of this nature will eventually be recorded in the statute book.

If by means of State action wages are increased, directly or indirectly, the next step which may be demanded is to protect them against competition from outside which employs labour more poorly paid or uses unfair methods. This is the reason, or at any rate part of the reason, for the “dumping clause.” It is a difficult matter to compare real rates of wages in different countries, but it is easy to

see whether an article is being sold cheaper abroad than in the country of origin. The term "dumping" is and is usually meant to be offensive, but there can be no doubt that many articles can be and are sold abroad at lower prices than at home, partly as a result of the greater competition in a more neutral place, and partly because the expenses of management and advertising are chiefly borne at home, so that agents abroad can make a lower price and still keep a profit. The working classes, however, readily believe that it is unfair to them as producers to sell in their country goods below the prices charged in the country of origin, and as on this point employers and employed agree a wide movement to secure industries against prices so lowered may be looked for. The last example of the "dumping clause" is contained in the Customs Management Bill of South Africa: "In the case of articles imported into the Union of a class or kind made or produced in the Union if the export price or the actual selling price to an importer be, at the time of its exportation to the Union, less than the current value, as defined above, of the same article when sold for home consumption in the usual and ordinary course in the country whence they were exported to the Union, there shall, in addition to the duties otherwise prescribed be levied, collected and paid on such articles on importation into the Union, a special duty (or dumping duty) equal to the difference between the said selling price of the article for export and the said current value thereof for home consumption."

It is feared by many that these legislative movements, promoted as they largely are by what has been termed in New Zealand the "class consciousness" of the workers, tend to set class against class. But the opposition between class and class is no new thing; the only new feature is that the lower class now organises itself. No doubt, to some extent the organisation protects the weaker members, but this may be more than balanced by the general improvement. On the other hand, the improvements in the conditions of industrial life may avert demands for more drastic remedies. The main reason for the idea of the nationalisation of the means of production is the desire to provide good wages, and so far as this object is secured by these measures more revolutionary proposals will recede. The general opinion, even among the working classes, is that Government officials cannot manage industrial undertakings efficiently, and whether this view is correct or not it has strength. Even if the State could produce cheaply, it is extremely doubtful whether it could sell well or regulate production to the varying requirements, and the vast army of intermediaries in commerce would oppose any encroachment on their ground.

## REVIEWS AND NOTICES.

"Canada To-day."—(*Stanley Paul & Co.*, 1s. net.)

This volume, the second of the kind brought out by the weekly *Canada* contains a very comprehensive account of the present position of the Dominion, and the mass of information is so well relieved by illustrations that the descriptions have the aspect of a sort of pictorial survey. It is wonderful value for a shilling. Explanations are given to the intending emigrant as to how to get to Canada, and what to do when there, and the only difficulty seems to be that the opportunities are so numerous and the prospects so bright that he may find it difficult to decide how to choose. The explanations are supplemented by various memoirs of successful settlers, to show how it is done, and a pleasing moral effect is given by the demonstration that energy is always successful. The Provinces receive full individual treatment. There is only one drawback to the abounding activity of Canada, and that is the rise of the price of Western land, which is so great as to invite a set-back if present methods are continued. It is also questionable whether the municipal authorities in some cases are not overloading the future by issuing debentures for periods which are much longer than the life of the improvements to be effected. These, however, are the inevitable accompaniments of rapid movement, and harm may be avoided if progress is kept up.

---

British and German East Africa.—By DR. H. BRODE (*E. Arnold*).

This book gives a detailed account of the commercial relations between the two possessions. A comparison is made between the charges on the Uganda and the Usambara railways, showing that on all goods except ivory the difference is greatly in favour of the former. German traders therefore prefer the British line, but of course as the Usambara line progresses into the interior its advantages grow. The Daressalam railway to Lake Tanganyika

will further cut into the transit trade through British East Africa, but the rapid development of the Lake districts will probably prevent any actual decrease. The tariffs of the two countries are practically identical. An instructive account is given of German cultivation in the tropical belt, which will be of service to British planters. The only matter in which some difference of policy between the two administrations can be seen is the treatment of slavery, and the following remarks may be quoted to show how Dr. Brode discusses the subject from the German point of view:—

“It has been ordained in German East Africa that every slave has the right to purchase his freedom at a just and reasonable price, which is fixed by the local authorities. They have also to give their permission, if a master wishes to sell his slaves to another owner, and this is only possible if the slave himself agrees to it, care being taken that members of the same family are not separated one from another by these transfers. Finally, according to an ordinance dated December 24, 1904, all children of domestic slaves, born after December 31, 1905, are free in German East Africa.

In the British possessions slavery has been recognised as a legal status only on the coast-belt belonging to the Sultan of Zanzibar, who in a decree of the 15th El Haj, 1307 (August 1, 1890), interdicted all future ‘exchange, sale, or purchase of slaves, domestic or otherwise.’ Children of slaves born since 1890 were declared free.

So, in British and in German territory, slavery seemed to be condemned to a natural death; but in home circles in England, influenced by a wrong humanity, this seemed still insufficient. It was declared shameful that in a dependency of the United Kingdom this institution should still be admitted in even a mild form. And so quite suddenly, October 1, 1907, was fixed as the date for the total abolition of slavery; a sum of £40,000 was voted by Parliament to compensate slave-owners; and it was ordained that no claims referring to slavery were to be entertained after the end of 1911. Money could hardly ever have been spent for a more unwise purpose. The slaves did not wish to be freed, and the masters did not like to part with their slaves. The money had to be pressed upon them; and the freed slaves, who by-and-by learned that they did not need to work if they did not like it, became idlers and criminals; the patriarchal ties which connected them with their masters were severed; in cases of disease they received no assistance; the number of marriages, and therewith the chance for future native offspring, decreased. The disastrous results on the side of the slave-owners are still more obvious. They lose their old labourers, and find, even if they are willing and able to pay wages, no recruits. The sums which they receive in compensation just help them through the first

stage of the calamity, but when these have been dissipated with Oriental indolence, they have not energy enough to adopt a new economic system, and are bound to sink into poverty.

It is to be hoped that our Government will not alter the present status, according to which the last slaves will die out in a few decades. Meantime the tie of slavery is becoming lighter and lighter, and sufficient opportunity is given to the present slaveholders to insure the survival of the fittest. Those Orientals who can justify their existence in a civilized country have meanwhile time enough to become familiar with the changed economic conditions."

It may be added that Dr. Brode admits that the general impression amongst the natives is that their treatment is not so good in German as in British territory. "It is true that the way in which the natives are dealt with is a good deal stricter in German East Africa than in the British colony, and the farmers would be the last to blame our Government for it."

The book is clearly written and contains a great amount of information in a small space. There is an excellent map.

---

**The Sea Road to the East.**—By A. J. SARGENT (*George Philip & Son.*, 1s. net).

This little book contains six lectures, prepared for the Visual Instruction Committee of the Colonial Office, and intended to be illustrated with lantern slides, sets of which can be purchased. The letters are graphically written, and not only is the descriptive matter clear and ample, but there are numerous observations of value on the character and prospect of our possessions. Thus Mr. Sargent observes of Cyprus: "The great railway, already in progress, from the Bosphorus to the Persian Gulf, must approach the sea at one point only in its course, where it comes down over the Taurus range beyond the head of the gulf of Antioch. The railway, when completed, will provide a route towards India roughly parallel to that through the Suez Canal, and may lead to a revival of agriculture in the rich valleys of the Euphrates and Tigris. The natural approach to this route from the Mediterranean is not by way of the Sea of Marmora but by the Gulf of Antioch, and there will be a branch from the main line to Alexandretta or some other port near. Cyprus will then once again be on the line of a great trade route and must have a share in its prosperity; at present it is side-tracked, and has suffered like an English town avoided by some great line of railway; its importance has declined as that of Egypt has increased. We may realize how far Cyprus is off the main line of traffic by the difficulty of getting back to

our route; as it may take us a week to reach Egypt, travelling by slow steamer and touching at ports on the Syrian coast on our way." Mr. Sargent concludes, on finishing his tour at Hong Kong, with the following epitome of the great lines of British commerce:—"South of us lies the route which we have traced from Singapore and India; while another route, as yet in its infancy, leads past Borneo to Australia. Across the Pacific, from the eastward, come the steamers from British Columbia and San Francisco; and soon, when the Panama Canal is finished, there will be direct communication from the Atlantic seaboard of the United States. So we see a great concentration of routes on our Eastern Empire, in the region where the influences of India and China meet and overlap. The key to this frontier region is in Singapore, but behind Singapore lies India. We have approached India from the north-west, by the passage of the Mediterranean and the Suez Canal; and we have seen how our interests in the Mediterranean, at first purely European, have become more and more related to the control of the seaway to India. South-west is the older route, by way of the Atlantic and the Cape, a route still valuable for some purposes. Here the control of the route led us on to the occupation of the neighbouring mainland of Africa. South-east again we reach Australia, either directly across the ocean or threading the island group of Malaya; while the Indian Ocean has its own system of minor local routes. So we have lines of traffic from every part of the world converging on the Indian region, with its vast trade and swarming population; the natural junction of all these sea roads, great and small, is Colombo, close to the mainland of the Peninsula, yet at the same time well out in the open sea, the centre of control from which India reaches out in every direction and dominates the Indian Ocean."

---

**The Barbados Handbook.**—By E. G. SINCKLER (*Duckworth & Co.*, 2s. 6d. net.)

Barbados, being the most eastern of the West Indian Islands, attracted English settlers from an early period, and as it lies far out to sea and possesses a soil which rapidly absorbs the rain it has proved more healthy for Europeans than most of the islands. In a passage quoted by Mr. Sinckler, Sir Charles Lucas observed that "In tropical lands Englishmen, as a rule, cannot settle, live and thrive. In Barbados they can and could, and the history of the island, with its long generations of English inhabitants, is the most striking exception to the rule that the tropics must be peopled by other than the nations of northern Europe." The whites in Barbados number 15,613 out of a population of 182,306, a much higher proportion

than elsewhere in the West Indies; thus in Jamaica the rate is under 2 per cent. Still the number of whites is hardly large enough to establish, without other evidence, the suitability of Barbados, and it would be interesting to have Mr. Sinckler's views on the effects of the climate on European families which have been long settled in the island. In any case it is a very pleasant and interesting place, as many visitors are discovering, and abundant information for the purposes of both business and pleasure is contained in this well got-up Handbook.

---

**Fruit Farming on the "Dry Belt" of British Columbia.**—By J. S. REDMAYNE (*Tunis Book Club*, 2s. 6d. net).

Lord Strathcona, in a prefatory note to this book, remarks that the nature of the industry treated of—in small holdings of ten acres with intensive culture—tends to promote "close settlement," in other words, the establishment of small fruit-farming townships with the social advantages attaching thereto, and that a considerable number of young men from the English Public Schools are now set up as fruit-farmers on the "Dry Belt" of British Columbia. Young men of this class are found in every new country which offers a career away from the office stool, and often in hopeless positions; but there is little chance of missing the mark in the fruit industry of British Columbia, for it is one of the safest in the world. The cultivation came up the coast from Washington and Oregon, but now it is claimed that at least equal opportunities can be found in British Columbia. The soil in the "Dry Belt" is a rich volcanic loam of great depth, and for land of this kind, irrigated, a price of from \$300 per acre upwards must be paid; cheap but unsuitable land only invites failure. The results of cultivation are undoubtedly magnificent. Particulars are given of an average 10-acre apple orchard, which in the sixth year produced 96,800 lbs. of apples from 484 trees, or a value of £726. Labour is of course scarce, as everyone wants to be his own master, and this militates against large estates, but this is in favour of the small grower. Mr. Redmayne understands the difficulties and dangers of the new arrival, and gives him plenty of excellent advice.

---

**Handbook of the Southern Nigeria Survey and text-book of topographical Surveying in tropical Africa.**—(*W. and A. K. Johnston*, 3s. 6d.)

This handbook contains the rules and regulations governing the administration of the Southern Nigeria Survey and also explains the principles on which topographical Surveying is carried out. It is an

adaptation of the ordinary text-book to the special conditions of such a country as Southern Nigeria, and will be found useful by surveyors working in any similar places.

---

“Cocoa.” By W. H. JOHNSON, F.L.S., Director of Agriculture in Southern Nigeria (*Imperial Institute Handbook: John Murray, 5s. net*).

Cocoa or Cacao of commerce is made from the beans of two or three species of small trees indigenous in Central America, and was cultivated there before Columbus' discovery. It became a very fashionable (and very dear) beverage in Europe early in the eighteenth century, but made no great progress till well on in the nineteenth. Brazil is still the largest producer and Ecuador the second, and now nearly every tropical country is exporting it. The tree requires a hot, equable, moist climate, and a well-distributed rainfall, and the best results are got from soils that are rich in potash.

The increasing importance of the product makes an authoritative work on it welcome, and Mr. Johnson has carried out his task thoroughly. He explains how to lay out a plantation, how to provide shade, and how to propagate and cultivate. The methods of fermentation are described, and calculation given of yield and expenditure in various countries. To quote an instance, it is estimated that a bag of cocoa (165 lb.) can be produced in Tobago for £1 15s. Crown land costs £2 per acre. Labourers are paid from 10d. to 1s. 2d. per day and women from 6d. to 8d. per day. Abandoned sugar-cane estates may be cleared, planted, drained, and kept clear of weeds during the first year for £5 per acre; this sum likewise includes the purchase of bananas, cassava, cocoa beans, and nursery. When a cocoa estate is established on such lands the total cost for eight years is estimated at £12 10s. per acre, exclusive of superintendence. In heavy forest land an expenditure of £7 10s. per acre is considered sufficient to fell, clear, plant, drain, and keep clear of weeds for the first year, including purchase of bananas, cassava, cocoa beans and nursery. The total cost for eight years, in this case, is estimated at £15 per acre, exclusive of superintendence.

It is pointed out that the above figures are for actual outlay on cultivation alone, and do not allow for expenditure on road-making or fencing. Cocoa estates are frequently established by the contract system. At the expiration of the period of contract the cocoa trees are counted, 1s. is paid for each full-bearing tree, 6d. for each tree not full bearing, but over three years of age, and 3d. each for trees under three years of age.

**Bulletin of the Imperial Institute.**

The quarterly *Bulletin* is now enlarged and is published by Mr. John Murray, Albemarle Street, W. It will be the means of publishing the results of the chief investigations of new raw materials from the Colonies and India carried out at the Institute and recent information regarding developments in tropical agriculture and planting industries, and in the commercial utilisation of natural resources, especially those of the Tropics.

The great activity shown in tropical planting enterprise in recent years has resulted in a large demand for this *Bulletin* and to meet this demand the enlarged publication has been decided on. The price of the *Bulletin* is 2s. 6d. per number or 2s. 9d. (post free). The annual subscription will be 10s. or 11s. (post free).

## BUSINESS NOTES.

## Rubber.

The battle between the wild and the cultivated rubber has gone heavily against the former, and Brazil is waking up to the gravity of the situation. A recent commission there has recommended various measures, including reduction of the export duties and experimental gardens. The resources of the country are of course vast, in the sense that there are enormous areas in which rubber grows abundantly, but the distances over which the collectors have to travel in search of wild rubber, coupled with the dangers of the work and the great mortality, must inevitably make collecting expensive, and it is impossible to prevent wholesale waste by improper tapping. There are a number of Brazilian companies which were floated with most attractive pretensions, but it would be difficult to discover one which has paid a dividend. Everything points to the conclusion that the future rests with the undertakings devoted to cultivation, and in which the means of transport and the supply of labour have been borne in mind.

The drop in price, however, has had its natural effect on production, and many plantations which were started in an optimistic spirit are now being somewhat neglected. Many as are the uses of rubber, the demand and price are practically determined by automobilism, and this means that they are settled by the state of things in the United States, where there are some 400,000 motor vehicles, and 60 per cent. of the world's consumption of rubber is taken. It is difficult to believe that a great expansion will go on in the United States considering that the supply of cars is already so large, but large markets are being opened up in South America, which is probably at present expanding more rapidly than any other part of the world, and it is reassuring to find that the increase in Germany of late has been 50 to 60 per cent. a year. The price is now steady and prospects good.

The need for not neglecting any possible source of profit from plantations will no doubt cause more attention to be given to the utilisation of rubber seeds for oil extraction. Decorticated

seeds fetch about £10 per ton in this country, and nearly a ton is produced by ten acres of hevea trees when developed. The kernel contains nearly half its weight of oil resembling linseed oil and suitable as a dryer in the manufacture of paints.

It is possible to weed rubber plantations too well in comparatively dry localities. A complete clearance leaves the soil to be dried up by the sun and wind, so that not only is moisture not retained, but when the rain does come the soil is denuded. On a small scale the results of the destruction of woods are shown. The following remarks have been made by the Director of Agriculture in Nyasaland on the subject:—

“It has been proved that the flow of latex from a rubber tree is affected by endosmotic pressure, which practically means the amount of water in the plant roots. It is the practice to tap rubber in the early morning and evening and to discontinue during the heat of midday and early afternoon. During the heat of the day much water is evaporated by the leaves, and latex flows slowly, but in the early morning and evening water wishes to enter by the root quicker than it is evaporated, with the result that there is an internal pressure which helps the flow of latex; therefore it is practical to assume that there is an intimate connection between the presence of water in the surface soil surrounding the roots, and the flow of latex from the rubber tree. For half the year in Nyasaland there is no rain, and daily the sun is strong enough to evaporate water from the plants and from the soil. The question arises, where does this water come from? The answer is from the lower layers or subsoil, by the rising to the surface in the form of water vapour and water liquid (capillarity). In the surface soil of a clean-weeded estate the water during the day is principally in the form of water vapour, the water being vaporized to a considerable depth by the direct overhead rays of the tropical sun. In the surface soil of an estate growing a green manure crop, there is a large proportion of the water in the liquid form, as the covering of the vegetation reduces the temperature of the surface soil, and prevents the direct penetration of the sun's rays. Therefore, when rubber is growing surrounded with vegetation, its roots have actual access to liquid water through the greater part of the day. If we examine the same soils during the dry seasons after the green manure crop is dead, we still find more moisture in the latter, as the dead remains of the green manure crop absorb and retain water more firmly than ordinary soil, but deliver it freely to the rubber roots, although not as freely as to the atmosphere.”

Dr. Unwin reports very good results in Togoland from Ceara. It will grow in almost any soil, and when it is more established thousands of self-sown seedlings spring up everywhere. The natives find that the seeds germinate soon and the seedlings grow quickly, not suffering from damping off as do the Funtumia or Iroko. The quick growth makes the species very suitable for native plantations, as when a tree can be tapped to death it is soon replaced.

---

It is still arguable what system of incision gives the best results, but in the case of *Castilloa* the cuts should be at an angle of about 25 degrees from the channel, as at this angle almost all the rubber flows down; but if the cuts are more acute clots of rubber constantly drop off and there is a great loss of latex. In the Journal of the Jamaica Agricultural Society it is recommended that a tree should not be tapped more than twice a year if regular and continuous returns are wanted for a number of years. "At twice a year therefore the lower portion of the tree would give tappings over five or possibly six years if carefully done, always making the cuts two feet apart. After this period the next six feet up the tree might be tapped in the same way which would give another three or four years. This would give ten years for the first cuts to recover, and tapping these might be resumed. My reason for thinking tapping should only be done twice a year, is that otherwise if done say three or four times, though the returns would be larger for two or three years, yet the tapping surface would be as quickly reduced to nothing before the new bark had time to grow.

It is true that even the injured bark will bleed if cut, but it is not possible to collect it or even cut it cleanly under these conditions as it tears out. It must be borne in mind moreover that as tapping is the chief expense incurred unless the returns are proportionate, it cannot be profitable to increase the number of times we tap."

---

### Cotton.

The last American crop was a very heavy one, and the price of cotton went down to below 5d. per lb. This is calculated to discourage cotton growing in West Africa, and the British Cotton Association, which pays a fixed price of 1d. per lb. of seed cotton in Northern Nigeria, in order to encourage steady production by establishing a minimum rate, will on this occasion hardly fare well. Nearly 4 lbs. of this seed cotton are required to produce 1 lb. of lint, and when transport, ginning and other charges have been met the above market price leaves no room for profit. It is, on the other

hand, impossible to reduce the price paid for cotton seed in Northern Nigeria without crippling production, as other crops would then be preferred. It is no doubt possible to improve on native methods of cultivation, but much time and trouble will be necessary to effect this. What is wanted is a cotton variety which will yield a larger percentage of lint than the native kinds. Some success in this direction has been obtained on the Gold Coast. Recently prices have advanced, and though a large American crop may temporarily reduce prices the rate is not likely to go down again to as low a point as has been touched in recent years. The Cotton Growing Association estimates that the present crop will amount to over 2,000 bales, and looks forward to over 5,000 next year and 10,000 in 1914. The ginnery at Zaria is being run by a gas producer plant on cotton seed, with excellent results.

---

In South Africa some remarkable results have been obtained at the Government Cotton Farm, Rustenburg. Last season eight varieties were tried and gave more than 1,100 lbs. of seed cotton per acre; one variety gave 1,684. Each variety gave more than 400 lbs. of lint per acre, the highest giving 658. This is far better than in the United States, where the average yield of lint is some 174 lbs. per acre. The care taken in such a place is of course exceptional, but it is clear that the climate is suitable, as there is plenty of sunshine, a good rainfall during the growing period, and (an important requisite) little or no rain during maturing. The Transvaal is likely to produce one of the greatest cotton regions in the world.

---

In the West Indies it does not seem likely that this crop will be much increased for some time to come. The islands have confined themselves almost entirely to Sea Island cotton, and this is strong in the staple, which is the most desirable quality in the eyes of spinners. But at the same time West Indian cotton contains a great many immature fibres or neps, and this is a serious fault. The defect is probably due to irregular growth, caused by alternations of drought and rain. Egyptian cotton is much superior in this respect, and in that country under irrigation the plants are nourished in a more regular manner. The result is that spinners often only get half as much good yarn from West Indian cotton as from the same quantity of Egyptian. This, however, is making a comparison with a very high standard. The tendency is, on the whole, for the demand to grow and the price to rise. The world price is fixed by the American production, and this is likely not merely not to keep pace with the demand, but to fall off, as the United States planter is

turning his attention to other products which pay better. Wherever irrigation can be practised, the cotton will probably grow cleaner and healthier. Much can also be done by plant selection, an progress has been made with the study of this matter.

---

St. Vincent has the reputation of producing the best cotton in the West Indies. The success of the industry there is largely due to the Cotton Ginnery, which is under the management of the Imperial Department of Agriculture. There is practically no estates cultivation and the cotton produced by the peasants is bought, ginned and exported by the Government. The Ginnery charges 1d. per pound for ginning and baling, and makes a profit of some £400 a year. Cotton is bought by the Ginnery from the peasants on a profit-sharing basis, and this system has proved very popular and has given a great impetus to cultivation. The Ginnery possesses a disintegrator by which cotton seed is crushed for manuring cotton lands. The average sale price for Sea Island cotton has been 17d. to 20d. a pound. The introduction of cotton however is limited to the coastal lands, and will not oust arrowroot elsewhere. With the latter product St. Vincent has no rival in the world, and an association there has taken advantage of this to fix a minimum price for sale in the United Kingdom. The result has been that the price rose from about 1½d. to 3¼d. per pound.

---

Cotton growing gives widely different results in different districts, and much attention is being given to the suitability of the seeds; the nature of the soil, however, is an important factor. The *Bulletin* of the Imperial Institute states that a good cotton soil should contain a large proportion of sand in a finely divided state, and thoroughly incorporated with the other soil constituents. A soil which is very rich in humus is unsatisfactory, as the plants are induced to make luxuriant vegetative growth at the expense of the fruit. Stiff clay soils are quite unsuitable, since they are too retentive of moisture. In general, it may be said that the ideal soil for the cotton plant is a deep, sandy loam, of fairly permeable character, but capable of retaining sufficient moisture for the needs of the plant. The best types of soil for Upland cotton in South Carolina contain from 25 to 30 per cent. of clay and 40 per cent. of silt, and during the growing season maintain a degree of moisture of about 10 to 12 per cent. In the case of Sea Island cotton, however, the most suitable soils are composed of 4 to 8 per cent. of clay, 4 to 6 per cent. of silt, and 75 to 90 per cent. of fine sand, and are capable of retaining about 5 per cent. of moisture.

### Sugar Cane Cultivation.

In countries where there is a plentiful rainfall, soluble artificial manures, such as sulphate of ammonia, can be used, but where this is not the case organic manures are the best. Besides supplying nitrogen, they increase the power of the soil to retain moisture. In dry regions only the narrow-leaved canes, which resist drought, should be grown. Green-manuring is a useful way of providing nitrogen as well as holding moisture; the stuff should be allowed to rot on the ground at least a month before being ploughed in.

Moisture is necessary to enable the flowers of sugar cane to open, and arrows which are at all dried do not flower. Infertile pollen can be detected by the iodine test. If there is no starch in the grains they are infertile.

---

The success of the central factory system is remarkable, and the Leeward Islands Report remarks that it has superseded the old-fashioned and wasteful muscovado process by modern and economical methods of manufacture. The system was introduced in 1904 when the present factories at Gunthorpes and Bendals in Antigua were erected, grants in aid of their construction being made by the Imperial Government. Seven years' experience has conclusively shown the value of the innovation, and the past year marks a period of further expansion in this direction. In Antigua considerable additions and extensions have been made to the Gunthorpes Factory, thereby increasing its manufacturing capacity to about 8,000 tons of grey crystals in a crop; a further considerable number of estates have, in consequence, abandoned the muscovado process and now sell canes to the factory. In St. Kitts negotiations were completed during the year for the erection of a central sugar factory near Basseterre; the factory is in course of construction at the time of writing, and it is expected will be completed in time to deal with the crop to be reaped in the early part of 1912. When completed, it will have a maximum output of 10,000 tons of crystals. When working to their full capacity the central factories in St. Kitts and Antigua will be able to deal with more than half the total sugar output in these Islands. The firm of Henckell du Buisson & Co., of the Gunthorpes Factory in Antigua, are also responsible for the promotion and erection of the St. Kitts Factory. The success so far achieved prompts the hope that acceptable plans may be put forward for the erection of further factories at an early date, and if this bears fruition the almost complete supersession of antiquated methods of manufacture may be hoped for in the course of the next few years. On the first occasion Government aid was necessary, and rarely has it

been given with such beneficent results. The St. Kitts Factory has been established without any such assistance. In Queensland the establishment of central mills has proved very successful; one result, as in the West Indies, is to encourage small holders, and growing is gradually passing from big plantations to small proprietors. Barbados, where there is no co-operative factory, has made provision for loans to groups of planters who can supply at least 1,200 acres of cane annually to each factory.

---

### Coconuts.

There is not exactly a boom in coconuts, perhaps because the experiences of late investors in rubber are too recent, but the value of the product is being more and more appreciated. It is, of course, necessary to bear in mind that the time of waiting is long, and the various prospectuses which set out the amount of land devoted to the trees do not always mention that fact. Generally, trees begin to bear in six years and are in full bearing in ten. The yield varies greatly according to species and climate, so that any estimate of profit on a plantation is more uncertain than even in the case of rubber, but if the trees do well the profit on the capital cost is very great, in some cases 50 per cent. or even more. Trinidad alone exports a value of nearly a quarter of a million per annum. The Leeward Islands have begun to plant, and if the result is good large areas of land now in waste will be utilised. The increase in the value is due largely to militarism on the continent of Europe, an immense quantity of copra being turned into vegetable butter for the soldiers. To get a proper price care must be taken that the copra arrives in Europe in good condition, without mildew and decomposition. The Philippine planters have lost very heavily by inattention to this. The *Bulletin* of the Imperial Institute has an article on the cultivation which planters will do well to study. The following extract describes the situation which is found most suitable:—  
“The coconut palm is a light-loving species, intolerant of shade, delighting in a maritime climate where the light is strong and there is a constant breeze. It is essentially a tropical plant, requiring a considerable amount of heat and moisture to attain full development. An average mean temperature of about 80° Fahr., with little variation throughout the year, is perhaps the most suitable. An average annual rainfall of from 60 to 80 in. is advantageous, but as low a rainfall as 40 in., evenly distributed throughout the year, is found to suffice when the palm is growing on fertile, moisture-retaining soils. If less than 40 in. is received artificial irrigation becomes necessary. On poor, sandy soils a rainfall of not less than 70 in. is essential.

The soil best suited to the coconut palm is a deep and fertile sandy loam, such as is found in alluvial flats along the sea coast, at the mouths of rivers, or in wide river valleys. It is in such situations and on such soils that the coconut palm is most commonly found to flourish, but it can be grown on a variety of other soils and also in inland situations, especially near villages or towns, provided care and attention are bestowed on its cultivation. It has a preference for soils of a calcareous nature, and lime in the form of decomposed sea-shells is usually present in the soil of coastal regions and small oceanic islands. The presence of humus or decayed organic matter in the soil is also essential, and this is found in greatest abundance at the mouths of rivers or on land subject to flooding. The situation of the soil is also of importance, as in low-lying localities, such as those indicated above, the subsoil moisture which comes from higher levels will be charged with plant food in solution. The roots of the coconut palm, in a free and porous soil, penetrate to a depth of 6 ft. or more, and the palm is thus enabled to obtain an abundant supply of nourishment from the subsoil; it is probably this fact that accounts for the flourishing condition of palms that are apparently growing in a very poor and sandy soil."

---

### Rice.

Last year there was a great falling off in the production of rice and the price went up accordingly, a very serious matter in the East. Rice is the greatest agricultural product of the world, and the greatest export. Usually the production shows a regular increase, not because rice displaces other industries, but because every year fresh land is used. In 1911 the crops, in consequence of drought, were poor over a large portion of the East, and from September last the exportation of rice from Cochin China was prohibited. It is largely by the produce of that country and of Tonkin that the international price is determined.

---

### Preservation of Fruit.

The exhibition of fruit makes an attractive advertisement, and its preservation for this or other purposes can be secured by simple methods. The Idaho Experiment Station (United States) gives the following rules:—Selection and handling of the specimens are of first importance. They should never be fully matured, should be in the best possible condition and without blemish of any kind. After washing in pure cold water, place carefully in the receiving jar with as little handling as possible and fill with the preserving

fluid after straining it through several layers of cheesecloth. Make the lid air-tight and place the jars in a dark room at a temperature of from 30 to 40 degrees Fahrenheit. Examine every few days to detect any fermenting, which would necessitate the use of fresh liquor after rinsing the fruit.

For fruit in general, use one pint of glycerine and five ounces of powdered borax to every gallon of water; after fifteen days add two ounces of formaldehyde to each gallon for dark fruit, and two ounces of sulphurous acid for light-coloured fruit. For apples use one and a half ounces of formaldehyde to every gallon of water; for pears, peaches, and prunes one quart of glucose and one and a half ounces of formaldehyde to every gallon of water. For small fruit use clean water. For vegetables dissolve a pint of pure table salt in each gallon of water used, allow it to stand twelve hours, then strain through several layers of cheesecloth and pour over.

---

### Tin.

Stocks are low and high prices have been reached. The exports from Malaya have improved. A considerable Chinese immigration has taken place and a further increase of production is likely. The Chinaman has not interested himself particularly in the mineral resources of his own country, but this is probably due to respect for the remains of his ancestors; in other countries to which this consideration does not apply he is a most enterprising prospector and works well as a tributor or under contract. Nigerian tin is not coming in yet so fast as some have expected, but when the railway to Naraguta is completed work will be pushed on more rapidly and a large number of labourers will be liberated and available for mining. There will in any case be an ample supply of labour, and at the ruling rate of 9d. a day it will be cheap. The areas under examination are very large, and much more time should be allowed for prospecting and preparations than has generally been given.

---

### Tropical Plantations.

Dr. A. H. Unwin, Conservator of Forests in the Eastern Province of Southern Nigeria, has reported on a visit which he has paid to Togoland. A comparison with another country is always useful, and Dr. Unwin made good use of his opportunities. An important matter in tropical towns is the provision of shade, and Dr. Unwin remarks that the *Casuarina equisetifolia* seems a very useful tree for

seaside planting, as it grows rapidly and stands the ocean wind well. On the Government plantations large quantities of *Ezythrophleum* seedlings have been planted, the object being to obtain a supply of hard and durable timber for public works. The timber of this tree has been used for piles and trestles, and has proved termite resisting. The wood has been used in Southern Nigeria, but apparently did not find favour with the native carpenters as they had to sharpen their tools more often than when working on European woods. Seven hundred and sixty acres are thoroughly planted with various trees each year—a very creditable performance. The cost works out at £4 4s. per acre in the first year and diminishes rapidly afterwards. Sixty-two men after a few days' work planted 12,830 plants in a day. In every case seeds were sown in nurseries and transplanted. About a million Ceara seeds were distributed to natives in 1907, and the trees are growing fast; this species seems more suitable than others in a dry climate. There is a great quantity of teak, which should be judiciously mixed with other trees. Large pure forests of teak do not exist in nature, and generally forests of trees of one kind, except oil palms, suffer from insects and parasitic growths, as such pests easily spread. The study of suitable combinations is, therefore, very important. It is found that the yield from oil palms planted is greater than that from the wild trees, which is natural, as the former are properly weeded and cultivated and are protected from animal and plant pests. Cultivation will probably in this case, as in that of rubber, give satisfactory results; the native forest must in fact eventually give way in all products to the plantation.

---

### Coconuts.

A Bill has been brought before the United States legislature which *inter alia* imposes an import duty of  $\frac{1}{4}$  c. per lb. on cocoa-nut oil and palm kernel oil, which have hitherto been duty free. This is intended to allow the crushing of copra in the United States, and would probably stop the importation of cocoa-nut oil, and eventually that of palm oil. The importation of palm oil has grown enormously lately, and no doubt has invited attention. More than half has been sent from this country. The duty is likely to affect Ceylon and other Colonies.

---

### Irrigation.

Irrigation is of special value when the rivers of the country contain salts. This is the case for instance in South Africa, where in many parts the salt pans are a frequent feature. In other cases the salt has gradually collected in depressions guarded by trees and

rushes, and in the course of ages has often reached a great quantity. Much salt of this kind would be carried over the land by irrigation, much to its improvement.

---

### **Tent Material.**

Cotton duck canvas has been known to rot quickly, and a recent chemical analysis shows that this was not due to proofing by the ammonia copper process, but to the fact that the canvas contained chlorine and iron, in small quantities, but sufficient to cause the trouble. The chlorine comes from the magnesium chloride used in sizing. Iron, which is an active catalyst, and causes oxidation of the fabric, presumably was due to the water in the mills. It is advisable to use flax duck, which is a stronger and harder fabric, and less likely to contain deleterious substances, as it is boiled in the course of manufacture and not sized like cotton materials.

---

### **Protection against Lightning.**

Iron roofs can be connected with the rain-water pipes for this purpose, but every projection above them should be covered with wire (barbed galvanized iron wire), which is joined with the roof. The roof should be connected with the ground by means of drain-pipes or wires at each corner, and where the wires enter the ground it is well to join them on to empty paraffin tins which will retain moisture and so form a good "earth." For lightning conductors iron is better than copper, and there is nothing better than galvanized iron wire.

---

### **Landing Arrangements.**

So much depends on the proper handling of cargo, especially when the Government is itself a large importer, that a method recently adopted by the Customs Department of Southern Nigeria, as explained by Mr. T. F. Burrowes, may be cited. In the latter months of 1911 the Customs Authorities took over the provision and supervision of the labour on the wharf for handling cargo from the steamship companies, to insure more expeditious delivery of the goods and to avoid the confusion which existed in stowing the goods. Although hampered by the limited shed accommodation it has been contrived that each ship's cargo should be stored in the sheds separately, and consignments divided with marks facing outwards and the whole cargo stacked so that each consignment can be checked. No delivery is made until the ship has completed the discharge or a consignment is completely landed. At a meeting of the merchants in October last it was

suggested that delivery should be made as each hold of a ship was emptied, but it was not practicable to give effect to this suggestion. Isolated instances of delay in delivery may occur where the merchant's clerk is ignorant of the ordinary procedure, but where in the past a ship took two or three weeks at least to deliver the whole of the general cargo, at the present time seven days is the maximum period for which a merchant may have to wait for delivery of his goods after the ship arrives in Lagos, and this only occurs in the case of the larger branch steamers where attention has not been given to stowing the goods. The system has worked satisfactorily, except at the inception when the commercial community were not acquainted with the procedure. Claims for shortage and damage against the steamship companies have been considerably reduced, and consignments of general cargo delivered as a whole at least seven days quicker than in the past, when the branch steamers sorted the cargo in the holds and delivered even small lots at each importer's landing stage. Strict supervision is exercised over the labour. The Agents of the Steamship Companies have co-operated in expediting the discharge of the ships, but at times some delay is caused by the manner in which the branch steamer's cargo is stowed, the bad stowage being attributed to the way in which the main liner's cargo has been stowed in Liverpool, where attempts it is understood are now being made to introduce more method into the lading of the ships for Nigerian ports. The defects in stowage are possibly due to want of local knowledge on the part of the responsible authorities at Liverpool, and the fact that it has not been realized that the extent and conditions of the trade now require more careful attention to details than perhaps was necessary seven or eight years ago. When the defects in stowage are remedied it is confidently expected that the cargo will be more expeditiously delivered, though there is no doubt that the present arrangements mark considerable progress in the method of handling and delivering the cargo.

---

### Coal.

The Coal Strike caused numerous enquiries from the Colonies about foreign coals, but it is satisfactory to find that in quality the British article is hard to beat. The following is an account of a comparison with American coal made on the Stann Creek railway, British Honduras:—

“The trial of the Pittsburg coal as compared with the English coal we used to get for the railway was carried out and is very interesting.

"The trial was made on the same engine (No. 2.) by the same driver (Burgess) and the same stoker, and they were given to understand they were to use their best effort on both occasions.

"The trial on each occasion was from the Friday morning till the Friday evening of the following week, or eight days in all.

"In the case of the Pittsburg the traffic was comparatively light that week, and the usual four cars were used for fruit and passengers, no stone being transported at all.

"She ran 115 miles and used 35 bags of coal, each bag containing approximately 100 lbs. The tubes were very dirty and required constant cleaning and attention.

"The traffic was considerably heavier the week in which English coal was used. Stone and ballast were required, and she ran 210 miles in the period, and only used 15 bags of the same size and weight. The usual clean through in the evening of the tubes was all that was necessary.

"The difference in consumption is very pronounced, and it is desirable to resume shipments from England as soon as can be arranged.

"The Alabama Coal is out of the reckoning altogether, as it is worse than Pittsburg."

---

### Electrically Driven Air Pump.

In connection with a pneumatic cesspool emptying intallation for service at a large hospital abroad, Messrs. Merryweather & Sons, of Greenwich, have recently supplied a new type of air pump, arranged to be driven by a small electric motor. The motor and pump are mounted on the same bed-plate, forming a very compact set. The service of the pump will be requisitioned for exhausting the air from two portable tank vans, each of 350 gallons capacity, enabling the contents of the cesspool to be drawn up into the tanks through suction hose. The pump, which is known as the "Ravensbourne" pattern, is of the double barrel type, constructed entirely of gun metal, with rubber disc valves arranged under separate covers so as to be instantly accessible. The pump barrels are placed opposite each other, and the plungers are driven by means of a crank and connecting rod. The electric motor gives 2 B.H.P. at 950 R.P.M. In view of the fact that the plant was required for a hospital, special precautions have been taken in order to ensure noiseless working as far as possible, and the drive from the electric motor to the pump is therefore transmitted through a special worm wheel gearing, which is enclosed in a gun metal casing forming an oil

bath. This arrangement is so effectual that the appliance is absolutely noiseless in working. The pump can be operated alternatively by means of hand gearing, with detachable winch handles, this gearing being put in and out of action by means of a small lever.

---

### White Ants in Houses.

The Entomological Division in South Africa has advised as to the best way of dealing with this pest. Where the termites are working in the flooring the floor should be taken up and the nest, or galleries leading into it, will be found underneath. Into these galleries arsenical fumes should be pumped by means of the Universal Ant Destroyer, the most satisfactory machine for this purpose now procurable in South Africa. This will not only destroy the inmates of the nest, but lines the galleries with a coating of arsenic which will make it uninhabitable for any termites in the future. The wood which is being eaten by the termites should be replaced by new timber which has been soaked previously in an arsenical solution, or painted with an arsenical paint, or treated with some white ant preservative which can be obtained from dealers in building materials. If the termites are working in the walls, part of it should be broken down so as to find a fair-sized gallery which leads into the nest, and the ant pump should then be applied. Often the entrances to the nest can be located by digging a hole just outside the wall. Or if no galleries are found by this means, the white ants can be trapped by burying a piece of deal about two feet by six inches in the neighbourhood of the place where they are working. After a short time this wood will be found to be attacked and galleries leading into the nest can thus be located. When putting up a new building the following methods of prevention will be found effective. In a badly infested ant district the house should be elevated on pieces of stone or of well burnt brick, so that the floor is over two feet from the ground, as the ants will rarely build on a stone or brick pier more than one and a half to two feet. If the supports are made of wood, the wood should be of an ant resistant kind, or have been specially treated with an ant preservative. Pieces of galvanized iron should be placed on top of the posts so that they project a few inches beyond the support, or an iron cap shaped like a mushroom should be fixed upon the post on which the joists of the floor rest. A cement floor would also be effective in preventing the ants from entering a house, but it should be well made so that no cracks occur, and it should extend beyond the base of the walls for about eight inches.

**Trade enquiries.**

A large number of enquiries are addressed by colonial officials to His Majesty's consular officers about industrial matters, such as products or manufactures in the particular consular district, and no doubt this often appears to be the most convenient mode of obtaining the information. It has, however, been decided that the practice should be discouraged as much as possible. In many cases the information desired can be supplied by the Commercial Intelligence Branch of the Board of Trade, or by the Commercial Attachés at the Foreign Office, or at His Majesty's Diplomatic Missions abroad. Further, His Majesty's Government are as a rule unable to benefit from any information that may be obtained by direct application.

## RAILWAY AND HARBOUR NOTES.

The end of the coal strike left manufacturers full of accumulated orders, and in many cases further orders have been refused. An order from Australia for 135,000 tons of rails, another from South Africa for 89,000 tons, and others are likely to occupy makers for the rest of the year. Prices have naturally gone up.

---

### Ceylon.

The Railway Traffic Commission have recommended that all passenger carriages should be built in the railway workshops, but do not recommend any further extensions at present, so as not to encroach on the funds which, for the next few years, will be required to place the existing lines in a thorough state of efficiency. The phenomenal increase of traffic during the last few years has made the present equipment inadequate.

On the 1st of May the Governor of Ceylon laid the last stone of the Colombo Harbour Works, which have been under construction for 37 years. A telegram was sent to Messrs. Coode, Son and Matthews expressing in warm terms appreciation of their services in connection with this great work. The works from first to last have occupied 37 years.

The Ratnapura extension was officially opened in April. It had already secured a large amount of the goods traffic.

The progress of the Mannar extension has been retarded by the scarcity of labour during the rice harvest and ill health among the staff and labour force. Rail head in April was 19 miles 14 chains from Madawachchi.

Messrs. Mansergh and Sons have been engaged to prepare plans and estimates for a drainage scheme for the southern portion of the Colombo Municipality and a report on the extension of the municipal limits further south.

**Malay States.**

Kedah extension : the survey starts at Bukit Mertajam, a station on the main line in Province Wellesley, and proceeds due north to Alor Star. The line will be 60 miles long. By the end of March, 28 miles had been located. From this point to Alor Star the country is all cultivated and densely populated.

On the Padang Java-Kuala Selangor line the rails were linked in for 22½ miles.

---

**Fiji.**

It is proposed to substitute an iron pontoon ferry, with an oil engine, for the present wooden ferry across the Rewa river. In such cases it is desirable to stretch two ropes across the river, one on each side of the pontoon, and to increase the breadth of the pontoon as a long broadside offers a great resistance and necessitates heavy warping gear. The cost of a pontoon 45 feet long, 20 feet wide, and 3 feet 9 inches deep at side, is about £2,000. If the expense of shipping in sections is very heavy, it may be better in such a case to ship in plates and angles and send out a man to re-erect.

---

**Seccondce Harbour Works.**

By the end of March, 182 feet of breakwater had been completed. On the reclamation, 32,631 cubic yards had been tipped.

---

**Lagos.**

On the Northern Extension excellent progress was made in February on the Taraji and Ebba bridges, and the Pimmi and Igberri bridges were opened for traffic.

The bank at the Jebba end of the Ebba bridge is completed and the stream diverted and flowing through the centre span of the bridge and new channel.

The following regulations are in force for the carriage of passengers' baggage between Iddo (Lagos) and Kano (or intermediate stations) by the boat trains which now run in connection with outward and homeward passenger steamers:—First 2 cwts. carried free; next 20 cwts. at second class goods rate; next 20 cwts. at third class goods rate; any excess is charged for at full luggage rates. There is no restriction as to the quantity of luggage allowed. The rates per cwt. from Iddo to Zaria and Kano are:—Zaria, second class, 9s. 3d.; third class, 13s. 3d. Kano, second class, 9s. 11d.; third class, 14s. 6d.

By the end of March the staging on the Niger (South Channel) Bridge was completed to Pier 5, in the Decauville tracks. The bore at Pier 2 reached rock 39 feet below river bed. It is expected that the bridge will be completed at the end of 1913 or early in 1914.

The next railway extension will probably be through the oil palm country of the Eastern Province.

A survey is being made for a line from Onitsha on the Niger to the Udi coalfields, about fifty miles from Onitsha.

The route is under consideration by which the railway is to be brought into Lagos by the new wharves.

On the harbour works lineal progress on the East Mole has been retarded by the diversion of stone to the Apapa West Mole wharves. Satisfactory progress has been made with the East Mole wharf.

Fifty open goods wagons, twenty third class coaches and nine composite coaches have been ordered. Seats in first class compartments to fold down into beds. Coaches to be Hale Coaches and fastened to floor. Lighting, Ridsdale roof lamps. Three sleeping saloons and four Improved Emir class locomotives are also on order.

---

It is understood that the proposal to erect a power station at the Kwa Falls for lighting the town of Calabar with electricity has been found to entail a prohibitive expense. An alternative proposal to run a power house by Diesel engines is under consideration.

The use of Diesel engines will be greatly encouraged in West Africa if, as is reported, they can be run on ground nut oil.

---

### Northern Nigeria.

By the boat express from Lagos passengers arrive at Kano, 712 miles from Lagos, within three days. At present passengers have to change at Minna Junction (467 miles), but it is hoped before long to run the Lagos train de luxe through to Zaria. For the present passengers for points beyond Minna must be provided with their own "chopbox" and camp beds. Zaria is the station for the tinfields, and here the Bauchi Light Railway takes passengers ninety miles on their way to Rahama. The fare to this place is £9 14s. 7d., and to Kano £9 14s. 10d.

**Baro-Kano.**

Now that the line has been built, some regret will be felt that the important town of Bida, with some 30,000 inhabitants, was passed by. To touch at this point would have involved a much more costly bridge. Possibly a short branch line will eventually be laid. The gradients of the railway have been kept very flat so as to render running economical, but the adoption of 1 in 145 and 1 in 165 between Minna and Baro has had the effect of lengthening the line, the length being 42 per cent. over the distance, and greater gradients might have been preferable. Great care was shown in selecting good sites for the bridges, six of which remained to be built while the traffic was carried on deviations. From Zaria to Kano better ballasting is required, as the sleepers are only packed with the earth from which the banks have been thrown up and when any rain falls the road will rapidly get into a very bad state.

Zaria is likely to become a very important station. It stands high, 2,100 feet above the sea and in open country, it is also the junction for the Bauchi plateau. The city is at mile 263. It may become the headquarters of the Government on the ground of health.

The work of construction has been admirably done, but further capital outlay is necessary to make the line efficient, and an expenditure of £100,000, or £300 per mile, would still leave the total cost low, less than £4,000 per mile.

---

**The Navigability of the Niger.**

It was anticipated that one, or at most two dredgers would be able to keep open nine miles of 6 feet channel 150 feet wide, the estimated maximum obstruction, this calculation being based partly on the work done on the Mississippi. But probably the comparison does not fairly apply to a river like the Niger, which has long periods of low water and a very lively sandy bed. During low river the volume of water passing down is small and probably not sufficient to maintain such a channel as the above without a reduction of velocity and deposit of silt. The results of the dredging operations of the "Quorra" have been disappointing. In 1911 the maximum depth of channel rendered available was from 3 feet 3 inches to 3 feet 9 inches, and of this 6 inches may be attributed to the dredging.

---

**Sierra Leone.**

The branch from Boia to Roruks is being extended to Rowalla, another 50 miles, and a further extension in a northerly direction across the Rokell river for about 20 miles has been sanctioned. This branch will tap a very rich palm belt. Other branches are pro-

posed with a view to this traffic. The wharves and railway sidings at Freetown are cramped and a Fourah Bay scheme has been projected to provide suitable accommodation for ocean-going steamers.

Proposals have been made for the utilization of the Sewa River Falls for the production of electrical power. The Baykongo Falls, 55 miles from the railway, would provide ample power, and the project includes a transmission line for  $227\frac{1}{2}$  miles along the railway from Pendembu to Freetown, the supply of electric light, power and tramways to Freetown, the electrification of the mountain railway, and supply of power to industries. It is considered that with cheap electric power available oil mills could be erected, so that the labour employed in the drudgery of cracking palm nuts by hand would be set free for the work of collection. The promoters of the scheme make it a condition that the Government should pay the cost of a section of the transmission line.

It is calculated that at the Falls there is a net head of water available at lowest level of 200 feet in a distance of 900 feet; the quantity of water measured was 4,000 cubic feet per second at almost low water period; the minimum power is put at 70,000 B.H.P. and at high water about 500,000 B.H.P.

It is, however, questionable whether the proposal is the best plan for the Government requirements.

---

### Uganda.

The monorail between Kampala and Port Bell has been found costly and inefficient, and motor vans have been employed to supplement it. Proposals have been made for the construction of a tramway. The traffic over the route is estimated at 967 tons per month. There is a feeling in favour of Entebbe being made the port for Kampala, but Port Bell is considered the natural outlet.

---

### Trinidad.

The Ciperó tramway agreement has been settled.

Good progress has been made with the earthwork of the Siparia line. The progress on the Tabaquite Rio Claro line has also been more satisfactory this year.

---

### Mallet Engines.

The first of the Mallet type engines, built by the North British Locomotive Company, recently arrived in South Africa. This locomotive presents several different features in outline to the earlier types built by the American Locomotive Company, the appearance

generally being more in keeping with the accepted type of British manufacture.

The sand boxes, instead of being placed on the top of the boiler, as is usual in the American type of locomotive, are arranged on an entirely different system, the boxes for the trailing or high pressure engine being fixed on the footplate, just to the back of the high pressure cylinders, whilst the sand boxes for the front engine are placed on the side of the boiler, just behind the smoke box; the result being that the outline of the engine becomes similar to that of the usual South African type, whilst the sand boxes are more accessible.

A notable feature of the Mallet type of engine built by the North British Locomotive Company is the band fixed round the boiler just behind the smoke box, to which is fixed a lifting link, giving increased facilities for lifting the boiler, particularly when the low pressure engine has to be uncoupled and removed.

---

### Hill Railways.

Rope railways necessitate two or more sections, if the length is considerable, and the resulting changes. If the ground is unfavourable, the expense of the sub-structure is necessarily great. Rack railways can go from point to point, and can follow the lie of the land, so that the cost of the sub-structure may be reduced to a minimum. The stations can also be arranged at more convenient points, and the traffic capacities adjusted to the demands. In some places, owing to meteorological conditions, the rope system has the further disadvantage that the traction cable is liable to slacken; thus near the sea compounds of chlorine are injurious to it. The alignment should be straight, as the introduction of horizontal curves increases the wear on all parts of the line and necessitates greater power, but this may cause expensive work. On the other hand, the rack railway must be longer, and the amount of protective work is larger than in the case of a cable railway, and when the traffic is fairly uniform and not considerable motor driving is probably cheaper than locomotives.

## CAVENDISH BRIDGE, MAURITIUS.

By P. LE JUGE DE SEGRAIS, M.INST.C.E., Director of Public Works,  
Mauritius.

---

PREVIOUS to 1905, most of the road bridges of the Colony were built in timber, 19 only out of 189 being constructed in masonry or steel. The sums spent annually for maintaining these timber bridges in good state of repair have amounted to about £4,000, and, with the object of doing away with this large recurrent expenditure, the policy of replacing gradually all the timber structures in material of a durable character has, on the suggestion of the author, been adopted by the Colonial Government.

As a result, three bridges have been entirely re-built in masonry (arches) and three with steel super-structures. Over thirty have been re-built in reinforced concrete, which has proved cheaper than either masonry or steel, and practically requires no maintenance. All the ferro-concrete bridges are periodically examined and show no sign of cracking anywhere.

The existing abutments or piers of the timber bridges are generally of substantial basalt masonry, so that the super-structure only requires renewal, and this is done by blocking the road, if there is another road available within some reasonable distance, or the work is carried by halves, which is naturally not so satisfactory, and more costly also.

In some cases, however, it is necessary to re-build the bridge entirely, either because there are no satisfactory abutments or piers, or because the position of the existing bridge is dangerous and difficult of approach, especially with the motor traffic, which is daily largely increasing.

The bridge just completed and called CAVENDISH BRIDGE, after Sir Cavendish Boyle, K.C.M.G., the Governor of Mauritius, whose services expired in August last year, is the longest road bridge in the Island.

The old structure, built about the year 1856, consisted of 35 pairs of timber piles, spaced 18 to 20 feet apart, across the

estuary of River "La Chaux," to connect the town of Mahebourg with its suburb called "Ville Noire," and establish communication between Mahebourg and an important section of the district of Grand Port; Mahebourg being the head centre of that district and formerly the main port of the Island.

The cross section of this old timber bridge shows how the work was carried out, the timber piles, 10 to 12 inches square, driven about 20 feet in unsafe ground, being connected top and bottom by horizontal timber ties and struts, on which the timber platform, 4 inches thick, was laid across longitudinals fixed in the top horizontal member. It will be understood that a structure of this description, measuring 533 feet from end to end (there being no masonry abutments, but piles driven at each end were secured in dry walling to form the abutments), was not very satisfactory as regards stability; in fact, it was so shaky that it was with difficulty that the author could use his level while standing on the bridge, the spirit bulb being thrown out of level by any person passing the instrument.

Only light traffic, such as carts and carriages, was permissible, and now and then a roller, not exceeding 5 tons in weight, was allowed to be dragged over the bridge by men with the greatest precautions.

Traction Engines were, of course, prohibited from going over, so that those conveying sugar from three sugar factories had to stop at the end of the bridge and transfer their loads from trailers into light carts carrying half a ton, which took the sugars across the bridge, either to a wharf on the opposite bank of the river for shipment in coasters to Port Louis, or to the Railway Station for conveyance by rail to the same place.

The same process had to be gone through again for all the Estate's stores and provisions coming from Port Louis.

The new bridge was designed with a view to facilitate the traffic, and to carry a moving load of one ton per foot run, which is more than ample for the local requirements.

A good view of the bridge is given by the photograph taken on the down stream side. There are seven flat arches span 62 feet 6 inches and rise  $\frac{1}{6}$  of the span or 6 feet 3 inches, the piers at the springings of the arches being 5 feet thick, and the abutments 20 feet deep, giving a total length of 507 feet 6 inches for the portion of the work done in reinforced concrete. The approaches, measuring 82 feet and 177 feet respectively, are made in coursed rubble masonry with a finely dressed ashlar parapet.

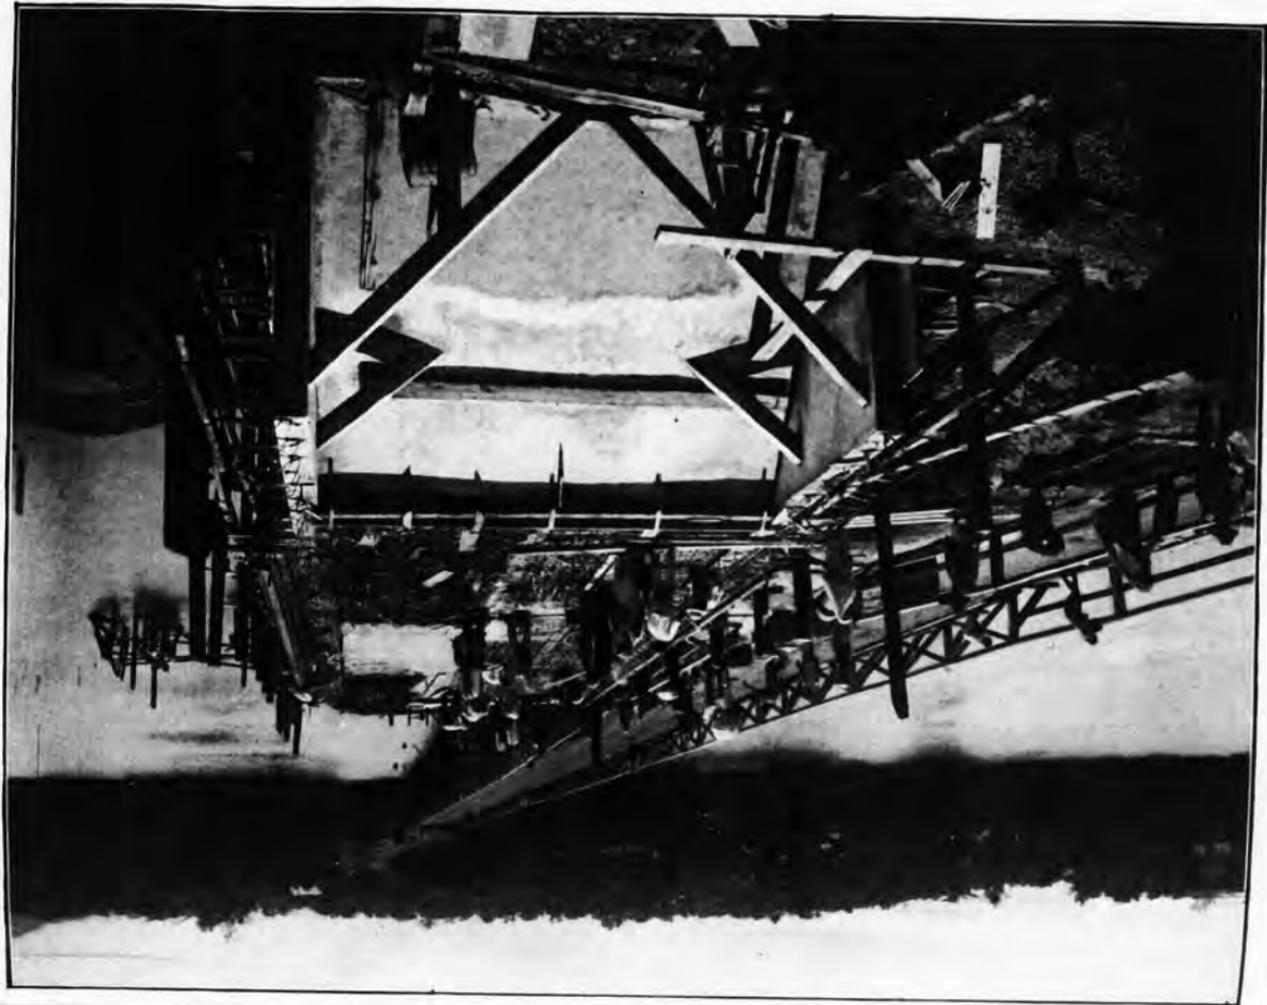

*Abutments.*—The southern abutment on the Mahebourg side rests on 20 teak piles, 10 inches square, driven in the solid 10 to 20 feet; these piles support a reinforced concrete base, 2 feet thick, by means of  $1\frac{1}{2}$ -in. round steel bars fixed on the top of the piles, to

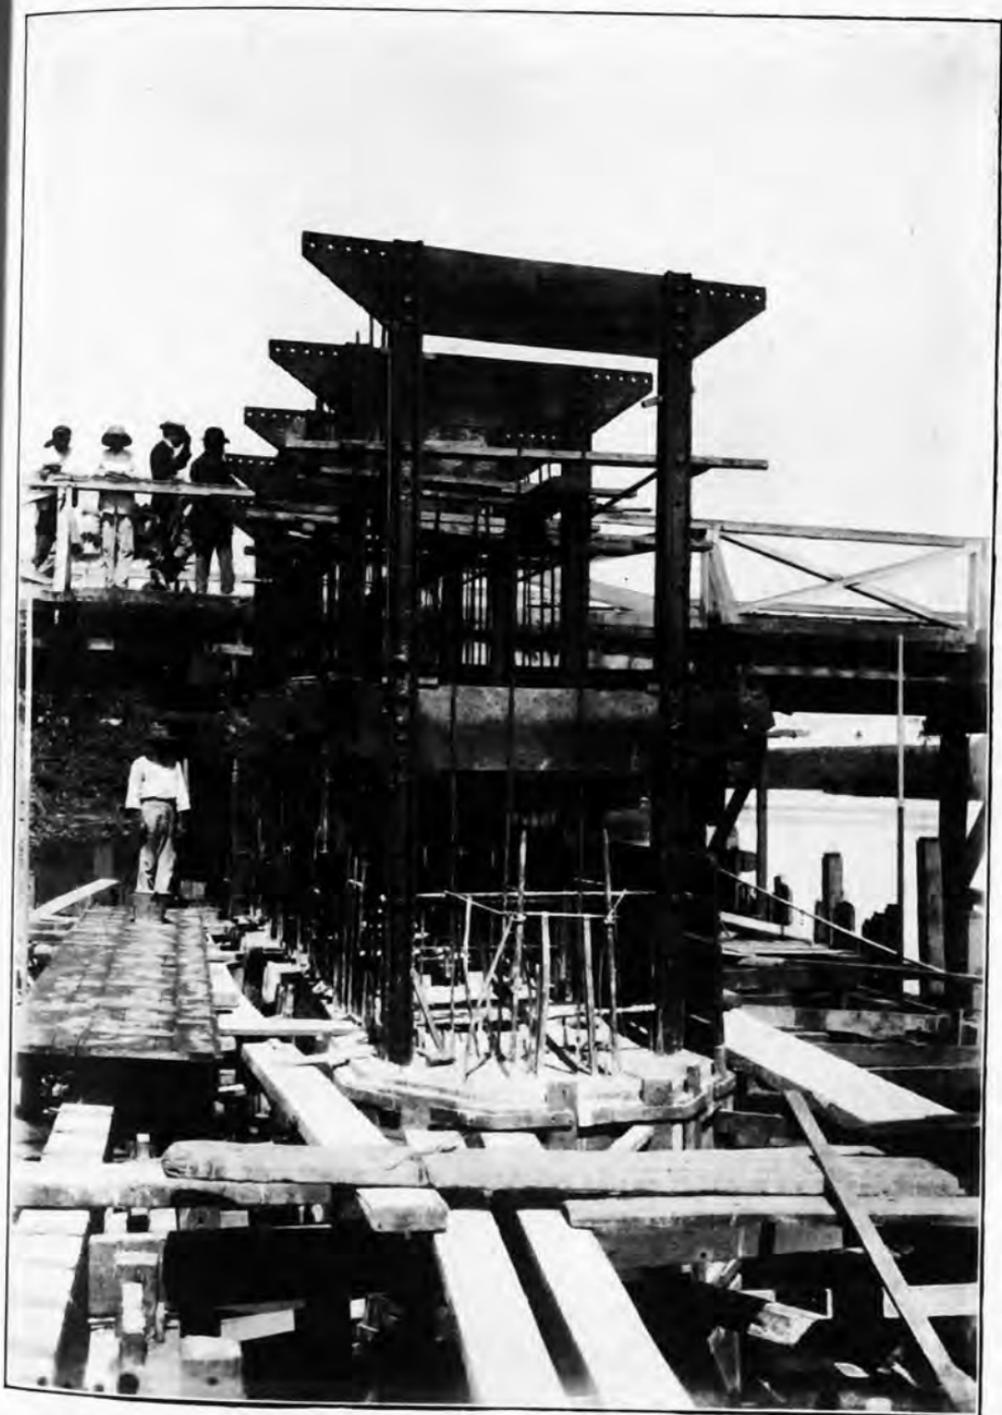

which a lattice work of  $\frac{5}{8}$ -in. and  $\frac{1}{2}$ -in. round steels fixed 6 inches apart are connected.

Light walls of ferro-concrete were then built one foot thick, leaving hollows which were filled up with coral sand.

The abutment has the shape of a trapezium, with the exception of the two outside walls, which are tied by reinforced beams into the central wall.

This is shown by the photographs of the abutment. The light walls are reinforced by vertical  $\frac{5}{8}$ -in. round steel bars placed 8 inches apart, and horizontal  $\frac{1}{2}$ -in. round steel bars similarly spaced.

The walls are further reinforced by 5 pairs of unserviceable rails where the arch reinforcements are attached, and also a second line of 10 old rails at the back which serve for further anchoring the arch reinforcements by means of 2 pairs of  $1\frac{1}{2}$ -in. round steel bars.

Some difficulty was experienced in making the foundations. It was first of all anticipated that it would be possible to find solid ground from trial pits previously made, but water percolating made the excavation very difficult, especially at high tide, and steam pumping had to be resorted to. It was then found preferable to drive piles to support the concrete.

The northern abutment in "Ville Noire" was built in the river bed as well as a part of the masonry approach wall, and a cofferdam was first of all made; fifteen ferro-concrete piles were driven to support the abutment, which was, in other respects, the reproduction of the southern one. Below water, these piles were connected together in the same manner as those for the piers, as explained further on. Sixteen ferro-concrete piles were subsequently driven to support the masonry walls of the approach on that side, the piles being spaced 18 feet and 4 feet centres, and connected by a ferro-concrete base 6 feet wide and 1 foot thick, on which the masonry walls, 17 feet high at the deepest part on each side, were built without difficulty.

Each pile was reinforced with four  $1\frac{1}{8}$ -in. round mild steel bars, tied with  $\frac{3}{8}$ -in. wire spaced close at the point and end, and nowhere less than 6 inches apart.

The piles were moulded horizontally always two months in advance; they were driven by a  $1\frac{1}{2}$ -ton cast iron monkey with a drop not exceeding 7 feet until the piles reached the firm ground, that is when the penetration per blow did not exceed  $\frac{1}{8}$  of an inch. No difficulty was experienced in driving the piles with the interposition of a wooden dolly and a steel square box fitted on top of the pile and filled with sawdust and wooden shavings.

*Piers.*—A cofferdam had to be made for each pier. Ten ferro-concrete piles were driven from 15 to 24 feet. In one case the piles had to be lengthened, and in others they had to be cut off.

These piles were connected by short ferro-concrete walls, 1 foot thick and 2 to 3 feet deep, *i.e.*, about 5 feet below low water level, to protect the piles further down in case of erosion. The ferro-concrete base, 26 feet long, 7 feet wide, and 27 inches thick, resting on the piles, is reinforced by two 1½-in. steel bars resting on the tops of the piles lengthwise and crosswise, the intervals being fitted up with a netting of ⅝-in. and ½-in. round steels, spaced 6 inches apart. When a foot of concrete had been laid the old rails were fixed in proper alignment, these being fixed in pairs 5 feet centres, and the remaining 15 inches of concrete were then laid. Each pier has four hollows 4 feet 0 inches by 3 feet 6 inches; these were left empty to save weight on the piles and give more elasticity to the pier. The walls were reinforced in the same way as those of the abutment. The photo of the pier gives a good idea of its construction.

*Arches.*—Each span consists of 5 beams, the 3 central ones 15 inches thick, and the outside ones 13½ inches; the depth of each beam is 1 foot 0 inches at the centre and 7 feet 3 inches at the haunches.

The concrete platform is tied on the top of these beams, which are connected crosswise by 9 cross beams 9 inches thick and 12 inches deep. These beams form continuous beams from one end of the bridge to the other, and are firmly tied into the abutments as already explained. The reinforcement consists of two 3½-in. by 3½-in. by ½-in. mild steel angles forming two inverted tees top and bottom, which are connected by vertical and diagonal bracings bolted to the steel angles by ¾-in. bolts spaced 2 feet 1 inch apart.

The lower angles are placed 2 inches below the intrados, and the upper ones project 3 inches into the 6-in. platform.

The cross beams are reinforced by five 1-in. round mild steel bars, one of each passes over the upper steel angles and is inclined towards the centre of each bay to provide against shearing. The platform consists of a series of ⅝-in. and ½-in. round mild steel bars forming a square of 8 inches with stirrups (made of cement casks steel bands) at each intersection.

The concreting of each beam took one day, and that of the platform three days on each occasion; a rendering of ¾ inch of cement mortar 1 to 1 was laid immediately after, and the whole kept moist for a fortnight.

The cornice on which the handrail is built was next concreted.

A small footpath is provided, which serves as cover for a channel to hold the C.I. water pipes which supply the town of Mahebourg.

Each span was made in succession, and it is to be noticed that there is no crack noticeable where new work was laid against old on six different occasions at intervals of 4 to 6 months.

The composition of the concrete used was a mixture of 12 parts by volume of carefully cleaned and washed basalt macadam of  $\frac{3}{4}$  inch and  $1\frac{1}{2}$  inch in size, 6 parts of screened coral sand, and 2 parts of Portland cement for all the walls in compression, and 3 parts of cement for the super-structures.

All the outside work was carefully rendered and polished with fine cement mortar 1 to 1, and by fixing small wedge-shaped battens inside the moulds to imitate masonry joints the work has the appearance of being made of blocks of marble.

It took a little over three years to build the bridge. The work was started on the 17th February, 1908, and the bridge tested on the 28th March, 1911, when, on passing a traction engine weighing 17 tons and 3 trailers loaded with bags of sugar each weighing 9 tons, a maximum deflection of  $\frac{1}{4}$  of an inch was obtained.

The calculations were made in the same manner as those adopted for the Trianon Bridge, a description of which is to be found in Volume clxxxiii. of the minutes of proceedings of the Institution of Civil Engineers.

The cost of the work is given below. The old timber bridge was built originally for a contract price of 47,000 dollars, equivalent to £9,400; the timber was naturally periodically renewed. The sums spent for repairs to the bridge for a period of nine years, from 1896 to 1904, amounted to Rs. 36,425, giving an average sum of Rs. 4,000 in round figures, or £266, for annual maintenance.

The following is the detailed schedule of cost:—

	£	s.	d.	£	s.	d.
<i>1. Reinforced Concrete Work:—</i>						
Portland cement from England .....	1,296	4	7			
Mild steel from England.....	1,272	3	10			
Timber for false work.....	248	12	4			
Labour .....	3,456	18	8			
Sand .....	63	5	4			
Cartage, dressed stones for caps of parapets, edge of roadway, inci- dentals .....	380	18	7			
				6,718	3	4
<i>2. Masonry Approaches:—</i>						
Portland cement from England .....	281	11	9			
Steel from England.....	82	0	11			
Labour .....	1,098	0	3			
Sand .....	11	11	10			
Cartage, dressed stones, and incidentals	445	10	4			
				1,918	15	1
				<hr/>		
				Total...	£8,636	18 5

P. LE J. DE SEGRAIS.

25th March, 1912.

## MEDICAL NOTES.

FROM July 1st the Sleeping Sickness Bureau will be incorporated in a Tropical Diseases Bureau. Appalling as Sleeping Sickness is in some places, it can hardly be said to be widespread, and the attention given to it should not be allowed to detract from the study of other more representative diseases. The Bureau, which will be at the Imperial Institute, will issue at frequent intervals a Tropical Diseases Bulletin, and thus the result of recent researches and methods will quickly become available throughout the Empire. The present library is expected to grow rapidly and to be of great use to medical officers who are at home on leave from the tropics.

The *Sleeping Sickness Bulletin* No. 37 (vol. 4) records the discovery that *Glossina Morsitans*, caught in nature in the Luangua Valley, Northern Rhodesia, can transmit the human trypanosome to monkeys and other mammals, and presumably therefore to man.

---

### Tuberculosis.

The situation disclosed by the Bermuda statistics is most disquieting, and Mr. R. Popham Lobb has some strong remarks on the grave character of the evil and the need of teaching the elementary laws of health to the young. He states that among the European population the mortality from Tuberculosis is distinctly low, 3·7 deaths to every 100 births, or only 2·8 per cent. if the deaths of non-Bermudians are excluded, as against a percentage, for instance, of 5·9 for England and Wales in the year 1909.

In the case of the coloured population, on the other hand, the mortality is more than twice as great, and it must be remembered that the coloured inhabitants outnumber the white by nearly 2 to 1.

The recorded deaths from Tuberculosis were in the proportion of 104 per 1,000 deaths; if the same ratio held good in the case of 514 uncertified deaths, or even of a majority of them, it follows

that the mortality as given in the Tables has been understated. There are no means of verifying this hypothesis, but the Registrar-General has little doubt that it is to a large extent correct.

Tuberculosis is responsible for more coloured deaths than any other form of disease. During the 10 years under review the deaths from this cause formed 15 per cent. of the total coloured deaths from disease of all kinds, as compared with a percentage of only 7.0 in the case of Europeans. In each of the two worst areas, Tuckers Town and Warwick Parish, out of every 5 coloured deaths from disease, 1 was due to Tuberculosis.

If the Coloured population lived entirely apart from the European community, the prevalence among them of Tuberculosis would lose one at any rate of its most serious aspects. This, however, is very far from being the case. With the solitary exception of the Tuckers Town peninsula, the most remote spot in the Colony, which has an entirely coloured population, the coloured inhabitants throughout the Island live in close proximity to, and sometimes, in the urban districts, in houses adjoining those of Europeans.

It is not generally realized that Bermuda is one of the most thickly populated islands in the world. The density of the resident civil population is approximately 1,150 to the square mile, varying from 360 in Smiths to 1,350 in Sandys and 3,400 in Pembroke.

A second and more significant circumstance is that the whole of the domestic servant class, excepting a few West Indians, is drawn from the local coloured inhabitants.

Taking into account the firm hold which the disease has already obtained over the coloured inhabitants, the fact that they constitute a large majority of the population in every parish, that they live and, as domestic servants and in other capacities, work in close proximity to Europeans and are wholly ignorant of the elements of hygiene and ordinary precautions against infectious disease, it must be admitted that the conditions for the spread of Tuberculosis among all classes of the community are distinctly favourable.

Against these disadvantages however must be placed two distinctly beneficial circumstances, namely, the absence of overcrowding, in the sense in which the term is understood in European countries or America, and the fact that the great majority of the population, European and coloured, follow out-of-door occupations. There is no industrialism in the Colony and consequently no factories, mines or crowded workshops. Excepting in a few streets in St. George's and Hamilton, almost every household, White or coloured, occupies a detached stone-built cottage open on all sides to the sun and air and generally standing in its own patch of garden,

and the middle and lower classes are probably better housed here than in any other part of the world. These factors are undoubtedly of great value in counteracting the spread of infectious or contagious disease of all kinds.

The prevalence of this disease among the natives of a densely populated island only 19 square miles in extent, frequented annually by some 30,000 Europeans and enjoying a wide reputation as a health resort, and the certainty that unless timely steps are taken it will increase, are circumstances which cannot be disregarded and they call for the adoption of active measures of prevention without delay.

The mortality from this cause may or may not be less here than in other countries but even if it were the lowest, the fact remains that it is capable of being very greatly reduced and public policy and humanity alike dictate that steps to that end should be taken.

Few persons outside the medical profession have had any opportunity hitherto of realizing the full extent of the evil and the steady drain which it makes upon the population, and for this reason little has so far been done to check it.

With a magic lantern, provided by the General Board of Health, Dr. R. R. Higinbotham, Health Officer of the East End, gave a series of free lectures on Tuberculosis throughout the Island in the winter of 1910-11. Two very useful pamphlets on the nature and prevention of the disease, prepared respectively by the same officer and Dr. Eldon Harvey, Medical Officer of Health, were printed and widely distributed by the Board in 1909 and 1910.

Since 1907 the Board of Education has provided an annual course of free lectures on Hygiene for school teachers but it goes no further. Hygiene is not a compulsory subject in the aided schools, and apparently it is never taught voluntarily, not even in the best European schools.

The Colony spends on an average £2,400 a year on education, 94 per cent. of which goes in grants to the teachers, and attendance at school is compulsory. In no case however does the curriculum in any school include what from the standpoint of the individual, and therefore of the community, is assuredly the most vital subject of all, namely the laws of health.

For want of this elementary and essential knowledge the great majority of children are destined in all probability to undergo unnecessary physical suffering in later years, and a considerable number must inevitably die in early youth or manhood. Each new generation of parents not only remains as incapable of instructing its offspring as the last but is increasingly liable to transmit the disease which this ignorance directly fosters.

The child of to-day is the parent and citizen of to-morrow and upon his efficiency, both of body and mind, depend the efficiency and prosperity of the community. A State which permits its members to grow up without taking any steps to ensure that they are taught how to avoid the diseases most fatal to human life resembles an owner who allows his ships to go to sea in charge of officers wholly ignorant of navigation and seamanship. Under such conditions the individual has almost as little chance of attaining a useful old age as the ship of reaching port.

The Colony cannot in its own interests continue to allow each rising generation to go adrift without any guidance in such matters, and if the exciting evils are to be checked and reduced to a minimum, systematic measures must be put in force to dispel this ignorance.

When it is remembered for instance that the Colony has for some years past expended £500 a year in exterminating an insect pest which destroys fruit and *nothing* in combatting a preventable disease which is responsible for more deaths than any other cause and a growing menace to residents and visitors alike, the Registrar-General submits that it will be recognized that there is room for a more equitable and reasoned application of public energies and funds. Bermuda is by no means the only place of which this can be said.

The main obstacles standing in the way of any reduction in the mortality from Tuberculosis are ignorance, poverty and distance from medical aid.

The first of these, ignorance, though the chief preventable cause of the disease and practically universal, is fortunately one which can be easily attacked and almost wholly overcome; poverty and the distribution of medical practitioners are economic factors and consequently less susceptible to amendment by State action.

The schools are the only means by which Government can reach practically every child in the Colony, and the machinery controlled by the Board of Education should be utilised for the purpose.

What is thoroughly learnt in youth is seldom forgotten in later life, and if the curriculum of every school included the teaching of hygiene and the laws of bodily health, with especial reference to the prevention of Tuberculosis, a marked reduction in the death rate could hardly fail to follow.

Every teacher, whether in receipt of a Government grant or not, should be required by law to qualify in hygiene within a reasonable time; regular courses should be provided for them at the public expense, and instruction in the subject should be made compulsory in every school, aided or otherwise.

The poorest section of the inhabitants, who are also the most ignorant, are to be found in the rural parishes, Hamilton parish and Tucker's Town, Warwick, Southampton and Sandys. It is in this group that the mortality from Tuberculosis is highest among the coloured population, who form over 70 per cent. of their combined inhabitants, namely 48 per 1,000 of mean population. In the rest of the Colony the rate is only 29 per 1,000. Stated in another way, the deaths number 103 per 1,000 living births in this group and only 70 per 1,000 elsewhere.

In the poor districts medical attendance is difficult to get, and if the evil is to be combated State assistance and organisation is necessary. At present Bermuda has only two medical officers, and compares badly in this respect with other West Indian Islands.

---

### Leprosy.

An article in the South African Journal of Tropical Medicine and Hygiene suggests that the leprosy bacillus is transmitted by bed-bugs. The cause of the transmission of the disease has never hitherto been traced, but the discovery that plague is spread by fleas indicates that other diseases may be communicated in a similar way. Leprosy, apparently, is not contagious, but some of the people who live in close association with lepers become lepers too. The following story is told to confirm the suggestion as to the cause of this. A native residing in a village about three miles from Maseru, presented himself as an out-patient about three months ago with some well-marked tubercular leprosy patches on the face. They had appeared about six weeks previously. There are no lepers in his village, and none of his relatives are lepers. Inquiries as to how he had spent his time and where he had been during the preceding year elicited the fact that he had during that period visited on three or four occasions a village about 50 miles away where there was one leper, who was, however, driven from the village during the period in question. He had been in the leper's hut, but had never partaken of food there. After the leper had been driven away, X spent one night in the hut and was severely bitten by bugs there. The closest questioning failed to elicit any further evidence of contact with lepers or their dwellings, and one is almost forced to the conclusion that X was inoculated by leprosy infected bugs or other parasites on the one night he spent in the infected hut.

---

### Mortality of European Officials in West Africa.

In the "Returns for 1911" (Cd. 6089) it is observed that in that year the total death-rate was 13.9 per 1,000, a decrease

of 6·5 on 1910; or excluding deaths not due to disease, 11·7, a decrease of 5·0. This is a considerable fall, and must be regarded as very satisfactory, especially as there were serious outbreaks of yellow fever in the Gold Coast and Gambia. There was also a decrease in the invaliding rate. It is mentioned, "As supporting the view that a man quickly recovers from the effects of the West African climate, that officials invalided from the service are not infrequently found fit for re-employment after residence of a year or so in this country. Also officials pensioned generally enjoy their pensions for many years; in one or two cases the period on pension has been as much as 40 years."

Lest, however, these last cases should be unduly relied on, it may be pointed out that the average length of service shewn in these returns is still very short—last year it was 4 years 4 months. The statistics given are therefore based on the records of men who are only a comparatively short time in the country.

---

#### Transport of Lymph.

A form of "Thermos" flask is being used for this purpose in tropical countries, and satisfactory results have been obtained.

## COLONIAL STAMPS.

THE following new designs and varieties have appeared since our last issue :—

BAHAMAS.— $\frac{1}{2}$ d.,  $2\frac{1}{2}$ d., 4d., 6d., 1s., 5s. and £1, new portrait.

CEYLON.—3, 6, 10 and 15 cents., new portrait, old D.L.R. type of keyplate.

EAST AFRICA AND UGANDA PROTECTORATES.—3 and 6 cents. stamps from a new keyplate to fit the existing border plates.

FALKLAND ISLANDS.— $\frac{1}{2}$ d., 1d., 2d.,  $2\frac{1}{2}$ d., 6d., 1s., 3s. and 5s., new portrait.

FIJI.—1d., 5s. and £1, new portrait.

GAMBIA.— $\frac{1}{2}$ d., 1d.,  $1\frac{1}{2}$ d., 2d.,  $2\frac{1}{2}$ d., 3d., 4d., 5d., 6d.,  $7\frac{1}{2}$ d., 10d., 1s., 1s. 6d., 2s., 2s. 6d. and 3s., with new portrait. The  $1\frac{1}{2}$ d. is a new value.

GIBRALTAR.— $\frac{1}{2}$ d., 1d., 2d.,  $2\frac{1}{2}$ d., 6d. and 1s., from a new keyplate to fit the existing overprint plates.

GILBERT AND ELLICE ISLANDS PROTECTORATE.— $\frac{1}{2}$ d. stamps, portrait of H.M. the King. The word "Protectorate" is omitted from the inscription for the sake of brevity.

KEDAH.—Three designs have been used in the production of this series by the copper plate process :—Shock of Padi, 1, 3, 4, 5 and 8 cents. ; Malay ploughing with a pair of bullocks, 10, 20, 30, 40 and 50 cents. ; The Council Chamber, 1, 2, 3 and 5 dollars. The first five values are of the ordinary postage size ; all the rest are of the revenue size, the design being horizontal and not vertical.

LEEWARD ISLANDS.— $\frac{1}{4}$ d.,  $\frac{1}{2}$ d., 1d. and  $2\frac{1}{2}$ d., new portrait.

MALTA.—1s. stamp bearing King Edward's head overprinted "Revenue."

NEW HEBRIDES CONDOMINIUM FRENCH SERIES.—The latest issue of the stamps of this series in which denominations were represented was printed on paper each sheet of which contained the letters

"R. F." once only in large characters. The result of this is that some of the stamps will be found to be unwatermarked while others will contain unrecognizable portions of one of the letters. The stamps were despatched to Paris early in April. This paper will naturally only be used for the French series.

ST. LUCIA.— $\frac{1}{2}$ d., 1d.,  $2\frac{1}{2}$ d., 3d., 6d., 1s. and 5s., for the first time with the new portrait. Old D.L.R. Universal design.

SIERRA LEONE.—1d. and 2d., new portrait.

SOUTHERN NIGERIA.—2d., new portrait.

**RECENT TRANSFERS AND PROMOTIONS  
MADE BY THE SECRETARY OF STATE.**

- Mr. P. M. C. SHERIFF (Chief Justice, St. Lucia), Chief Justice, Bermuda.
- Mr. J. A. S. BUCKNILL (King's Advocate, Cyprus), Attorney-General, Hong Kong.
- Mr. J. M. M. DUNLOP (Police Magistrate, Southern Nigeria), Attorney-General, Northern Nigeria.
- Mr. A. E. CRUICKSHANK (Traffic Manager, Uganda Railway), General Manager of Railways, Gold Coast.
- Mr. N. FARRAR (Postmaster-General, Nyasaland), Postmaster-General, British Guiana.
- Mr. S. SIMPSON (late Cotton Expert, Nyasaland), Director of Agriculture, Uganda.
- Dr. L. D. PARSONS (Assistant Surgeon, Colonial Hospital, Gibraltar), Medical Superintendent of Lunatic Asylum, Ceylon.
- Mr. E. B. JARVIS (Assistant Colonial Secretary, Leewards), First Assistant Secretary, Uganda.
- Major W. H. ROBINSON (Inspector of Police, Mauritius), First Assistant Superintendent of Prisons, Ceylon.
- Mr. A. W. HODSON (Assistant Resident Magistrate, Bechuanaland Protectorate), District Commissioner, Somaliland.
- Dr. W. R. W. JAMES (late Medical Officer, Bechuanaland Protectorate), Medical Officer, Gilbert and Ellice Islands Protectorate.
- Mr. W. H. PATTERSON (Resident Master, Agricultural School, St. Vincent), Entomologist, Agricultural Department, Gold Coast.
- Mr. W. H. G. THORNE (Sub-Inspector of Constabulary, Trinidad), Sub-Inspector of Police, Barbados.

## OFFICIALS ON LEAVE OF ABSENCE IN THIS COUNTRY WITH DATE OF EXPIRATION OF LEAVE.

—

This List is compiled from the Leave Certificates sent to the Crown Agents for the Colonies. The Editors will be glad to receive notice of any other cases of Colonial Officials on Long Leave.

## **The "Handy-Cosy" Bed.**

*A Light Steel-frame Portable Folding Bed.*

# ELECTRICAL ENGINEERING

is the representative engineering journal of the electrical industry. It is read by the leading electrical engineers, and is regarded as the reliable authority in all matters connected with electricity.

The articles are of a practical nature, and well illustrated ; they deal with the technical and engineering aspects of electric lighting, electric power distribution, the use of electricity in mines, electric traction, telephony, and telegraphy.

Electrical Engineering is the best medium for advertisements.

THE  
**TINFIELDS OF NORTHERN NIGERIA**  
 Via THE NIGERIAN RAILWAY.

**A**N ALL RAIL ROUTE is now open for both Goods and Passenger Traffic from the Port of Lagos, the capital of Southern Nigeria, to Rahama, the present terminus of the BAUCHI LIGHT RAILWAY, a total distance of 712 miles. A Weekly BOAT EXPRESS connects with both the Outward and Homeward MAIL STEAMERS at LAGOS, and consists of Saloon Carriages provided with modern conveniences, including a Restaurant Car, comfortable Sleeping Accommodation, Lavatories and Bathrooms, and fitted throughout with Electric Light and Fans. The train runs through to Zaria (622 miles) in 45 hours and Passengers tranship there to the Bauchi Light Railway for Rahama.

2. At Lagos, Passengers and their luggage, etc., are conveyed to and from the Ocean Liner by a Tender which lands them at Iddo Wharf, where the Boat Express is drawn up. All Meals and Refreshments can be had in the Restaurant Car throughout the journey to Minna. The saving in time by the All Mail Route is from Eight to Ten days on each journey in comparison with the old Niger River Route via Forcados.

3. The Passenger Fares from Lagos to Rahama are as under:

First Class ... .. £9 14s. 7d. Third Class (Servants only) ... .. £0 19s. 0d.

There is no restriction on the quantity of baggage which can be taken by Passengers by the Boat Express.

The rates to Rahama are as under:—

First 2 cwts. ... Free. Next 20 cwts. ... 11s. 8d. per cwt. Next 20 cwts. ... 19s. 6d. per cwt.

Any baggage in excess of 2 tons 2 cwts. will be charged at excess luggage rates.

4. All goods are carried from Iddo (Lagos) to Zaria, Rahama and Kano at the same rates as from Forcados by the river and rail route, and every facility is provided at Iddo for the handling of heavy and bulky articles of machinery, etc.

The rate per ton for machinery from Lagos to Rahama, or from Forcados to Rahama, is £18 3s. 5d., and for tin ore from Rahama to Lagos or Forcados, £13 17s. 6d.

For further particulars apply to the—

# "HANDBOOK OF THE BRITISH COLONIAL EMPIRE."

BY  
**W. H. MERCER, C.M.G.,**

*One of the Crown Agents for the Colonies :*

AND  
**A. J. HARDING,**

*Of the Colonial Office.*

"Whilst the 'Colonial Office List' is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring succinct and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts."

*Journal of the Royal Colonial Institute.*

\* \* \* \* \*

"The book is intended for educational purposes and is so attractively written, and contains such a fund of information, that it cannot fail to become popular."

## EDITORIAL NOTES.

THE prosperous condition of Australia is reflected in the returns of imports during the first quarter of this year. These showed an increase of more than 21 per cent. over those of last year. The increase of imports coincided with an increase of population due to immigration, and this will be a continuing cause. Intending emigrants will be encouraged by the recent reports which show that New South Wales has perhaps the lowest death-rate in the world, though it may be remarked that the death-rate is always kept down by a tide of healthy immigrants, and that, therefore, a good deal of allowance must be made for this in drawing comparisons.

In Australia a big policy of immigration depends on "closer settlement," but when attempts are made to break up large estates for this purpose the interests threatened naturally make their objections heard. Wool is the predominant rural industry, and this means extensive runs. But agriculture is now developing more rapidly than sheep farming, and more land is wanted to meet the demand. But it has been said by a minister in New South Wales that if 1,000 settlers came there to-morrow the department could not find 50 blocks of decent land within 15 miles of a railway to offer them. This fact marks the great difference between Australia

and Canada. The purchase system which has been resorted to in Australia has apparently not made much impression. In New South Wales in six years between two and a half and three millions have been spent, and only 2,400 settlement blocks have resulted. The rise in values has in many places been very great recently and stops government buying. An extensive railway policy is in view, twelve new railway lines being contemplated, but to make any substantial impression on the adjoining land by the purchase system would cost, it has been estimated, the enormous sum of fifty millions. The Government will not consider it satisfactory to incur the heavy expenditure on these railways without providing room for the settler, and if the large holders do not themselves move in the matter it seems likely that legislation will be resorted to. The federal land tax, the first report on which has just been issued, has had a substantial effect in inducing those owners who are liable to the higher scales to sell.

The comparative advantages of Canada and Australia to the emigrant are frequently discussed, and as each Dominion has special advantages of its own it would be difficult for impartial observers to decide which offers the greatest attractions. The Canadian people have certainly an extremely strong belief in and affection for their country. There is a spirit of confidence and optimism which rises above all trials. The man in the street has no doubts and can tell you all about the phenomenal progress of his own locality. There must be something in the climate or soil of the North American continent which inspires this vivid faith in the country, the belief in the future, the devotion to work, and the love of enterprise and advertisement. The average Australian may have as deep a trust in himself and his territory, but he does not display it, any more than the ordinary Englishman, in so marked a manner. On the other hand he has in his favour a potent element of stable prosperity. He can borrow money more cheaply. In Canada the settler has to pay generally 7 to 10 per cent. for the money he wants to improve his property; in Australia the ruling rate is not more than 5 per cent. In both cases there is practically unlimited room, and while in Canada the obstacle to development is the cold winter, in Australia it is the aridity of the interior. The Canadian winter stimulates the forces of the individual; the Australian problem, which is being energetically attacked by wells and irrigation, calls for great government schemes, and this difference has a marked effect on the character of politics and, in the long run, on that of the people. In Canada the trapper and explorer have been the pioneers, and their present day successors must have something of the same qualities, for they must overcome the essential difficulties with their own hands and without state help. In Australia it is the Government which, by vast and organized methods, will lead the way westward and conquer the desert.

The life of the Australian settler will be made easy, but generally speaking a Canadian career contains the greater possibilities.

In our last number we referred to the enquiries which are being made in Canada as to the increased cost of living, and it now appears that New Zealand is also bent on tackling the problem. A Royal Commission has been appointed by the Dominion Government to see whether the cost of living has increased within the last twenty years; if, so, has the increase been greater than in other English-speaking countries; how far the increase is due to the higher standard of living, or to monopolies, trusts, tariff, price of land, or labour legislation; also what steps should be taken towards reducing the cost of the necessaries of life. New South Wales is also investigating the subject. In the United States there has been a proposal to send a Commission round the world to study the subject. There will evidently in due course be a vast accumulation of evidence, and no doubt the operation of various causes will be traced, but it will take a good deal of faith in administrative measures to believe that a world-wide movement of this character can be stopped. Broadly speaking a general change in prices is the result of a variation in the value of gold, and if everyone was a direct producer the effect of such a variation would be comparatively slight, as it would be balanced between the sales and purchases; but as a very large proportion of the world's workers are unnatural beings who receive a fixed wage, an alteration of the usual equilibrium in the direction of making goods dearer is attended with a vast amount of inconvenience. The last news from Canada is that the "index number" has gone up ten points in the year ending May last, and that this is largely on account of common necessaries is shown by the fact that the price of the potato has advanced 50 per cent. The explanation ordinarily advanced for this universal rise is that there is an over-production of gold. The production of gold has no doubt something to do with it, but the world's commercial transactions are largely conducted with paper and on a small basis of gold, and it is therefore probable that the reduced purchasing power of money is to a great extent brought about by the extension of credit and banking systems, which in effect multiply the actual quantity of gold and silver in circulation.

The Northern Territory of Australia has been reported on by the "Preliminary Scientific Expedition," and it does not appear that any attractive prospects can at present be held out so far as agriculture and ranching can be concerned. Professor Gilruth, now the Administrator, writes:—"Since my return I have been asked by several individuals what is the present outlook for the investment of capital and the establishment of their sons in the Territory, and have been compelled to reply that under existing circumstances there is

none. Until it is demonstrated what the country can do, beyond carrying a bullock to the square mile where occupied, and less than one domesticated animal (including man and poultry) to the square mile over the whole area, especially with the present insecure tenure of land provided by the 'permit' system, under which no sane man would effect any improvement, an influx of population cannot be looked for." Of the mining prospects the Commissioners speak more favourably. They think that the practice of letting mines to Chinese on tribute is to be condemned, on the ground that they deplete valuable reefs of their richer portions, leaving only the lower grade material, which by itself might not be worked profitably. They also consider that the families of the second generation of Europeans showed no signs of physical degeneration. If this were the case on a scale sufficient to justify a generalisation, the prospect of a "White Australia" in the Northern Territory would be immensely strengthened. But Dr. Ahearne, whose observations were much more extensive, in his paper on "The Effects of the Tropics upon the White Australian," came to a totally different conclusion, and the experience of other hot countries, such as India, supports him. The Australians have made up their minds to exclude coloured labour, as far as possible, from the north, but there is so far no indication that they can populate it themselves. However, the territory does not appear to be attractive enough to cause other races to cast jealous eyes on it. The "yellow peril," if there is one, will not come that way.

---

The libel action brought by Mr. W. F. Massey against the New Zealand Times Company, although taken to the Privy Council, turned on a small incident, but the case is no doubt edifying as helping to show how far politicians or journalists can go in the way of satirical comment on their opponents "in good faith and without malice upon a matter of public interest." The cause of offence was the publication of a picture showing a man harnessing a donkey to a waggon, the donkey being labelled "Ananias," and laden with packages labelled "private calumny," "startling revelations," etc., while under the cartoon are the words:

"Hitch your waggon to a star—Emerson."

"Hitch your waggon to a lie—Dr. Findlay's amendment."

It appears that Dr. Findlay, the Attorney-General, had accused the Opposition of having "hitched their waggon to a lie," and the cartoon is a pictorial representation of this attack. The jury in the dominion found that the figure of the man represented the plaintiff, but the Lords of the Judicial Committee somewhat plaintively remarked that it was to be regretted that they had not a report of Dr. Findlay's speech before them, "because if they had been thus favoured it might have appeared clearly and definitely what was the particular lie to which the Opposition were exhorted to hitch their

waggon, or to which they were accused of having hitched their waggon." This momentous matter must therefore be left unsolved, but as regards the picture of the plaintiff their Lordships decided that it might well have been introduced as typical of the party, and not at all for the purpose of fixing on him a charge of personal misconduct. They referred to the evidence of Mr. McBeth, himself an artist, who stated in cross-examination that if he wanted to typify the Opposition he would do so by their leader; that to typify the party generally he might use their leader; that the cart as he understood it was the party cart; the cargo, the cargo of members of the party, and represents either the stock in trade of the party, or the stock in trade of the man who drives the cart. This view was adopted by the jury and their Lordships upheld their verdict. The moral seems to be that it is not only safe to accuse a political party of mendacity or nefarious designs, but that the leader of it may for pictorial purposes be specially included in the charge, in which case, however, it should be understood by an intelligent public that the representation is only "typical." We presume that it must be quite clear on such occasions that the "type" is really the leader. Evidently complications might occur if unfortunately anyone was selected for this vicarious office who, in his own estimation, was not the leader. The decision in the present case ought to be satisfactory to all parties, as it vindicates the right of the press to indulge in political skits, while establishing that the effigy of a political leader is merely representative. The only person who, if he were alive, might still be grieved over the case would be Emerson.

---

We are all becoming familiar with the idea that illegal strikes, that is to say, strikes contrary to agreements or awards, or prohibited by law, should be stopped by means of penalties, but there are some misgivings as to whether such penalties would be practically enforceable. The experience of New Zealand gives a basis of fact on which this question can be considered. Here, if a strike takes place in any industry, each worker who is a party to the strike, and who is bound by an award or agreement, is liable to a penalty not exceeding £10, and in case of a lock-out each offending employer is liable to a penalty not exceeding £500. For inciting, instigating, aiding, or abetting an unlawful strike or lock-out, or its continuance, a worker is liable to a penalty of £10, and a union, association (of employers or workers), or an employer, £200. A gift of money or other valuable thing for the benefit of a party or union engaged in a strike is deemed to be aiding or abetting. There are special provisions in the case of strikes and lock-outs in industries affecting the supply of the necessaries of life, such as water, milk, meat, coal, gas, or electricity, or in the working of any ferry, tramway, or railway used for the public carriage of goods or passengers. In these

industries, whether affected by an award or agreement or not, fourteen days' notice must be given within one month of an intended strike or lock-out, failing which each worker concerned is liable on summary conviction before a Magistrate to a maximum fine of £25 or an employer to a maximum fine of £500. The maximum penalty for inciting, aiding or abetting in these cases is £25 for a worker and £500 for an employer or a union or association. Strikes and lock-outs are forbidden during the hearing of a dispute by the Council or Court of Arbitration. There are also penalties for breaches of awards and industrial agreements.

In the four years 1908-11 there were 29 strikes in all, but some of these were not illegal. In only three cases was a union concerned and in these fines were imposed and recovered of £60, £75 and £100. A large number of men were fined £5 each and the money was actually recovered except a small proportion. The result shows that the law can be enforced, and though the fines are not on the whole heavy, convictions are likely to have a considerable moral effect. It may be observed that in one case the crucial question whether employers will recognise the union representative when he is not one of their employees was settled by a conference at which it was agreed that when a dispute arises the matter should first be laid before the employers by the men, and if the latter are dissatisfied with the decision they should have the right to refer the matter to the union, whose officials would then be recognised by the employers.

If the penalties in such schemes are not drastic enough they can be increased, and in the Queensland bill lately introduced, which is the result of recent industrial disorder, the fines are heavier than in the New Zealand Act. Thus anyone inciting to or assisting a lock-out will be liable to a fine of £1,000, and anyone participating in or inciting to a strike to a fine of £50.

In Canada, where there is compulsory investigation with a view to agreement but no compulsory arbitration, a very large proportion of cases have been settled satisfactorily. The general result, in Canada and in Australia, is that the great majority of disputes are arranged under the statutory machinery, but there are serious exceptions. A working class, in the last resort, will probably strike if it thinks fit in spite of penalties, but the good done by the Acts deserves recognition.

---

The old question of the effects of different gaol systems on crime receives some light from a return prepared by the Prisons Department of New South Wales. It appears that out of 8,242 persons who were convicted in the last ten years (excluding those who were granted the benefits of the First Offenders' Act), only 562 have been convicted a second time, or about 9 per

cent., and of these 96 have been convicted a third time, or 7 per cent. The efforts to make imprisonment reformatory and not degrading are clearly being crowned with success. The prisoners are carefully grouped into different classes and young men are shielded from contact with old offenders. Educational and moral influences are brought to bear, always with a view to lifting up the prisoner, and the results are seen in a rapid decline of the gaol population.

---

By a fortunate coincidence it fell to Mr. G. E. Foster to introduce to public notice in this country the terms of the agreement between Canada and certain of the West Indian colonies. Two days after the official publication came the banquet given by the West Indian Committee, and the Canadian Minister reviewed the steps which led to the agreement and outlined its terms. In this matter Mr. Foster has carried out views which he has held for many years and expounded on many occasions. At the Intercolonial Conference at Ottawa of 1894, he moved a resolution in favour of reciprocal relations between Great Britain and her colonies, and that pending such an arrangement it was desirable that the colonies should take immediate steps to place each other's products, in whole or in part, on a more favoured customs basis than is accorded to the like products of foreign countries. No one can hear Mr. Foster on the subject without realising that he is prompted by an intense desire to promote the progress and stability of the Empire. Any definite project for carrying out this object must have a material side, and on questions of trade, as such, opinions may differ amongst men who have equally at heart the welfare and unity of the mother-country and the colonies: but in the mind of Mr. Foster there has ever been present a consideration which is not material in that sense, and which arises more naturally in Canada than it does here. This is the desire to keep the British subject under the British flag instead of allowing him to drift abroad. A dominion which has seen vast numbers of emigrants from these islands pass to its neighbours and abandon their connection with the Empire may well be exercised over the problem and disposed to take a view of the matter which is not bounded by commercial considerations. Mr. Foster on this occasion expressed this feeling when he said that "underneath all was the basis of British sentiment." No one who has followed the trend of public opinion in the West Indies will think that some effort to encourage this sentiment is superfluous.

The West Indies already have a preference in Canada, but Canadian refiners are allowed to import 20 per cent. of their requirements from foreign countries at the same rate of duty, and it is very probable that this right not merely diminishes the imports from the

West Indies up to 20 per cent. of the requirements, but also operates to reduce the price obtainable by them. When sugar is procurable from all quarters on equal terms, even though the total quantity is limited, the importers naturally encourage competition, and in the result are able to secure for themselves a part of the preference. This is not a satisfactory result, and probably a smaller preference would have been more beneficial to the West Indies if this exception to it had not been introduced. The abolition of this right, therefore, will be welcomed.

---

The peasants of Great Britain, in addition to being keenly vied for by Canada and Australia, will now be sought for by South Africa. The Land Settlement Act passed last Session authorises the importation of men, and it is expected that many landowners would be willing to pay higher wages than they do at present in order to secure white labourers. It is proposed that the imported men should contract to work for their employers for three years, after which period of service the Government would grant them small holdings. It remains to be seen what the wages to be paid will be and what will be the value of the assistance given by the Government, but an obligation to work under an employer for three years will create a substantial difficulty at the outset. It would be a new departure in the case of European immigrants and it is difficult to see how a system of indentured labour, for that is what it comes to, could be applied to them. At any rate the condition would militate against South Africa's chances in the competition for white labourers. The immigration policy of the Government must also be limited by the amount of land which it can acquire for the holdings contemplated. In this respect South Africa is in much the same position as Australia, with the additional difficulty that expropriation has been ruled out, and there is therefore nothing for it but to buy in the open market, a course which, as usual when a government is a purchaser, tends to cause a great advance of prices. The Government will, no doubt, make the best use of its opportunities, but probably there is no intention, or desire, to force the pace. The criticism of the opposition is that the proposals for acquiring land are not sufficiently effective and that provision should have been made to enable the Government to acquire land at a fair price if it is lying idle. Thus, so much do terms vary in our Empire, we have a Unionist Party which wants a tax on unimproved land.

---

In another serious respect South Africa labours under a disadvantage which does not exist in Canada or Australia. It arises from the existence of the native population. There is much special legislation, or special exceptions, which discourage the employment of white men. Thus the Workmen's Compensation Act does not apply

to natives, and this is sufficient, in vast numbers of cases, to make an employer prefer a native workman. The pass laws give the employer a control over his native employes which is impossible in the case of white men, and the laws preventing natives from obtaining spirituous liquors are another inducement to prefer them.

---

It is noteworthy that in Australia the civil service has attained the dignity of being constituted an "industry" within the meaning of the Conciliation and Arbitration Act, 1904-11. An organization of civil servants therefore (provided it comprises three-fifths of their total number), can bring before the Court any plaint relating to their salaries or conditions of employment, and the claim will then be treated as if it were an industrial dispute within the meaning of the act. The award is not limited to the subject matter of the claim, but may include anything which the Court thinks necessary in the interests of the public. The award may even be contrary to the laws, but if so will not be operative if either House of Parliament passes a resolution disapproving it.

---

The abandonment of rebates by the Union-Castle line is a triumph for the South African Government, which has steadfastly fought for the principle. The effect on commerce will be watched with interest by many countries which are affected by the custom. The arrangement on the one hand renders the competition of other lines possible, but on the other it sets free the hands of the Company, which can bargain individually with merchants and vary its terms as it likes. In these negotiations the big man naturally has an advantage, and even without the assistance of rebates a powerful shipping line can do much by alliances with the leading merchants to secure the virtual control of staple exports. If one way of securing combination is given up, as in this case rebates are, it is not surprising if another is discovered, probably one which works in a more obscure manner. Public opinion, however, revolts against any system which openly brings about monopolies, and there is a wide feeling against rebates. The success of the movements against them depends on the strength of the competition for freights which can be maintained, and this, of course, differs according to place. The Union Government has had to pay a price for the abandonment of the rebates in the shape of an engagement to pay an increased rate of 10 per cent. on government freight. They have decided that it is worth while to do this in order to give the public the benefit of open competition. It has been suggested that, in order to secure uniform rates for all customers, the Union Government will take steps to discourage any outside lines from attempting to share in the trade; but this would mean discouraging competition after paying to encourage it.

A writer in a French journal has recorded the impressions resulting from a *coup d'œil* which he has thrown on the colonial organization in this country. He was evidently much surprised and even disconcerted at what he saw. He expected to find some system of administrative centralization such as he was accustomed to in France. Instead of that he found a number of offices "éparpillés à travers la ville. Chacun s'occupe de son département sans avoir à subir le contrôle incompétent des voisins." No doubt the system under which the offices of the great colonies are scattered indifferently over the city and the West-end is somewhat perplexing to the enquiring foreigner. It may be typical of our independent spirit but abroad it seems chaotic, like other features of London. Even the Colonial Office was an accident, being a sort of satellite thrown off by the War Office at a time when the European conflicts became too absorbing. He was also struck by the absence of any newspaper devoted entirely to colonial news generally. Here again the variety of the British Empire brings about a result different from that in France: our possessions have less in common with one another in either political or industrial matters than the fairly homogeneous French colonies. However, he notes that the press as a whole devotes a good deal of attention to colonial affairs, and that the public is attentive. "On ne saurait trop dire avec quelle attention jalouse l'opinion veille sur la plus grande Angleterre. Ici, l'éducation de la nation n'est plus à faire en matière d'expansion coloniale, et loin d'avoir à entraîner la masse, le gouvernement est obligé plutôt de modérer son élan."

---

The reputations of military positions fluctuate greatly with the changes in political and strategical considerations, but it is satisfactory to find that Gibraltar is holding its own in this respect. Not very long ago it was the fashion to decry this stronghold on the ground that it could be shelled from hills commanding it from the interior; but, while it may be conceded that this constitutes a vulnerable spot, the risk appears remote in any circumstances that need be considered, and the developments in naval design tend to increase the value of the position, this being so close to Great Britain and also at the end of the bottle in the Mediterranean. Mercantile vessels are realising the convenience of the place more and more, and the figures of entrances and bunkering are mounting upwards. The chief drawback in Gibraltar is the limited space, which has caused serious administrative and engineering difficulties. Apart from its military character, its most distinctive possession is the "unclimbable fence" which was put up to stop smuggling and is probably unique. The cheapness in such a free port of various favourite objects of customs taxation naturally led to a good deal of smuggling and to serious complaints

from Spain, and as we hold Gibraltar for a special purpose it was considered right to do everything that was possible to stop the practice.

---

The revenue of Ceylon exhibits a rapid growth, and there is abundant evidence of increasing general prosperity. The United Kingdom and the colonies secure a very satisfactory proportion of the import trade, the share of foreign countries being only 13½ per cent. There is no one to touch the United Kingdom in the important sphere of machinery. The most effective competition of foreign countries is in cheap articles of comparatively low quality, such as printing paper; and the explanation of this is that British manufacturers find that it pays best to devote themselves to a good article, and as they cannot do everything this leaves the field open for the cheaper goods. In the exports an increasing percentage is being taken by foreign countries, which is a natural result of a growing output and international demand for tropical prospects; the most striking feature is the increase of exports, principally green tea, to Russia in Asia, which country will, no doubt, as it develops, become a very important market for Ceylon. The alienation of land, which causes so many questions in other places, proceeds smoothly here. Where occupiers can prove prescriptive possession against the Crown, certificates of quiet possession are issued, and where the occupation has been for less than the prescriptive period, settlements are effected on special terms. Otherwise the alienation of crown land is effected by sale of the freehold at public auction. The total area settled under the Waste Lands Ordinance reaches about a million and a half acres, and the confidence of the large majority of the people in the fairness of the settlements offered has now been secured.

---

In Ceylon the criminal statistics show a large number of murders and "grievous hurts," and these cases are on the increase. On the other hand cases of burglary and theft are on the decrease, and it seems clear that the increase of crimes of violence is not due to poverty or adversity, but on the contrary is more or less caused by the extraordinary wave of prosperity. When trade is good there is more to quarrel about. The police can exercise little control. Stabbing is the national way of fighting, and not much improvement can be effected until this custom is changed. It is suggested in the Annual Report that in order to effect such a change it is necessary to begin with the children, and that it would be a good thing with this object to encourage boxing as a national pastime in the schools. It is remarked that this could do no harm, and in years to come might well tend to a more general use of the fists to the exclusion of the knife. We appreciate the excellent spirit of the suggestion,

but it may be doubted whether the somewhat laborious method of settling disputes which, by a polite fiction, is supposed to be still practised in English schools, would ever command itself to the quick-tempered and vendetta-loving Asiatic. Perhaps a shorter method would be to penalise the carrying of dangerous weapons.

---

It is good news for dwellers in Malaya that a local Simla has been discovered. It rejoices in the name of Gunong Tahan, and lies in magnificent mountain scenery on the borders of Kelantan and Pahang, over 7,000 feet high. The climate is likened to that of the Highlands of Scotland, which for the purposes of such comparisons appears to be reckoned at a plus figure. There are plateaux some five or six thousand feet high where there is ample space. The place would no doubt be a good one to recoup in after a bout of fever or other infirmities, but somehow such mountains are in practice not much used in the tropics when escape by sea is possible.

---

The mission of Mr. H. Conway Belfield to the Gold Coast Colony and Ashanti is an instructive example of the valuable results which may be obtained by sending an experienced and able officer to report on an administrative problem in a place with which he has not previously been associated, and to which he brings a fresh mind and unbiassed judgment. It was well worth while to have an enquiry made in this spirit into the conditions of the alienation of native lands in those possessions, for the Concessions Ordinance of 1900 was only arrived at after much trouble and doubt, and in fact after a complete change of the policy originally put forward. No doubt it bears upon its face the signs of conflict. The provision which left it to the judges to decide whether a proper price was paid by the purchaser for a "concession" without any guidance as to what a proper price should be, was something new even in colonial legislation, fertile in expedients as it has been. But it would have been equally new to vest such a power in the executive. Mr. Belfield observes that it is not clear why the unusual course was taken of placing the administration in this matter in the hands of the judicial rather than those of the executive authority. The explanation may, we suggest, be found in the fact that in this country the Government has not been in the habit of interfering with harsh and unconscionable bargains, but the court of law have. It is no part of any government department here to determine whether a contract is just or unjust, or to relieve any one from the consequences of what he has agreed to do, and the legislature has on the whole studiously avoided any measure which might seem to interfere with the sanctity of contracts. But the courts have built up a system which, however limited in its scope, is intended to afford relief in hard cases. It was

therefore in accordance with a substantial analogy that the Gold Coast courts were entrusted with the task of confirming or disapproving mining concessions. There is one great argument in favour of judicial decisions in such cases, and that is that they are given in public and after full opportunities of discussion. Mr. Belfield submits that, "while it is true that the court is the proper authority to adjudicate upon questions of contract generally, its assistance is only involved when a dispute or difference arises." This is not the case, such assistance is frequently involved for the settlement of matters about which there is no dispute. But while this may be said for the policy adopted in the Concessions Ordinance, it is another matter whether it has worked well, and in what respects it can be amended, and on these questions Mr. Belfield's examinations and suggestions are very valuable. His scheme comprises agricultural as well as mining concessions. He observes that no theory was offered to him to elucidate why the former were left out. We would suggest that the reason was simply that till 1906 there were not any. The one object of concession-hunters at the time when legislation was first contemplated was to obtain mining rights, this being a time when the knowing thought that they knew the country to be a second Rand. The innocence and ignorance of many of the native owners were undoubtedly being abused by these people, and something had to be done to put a stop to this. Whether better means can be devised for these ends will be a matter for the committee recently appointed. In the meantime it may be borne in mind that in any case the alienation of native lands has not after all gone very far, as in the Gold Coast it only amounts to one twenty-seventh of the area of the Colony. The sale of this small fraction has been accompanied by the construction of a railway and a vast improvement in the production and trade of the Colony. The natives participate in the benefits of this development, and there seem no indications that they have suffered from the process.

---

The only cloud on the serenity of Ashanti is, it appears, caused by Christian converts refusing personal service to their chiefs. There may be occasions on which services are required which would do violence to the convert's religious feelings, but the plea is often nothing more than an excuse to get rid of communal and personal obligations, and naturally irritates the chief, who sees his authority slipping away. It has been found necessary to draw up rules for the guidance of both parties—a task requiring considerable delicacy.

---

Much trouble was taken to make the census of Southern Nigeria as trustworthy as the conditions allowed, and the return is no doubt good enough for practical purposes. The population is shown at

7,858,689, and the average density works out at slightly under 100 inhabitants per square mile. Of this great number, all but 2,940 were natives. The European population then resident was 1,648. The more organized condition of the Western Province, as compared with the Central and Eastern, is shown by the size of its towns, all those of over 50,000 inhabitants being in that Province. Of the whole population of the Province 45 per cent. is collected in twenty of the towns. Here, practically only one language (Yoruba) is spoken, while in the Eastern Province there are 57. No attempt was made to schedule the religious beliefs of the natives except in the ports, but Mr. Birtwistle states that there is little doubt as to the pagan population in the whole of the Colony and Protectorate exceeding three-quarters of the total. No one can consider these figures without being struck by the difficulties of administering such a territory. The population of the Lagos Municipal area, which includes Ebute Metta, was 73,766, showing the remarkable increase of 70 per cent. in ten years. An astonishing number of these, viz., 21,293, described themselves as "traders," and, while liberal allowance should be made for the large number of women who add some kind of trading to their not very onerous domestic duties, it must be allowed that Lagos is exceedingly well supplied with this class.

---

The murderous attack on two white prospectors in Northern Nigeria shows how easily such outrages may arise from the superstitions of the pagan tribes. It appears that all the unfortunate men had done was to attach small pieces of cloth to the tops of bamboos set up to mark an area. Now, a rag attached to a pole or bough is a favourite form of the local ju-ju and, naturally, the pagans concluded that the ju-ju put up by the white men was hostile to them, or, at any rate, that their own spirits would be offended by its presence. This is no small matter when the spirits are believed to be capable of doing a vast amount of harm, and to be very ready to take offence. With the growth of Islamism, however, the hold of these superstitions over the natives is beginning to weaken.

---

The local revenue collected in Northern Nigeria is increasing in a very marked manner, and, no doubt, great credit is due to the Administration for this result. If this possession has not yet attained the present position of British East Africa by dispensing with a grant-in-aid, it is, at any rate, well on the way towards it. Northern Nigeria has, in one important matter, to bear a greater responsibility than the Eastern Protectorate; it has to carry on a railway which was built very economically as a pioneer line, and on which a further substantial expenditure was necessary at once.

The annual report of the East Africa Survey Department states that "the arrears are steadily increasing; they now stand over  $1\frac{1}{2}$  million acres and will in a few weeks be over 2 million." The word "arrears" hardly does justice to this energetic department, as the gathering numbers refer to surveys which are ordered of fresh territory. Reasons are continually arising for the survey of lands which have not appeared to have any particular value, and the growing demands on the Survey Department reflect the activity of the country. In 1911-12 the cadastral survey embraced 579,679 acres. The cost of the cadastral survey works out at 6.86 pence per acre, of triangulation at 19.4 shillings per square mile, and of topography at 11 shillings per square mile.

---

The importance of the distinction between white and black races increases in proportion with the improvement of the latter. It does not matter much at first. The uncivilised or partly civilised tribes readily accept the lot of war and the rule of the conqueror. This is the law of life to which they are accustomed and which seems natural. The trouble begins when he has been civilised. He is then confronted, not with open force, but with a race prejudice which he does not and cannot respect. War with such races has practically disappeared; in its place there is race hatred. This is inevitable if the coloured man is kept without political power and without openings for natural aspirations. One theoretical remedy is the creation of separate states for the bulk of the native races, in short, segregation. It is said that the Emir of Kano, an educated man, advocates this in Northern Nigeria. The black, he argued, has a latent fear of the white, and this feeling is easily turned into one of hate. There can be no doubt that the plan is excellent in places where the natives are intelligent and there is only a small element of whites, as in Basutoland, but there would be great difficulties when once the white admixture became important. Segregation would then imply removal, and the fate of various projects for that purpose shows how impracticable it is to dissolve a society into its component parts. After all, the black who has become accustomed to the resources of civilisation shows no disposition to leave them, even if he chafes at the restraint put upon him. Nor can any scheme of segregation, even if adopted at a sufficiently early stage, be permanent. Trade and travel break down the barriers, and the history of native reserves of all kinds is much the same in the long run. The solution of the problem can only be found in a generous and sympathetic treatment.

---

An anti-slavery society may seem to be a peculiarly British institution, but there is one in France. The establishment of the

French Protectorate in Morocco and the occupation of Benghazi by the Italians has, it appears, so completely stopped the slave traffic in these parts that the society finds nothing more to do so far as this traffic is concerned. But it has been pointed out by M. le Myre de Vilers that it cannot consider its work complete until the native family is so reconstituted that the woman shall not be submitted to the servitude of the harem. It is regretted that the administration has in the Soudan favoured the development of Arabian civilisation by setting up numerous Mahommedan schools. The suggested way to organise the African family on a proper basis is quite simple, on paper, and characteristically French. It is to provide the young native woman with a *dot*. On the dark continent the men who marry have to buy their wives, and this excludes the young men who cannot find the money. The remedy is to advance the necessary sum. It is recognised that the work would be a vast one, but, at any rate, a start has been made. A sum of 22,000 francs has been obtained, mostly from a *vente de charité* held under distinguished patronage. This suffices for 110 *dots* of 200 francs. Five years are to be allowed to the bridegrooms for repayment. The Society is certainly enthusiastic in the cause of constituting the native family,—“the essential basis of all civilisation.” It remains to be seen whether it can make a substantial effort to deal with the problem. Meantime, the spread of industry and the increased cost of living are operating against polygamy, even in Africa.

The problems of India are, to a large extent, the problems of the Crown Colonies, and a policy which succeeds in India deserves watching. India is eminently an agricultural country, but the native's methods of cultivation are primitive, and both in his own and the buyer's interest it is important that they should be improved. This is the case in many places, for though in an agricultural country the agriculturalist is the mainstay of the community, he is generally its weakest member. He depends on credit, but his credit—to use a phrase attributed to Louis XVI.—“supports agriculture as the rope supports the hanged.” The most promising means of helping him, in the opinion of the “Agricultural Journal of India,” is co-operation. An astonishing change has already been brought about by this method. “Rural credit has been reorganised. The co-operative society enables the small farmer to cultivate scientifically, to get good seed and manures and agricultural machinery at cheap rates, to sell his crops to the best advantage while avoiding the profit of the middleman, to manufacture his dairy produce and sell it in the best market, to improve the breed of his live-stock and to insure his possessions against all risks. These are only a few of the directions in which the co-operative principle has been applied. The movement encourages agricultural education and reaps the benefit in improved cultivation

and a stronger and more intelligent force within itself. The societies form practically a huge unpaid agency for making known and bringing into practical use in all parts of the country the improvements of agricultural science and economy." We have referred in a previous number to the various schemes of agricultural co-operation, the essential features of which should be that the people concerned should, as far as possible, manage the undertaking themselves, receiving the help and encouragement of the Government officials, but retaining the responsibility. There can be no doubt that the movement is a sound one and is destined to spread wide. The usual method in India is for the district officers to nominate a limited number of members, say thirty, and to suggest to them certain operations, such as the introduction of new seed or better methods of cultivation, acting as agents for ploughs, or making arrangements for marketing. Each man is supplied at once with the materials he needs and is visited once a month. At the end of six months the members meet and discuss the work done and to be done. It is considered an honour to be chosen to be a member. This method is, no doubt, suitable where agriculture is backward, and it is, therefore, necessary for the Government to take a prominent part, but it may be better in other conditions to have more independent associations.

---

The Putumayo correspondence furnishes a lurid disclosure of the treatment which may await West Indian labourers who are tempted to South America by the promise of high wages. Some 200 Barbadians were recruited by the firm of Arana Brothers in 1904-5, and the form of contract under which they were engaged certainly left nothing to be desired. The men were engaged as general labourers for a term of two years, work to commence one day after arrival at the Putumayo, and to cease upon the completion of two years. It was stipulated that a free passage both ways should be granted, and that the wages should be at the rate of £2 1s. 8d. per month, with free food daily to consist of tea or coffee, breakfast and dinner, free doctor and medicine, also free lodgings. The working days were to be six per week, and the working hours to be from 7 a.m. till sunset, with one hour allowed for breakfast and one hour for dinner. The contractor further agreed that the labourer should not during his contract be left destitute in the place to which he was going, and that on the termination of this contract, on his giving notice of his wish to be repatriated, his employer should repatriate him by paying his passage to Barbados. By Barbados standard this pay was good, but the men who worked on the Amazon River soon discovered that it was about one-half below the local rate, and most of them left before the end of the two years. In this part no serious abuse arose. But on the Putumayo the situation was

very different. The firm of Arana Brothers and its successors, the British company, do not appear to have scrupled to lay the burden of feeding the great majority of the employés very largely upon the surrounding native population, who were compelled by illegal force to labour in a variety of forms for the maintenance and profit of the company and its employés. In the exercise of this compulsion, frequently accompanied by gross outrages upon the Indians, including murder, flogging, and torture, many of the Barbados men played a constant part. These men, instead of being used as labourers, were forced to act as armed bullies and terrorists over the surrounding native population. Whether it was food-stuffs that were required, labour for building houses or planting cassava, sugarcane, maize, or other produce for the needs of each station, or the collection of india-rubber, the Indians had to satisfy all the demands of the so-called commercial establishment which had planted itself in their midst.

These demands were not supported by the offer of barter-goods in exchange for what was required of the Indian, but were enforced upon him, his wife, and children by absolutely illegal and often terrifying methods. In this system of armed extortion, which can only rightly be termed brigandage, the Barbados men were active agents. This part, no doubt, the men themselves were sometimes willing enough to perform, but in many cases it was made clear that the men had themselves protested, and had only discharged these duties with reluctance, and often under threats which in more cases than one had been realised. In a region so remote, where no civilised jurisdiction existed or government authority was exercised, the agents of the so-called trading bodies had and have supreme control. The Putumayo River is about 1,000 miles long, and in the district affected by the operations of the Peruvian Amazon Company and its predecessors, the Arana Brothers, it was not the main stream of this little-known river, but two of its northerly affluents, which were the theatre of the scenes in which these British subjects took part.

In some instances the Barbadians were themselves subjected to severe ill-treatment. Nearly all were in debt to the company, with no prospect of ever getting straight, and they could not leave the Putumayo till their indebtedness was wiped out. No doubt, the case of Arana Brothers is exceptional, but abuses have generally arisen in places beyond the pale of administrative control, and will probably continue to do so so long as there is any profitable territory left.

In British Guiana there has been trouble in a similar industry, but of an entirely different kind. The balata season of last year was generally disastrous to the companies, and the employers attributed this to the insubordination and dishonesty of the labourers, while the latter ascribed it to false prospecting reports

and inexperienced managers. The grants are all of Crown forests and their protection is a matter of vital importance to the colony, and largely on this account there is a system of registration of labourers to secure that only experienced men are employed; but on the whole the actual industry is left very much to its own resources. The labour troubles are inseparably connected with the appalling difficulties of travel and transportation. Over the 83,000 square miles covered by the licences there are no roads or telegraphs. Success depends entirely on proper organisation and tactful handling of the uneducated African creoles. Some of the new-comers have not realised that it is necessary to win the trust of these men, who, as a class, are neither foolish nor dishonest. The practice of employers making profits from supplies has led in some cases to abuses, and, no doubt, should be discouraged.

---

It appears that, notwithstanding the general amelioration of customs, the venerable practice of piracy is not quite extinct. Last December, the Weihaiwei report states, an exceptionally daring piracy was committed in the waters of the harbour. A band of six pirates, armed with pistols and knives, boarded a large junk which was lying at anchor at a short distance from Port Edward Pier, overpowered the crew and sailed the junk out of British waters. One of the captive crew was sent back by the pirates to Port Edward with a message to the effect that if a ransom of \$3,000 was not brought to a certain place in Chinese territory within three days the remainder of the captive crew would be killed and the junk burned. As soon as news of this outrage was received a launch which happened to have steam up was manned with a party of armed police and sent in pursuit of the pirates, who, being overtaken, tried to effect their escape by swimming ashore. But before they jumped overboard they deliberately shot and killed one of their captives. Three of the pirates were drowned in attempting to escape, the remaining three were captured. As they had committed a murder in Chinese waters, in which their arrest was effected, they were handed over, after a full preliminary examination had been held by the magistrate at Port Edward, to the Chinese authorities at Chefoo, by whom they were condemned to death and publicly shot.

On the whole, the results were not so encouraging as to invite imitation.

## BRITISH NATIONALITY AND CITIZENSHIP.

**British Citizenship.**—A discussion initiated by E. B. SARGANT, and reprinted by permission from the Journal of the Royal Colonial Institute "United Empire." (*Longmans, Green & Co.* 2s. 6d. net.)

**The Problem of Empire Governance.**—By C. E. T. STUART-LINTON. (*Longmans, Green & Co.* 3s. 6d. net.)

At the Imperial Conference of 1909 Sir Wilfrid Laurier urged that the "*civis Britannicus*" should hold that status "not only in the country of naturalization, but everywhere"; and Mr. Winston Churchill spoke of "a uniform and world-wide status of British citizenship which shall protect the holder of that certificate wherever he may be; whether he be within the British Empire or in foreign countries." These expressions, used as they were with reference to a definite political proposal, merit close consideration, and Mr. Sargant, who is admirably qualified to appreciate the ideas which they suggest, has done good work in setting out the questions which arise and in collecting the opinions of a band of distinguished contributors, including Mr. Bryce, Professor Westlake, and many colonial administrators. Mr. Sargant himself sums up the discussion in a way which shows that his object is not merely to investigate the meaning of phrases, but to find some scheme by which British citizenship should imply some responsibility for the common affairs of the Empire. But, no doubt, in the first instance it is desirable to clear our minds as to the meaning in our constitution of such a term as British citizenship, and the very considerable differences of opinion disclosed by the discussion show that there is room for an examination of the matter.

The only term known to the law of England as expressing English nationality is that of subject. The original or common law

rule was simple. Every person born on British territory was a British subject, and every person born abroad was an alien. Thus it was not a matter of the family, *jus sanguinis*, but of place, *jus soli*. As the old acts put it, the question was whether a person was born "within the ligeance of the King," or "without." The principle was a logical one, allegiance being claimed from everyone to whom protection was given at birth, and from no one else. And it suited the circumstances of this country when there was little intercourse with foreign countries. But when this intercourse sprang up the inconvenience of holding that the children born abroad of British parents were aliens became felt, and a demand arose for modifications of the rule. A statute of Edward III. provided that "children inheritors" born abroad should "enjoy the same benefits and advantages" as those born "within the ligeance," and a statute of Anne carried out the object fully by enacting that all the children born abroad of natural-born subjects should be deemed "natural-born subjects of this Kingdom." Thus the *jus sanguinis* was added to the *jus soli*. Later statutes further incorporated the *jus sanguinis* by providing that the children born abroad of those who had been made natural-born subjects by the preceding statutes should also be deemed natural-born subjects. The result is summed up by the Committee on the Naturalization Laws (1901) thus: "A person whose father or paternal grandfather was born within Her Majesty's dominions is deemed a natural-born British subject, although he himself was born abroad. . . . The effect of the statutes is that either the father or the paternal grandfather must have been actually born within Her Majesty's dominions." Thus the son of a British subject is not necessarily a British subject himself. But the old rule of *jus soli* continues in full force, and, therefore, to give an example, a man who is the son of Chinese parents and who is born in Hong-Kong is a British subject, not only in Hong-Kong, but throughout the British Empire.

An alien can acquire the status of a British subject by naturalization, and in this country the procedure is settled by the Naturalization Act of 1870. The most material conditions are that an applicant must have resided in the United Kingdom, or have been in the service of the Crown, for five years, and intends to continue so to reside or serve. As to the latter condition, apparently an intention at the time of application is considered sufficient, as there is nothing to show that the grant lapses if the intention is not carried out, and though there is a penalty for false statements there is no express power to cancel a certificate. It is further provided that the naturalized alien shall not, when in the country of which he was previously a subject, be deemed to be a British subject unless he has ceased to be a subject of that country by virtue of its laws or treaties. Thus naturalization does not make him a British subject for all

purposes, and this condition or reservation distinguishes him from natural-born British subjects. But "in the United Kingdom" he is "entitled to all political and other rights, powers and privileges, and subject to all obligations, to which a natural-born British subject is entitled or subject in the United Kingdom." On these words the question at once arises: Does the expression "in the United Kingdom" mean that the newly-acquired rights only hold good there and not in the colonies or elsewhere? If so, the recipient of the grant becomes an alien anywhere beyond the United Kingdom, though clearly he does not thereby regain his original nationality if he has lost it. The act does not seem to be concerned with this question, as nothing is said about it.

Thus complications arise when such British subjects pass from place to place. In the French Empire French subjects are for certain purposes governed everywhere by the same laws, and citizens have the same status. The difference between this and our system is due partly to the fact that our colonies have their own laws and administrative systems, and therefore for the present purpose rank as separate and independent powers, and partly to the incapacity of colonial legislators to pass any laws operating beyond their territories. The result is that colonial naturalization is necessarily, under the present powers, local, just as naturalization under the act of 1870 is; and this is recognised in the circulars which have laid down that persons naturalized in the colonies are only entitled to the good offices of His Majesty's Representatives abroad "as a matter of courtesy," when they are beyond the colony to which they belong. The transition from the status of subject to that of alien naturally leads to embarrassments and protests. But this particular anomaly is only one effect of our constitutional systems, under which, generally speaking, our fellow subjects in the colonies are for the purposes of the civil courts out of our jurisdiction, and we out of theirs.

An alien cannot vote at any parliamentary or municipal elections, or hold any parliamentary or municipal office, or fill any place of trust, civil or military. Perhaps the majority of the applications for naturalization are made in order to get rid of these disabilities, which shut residents out of the national life. A considerable number are also due to the wish to be able to travel in the country of origin under the protection given to British subjects, but this protection is only due there when the alien has "ceased to be a subject of that State in pursuance of the laws thereof, or in pursuance of a treaty to that effect." The naturalization granted in this country may therefore be either subject to the claims of the country of origin if the alien returns there, or it may be unconditional by virtue of an international agreement. In practice the conclusion of such an agreement largely depends on the period of residence which it is proposed should constitute a qualification for naturalization. Naturally a country

which on the whole exports emigrants is reluctant to release its hold over its subjects, while an importing country is anxious to absorb them as quickly as possible. The problem therefore becomes one of the number of years of residence. The Committee of 1901 recommended legislation to enable a Secretary of State, or the Governor of a British possession, to confer the status of a British subject on persons who fulfil the requisite conditions in any part of the British Dominions, and that the status so conferred should be recognised by British law everywhere, both within and without His Majesty's Dominions. They added that this provision should be "without prejudice to the power of the Legislature of any British possession to provide for the conferring upon any persons under such conditions as it might see fit the whole or any of the rights of British subjects within its own territory." These proposals point to a double system, the larger satisfying the foreign requirements and being therefore unrestricted, and the narrower being based only on local requirements and limited to the place. This appears to be the only possible solution of the difficulty.

In these questions we are only concerned with the term British subject. The rights and obligations implied by his status are clear. The term citizen does not appear in British statutes, and is in fact borrowed from foreign sources. The Encyclopædia Britannica quotes the following dictum: "The use of 'subject,' as the modern equivalent of citizen, is awkward because in a wider, earlier, and still permissible sense, 'subject' includes any person subject to the power and jurisdictions of the State, and therefore a resident alien no less than a subject in the narrower sense. A subject who is a citizen may be distinguished, when distinction is necessary, as a natural subject, one who is not a citizen may be termed an alien subject." But this is entirely contrary to the historical use of the term in our jurisprudence. "Subject" is not a modern equivalent of citizen, and it never in our laws included an alien. The term citizen originally meant a burgher of a municipal corporation possessing the rank of a city, and by an extension of the idea may describe a person who has full political rights in a State. Obviously a British subject does not necessarily possess such a franchise. In the United States under the constitution all persons subject to the jurisdiction are "citizens," and in this are included women and minors; here the term is adopted in place of subject and is more appropriate in a republic, but with us it is limited to local franchise, and there can be no "Imperial Citizen," except in a rhetorical sense, unless there is a franchise common to the whole Empire.

The proper meanings of the terms therefore appear to be clear, but there is evidently much confusion on the subject of British nationality. Thus in the contributions collected in "British

Citizenship," Professor Westlake states that "certain it is that the Foreign Office gives no restricted international effect to colonial naturalization. It grants passports to persons who have received it, and protects them everywhere except in their own country, where even those who have been naturalized in England would not be protected by reason of the practice above mentioned. Therefore, Sir Wilfrid Laurier, as quoted by Mr. Sargant, was in error in stating that the American citizens who have become British subjects in Canada are still American citizens in Great Britain." This ignores the fact that naturalization granted in a colony operates only in that colony, and it is sufficient to say that the recognition by the Foreign Office of colonial naturalization is not unrestricted but is only given as a matter of courtesy, and that Sir Wilfrid Laurier was right. Lord Brassey states that "British subject is British subject everywhere, with all rights and privileges. He bears as a shield the certificate of citizenship." The same error appears here, and as for citizenship Lord Brassey's expression must refer to an ideal rather than to a fact, as there are many millions of natives who are undoubtedly British subjects everywhere, but who have no title to citizenship in any sense, in fact such British subjects can be and are in some cases shut out and expelled from British territory, a circumstance which does not suggest the idea of imperial citizenship. The same consideration applies to Mr. Bryce's statement that "the citizenship which gives a man or woman full private rights, entitling him to be treated everywhere in the British Empire as equal in respect of all private rights to all his fellow subjects, is the basis of our whole imperial conception, and is the really great service which our law is rendering to every inhabitant of the British Empire who owes allegiance to the Crown." Unfortunately for this ideal our law does not render this service in South Africa, Canada, or Australia. In short the use of the term citizenship in such a sense sets up an idea of a status which does not exist.

It is different in France, where the citizenship of the Empire can be extended to all places and persons. Thus by a recent decree this title is conferred on all the natives of the French West African possessions on certain conditions—substantially as a reward for good behaviour and a knowledge of the French language. It appears to be anticipated that the measure will have a great effect in spreading French influence. France followed the Roman model, while England followed the feudal, and the latter is essentially local in its character. Some of the writers in "British Citizenship" evidently regret that there is no such thing as a "British Citizen" in this empire-wide sense. Professor H. E. Egerton considers that the absence of a system of common citizenship is a necessary consequence of the "formless and chaotic

character of the British Empire as a whole." This is a severe expression, and it may be submitted that the absence of a common form is due to the fact that the units differ in character and that it would be futile to think of any process for assimilating them. It may also be questioned whether uniformity in such a matter is desirable even if it were practicable, considering that climate and race and local circumstances create differences which cannot be ignored. These differences would remain even if a really Imperial Parliament were created.

The most conspicuous anomaly in the present position can be removed by legislation providing that all persons naturalized anywhere in the British Empire should be on the same footing as natural born subjects, and the Imperial Conference decided in favour of Imperial legislation for this purpose. Each Dominion would then have to decide whether it will apply the Act, and as its requirements may be different from those of this country the probable result will be that there will be two sorts of naturalization in the colonies, one being the limited or local type now in existence, and the other complying with larger requirements and effective throughout the Empire. But this alteration is one of detail, and will not affect the fact that each State in the Empire can and does settle its own conditions of citizenship.

The contributors to this discussion very properly keep clear on the whole of speculations as to political schemes for effecting a greater legislative unity in the Empire. The first object is to define things as they are. It is, however, evident that many of them are animated by a desire to find some plan for creating a body which would represent the whole Empire and decide on all matters of common concern. The idea of greater unity is undoubtedly attractive, and if all British subjects who possess the franchise in their respective territories had the right of voting and sitting in a Parliament of the Empire there would be a real Imperial citizenship. "The true ideal is, and should be," said Lord Rosebery, "a vast co-operative league of contented and emulous Anglo-Saxon States." A great advance has been made in this direction in recent years, for the co-operation now is vastly greater than it was not very long ago, but this is far from satisfying the aspirations for constitutional federation. Nor would any form of Advisory Council content the advanced advocates of Imperial unity. Such a body may be accepted as a useful stepping-stone, but a Federal Parliament is to them essential. The scheme is worked out with remarkable completeness by Mr. C. E. T. Stuart-Linton in "The Problem of Empire Governance." A federal constitution is here mapped out in detail and a full programme of work assigned to it. With much of the preliminary

argument most readers will, we think, be in agreement, but when it comes to the subjects which are to be handled by the Federal Parliament there is a difficulty which appears to us never to have been met.

This is the difficulty that there would be in getting the best and most influential politicians to sit in such a body. It may be argued with some force that distance counts for little nowadays as regards the necessities of travel, but distance does count for very much as regards the severance of a politician from his constituency and the local questions which make up much if not most of its political life. Men who represent constituencies must remain in close contact with them or they are likely to see the representation pass into other hands. They can only afford to pay a flying visit to this country on special occasions, and even then they do so at some risk. Nor are the subjects reserved for the Federal Parliament such as excite the deepest interest or determine the fate of electors. The matters enumerated by Mr. Stuart-Linton as proper for such a chamber would usually leave the colonial voter cold. What interest he has in them would be too occasional and distant to stir him greatly. This may be regrettable, but facts being what they are it is futile to expect that the most prominent men would elect to sit in the Federal Parliament. Yet it is necessary to secure the attendance of such men if the cause of co-operation is to be advanced, and this can only be done by their meeting in their country at intervals. This limitation makes an Imperial Parliament of the kind contemplated impossible, but it permits the Imperial Conference to be carried on. The Conference is a meeting of executive heads, and every British subject who has had a voice in their selection may fairly be said to have exercised a function of British citizenship.

## THE MAKING OF THE SOUTH AFRICAN UNION.

The Inner History of the National Convention of South Africa.—By the HON. SIR EDGAR H. WALTON, K.C.M.G., M.L.A. (Longmans, Green & Co. 10s. 6d. net.)

THE meeting of the National Union Convention in South Africa was a historic event of the highest importance, but hitherto it has been known only by its results. The proceedings were private. Usually in such a case an authorised statement is subsequently published which gives at least the substance of the discussions. When a number of men meet together for constructive work it may be impossible to allow the public to be admitted to the sittings, as this might lead to harassing demands and interference from critics who have not the same responsibility and possibly not the same objects; but this ban is generally taken off when the proceedings are at an end and the work done. But in the case of the National Union Convention this has not happened. Nothing was published but a bare minute of the conclusions. The reason is that it was resolved by the Convention that the proceedings should be absolutely secret and that no records of any speeches should be made. Only the resolutions, proposals and amendments, and divisions were to be recorded. There was, no doubt, special justification for this course. Many of the men who sat together had known of one another only by name and met then for the first time. It was obvious enough that the questions which would come up would elicit grave differences of opinion, and that the only hope of successful solution was that the members would speak with perfect freedom and listen with sympathy and confidence. Such a feeling is not to be created in a day, and for some time the members were engaged, not merely in the consideration of particular points, but in acquiring a knowledge of one another and the invaluable sense of companionship. At first there was some natural reserve, and it may easily be realised that the

thirty-three members felt the weight of their responsibilities to an extent which made them cautious and watchful; but in the result they rose to the height of the occasion and put in front of their differences the value to South Africa of union.

The absence of an official record of the proceedings is now largely supplied by Sir Edgar Walton's book. His materials have been his own notes and memory. The summary, therefore, is necessarily condensed and may not always be composed in right proportions. It does not appear that the author obtained the consent of all the delegates to the publication, and possibly some objection may be felt to the disclosure of speeches which were made under the seal of secrecy, but we gather that the publication was approved by Lord de Villiers, the President of the Convention, and it would certainly have been a grave loss if an occasion so remarkable for great issues and patriotic feeling had been allowed to pass without any memorial of the delegates' speeches. And so well are the various opinions expressed that it is scarcely conceivable that any reputation will suffer from the publication or that anyone will be aggrieved.

At the outset serious difficulties presented themselves on all sides. In the Cape Colony there was an apprehension that the occasion might be used to the advantage of the active and wealthy north. Nowhere in South Africa is local feeling so keen as here, nowhere are the historical associations so strong, and it could not be said that there was any predominant public opinion in favour of union. In Natal there was decided apprehension, largely because the colony is a small corner of South Africa and might be swamped by absorption. In the Transvaal there was a fear that their financial resources would be exploited for the assistance of the Cape, which had had a long period of depression, marked by several deficits, the suspension of the sinking fund, and increase of taxation. In the Orange River Colony alone the convention was awaited with calm approval.

The real business was introduced on the second day of the meeting by Mr. Merriman, the senior Prime Minister, in a speech which produced a great effect, and to which only slight justice can be done by a short summary. He was emphatically in favour of a strong central control, and argued that when this was secured, which is not the case in the United States, Canada, or Australia, not only is pure government possible, but larger powers of local self-government could safely be granted. He was followed by General Smuts, who appears to have become the principal authority on the questions at issue throughout the proceedings. He developed the argument for union, as distinguished from the looser tie of federation, by pointing out that federation is a contract between the states concerned, and that it is therefore necessary in such an arrangement to provide that the contract should be interpreted by the courts of law: this may

result, as was happening in Australia, in the courts giving judgments adverse to the parliaments, and eventually leads to political selections of judges. He agreed with Mr. Merriman that federation encourages corruption because power is so dispersed that it is difficult to fix responsibility and to punish offenders. Accordingly he proposed the British system, under which Parliament is supreme, and not the courts. These strong arguments for union appear to have quietly carried the day, and left open to discussion only the question, one comparatively of detail, as to the extent of the powers which should be delegated to the local parliaments. Thus Sir F. Moor, the Prime Minister of Natal, where considerable preference had been expressed for federation, did not oppose the resolution in favour of union, and directed his argument to the question of the local powers, though his colleague Mr. Morcom maintained that Natal would insist upon independent powers of legislation. The case for unification seems to have been substantially strengthened as the discussion proceeded by the references to the Australian Commonwealth, where actions at law had already taken place between the states and the central executive, and federation had increased the cost of administration by a heavy figure. General Schalk Burger and General Botha both urged that no form of government would be satisfactory except that of a supreme central parliament, and Sir George Farrar agreed. Sir Starr Jameson and Mr. Abraham Fischer, both of whom had been inclined to federation, were convinced by the arguments and the general tone of the debate that local interests had nothing to fear from union. Thus the cause of unification triumphed, and when the resolutions in its favour were put no division was called for.

There came next a question which was much more likely to divide the delegates into opposing camps. This was the question of language. To a large extent this was already settled on the basis of convenience. In the Cape both English and Dutch were spoken in Parliament, and in the country districts officers knowing both were appointed. The Transvaal had a similar practice, and in Natal there was no substantial grievance. The trouble was in the Orange River Colony, where the Dutch were in a great majority, and where before the war Dutch was almost the only language in the country districts. General Hertzog and ex-President Steyn spoke with great feeling on the subject and urged that the two languages should be treated on a footing of equality. Eventually a resolution moved by Sir George Farrar was adopted to the effect that the two languages should be treated on a footing of equality, and that both should be used in all parliamentary acts and records. By this action the question of language for the officials was to some extent side-tracked, the convention being content to lay down the general principle of "equality and no compulsion."

The third important issue was the franchise, which meant the coloured vote. Here the existing practices were widely different, and it was obviously anomalous to have three different systems in the Union. The claims of the natives were put forward by Colonel Stanford, who urged that the franchise was the best outlet for grievances, and that the natives if trusted in this way would prove themselves worthy of citizenship. Sir Percy Fitzpatrick contended in reply that the improvement shown by the native peoples did not constitute civilisation in the full sense, and that "the white man gave as security the traditions of his race of many centuries of civilisation." This opinion was strongly held by others. In South Africa there is a general belief that the natives have not shown themselves capable of European civilisation, and in addition to this there is the consideration that the white class has to keep itself supreme on the principle of self-preservation. On the other hand it is considered in the Cape Colony that the franchise granted there to natives who have attained a certain position and passed a qualification test has conduced to good order. It is a noteworthy fact that the registered voters had not joined in the rebellion. Elsewhere, however, public opinion is not ready to accept this policy, and even if it is admitted that it has been successful in the Cape Colony it is considered that the natives of that Colony stand in a class by themselves, as they have been long associated with civilisation. Thus agreement could only be secured in the Convention by leaving the Cape practice as it stood and excluding native franchise elsewhere. This was the solution proposed by General Botha and eventually accepted, with the important variation that only persons of European descent should be eligible as members of either House of Parliament of the Union. Thus the Cape gave up the right of coloured men to sit in Parliament. This decision caused much adverse comment in this country, and it will be remembered that Mr. W. P. Schreiner accompanied a native deputation to London to urge on the Imperial Government the amendment of the South African Act in this matter. Mr. Schreiner, however, had failed to obtain the support of the Cape Parliament, and it is clear from the proceedings that it was impossible to conclude any arrangement which, in addition to giving the Cape coloured voters for members of the Union Parliament, would have given them also the right of sitting in that body. It should no doubt be recognised that the essential duty of the Convention was to bring about a union of the white peoples of South Africa, and that this task presented sufficient difficulty without adding to it the problem of the native population.

Sir Edgar Walton gives a very clear account, however abridged it may be, of the discussions as to the constitution of the Union Parliament, the representation of the Provinces, and local self-government. Under the last head his pages may well be studied for

the discussion of the principle of proportional representation. The object in adopting this method was to minimise party divisions in the Provincial Councils by electing the senators and the executive committees from representatives of both parties, and, as Sir Edgar observes, it will be interesting to see how it works. The public subsequently showed itself slow to appreciate the innovation, and in the Cape especially it was viewed with much suspicion, as is naturally the case with anything not clearly intelligible. The machinery, however, does not affect the ordinary votes, as it only applies to elections made by the members of the Councils, and the provision was retained in the Imperial Act notwithstanding the objections that had been made. The subject of education appears to have been disposed of without much difficulty in view of the settlement of the language question. It was agreed to leave education to the Provincial Councils, and the Convention was content to stop at this; there is no indication that such a controversy as has since arisen in the Orange Free State was foreseen. The financial arrangements were also settled without any serious hitch, and were no doubt facilitated by the willingness of the Transvaal, though this did not appear in the official proceedings, to finance the Orange River Colony and Natal for their immediate necessities pending union. There followed the question which perhaps aroused more public interest than any other, the choice of a capital, and Sir Edgar Walton's summary will show that in the circumstances a compromise was the only possible solution. It may be remarked, as an instance of the judicious avoidance of contention-breeding words, that the word capital is not used in the Act, Pretoria being made the seat of government and Capetown the seat of the legislature.

The draft constitution arrived at by the Convention had to run the gauntlet of the Colonial Parliaments, and it emerged from this ordeal very satisfactorily. There was, however, enough criticism to show that the draft went as far as was possible without setting up serious difficulties, and that further decisions must be the work of time. The occasion, in fact, was one for setting up a machinery of union rather than for solving arguable questions of administration, and it may safely be said that this object was admirably effected.

## REVIEWS AND NOTICES.

**Through the Heart of Africa.**—By F. H. MELLAND and E. H. CHOLMELEY. (*Constable & Co.* 12s. 6d. net.)

THE authors are officers of the British South Africa Company who came home from their posts in Northern Rhodesia, via Egypt, by a route which avoided the beaten tracks as much as possible. They made for Lake Tanganyika and the German Territory, and their observations on what they saw in that Colony are specially interesting, because it is very little known to British travellers. They were struck at Bismarckburg with the absence of any means of recreation, and the life of the occupants, whose sole form of exercise seemed to be a short stroll at sundown outside the walls of their fort, did not impress them as exhilarating. In this matter we, no doubt, do better everywhere. They found that the methods in the district were that of the old military administration, and that there was a lack of keenness amongst the officials, who are officers seconded from the German army for two years duty in Africa, counting as four in their service. Thus they are not long enough in the country to acquire a real interest in it. It is remarked that the Germans apparently make a point of placing women in power among the natives, in succession to male chiefs who die or are removed, as being less likely to cause trouble, but it does not seem that there is any particular occasion for this practice as no chafing against German rule is shown. At Tabora the buildings and roads are good, though here again there are no recreation grounds, which is the more regrettable as the ground is described as constituting perfect golf links. Here the administrator had spent over eight years in the land, and had a wide knowledge of it. To this place large quantities of goods arrive from the Uganda railway and its steamers to Mwanza, but the Germans anticipate that the arrival of the railway from Dar-es-Salam will alter this. The authors, however, think that the line will diminish rather

than increase the importance of Tabora, which will be deprived of its importance as a transport centre, while for production it is not well placed, being in a bleak and waterless region. However this may be, the German line will undoubtedly affect the Uganda railway, though to what extent the authors do not attempt to judge. No doubt, in any case, there is ample room for both systems. At present the Germans have confined their work mostly to the coast region, and with good reason, as the section of the protectorate which the authors saw struck them as poor and not likely to come to much. It is, however, well populated, and the Swahili element seemed "infinitely superior as a civilising and educating influence to the 'Kitchen Kaffir' element of South Africa that is encroaching on Northern Rhodesia." The greater part of the country is really ruled through the native chiefs, to whom is left the collection of the poll-tax (four rupees per annum), and who receive five per cent. of the amount collected. The chiefs, it is said, exacts the tax as they like, and as no census is taken and the assessment is a rough one they make up the total without being so inconsiderate as to call on their own friends. No native can appeal to the white man, except through the wali or headman, which seems an excellent plan for simplifying matters, as the German military officer in this way "only hears what the local wali chooses to tell him, and knows little or nothing of what is going on." But at Tabora, under a civil government, a different system prevails, and natives have free access to the District Commissioner. No doubt this will be the case generally as the country is brought under effective administration, and civil rather than military methods are adopted. As to the development of the territory the authors' observe as follows:—

"The most outstanding feature of the German administration is without doubt the thorough way in which they investigate and experiment on the possibilities of the territory. The way in which they have fostered and organised trade up country deserves every praise. The roads that have been made are excellent, and the manner in which they are pushing on railway construction calls for a good deal of admiration. Thoroughly and systematically conducted, it presents a rather marked contrast to the usual haphazard British methods. The somewhat rigid systems and unbreakable rules in force at their stations may strike an Englishman as a trifle pointless, but, nevertheless, in an administration of a country, discipline and system are of the greatest importance, and probably some means between the German rigidity and our own casual elasticity would produce the best results. We should study each other's methods, and choose which can be adopted with profit and which discarded. The Germans are openly and admittedly learning from us with our greater colonial experience. We, on the other hand, need not think that we have nothing to learn from them."

The journey through British territories describes scenes and incidents which have become more or less familiar, but the narrative will well bear comparison with any other. The customs of natives are explained with a clear grasp of the subject. There is a concluding chapter on "some African Problems," which contains the fruit of the authors' general experience. They urge the right of the white invaders to the land, on the grounds that the occupation is in the interests of liberty and security, and that the native is an unprofitable producer. They do not think that it is possible for a negro to attain a European standard of civilisation, but he can be taught to do useful work if his wants are gradually developed. They recommend Labour Bureaus to prevent employers from competing to such an extent for labour as to raise wages unduly. They pay high praise to the missions in Africa, which, in their opinion, have generally ceased to step beyond a purely non-political sphere. The authors' views on these matters will not command universal assent, but they are well worth attention as coming from experienced and observant administrators.

---

**My Adventures among South Sea Cannibals.** — By DOUGLAS RANNIE, sometime Government Agent for Queensland. (*Szeley, Service & Co.* 16s. net.)

This book would have been excellent evidence on an important and controversial subject some quarter of a century ago. It gives with a detail such as has never seen light before an account of the Kanaka labour traffic as it used to go on under a strange administrative system compounded of Imperial acts, deputy commissions, naval officers, and government agents, until, after much vacillating, Queensland discarded it. Mr. Rannie's purpose is to recount his personal experiences in those flourishing times, and he is not concerned to bring the history of the matter up-to-date. But this is rather misleading to the ordinary reader, who is not likely to know that the whole business has passed away. We have just read an indignant review of the book in a leading newspaper, in which it is urged that the traffic should have the prompt attention of the Colonial Office. It would be hard to say now when that prompt attention was first given, but at any rate it was severely exercised from the year 1872, when the first Pacific Islanders' Protection Act, alias the Kidnapping Act, was passed. The traffic in Kanakas from the South Sea Islands to Fiji and Queensland was then in its halcyon period, and undeniable abuses brought about two Imperial Acts, and an Order in Council which for novelty and intricacy has never been surpassed, comprising as it did principles of procedure which were declared on high authority to be repugnant to British law and which certainly led to a vast amount of confusion. Incidentally it led to the creation of

a High Commissioner for the Western Pacific and eventually to the annexation of a great number of islands, so that it may at any rate be credited with some good results. But for the original purpose of putting down kidnapping the elaborate code of law and procedure set out in the Order of Council was singularly ineffective. The reason was simple. If an outrage was committed on an island, whether by whites on natives or by natives on whites, it was generally impossible to get the necessary evidence. The naval officer who in due course arrived to sift the matter according to his lights usually found that the vessel which had caused or received the trouble was gone, and that the natives in any case took up a hostile position. Frequently the naval officer, if the natives appeared to be in fault, settled the matter by landing a party which shot at all and sundry and burnt villages, until justice seemed to be satisfied. The traders frequently evaded the acts by changing the flag. To exercise any supervision over them it was necessary for the colonies importing the labourers to appoint government agents to accompany the vessels, and no doubt this precaution had a good effect. In the days of which Mr. Rannie writes, Queensland was anxious to retain Kanaka labour and was loyally supported by the Colonial Office when the traffic was attacked in this country. The curious may find in the annals of the House of Commons an admirable speech by the representative of that department defending the system, and showing that everything was as it should be. The time came, however, when the Queensland Government changed its views and the traffic was brought to a complete end in 1904. The lawless character of some of the traders had something to do with this, but the main cause of the change was that the colony began to stir with the idea of what is now called "a White Australia." No doubt, though the most flagrant offences were put down with the help of H.M. cruisers, objection on other grounds grew stronger as the traffic went on. Labourers could not be got unless bribes were given to the chiefs, and the usual bribe was fire-arms, the trader not concerning himself overmuch with the consequences. The practice of bribery naturally led to compulsion by the chiefs, and the virtual depopulation of the islands was in sight. The wages paid to the government agents were poor and intermittent, yet to raise them meant making the cost of importation prohibitive.

However, whatever academical objections might be made to the traffic, it certainly provided an abundance of lively incidents, and Mr. Rannie's pages are full of adventures which can truly be described as sensational. The savages were fighting men, born thieves and liars; but at the same time they played the game in a fairly sporting spirit and with an eye to the picturesque. The following will serve as a specimen of a long collection of fighting cases.

"The blowing of conch shells and the music of reed instruments, in the shape of flutes and Pan's pipes, drew our attention

to a procession of canoes coming towards the ship. The leading canoe was a new one, just launched that morning. It was manned by twenty-two warriors, all bedecked in their war paint, beads, and feathers. One man stood in the bow chanting a war song and waving a tomahawk and spears; another sat on an elevated seat in the stern steering with a large paddle, while twenty sat two abreast paddling the canoe, and joining every now and then in a rousing chorus.

"The prow of the canoe was decorated with the still bleeding and ghastly head of a woman, while the sides were liberally daubed with her blood. She had been killed that morning to celebrate the occasion, and her body was being cooked ashore to serve up at the feast that was to follow. The skipper of the *Atlantic* told me it was just touch-and-go with him the day before, and I might have found his head instead of that of the native woman ornamenting the prow of the new canoe.

"On the afternoon of the previous day, he said, several natives came on board, with a few strings of copra, i.e. dried cocoa-nut kernels, to barter. And when stooping down to get some articles from his trade-box, he saw the shadow of one of the natives raising his tomahawk. Starting back he was in time to draw his revolver, and before the blow descended he shot his assailant, and then emptied his revolver into the others. His two mates hearing the firing rushed up from below, and with their assistance the decks were cleared and the dead thrown overboard. This affair, he added, made no difference in his relations or dealings with the natives ashore, as they were always on the look-out to take him unawares, loot the ship and burn her hull. They had several times made the same attempt before, but had always come to grief. As they chanced the risks, they put up with the penalties, the blame rested alone with the dead, and by-gones all were by-gones."

---

**The Canadian Annual Review of Public Affairs, 1911.**—By  
P. J. CASTELL HOPKINS, F.S.S. (*Annual Review Publishing Co.,  
Toronto.*)

The Annual Review comprises what will probably be the best record of the stirring controversy on reciprocity with the United States which went on in Canada last year until the general election in September and which set up the dividing line between the political parties. In the past both Conservatives and Liberals had supported a policy of reciprocity. Both sides had made efforts to obtain the renewal of the arrangement of 1854, which was terminated by the United States in 1866. Various missions, or informal negotiations, went on from that date till 1898. All these attempts failed, and the result was that for several years the idea became

generally unpopular and was dropped from the political programmes. Sir Wilfred Laurier made it clear, both in Canada and in this country, that as Canada's offers had not been accepted she had put aside the project of reciprocity with the United States and was looking to British trade. The rapid growth, however, of Canada made the subject more important to the United States. Not only was their neighbour greater and richer than previously, but relations had been made closer by a considerable export of both emigrants and capital to the Dominion, and the vast resources which were being opened up had become a vital factor in the development of the continent. The proposed agreement immediately commended itself to certain great interests in Canada, but as discussion proceeded the disturbance to trade and transport and the effects on the national life and the Imperial connection came forward more prominently. The question was handled with striking skill and force on both sides, and in the end the general election seems to have turned not so much on directly economical considerations as on the desire to preserve Canada's independent character.

Provincial affairs and the commerce of the year are treated with the usual fullness of this admirable annual.

---

**Handbook of British East Africa, 1912.** BY H. F. WARD AND J. W. MILLIGAN. (*Caxton Printing Co., Nairobi.*)

To the intending settler in East Africa who asks what he can grow there, the answer is simple—"Practically everything." The larger holdings on the highlands, however, are chiefly devoted to cattle and sheep farming. The grazing land has a quality all the year through which can hardly be excelled anywhere, and a very fortunate circumstance in addition is that a half-bred beast approximates to the thoroughbred side of its derivation. Land in many parts has been eagerly taken up and has risen substantially in value. Capital is scarce and bank interest has seldom been under 8 per cent. It is of little use to commence stock farming with a smaller capital than £3,000, but agriculture can be undertaken with much less, and perhaps, on the whole, with more certainty. The next question of the settler is—"How can I obtain land?" and if, as is probable, he wishes to obtain a grant from government, he will find that a freehold can only be acquired on a homestead farm of 320 acres, and that all the other grants are leaseholds of 99 years, at rents varying according to the class of land from three to eighteen cents. He will also be made aware that a far-seeing legislation provides for a revaluation of the "prairie" value, or what the land would fetch if it were waste land without improvements, at the end of 33 years, and if 5 per cent. of this value is found to be 56 cents an acre or more, the rent will be

56 cents; the same process is again followed after 66 years. In the first instance, possession will be given by an occupation licence. The lease will not be granted till development has taken place and may be claimed after two years. The property will be liable to confiscation if the necessary development has not been effected in two years from occupation. The conditions of development are, briefly, in the highlands white occupation for eighteen months of the two years and the expenditure of twenty times the rent.

The highland district can be considered, roughly, as that land which is over 4,000 feet high.

Every applicant before obtaining any land in the Protectorate will be required to prove to the land officer that he is possessed of means sufficient to develop the farm applied for. The possession of £400 is generally considered by the land officer as sufficient to qualify for one farm. A letter from a banker, stating that the applicant in his opinion is worth the sum required, is accepted by the land officer.

The white population is largely recruited from travellers who have explored the country for pleasure and are attracted by the opportunities which it offers for business. The mode and cost of travelling away from the railway are matters on which reliable information is important, and the authors sum up the subject as follows:—

*“Probable Cost of Safari.*—Naturally the first question that presents itself to the intending settler, or the big game shooter, is the general expenditure that is likely to be incurred for a given trip or on a given time of sojourn in the country. Expenses naturally vary considerably with the requirements of the individual, and it is open to the sportsman to multiply his expenses over and above the usual estimated costs. To the settler bound on a business safari it can be made at a very greatly reduced rate to that of the sportsman who requires the larger retinue and a considerable number of native carriers. Roughly speaking, a hunting safari for a single individual works out at about £100 per month, but it is to be remembered that this is exclusive of a £50 sportsman's licence, horses or mules, service of a white hunter, and, furthermore, it would not cover the expenses of trips made into certain remote districts. For a one-man hunting safari, of two or three months' duration, the usual number of porters required is about thirty. The wages given are Rs.10 (13s. 4d.) per month per porter; in addition to this there is the food supply and equipment, the latter consisting of a blanket, water bottle, tent to accommodate six men, and a cooking pot for the use of the same number. Taking it all round, one may reckon that for the first month porters will cost Rs.15 (£1), while for subsequent months the rate will work out at about 15s. per month. Porters' rations consist of mealie meal flour costing (according to the

state of the market) approximately 4s. 8d. per sixty-pound load, and that amount is sufficient to feed one porter for one month. In addition to the porters the sportsman will require a head man to govern the caravan, also an English-speaking tent boy, a cook, two gun-bearers, and possibly two askaris (police boys). The wages given respectively to these men may average Rs.30 (£2) per month exclusive of their personal kit and daily rations."

The Handbook gives all the usual information, and, in addition, a great amount of clear and sensible advice.

## BUSINESS NOTES.

THE Dock strike was much more serious from the beginning than was generally admitted and it will still take some time before the state of chaos is fully dispelled. Not only were deliveries of shipments held up, but works on and near the Thames had to suspend operations for lack of materials. Many works in the colonies will feel the effect of the delays. Imports from the colonies were not so much affected as the exports from this country, as it is comparatively easy to vary the means of distribution, but business conditions generally suffered and the time was bad for new enterprises.

---

### Poulsen Wireless System.

Hitherto it has been generally believed that wireless telegraphy cannot enter into serious competition with submarine cables, and this is probably true of all "spark" systems. Lately, however, a remarkable development has been made of the continuous arc system, and it seems possible that this will supersede all "spark" systems. A demonstration of the Poulsen system was given in July between Cullercoats and Lyngby in Denmark, a distance of about 600 miles; the power used at the latter place was said to be under 14 kilowatts, and at the former 4. At a speed of 400 letters a minute the signals were extremely clear, but a small number of dots and dashes were missed and there were occasional signs of atmospheric disturbances causing a letter to be lost. In spite of this, plain language and "dictionary-word" code traffic could be dealt with as easily as, and faster than, by a cable of the same length. For "combination" codes it might be necessary to repeat the message, but probably the missing dots and dashes

were due to defective operation. The atmospheric conditions on the occasion were of the worst.

The power used was very low, and it is certain that a great increase of range could be obtained by using more power.

It seems highly probable therefore, that all, except a comparatively small proportion of cable traffic, will eventually be transferred to radio-telegraphy. The system is so much cheaper that it would admit of one-third, and perhaps one-quarter, of the present rates. Probably the cable companies will set themselves to acquire licenses in the countries in which they work, and in one instance at least this has already been done.

The development has a great practical interest for the West Indies.

Two stations on the Poulsen system have recently been opened at Honolulu and San Francisco: 36 kilowatts generators are provided. The masts are 438 feet high and of wooden lattice work instead of the usual square section. The distance is 2,360 miles, greater than that between Ireland and Nova Scotia (2,000).

The Poulsen system uses continuous undamped electrical oscillations produced by an arc in hydrogen and tuning can therefore be readily conducted. It is claimed that it can be adapted to communicate with any of the "spark" systems.

---

## Rubber.

Professor Perkin's announcement before the Society of Chemical Industry of a new method of making synthetic rubber has excited great interest and some alarm. It is believed to have had the effect of keeping down prices for rubber shares, but the general depression and the dock strike are sufficient to account for the state of the market during the summer. It is, no doubt, the case that a sort of rubber can be produced, and Professor Perkin suggested 2s. 6d. per lb. as the probable selling price for some years to come. At such a price artificial rubber would oust all natural rubber, except that from well situated and well managed plantations. But it remains to be seen whether rubber can be manufactured which possesses the physical and chemical properties of the natural product.

More than two years ago the German chemists discovered that, when rubber is subjected to distillation by heat, a liquid called Isoprene is formed, and that this liquid could be converted back into a spongy substance resembling rubber. Isoprene is a combination of ten parts of carbon and sixteen of hydrogen and the

problem became one of finding cheap materials for producing these. Starch was suggested, but it was found that the cost of splitting it up was too great. Then Professor Fernbach of the Pasteur Institute discovered a cheap way of permeating starch so as to produce a substance called Butyl Alcohol, which is very nearly the same as fusel oil, from a constituent of which Isoprene is obtainable, but the difference is that Butyl Alcohol contains four atoms of carbon to five in Isoprene. It is the addition of this atom that has been the problem recently. The difference is a serious one, causing a variation in the properties of the two bodies. The product of Butyl Alcohol is called Butadiene and it resembles rubber in appearance and vulcanizes by both the hot and the dry processes. But it cannot be obtained from rubber and therefore cannot be identified with it. It is not so resilient and more breakable when stretched; in fact it has not the same structure and does not exhibit the "nerve" of the natural product. The English experimenters seem to rely on a process of obtaining Isoprene from a constituent of fusel oil, but it is admitted that further experiments are necessary and Sir William Ramsay has stated that two years will be required for this purpose. On Professor Perkin's announcement some newspapers revelled in startling descriptions of the results which it foreshadowed, but as far as science has gone the only thing established is that a substance resembling rubber, but inferior to it in its characteristic qualities, can be produced from materials which are plentiful and cheap. There might very well be a market for such a substance, as for instance for paving purposes, but it would not compete with the natural product for the uses where strength and resiliency are important. The precedent of synthetic indigo has a good deal to do with the expectations of the possibilities of synthetic rubber, but it should be borne in mind that the artificial indigo is not the same thing as natural indigo and is not so lasting in its effects. It caught on with the dyers because it was cheap, easily handled and effective for a time, but people who have lived in hot rainy countries know very well that it is not equal to the old dye. If the public insisted on a first-class material there would be a good market for real indigo. No doubt for the purposes of clothes a cheap article has a great advantage, even if inferior, but in industries a difference in quality cannot be disregarded.

---

The recent Brazilian law and regulations are very full and well designed to encourage planting. All materials intended to be used are admitted free of duties and bonuses are given for new plantations according to the area of cultivation. The Government will

establish experiment or demonstration gardens. Further bonuses are given for rubber coming up to a high standard. Immigrant inns and hospitals are to be provided in suitable districts and various narrow gauge railways are specified. Bonuses are also provided for refining works. All this represents a determined effort to use the natural advantages of the country to establish plantations with which it is evidently recognised the future will rest. In time, no doubt, the competition of Brazil with plantation rubber will be a serious matter. The law has been translated into English and has been distributed by the "Bureau de renseignements du Brésil à Paris."

---

### Rubber Seeds.

Much disappointment is often caused by the failure of consignments of seeds which have been sent a long distance. Ordinarily it can only be expected that about twenty to thirty seeds out of a hundred will germinate, even when no long journey is made. From experiments made in Malaya, it appears that the best plan for increasing the percentage of germination is to coat the seeds with beeswax, by dipping them into the melted article and allowing it to solidify. By this means the germination has been raised to an average of about 55. Hard paraffin also improves germination, but not so much as beeswax.

---

### Coconuts.

Increasing attention is being given to this product and most places which can grow it are studying the methods of cultivation. Capital will, no doubt, be attracted by encouraging prospects, though from an investor's point of view some schemes that have been put forward are sadly wanting in definiteness. It is often the case that localities which cannot be profitably used in any other way can be turned to account by planting coconut trees. The Journal of the Jamaica Agricultural Society remarks that the axiom that the nearer the sea the better the coconuts is not always absolutely correct, yet there is no question that where the trees are near the sea, the roots even running out to be lapped in the waves, and where the soil is fairly good, though containing a large percentage of sand, then there is a situation and conditions which it is hard to better for the growing of coconuts. The coast lands of Jamaica, therefore, are in nearly all cases the choice for planting the trees, always excepting any lands that are swampy and difficult of drainage. It has been

supposed that the salt causes the trees to flourish, but it is more likely that the effect is due to the ease with which the roots, traversing a very porous soil, reach water, a plentiful supply of which is essential to the trees. The mineral food which has to be taken up to the crown depends for its passage on water. On heavy clay lands, root disease is apt to occur. Also the coast is usually more open to air and sun than the interior. Cultivation should be deep to enable the roots to reach abundant moisture. In hard soil an explosive saves much work. The seed nuts should be carefully selected from well matured trees and should be planted in the nursery in rows on their sides with the eye end slightly raised and exposed. Planting out should be early and before roots are thrown out.

Marseilles is still the biggest buyer of copra and of oil generally, but rivals are springing up in this country and Germany.

---

### Tobacco.

It is said that half a match-box full of tobacco will produce plants sufficient for an acre, and in Australia a gross return of £110 per acre has been secured. But the difficulties and expenses are great, and the British colonies, on the whole, lag behind in the industry. Tobacco requires "intensive culture." A man can only look after about three acres, and he must be an expert. The land must be carefully chosen, and is exhausted by tobacco, which is a great feeder, in three years. Much careful weeding is required, necessitating a thin and sharp hoe blade. Every plant should be examined and grubs, which are very small, removed by hand. "The Sydney Stock and Station Journal" states that it "is an extremely difficult thing to detect the existence of a grub in the stalk, and even men who have been tobacco-farming for years are baffled; but the Chinese workers can tell immediately. Sometimes the plant has to be cut down level with the ground to enable the removal of the grub, and so a fresh growth has to be awaited. Many inspections are needed to combat the parasites. The work of the grub is not noticed from the outside; and the layman would look at a damaged leaf and see no difference until he held it to the light, when he might easily see that only a film was left and that the grub had eaten the inside tissue away much as white ants turn a piece of timber into a mere shell. When the plant is fully developed it is 'topped,' leaving from eighteen to twenty leaves on the stalk. Immediately afterwards a shoot starts at the top of each leaf. Ten

days later this supplementary growth has to be rubbed off. Four times this operation is necessary.

“When the crop is ready to harvest the stalk of the plant is split right down the centre, to within about eight inches of the ground. By an expert slash with the same knife—which is provided with a blade at the end and one at the side—the plant is cut off at its base; it is then put astride of the stick, which is placed on a portable trellis that holds fifty sticks.”

---

Ceylon finds its chief market for tobacco in Southern India, but it has lately been confronted by the fear of this market being closed or restricted, and the production of a quality suited for European taste has been under consideration. The smoking tobacco at present produced is generally too coarse in texture, contains too large a percentage of nicotine, and has a strong and rather disagreeable flavour. The cigars are frequently spoilt by tobacco borer. However, the climate and soil are favourable, and, if the methods are improved, the industry should do well. It should be recognised that tobacco production is more like an industry than ordinary agricultural work, and is highly specialised into different branches, according to the kind to be turned out. The expert is, therefore, necessary, perhaps more for this article than for any other tropical product, and careful and methodic experiments, under proper supervision, will save a colony much time and money.

---

It is a great advantage to a colony, in the case of such an industry as tobacco, if a substantial company undertakes to buy the produce on the spot. Thus the Rhodesian Tobacco Company receive the leaf at central warehouses, where it is graded and resold. An immediate advance will be made, when the leaf is delivered, up to 50 per cent. of its estimated value, and a further 25 when it is ready for sale. The Company gives expert advice, and also, in suitable cases, advances money for building curing barns. The output under this encouragement is making remarkable progress, and there is no doubt that planters are doing well. Good land can be got for 3s. to 4s. an acre. The grower of tobacco must specialise in the business, but he can combine it with ranching. As in most such places, he should have a capital of over £500 and must do some hard work to prepare the land; but the country is in many respects more advanced and comfortable than many others which are competing for such settlers.

## Cotton.

"The South African Agricultural Journal" puts the cost of producing an acre of cotton at £2 5s., arrived at as follows:—

Preparing and breaking (old lands) ... ..	£0 10 0
Harrowing ... ..	0 2 0
Planting ... ..	0 1 0
Cultivating ... ..	0 5 0
Harrowing and hand hoeing ... ..	0 7 0
Picking 1,000 lb. ... ..	0 15 0
Cartage to gin ... ..	0 1 0
Wear and tear on implements ... ..	0 1 0
Sundries ... ..	0 3 0
	<hr/>
	£2 5 0

One acre of good cotton should produce 1,000 lb. of seed cotton giving 30 per cent. of lint, i.e.

300 lb. at 5½ <i>d.</i> per lb. ... ..	£7 3 9
Total cost of production ... ..	2 5 0
	<hr/>
Profit per acre ... ..	£4 18 9

The last two or three crops marketed have realised on an average more than 5½*d.* per lb. American uplands have at times fetched on the European market about 7*d.* per lb. Reports on South African cotton usually place it about 1*d.* per pound higher than American uplands. But, placing this cotton at 7*d.* per lb. last year, with the above calculations, we have:—

300 lb. lint at 7 <i>d.</i> per lb. ... ..	£8 15 0
Cost of production ... ..	2 5 0
	<hr/>
Showing a net profit per acre of ... ..	£6 10 0

The American crop last harvest has been estimated to yield 14,885,000 bales of lint of 500 lbs. each. This is the largest crop on record, and at 5½*d.* per lb., the average price obtained during the last five years, represents the enormous sum of over £178,000,000. It is said that the planters are taking steps to organise themselves into co-operative unions, and are considering a price of 7½*d.* per lb. The cost of production with them is lower than it appears to be in South Africa, being £1 17*s.* an acre, and, no doubt, this is largely due to better organisation.

It appears that the seed cotton in South Africa yields a much greater proportion of lint than is got in the United States.

At Rustenberg several varieties gave more than 400 lbs. of lint per acre, while in the United States the average yield in recent years has been only 174 lbs. per acre. The Rustenberg cases may be exceptional, but it seems likely that the climate and soil of the Transvaal are so favourable that this territory will before long become the greatest producer of cotton in Africa. A new "bond" of Empire will be created when these supplies reach Lancashire.

---

### Rice.

Experiments in India, it is stated in the "Agricultural Journal of India," show that, at least under certain conditions, a larger yield of grain is obtained by ploughing the land in puddle immediately before transplanting paddy than by ploughing immediately after the previous harvest. This seems to be partly due to the breaking up of the soil by desiccation followed by rain. Early ploughing conserves the moisture and prevents this process. It may also be due to an alteration in the bacterial contents of the soil.

The Japanese salt-water method of selecting paddy seed of high specific gravity brings about a decided increase of yield. It consists in using only grains which sink in a solution of one part by weight of salt in two of water.

---

### Canadian Coal.

We are presented at recurring periods with prophetic pictures of the approaching time when there will be no more coal, and few people can or care to question the data given on these occasions. But as regards immediate requirements the remarkable thing is the constant discovery of new fields. In almost every part of the earth fresh stores are being opened up. Thus Dr. Dowling, of the Geological Survey of Canada, has computed that in the province of Alberta alone there are some one thousand million tons, leaving out many areas not yet prospected. Between four and five millions are now being mined annually in the province, and constitute a resource which is contributing in no small measure to the development of the West. At present the coal is only worked where it is close to the surface, and the methods adopted are rather rudimentary and wasteful. The coal-bearing strata are of later epoch than those of Great Britain, and the youngest yield lignites rather than true coals. Coal deposits improve with age, largely because earth-movements compress them, so that they become harder, brighter and more solid. A large part of the Alberta coal is too young for any but domestic purposes, but there are great areas at present untouched of steam coal. There is reason to believe that these stores can be

reached without great cost, and there is every prospect that they will lead to the rise of great manufacturing cities on the prairies. It is well known that in the past these bare expanses have been covered with thick forests, the remains of which now lie at no great depth, and the time is now at hand when these treasures will be made available.

---

### **Tin.**

In Malaya last year was a satisfactory one, and there was a substantial increase from 170,361 to 196,427 in the number of labourers. The Chinaman has evidently not been tempted away by rubber. Suction gas is being largely resorted to for power. Coal has been discovered at Rawang and, if it proves to be of good quality, would stimulate the use of suction gas and the adoption of up-to-date plants.

In Nigeria attempts have been begun to conduct tin-mining by mechanical means, but the size of the properties makes a difficulty, to say nothing of the transport. There has been a good deal of activity and the figures of production should show improvement.

---

### **Solid Oil.**

The troubles of transport and storage of liquid oil make a solid form very desirable, and this article is now produced under the Armstrong-Mordan process by the Petroleum Solid Fuel Co., Ltd. If the invention is to be fully used, the oil must be made into solid blocks at the place of production so as to save the great expense of special tanks and steamers, and this object is in view. At present the production appears to be limited by the difficulty of getting the raw material.

---

### **Steam Pumps.**

A portable steam pump is desirable in places where there are no roads or means of traction, and one called the "Valiant," made by Messrs. Merryweather, is doing good service under many awkward conditions. It can be carried by men on shoulder poles or supplied with a carriage. It has a powerful throw and can be used as a steam fire engine. It is used to supply water to troops or to vessels stationed off the coast, and to fill tanks on railways. The small size weighs  $6\frac{1}{2}$  owt., and the large 11 owt., and it can be taken apart into five or six sections to facilitate transport over long distances. The price is from £160 to £340 according to size and fittings.

### Reinforced Concrete.

At the International Congress of Navigation held in Philadelphia in May, some useful communications were made as to the use of reinforced concrete in hydraulic work, and the general opinion was that little if any damage is suffered by even a poor concrete structure below water, except in cases of freezing, or when sea water has been used in the mixing. But many concrete structures exposed to sea water have suffered much from disintegration of the parts not constantly immersed, and it is desirable that the cement used in making concrete to be exposed to sea water shall contain sufficient silicious materials as will satisfy whatever excess lime there may be in the hardened cement. This is accomplished in many parts of Europe through the addition of trass or puzzolana to hydraulic cement containing an excess of lime, which tends to increase its strength and render it stable in sea water. Also one of the prime essentials for a concrete structure that will be immune against sea water action is that the surface shall be dense and impervious. An attempt has been made to secure this condition by applying mortar under an air pressure of upwards of 30lb., and while this undoubtedly increases the density as compared to hand methods, nevertheless it remains to be seen whether it achieves the object desired.

Good practice demands that the concrete shall be mixed a sufficient length of time, without too much water, so that there results a mass of viscous consistency which will flow readily and yet the ingredients do not separate. If such a concrete is deposited under conditions which will prevent the sea water permeating it before it has set, such concrete affords excellent resistance to sea water. Another method proposed has been to deposit the concrete in tremie, as with this form of construction only the upper surface comes in contact with the water, and there results a concrete which is not affected by sea water action.

When reinforced concrete is used in sea water it is essential that the aggregate shall be a hard, dense material of low absorption, and that the reinforcement be protected by a coating of at least one inch of silicious mortar.

When concrete is subjected to the action of alkaline or acid waters the same precautions must be observed as in the case of exposure to sea water.

It is important for the purposes of harbour works to note that concrete for reinforcement should not be made with sea water, or have salt mixed with it. If this is done, the reinforcements corrode. The other danger is that of cracks; but there is small chance of shrinkage if the concrete is kept wet while setting.

Properly made, the material is practically immune, and as it acts by resistance and not by weight the work required is less than when material in mass is used.

---

### Cape Town Reinforced Concrete Pier.

Fast work on this work was accomplished by the use of a travelling stage, which was erected on land and travelled on its own legs to the sea in position for driving the first pile. Thus no temporary staging was required, and the stage moved along the front of the work, driving the piles as it proceeded, in a zig-zag course, so as to bring the pile driver into the necessary position for the next pile. The movements were made with remarkable ease. This is said to be the first instance of the use of such a stage for pile-driving.

---

### Deterioration of Coal in Storage.

Coal has commonly been regarded as liable to serious change and loss on exposure to weather. In 1870 a German gasworks engineer claimed to have found that moist fine coal sustained an average loss per week of 1.7 per cent., this loss being due to gas. The 1889 edition of "Groves and Thorp's Chemical Technology of Fuels" says: "In some places coal is known to lose 50 per cent. of its heating value in six months." Other statements like these are to be found in recent literature, but probably the great majority of chemists and engineers to-day hold no such exaggerated ideas on the subject. There is, on the other hand, a well-defined suspicion in the minds of many that sufficient loss of volatile matter and sufficient deterioration by oxidation does occur in coal to be of industrial importance. Recent experiments in America, however, showed that the loss in calorific value by weathering in the open has been very much over-estimated, as the loss was generally found to be about 1 per cent. in a year. Slacking and crumbling on the surface of a pile indicates the beginning of loss, but this process does not appear to penetrate more than about 18 inches.

Theoretically the best way to preserve coal is to store it under water. An English railway and dock superintendent reported in 1903 that he had found that coal submerged for 10 years in the salt mud of the English Channel actually improved in calorific value by 1.8 per cent. He claimed that salt will preserve the virtues of coal and that if coal was given a strong dose of coarse salt and water, 12 hours before using, its calorific value was improved.

Storage under water unquestionably preserves the heating value and the physical strength of coal. But it practically necessitates firing wet coal, and therefore means the evaporating in the furnace of an amount of moisture varying from 1 per cent. to 15 per cent., according to the kind of coal. This factor is an important drawback to under-water storage with coals which mechanically retain 5 to 15 per cent. of water after draining, but in case of high-grade coals, if firemen are permitted, as is ordinarily the case, to wet down their coal before firing, so as to make, as they say, "a hotter fire," then the addition during storage of the 2 or 3 per cent. moisture which these coals retain would be of little consequence. Submergence storage is an absolute preventive of spontaneous combustion, and on that account alone its use may be justified with some coals, but merely for the sake of the saving to be secured by avoidance of weathering there does not seem to be good ground for its use.

---

#### White Ants and Buildings.

There are numerous expedients for keeping down this nuisance, but the simplest method which we have seen suggested is to sprinkle salt freely on the ground between or under the foundations, and in each post hole if there are any, in order to give a brackish tone to the soil. It is said that this has entirely kept off white ants. It would perhaps be an improvement to soak posts intended for building in boiling brine.

---

#### White Ants and Trees.

Trees can be protected by worrying the ants with arsenical fumes, but this treatment is not as a rule absolutely successful. Immense devastation to orchards is often done, and the reason is not far to seek. It is simply that when land is carefully cleared and prepared the insects are deprived of their usual food. In such cases the agriculturalist has carefully removed all the natural food of the insects which existed in superabundance—fallen leaves, dead twigs, stumps, and the like—and left the ants nothing to feed upon. Similar cases are often to be found where land is first set out to sugar-cane, the plant cane suffering owing to the fact that the natural food, grass, and scrub, has been largely removed in ploughing the land and preparing it for planting. At the same time old sugar-cane fields are riddled by white ants without a sign of damage, because the débris of cane growth supplies a sufficiency of food which is, to them, preferable to the living cane.

**Hull as a Distributory Centre.**

Colonial exporters continue on the whole to favour London without considering the merits of other home ports, and many of them are not in a position to weigh such questions and simply follow established customs. There can be little doubt, however, that as time goes on the convenience of other distributing points will assert itself. Thus Hull serves a very large and growing population. It gives a fast train system to all parts of the country, and its navigable waters and canals serve one-sixth of the total area of England. All river craft use the docks free of dues and compete actively with the railways, and as a result of this the railway rates are on a lower basis than from any other port in the United Kingdom. Thus it is said that Hull can deliver meat and apples to London markets at practically the same cost as when they are delivered from the London Docks. Not only is London generally admitted to be the dearest port in the United Kingdom, but also the charges for handling and selling goods are higher in London than in Hull. It is most important for exporters to avoid unnecessary changes for transport and handling and to discard roundabout methods.

## RAILWAY AND HARBOUR NOTES.

### Lagos Harbour Works.

The quantity of stone deposited in the East and West Moles in June was greater than in any previous month, and it was anticipated that, when the new railway deviations had been put into proper working order, a substantial further increase would be made. At the end of June the East Mole had progressed 7,517 feet, and the West Mole 281 feet, and the expenditure was about £320,000. The iron wharf at Apapa was completed in the half year, and affords a berthage of 345 feet with depths at low water alongside varying from 10 to 16 feet.

The bar draught from January to July varied from 11 feet 6 inches to 16 feet 6 inches. During the latter part of this period the entrance channel became extremely difficult for navigation, owing to the encroachment thereon of the western spit and the resulting narrowing of the fairway between the leeward side of this spit and the "Egga" wreck. This action became so pronounced that at the beginning of June it was considered advisable to reduce the official draught to 11 feet 6 inches for vessels inward and enable navigation to take a course leeward of the "Egga" and "Kittiwake" wrecks. In view of the advance of the East Mole the use of this channel could only be a temporary measure, and subsequently matters got worse. However, it was believed that as the volume and strength of the ebb tides increase, corresponding with the augmented discharge of fresh water, the encroachment of the weather spit would be checked and the formation of a navigable channel windward of the "Egga" again result. The advance of the East Mole will contribute materially to this effect.

The making of the new wharves near Wilmot Point, which will be 2,000 feet long, necessitates a reclamation plant, which includes a dredger and a tug and towed barges. It is intended to employ the "Egerton" for the dredging, and orders have been given for the other requisites. The plant will be of great service elsewhere in turning swamps into valuable land.

---

The Lagos and Baro-Kano railways tariff, printed at Lagos, has been provisionally approved, but subject to notification that the Government is not prepared to guarantee freight between Burnutu and Baro by river and will only undertake to convey up to the available capacity of its own boats at the advertised rates. A schedule of rates for public goods to stations on the Baro-Kano railway has been issued separately. Copies of a pamphlet entitled "Northern Nigeria," descriptive of the journey from Lagos to Kano, have been distributed from the office of the Crown Agents for the Colonies. The post of General Manager, Southern Nigeria Railways, held by Mr. F. B. Glasier, C.M.G., has been abolished, and Mr. J. Eaglesome, C.M.G., Director of Public Works, Northern Nigeria, has been appointed "Director of Railways and Works."

The combined Nigerian Railway systems are to be called the "Nigerian State Railway."

---

### **Accra Harbour Works.**

In May the sand pumping plant did exceptionally good work and soundings showed an appreciable deepening over almost all the sheltered area.

---

### **Freetown Harbour.**

A proposal has been under consideration for the construction of a deep sea export wharf. As Freetown is not a terminal port, this could be done at a distance from the place where imports are landed. A possible site has been found where the sea-bed is free from mud, at Fourah Bay, the sites nearer Freetown being so occupied and the depths of water so limited that the requisite accommodation could not be provided at a reasonable cost. The distance from the business premises near Susan Bay and the Government Wharf would be from one-and-a-half to two miles, but the inconvenience would diminish as the land is taken up for trade purposes. Borings will be made to test the possibility of the scheme.

Meantime the extension of the jetties and an additional jetty have been decided on.

---

### Barbados Harbour Works.

The question is under consideration of the improvement of coaling facilities in Carlisle Bay. One proposal is to accommodate the lighters at Needham Point, which is naturally sheltered largely during the hurricane months when the wind is from the south-east. A sheltered area would be found by a breakwater extending from the Point northerly and an arm from the shore, affording an entrance 150 feet wide. These constructions would be 750 and 450 feet long respectively. The cost may be put at £52,000. Another proposal is to provide accommodation for ocean-going vessels in Carlisle Bay by prolonging the harbour westwards providing a breakwater, which might be 1,200 feet long, a jetty and a dredged area. Such a breakwater would have to be longer to afford sufficient protection to vessels on the occasion of a hurricane, but such hurricanes occur only at long intervals, the last having been experienced in 1898. The accommodation would benefit the port by enabling vessels to load and unload, without, as at present, barging, but it remains to be considered whether the benefit would be likely to prove commensurate with the cost, which is estimated at £325,000. It does not seem possible to deepen the Carenage for the reception of ocean-going steamers.

---

### Grenada.

A project is under consideration for improving the harbour by dredging and providing wharfage accommodation. The immediate extent of this accommodation will no doubt be largely determined by the results of an examination of the site.

---

### Uganda.

In the year 1911-12 the receipts were £360,224, and the expenditure £228,852, giving a net profit of £131,372 against £98,519 in the previous year. The report refers to the inadequacy of the rolling stock and the necessity for more wharfage at Kilindini, and states that the investigation now being conducted in order to utilise the grant recently sanctioned to the best advantage is being followed with the keenest interest. The railway staff mourn the loss of the late General Manager, Mr. H. A. F. Currie, C.M.G., to whose indefatigable energy the progress of the railway was largely due.

Plans for the construction of the Deep Water Pier at Kilindini have been under consideration. A screw pile pier would probably be difficult, as in many places there is not enough sand to hold the piles and the rock in parts is too steep for them to enter. But a good foundation is obtainable and a solid construction is therefore possible. Further enquiries will have to be made as to the character of the rock, and Mr. J. H. Gailey has been engaged for this work. Mr. Gailey was the engineer of the barge pier.

A rocky foreshore can be cleared away by a Lobnitz rock-breaker to a depth sufficient to enable ships to lie alongside a quay, which can be faced with timber or steel, with a mass of concrete between the rock and the frame.

---

### Malay States.

The through main line from Kuala Lumpur to Salak South was commenced at the beginning of the year and by the end of June the jungle had been cleared for the whole length and the permanent way commenced.

On the survey from Bukit Mertajam to Alor Star at the end of June plans were completed for forty-four miles of line.

The western route has been adopted for the railway from Tembeling to Kelantan.

---

### Ceylon : Mannar.

There were very heavy rains in December, and on the 19th the "Kalaar" rose rapidly. At that date the two main girders were bolted up, but the top booms were not in position and if the trestles had been swept away the bridge would certainly have been wrecked. The water continued to rise till it was about thirty feet above the bed of the stream and the whole valley was under water; the buildings were flooded and many of the coolies narrowly escaped drowning. The bridge, however, was saved by the promptitude of Mr. Crawford. Rails and steel were piled on the bridge to steady the trestles and gangs of men stationed to prevent brushwood and floating trees becoming foul of the staging.

It is anticipated that the piers will be completed early in 1913 and through communication established between Madawachohi and Talai Mannar, but the line may not be fit for a night passenger service till a much later date. The wet season terminates approximately in March and the road may be expected to be then

in its worst condition. In July railhead was at twenty-five miles forty chains. It was expected that the north pier would be finished in October.

---

### Fiji.

A scheme has for some time been under consideration for the construction of a railway from Suva up the valley of the Rewa to the junction of the Wainamala and Wainibuka Rivers. The means of communication in the Colony are so restricted that an improvement of this kind would be very welcome if it can be made to pay. The line would pass through a region where there is much fine land now lying idle, and if the Government acquired some of this cultivation could be stimulated and the railway receipts augmented. A preliminary survey is being made, and an engineer is going out to report on the scheme.

---

### Non-Parallel Axle Tracks.

It has long been realised that the axles of railway rolling stock should be allowed freedom to assume positions other than parallel, the ideal being that there should be as many degrees of flexure as there are axles, subject to such control as would ensure safety when passing over crossings. When the axles are rigidly aligned, the running must be laboured and great energy is required to force such vehicles round a curve. The result is bad for tyres and rails.

The Warner system claims to overcome these difficulties by suspending the weight of a vehicle by means of hangers or other flexible connections and separate underframes or carriages from that of the main vehicle, so that the axles are not constrained to remain in parallel position, nor is the truck body compelled to align itself into one particular position relatively to the axles. It will be interesting to see how the scheme works in practice.

---

### Oil Fuel.

The Caledonian Railway has been experimenting with oil fuel for its locomotives. In the engines so fitted, the oil is stored in a cylindrical tank placed on top of tender in part of the space ordinarily occupied by coal. The oil flows from the tank to the engine injectors, which force it into the fire-box at two separate points about eighteen inches apart, where a current of steam from the boiler causes it to assume the form of fine spray spreading itself throughout the fire-box. By means of a thin layer of wood or coal fire covering the firebars this spray is ignited, and so

generates steam for the motive power, as well as for the injecting and spraying. The extent of the flame is regulated by a controlling valve on each of the injectors, and the operation of driving is, of course, the same as with coal fired locomotives. The fire-box, in addition to the customary fire-brick arch, is equipped with a fire-brick wall to protect the copper front plate from the effects of the extraordinary heat given out by the oil fuel. It is to be noted that these special fittings are of such a kind as permit of the engine using oil fuel, or coal, as found desirable. The Company's present locomotive stud consists of 927 engines.

## MEDICAL NOTES.

## The Prevention of Malaria.

The most satisfactory method is mosquito destruction, for mosquitos carry several other diseases, but when the population is sparse and scattered over great spaces the quinine method is more practicable. Dr. D. Thomson, in the ("Liverpool Annals of Tropical Medicine" (Vol. VI., 2), states: that the most scientific method of taking quinine is, not the conventional daily dose of five grains, but that every adult person in the population (children in proportion according to age) should take twenty grains of quinine daily and simultaneously for a period of three weeks, quarterly, i.e., four times a year. This amounts to 1,680 grains per adult per annum, if well during the year, and probably 1,800 grains, if ill at some period in the year. This, in the aggregate, is less quinine than in the former method, which is faulty in the following respects:—

(1) Five grains of quinine daily is insufficient to prevent infection from mosquitos.

(2) Five grains of quinine daily will take a long time to eradicate malaria from the system. In many cases it will not eradicate it. The fact that a person can take an acute malarial attack during such dosage, proves that it is an insufficient amount to render the blood uninhabitable to the parasite.

(3) This amount of quinine makes the blood less suitable for the parasites, and, hence, tends to keep the disease latent in the system without properly curing it. A few parasites may be present in the blood not sufficient to cause fever, and the person may feel comparatively well and congratulate himself that he is free from the disease, yet he may be harbouring numerous crescents for long periods of time, since those latent chronic cases are often the most fertile producers of crescents.

On the other hand:—

(1) The administration of quinine in doses of twenty grains daily for three weeks is almost certain to destroy both the asexual and sexual parasites. After this period, the person will be non-infective to mosquitos, and, in the great majority of cases, will be cured of the disease. Very few patients have a tendency to relapse after this treatment. By this method, therefore, every person would be non-infective to mosquitos, and freed from a tendency to relapse, four times a year.

(2) Infective mosquitos must necessarily become much fewer in number.

(3) The amount of quinine taken is less in the end, and none is taken during nine months of the year.

(4) After the third day the majority of people feel very little inconvenience when taking 20 grains of quinine daily.

(5) It is quite as practicable a method as the five-grain daily method. It would be as easy to make a population take 20 grains daily for three weeks, quarterly, as to make it take five grains daily for a year.

---

### Mosquitos.

In up-to-date legislation we have got to the point that the mere presence of mosquito larvæ on any property constitutes an offence. Such larvæ can only exist on water, and it is the duty of an owner to see that there is no casual water on his premises on which larvæ can collect, or to prevent any collection of water from becoming a nuisance in that way. A recent Gambia ordinance expresses it in this way: "the occupier or owner of any house or premises, or the owner or person having the charge of any ship, boat, canoe, hulk, timber, cask, or other article lying upon any street, shore, beach or open space, in or about which there is any collection of water found by the Board to contain mosquito larvæ, shall be liable in respect of each and every such collection of water to a fine not exceeding twenty shillings, or in default to be imprisoned with or without hard labour for seven days."

---

### Sleeping Sickness.

Mr. R. Paske Smith, the Officer-in-Charge of the Sleeping Sickness Administration Measures, Uganda, writes as follows:—

"Of the measures adopted for the suppression of Sleeping Sickness the clearing of fly areas will, I consider, where the population is large or sufficient, prove the more effective and in the long run the more suitable from every point of view. The difficulties and trouble

of moving natives whose ancestors have lived for generations in these areas, and who often strongly object to moving to new districts, is avoided; trade routes can be opened and maintained without danger of spreading Sleeping Sickness; valuable land—some of the richest land in the Protectorate is situated within these areas—can be developed; the cost to government is less, there being no loss by reason of tax exemptions; and there is less hardship to the natives.”

Observations in German territory confirm this view. In places where the last clearing has taken place more than a year ago and the bush has thickly grown again, the *glossina palpalis* is not found. It seems that the slow mode of propagation of the fly does not enable it to reoccupy positions quickly once they are lost. Surgeon-General Stendel considers that usually it is enough to clear the underwood, without radical clearing and uprooting; the flies do not find their food in large trees. The Germans are evidently making a systematic attempt to eradicate the fly.

Unfortunately, while the *glossina palpalis* is generally found only in narrow limits near water, the *glossina morsitans* is spread widely over the continent. The discovery, therefore, that the latter is a carrier of the disease is alarming, but as this fly is migratory the cases are likely to be sporadic.

---

### Tuberculosis.

South Africa has a well-deserved reputation as possessing a beneficial climate for persons afflicted with consumption, and considerable numbers have gone there to get the advantage of the warm and dry air. The country cannot, however, be expected to welcome these visitors when it is found that the disease is rapidly spreading, and steps are being taken with a view to discouraging them from coming. Other countries are adopting the same policy, but there is a practical difficulty in the fact that early or slight cases of tuberculosis are difficult to detect. In the United States, persons afflicted with tuberculosis are excluded from admission, and quite a catalogue of other diseases is added; at New York, however, the principal gateway, not more than two minutes can be given to the first inspection, at which over 70 per cent. are usually admitted, and the inference is necessary that diseases which require a long and careful examination, such as tuberculosis, largely escape detection. A recent commission in South Africa remarks upon this inherent difficulty, and adds that apart from this there are other reasons why total exclusion of tuberculous immigrants is inadvisable. Thus in very advanced cases it is often impracticable to subject them to the risks of a long voyage back to their port of embarkation. To do so would in many

instances mean hastening their death. This fact was strongly emphasised by the Chief Immigration Officer for the Cape Province in the course of his evidence. Such cases, therefore, must necessarily be landed for treatment in a suitable institution. It may be remarked that in respect of the deportation of immigrants, South Africa is less favourably situated than are America and Canada, by reason of the much greater length of the return voyage to the ports of embarkation.

Furthermore, in the case of persons suffering from phthisis in its early stages, difficulty is felt by many in justifying action excluding them from the benefit which the climate of South Africa may afford them, provided that they are able and willing and can be trusted to carry out such precautions as will reasonably insure the safety of our own inhabitants. It is a well-established fact that residence in parts of South Africa, especially the higher and dryer portions, often results in the permanent arrest of the disease in suitable cases. Most medical men practising in South Africa can recall such recoveries.

There is another and very practical objection to an attempt at rigid exclusion, and that is that whenever administrative measures of control involve excessive severity they tend to defeat their own ends by leading to evasion by the public. A tuberculous immigrant who has some hope of being admitted to the country, if he conform to the reasonable requirements of the State, is much more likely to play an open hand than the person who knows that he cannot gain admittance except by concealment or fraud. This point is of special importance, in view of the extensive land frontiers of the Union, at which it would appear from the evidence that there are and always will be exceptional difficulties in exercising effective control over immigration.

But although it may be impracticable to exclude entirely all tuberculous immigrants, the Commission was very strongly of opinion that every possible and legitimate means of discouraging such immigration should be adopted by the State. Moreover, whenever such immigrants are admitted, measures of a thorough kind should be insisted upon in each case, in order to prevent spread of infection. The Commission therefore recommend the following rules and conditions under which alone should be admitted any immigrant recognised to be suffering from tuberculous disease in an infectious stage:—

- (1) A tuberculous immigrant should be admitted only through a recognised port of entry proclaimed for that purpose.
- (2) He should be admitted only on a permit issued to him on the authority of the Minister, entitling him to remain within the Union for a definite time, to be named in the permit.

(3) Every such permit should be issued subject to the proper observance by the immigrant of conditions to be written into his permit, having for their object (a) the keeping of the immigrant under suitable surveillance and control, and (b) the observance by him of adequate measures for preventing the spread of infection.

(4) Such conditions should include the following:—

(i) That the immigrant shall possess sufficient means: (a) to make a deposit of not less than [£20] with the Immigration Officer, to be applied by him in meeting the cost of deportation (if found necessary) or any other expenditure properly incurred by the Government in the immigrant's behalf. (b) To support himself during the period of the currency of the permit in conformity with its conditions.

As a guarantee that the means of support actually exist, or, that existing, they will be properly applied and not lost or dissipated, the Immigration Officer shall require the surety of an approved person resident within the Union or of the master or owner of the vessel bringing the immigrant; or otherwise a sum of money to be deposited with the Immigration Officer sufficient for the proper maintenance of the immigrant in accordance with the conditions of the permit during the period of its currency; such money to be paid out to the immigrant by the Immigration Officer in such instalments at such intervals as that officer may deem fit.

It is suggested that the sum to be deposited for this purpose should not be less than an amount equal to [£8] per month of the permit's currency.

(ii) That the immigrant shall reside at a specified place.

Other details as to residence and examination are added.

Efforts to stamp out the disease on lines similar to those proposed in South Africa will, no doubt, be made in other quarters. It does not do to rely on the fact that the climate of a place is favourable for the treatment of consumption, or unlikely to originate it. The disease has only been known in the West Indies in comparatively recent years, and it used to be thought that the islands were fit to be sanatoria for persons affected. But the growing mortality, to which we referred in our last number, shows that when the disease has got a footing it will spread, unless effective measures are taken. In this case better housing is no doubt the first remedy.

### Quarantine.

The horrors of quarantine require no description, and medical men generally are anxious to reduce this institution to the minimum degree consistent with public safety. The three great infectious diseases which have to be considered are small-pox, cholera and plague, and the first question is during what periods a "contact" is infectious. In the case of small-pox a Straits Settlement Quarantine Inquiry Commission considers it sufficient for a contact to be inspected daily for 15 days, this being the period of incubation in the disease during which the infected person is harmless and isolation is unnecessary. Plague takes three forms, but of these, two, viz., septicæmic, or general blood infection, and pneumonic, are uncommon, and at Singapore are almost unknown. In bubonic plague the victim gets the disease direct from the rat flea, and it is the locality rather than the persons in it that requires isolation. When a contact's body has been cleansed, and his clothing dealt with to ensure that no rat fleas lurk in it, he ceases to be a source of danger and may be set free.

There appears to be a certain amount of doubt whether infection can be conveyed from a septicæmic plague sufferer to a healthy person. All that can be said is that the risk of this in septicæmic cases is greater than in bubonic cases.

It is beyond doubt that in pneumonic cases the sufferer is actively infective, and as contacts may receive the germs of the disease from breath or from expectorations and may convey them to others, they require most careful disinfection, and it would be necessary to subject them to isolation as in the case of cholera contacts. In Singapore the climatic conditions are hostile to all forms of the disease, which, therefore, is not likely to reach serious epidemic proportions. The recommendations are:—

- (1) That bubonic plague contacts should be disinfected, inoculated and thereafter released, subject to the same conditions as to daily medical inspection as are proposed in the case of small-pox contacts.
- (2) That in septicæmic and pneumonic plague cases the Health Authorities should have full discretion as to whether contacts should or should not be isolated after disinfection.
- (3) That all houses in which plague cases have been found be closed until the premises have been thoroughly cleansed, all rat holes have been stopped, and, as far as possible, all rats destroyed.

Cholera is the most difficult case to deal with from this point of view. Cholera contacts ought beyond all doubt to be isolated

without delay for the full period of five to six days which elapses between infection and development of the disease. In this disease daily medical inspection would not be a sufficient safeguard: an infected person may appear to be in good health at say 10 a.m., be in an extreme stage of the disease at noon, and be dead within the next two or three hours. In the interests of the contacts themselves, and still more in the interests of the community as a whole, it is essential that they should be placed under conditions which will ensure their prompt treatment if seized with the disease. Even before any serious symptoms are felt the excreta of the sufferer may be extremely infective, and the only safeguard is its treatment by the most perfect systems of disinfection. Further, the medical evidence indicates that cholera contacts may be a danger, even though they do not themselves show active signs of the disease: they may act as "carriers" of the infection, and no system of disinfection is known which would entirely avert this danger.

However, it is an advantage that the period of incubation of cholera is short (being about five days), and the inconvenience to contacts who are isolated is not so great as in the case of other diseases.

### Typhoid Epidemics.

The report of a Jamaica committee discusses the subject of waterborne endemic typhoid and allied diseases. The committee observe that Dr. Houston, of the London Metropolitan Water Board, who is an undoubted authority on water supplies, has given this question much investigation, and is not inclined to attach much weight to the belief in waterborne endemic disease from a fair, usable filtered river water.

On the other hand Professor Starkey, of McGill University, Montreal, and an influential body of American sanitarians, are strong in condemnation of river water even reaching the standard of purity that Kingston filtered water attains.

Rainfall and the water supply are intimately connected.

The evidence of the year 1911 and of the previous six years goes to suggest a certain influence on the rise of typhoid of a spell of drought followed by slight rain. A fall seems to succeed flood rains.

It is clearly recognised that the tributary streams of the water supply are certainly liable to excremental pollution of human origin; and in spite of shutting off the first flood waters the Bacterial content of the water is usually raised after rains. That content is reduced some 80 to 90 per cent. by filtration, and the chances of infection are considerably diminished. It is just the importance of those remaining chances that is debated by authorities.

In the past year the quality of the water supplying most of Kingston was inferior during the first four months to what it was later, with perhaps the exception of the month of August, when again the quality was less good. Cases of typhoid rose in April, May and June, fell to a minimum in August, and a rapid rise occurred in September.

While one may not be prepared to lay much importance on these coincidences of rainfall and drought, with water pollution and the rise of typhoid, in view of collateral evidence of the probably more important personal factor, it must be realised that there is a possible danger in the water supply in its present condition, and that all means possible should be taken to render the supply as pure as possible.

One single case attributable to water may be the source through personal means of a number of cases extending over years.

---

### Ankylostomiasis.

Dr. R. P. Cockin, of Grenada, reports in favour of the use of Beta Naphthol, on the ground of its effectiveness as a germicide, its rapid and complete expulsion of the parasites, its cheapness (2s. per lb.), and the absence of danger. He states:—"For this kind of work the Beta Naphthol could be made up in pill form—five grains to each pill—and given in five, ten or fifteen grain doses (according to the age and condition of the patient) on alternate days for ten days or a fortnight.

"This course was, I believe, adopted by the Porto Rico Commissioners with regard to Thymol and with good results: and I consider could be undertaken with Beta Naphthol with far less risk."

It appears likely that ankylostomiasis is encouraged by the newer modes of cultivation. Dr. Lee Bennett, of Grenada, observes that in the old sugar days the soil had frequent chances of getting dried up and aerated, and so did not afford the worm a suitable nidus for its eggs and larvæ; but to-day, under the shade of cocoa and nutmeg trees, the soil is always damp and ready for the requirements of the parasite.

If the yards of the dwelling-places, in certain localities, were kept free from vegetation, allowing the sun and wind to dry them up, very few people would require to be specially treated for ankylostomiasis; this disease has a natural tendency to cure itself; and it is the reinfections that cause all the mischief. The process of cure and reinfection will go on till the soil surrounding dwellings is treated.

### Use of Salvarsan for Yaws.

Dr. R. P. Cookin reports good results throughout at Grenada, but that the drug, although efficacious, may, at times, be a dangerous remedy.

The duration of patients' stay in the Hospital, after injections, averaged out at  $25\frac{1}{2}$  days, as against an average of about 3 months under other modes of treatment.

With regard to "duration of stay" in Hospital it must be remembered that practically all Yaw cases are infected with Ankylostomiasis, and that removal of these parasites is necessary as a preliminary to any treatment by Salvarsan.

---

### The Chinese Hospital in Hong-Kong.

At the Congress of the Far Eastern Association of Tropical Medicine, Sir Frederick Lugard made a reference to a very interesting, and, in fact, unique institution, the Tung Wa hospital. This, he stated, is entirely managed and controlled by an annually elected board of Chinese gentlemen, under the supervision of the registrar-general, and with a government inspecting medical officer. Primarily a hospital which admits annually over 4,000 patients, with an average in the wards of about 25, treated in equal proportion at their choice by Western or by Eastern methods, together with a clientele of 110,000 to 120,000 outpatients, it is in reality an institution with a much wider sphere of usefulness. It contains a refuge for the ailing poor and destitute, and special facilities for vaccination; it affords a temporary shelter for destitutes pending repatriation (generally at its own cost), and free burial for those unable to afford the cost, averaging some \$3,600 per annum. In addition, it is the recognised agency for collecting subscriptions for famine and destitution in China, and for other charitable purposes in or beyond the colony by Chinese in all parts of the world, who are eager to employ it as a medium to transmit their collections. It administers an income of about \$100,000 per annum, of which only \$8,000 is subscribed by government, and it is in charge of various charitable funds amounting to about \$100,000. It has just opened a branch in Kowloon, similarly managed, and capable of accommodating about 70 patients in its ward, as well as a new small-pox hospital to correspond to the one on the island.

In the Hong-Kong University, which it is hoped to open shortly, the first faculty will be that of medicine, since the University incorporates the College of Medicine, which for over twenty years has done admirable work in training students, chiefly Chinese, up to the standard of its "licenciate" certificate. In the new University they will be able to take a full medical degree, of the standard required

by the British Medical Council, without (in the case of Chinese) having to reside for a long series of years in a foreign country, away from their own people, and at a fraction of the cost. This institution will, no doubt, achieve invaluable results for China.

---

### Rat Guards.

It is important to prevent, if possible, the passage of rats from ships coming from infected ports to the shore, and guards on the ropes are useful for this purpose, especially in ports where the rats cannot easily swim to a landing place. The Port of London Authority has adopted a guard, recently patented, which is self-adjusting so as to fit closely any rope, from  $1\frac{1}{2}$  inch to 12 inches in circumference; it is strongly made of galvanized iron, can readily and without skill be fixed in position, has no loose parts and remains at right angles whatever the position of the rope, effectively preventing the passage of a rat. The device automatically closes the aperture through which the rope passes. It is flat and easily stored; price about 10s.

---

A "Course of Hygiene" for the use of schools has been published in Fiji. It contains the elementary information which children in the tropics ought to be taught, and being very lucid, could be adopted for this purpose where no local handbook has been prepared.

## COLONIAL STAMPS.

THE past quarter has witnessed the appearance of a great number of the expected issues bearing the portrait of H.M. the King: in fact only one new issue has borne any other emblem and that has the portrait inset. It seems quite possible that in the near future, this sign of the Unity of the Empire, will be shown on all stamps issued by its component parts, and there are few more effective ways of keeping the fact before the eyes of the world.

The recent issues are given below: the character of the stamp, where it is produced from one or other of the universal keyplates, being indicated shortly as old D.L.R., Nyasaland type, or new D.L.R., with reference to the illustrations which accompanied our April issue. Where no description is given, it may be taken that a new special keyplate similar to the old one has been made to fit the existing border or overprint plates.

It may be taken that all stamps follow the Universal Colour Scheme and that all values above 2½d., or its equivalent in other currencies, are on surfaced paper unless otherwise stated.

BAHAMAS.—1d.

BARBADOS.—¼d., ½d., 1d., 2d., 2½d., 3d., 4d., 6d., 1s., 2s. and 3s.

In these stamps the Charioted Britannia appears on a smaller scale, the portrait of H.M. the King being inset at the top left hand corner in the case of all values up to 6d., inclusive. Above 6d. the stamps are of the revenue size and the portrait is centred in the upper half of the stamp.

The value is the only portion of the stamp which is applied at the second printing. This appears at the left hand bottom corner in the values below 3d., at the top right hand corner in the remaining small stamps and in both top corners in the large stamps.

Ceylon.—2, 5, 25, 30 and 50 cents; 1, 2, 5, 10, 20, 50, 100 and 500 rupees.

All the above stamps are printed from the old D.L.R. keyplate, with the exception of the three highest values, which are of the

Nyasaland type. The figures are in colour on a white background and the following are the colours :—

- 2 cents. Same as now but brighter.  
 5 cents. Same as now but brighter.  
 25 cents. Bright yellow, with name and value in blue  
 White paper.  
 30 cents. Green. Name and value, violet. White paper.  
 50 cents. Black. Name and value, violet. White paper.  
 R. 1. Purple, on yellow paper.  
 Rs. 2. Black. Name and value red, on yellow paper.  
 Rs. 5. Black, on green paper.  
 Rs. 10. Purple. Name and value black, on red paper.  
 Rs. 20. Black. Name and value red, on blue paper.  
 Rs. 50. Purple, on white paper.  
 Rs. 100. Black, on white paper.  
 Rs. 500. Green, on white paper.

In our last issue we omitted to mention that the colour of the 10 cents stamp is now all sage green.

DOMINICA.—3d. First time on ordinary paper.

EAST AFRICA AND UGANDA PROTECTORATES.—1, 10, 12, 15, 25, 50 and 75 cents; 1, 2, 3, 4, 5, 10, 20 and 50 rupees.

In adopting the Universal Colour Scheme, 10 cents has been taken to represent 1½d., 12 cents 2d., 25 cents 4d., 50 cents 8d., 75 cents 1s., R. 1 1s.

The remaining values are as follows :—

	KEY.	BORDER.	PAPER.
Rs. 2.	Red.	Black.	Blue.
Rs. 3.	Blue Purple.	Green.	White.
Rs. 4.	Red.	Green.	Yellow.
Rs. 5.	Blue.	Purple.	White.
Rs. 10.	Red.	Green.	Green.
Rs. 20.	Black.	Purple.	Red.
Rs. 50.	Red.	Green.	White.

GIBRALTAR.—2s., 4s., 8s. and £1.

GILBERT AND ELLICE ISLANDS PROTECTORATE.—1d., 2d., 2½d., 4d., 2s., 2s. 6d. and 5s. (old D.L.R.).

JAMAICA.—2d. and 1s. (Nyasaland type).

The new design for the 2s. and 5s. stamps is shown in the Judicial stamps, but has not yet been issued without the overprint.

LEEWARD ISLANDS (sent to Antigua).—2d., 3d., 6d. and 1s.

NORTHERN NIGERIA.—½d., 1d., 2d., 3d., 4d., 5d., 6d., 9d., 1s., 2s. 6d., 5s., 10s. and £1.

The 9d. and £1 stamps are new values. The former is printed in the colours allocated to 10d.

ST. HELENA.—½d., 1d., 2d., 2½d., 4d., 6d., 8d., 1s. and 2s.

The 4d. and 6d. are similar to the existing issue, but the remaining values are of the large size and limited to postal use. The 2½d. stamp is from the "Wharf" keyplate and the view in every case is printed in black and the border in the colour appropriated to each duty on the colour scheme. Only the 4d. and 6d. values are on surfaced paper.

SOMALILAND PROTECTORATE.—1, 2, 4 and 6 annas and 1 rupee.

The 2 anna stamp is still on surfaced paper.

SOUTHERN NIGERIA.—½d., 1d., 2½d., 3d., 4d., 6d., 1s., 2s. 6d., 5s., 10s. and £1.

STRAITS SETTLEMENTS.—5 and 10 cents, and \$500.

In St. Vincent it has been notified for general information that St. Vincent Postage Stamps bearing the head of His late Majesty King Edward the Seventh, together with all other stamps of the present issue, will be withdrawn from circulation on the 1st day of January, 1913. The remainders will be destroyed.

---

NEW HEBRIDES CONDOMINIUM.—The stamps of the French series will no longer be on sale officially in Paris, but will be obtainable in the same way as the English series, by direct application to the Postmaster at Vila, New Hebrides.

---

### Book Received.

"ST. HELENA."—By Fred J. Melville. Published by the *Melville Stamp Books*, 47 Strand. 6d. net.

## RECENT TRANSFERS AND PROMOTIONS MADE BY THE SECRETARY OF STATE.

- MR. G. F. M. ENNIS (Chief Justice, Uganda), Puisne Judge, Ceylon.
- MR. R. B. RODEN (Police Magistrate, Barbados), Chief Justice, St. Vincent.
- MR. W. A. RUSSELL (Crown Advocate, Uganda), King's Advocate, Cyprus.
- MR. D. KINGDON (Legal Assistant, Gambia), Crown Advocate, Uganda.
- MR. C. P. HUGGINS (Clerk of the Courts, Jamaica), Stipendiary Magistrate, Trinidad.
- MR. H. C. MORCOM (Deputy General Manager of Railways, Gold Coast), General Manager of Railways, Sierra Leone.

# TINFIELDS OF NORTHERN NIGERIA

Via THE NIGERIAN RAILWAY.

AN ALL RAIL ROUTE is now open for both Goods and Passenger Traffic from the Port of Lagos, the capital of Southern Nigeria, to Rahama, the present terminus of the BAUCHI BRANCH, a total distance of 712 miles. A Weekly BOAT EXPRESS connects with both the Outward and Homeward MAIL STEAMERS at LAGOS, and consists of Saloon Carriages provided with modern conveniences, including a Restaurant Car, comfortable Sleeping Accommodation, Lavatories and Bathrooms, and fitted throughout with Electric Light and Fans. The Train runs through to Zaria (622 miles) in 45 hours and Passengers tranship there to the Bauchi Branch for Rahama.

2. At Lagos, Passengers and their luggage, etc., are conveyed to and from the Ocean Liner by a Tender which lands them at Iddo Wharf, where the Boat Express is drawn up. All Meals and Refreshments can be had in the Restaurant Car throughout the journey to Zaria.

3. The Passenger Fares from Lagos to Rahama are as under:

First Class ... .. £9 14s. 7d. Third Class (Servants only) ... .. £0 19s. 0d

There is no restriction on the quantity of baggage which can be taken by Passengers by the Boat Express.

The rates to Rahama are as under:—

First 2 cwts. ... Free. Next 20 cwts. ... 11s. 8d. per cwt. Next 20 cwts. ... 19s. 6d. per cwt.

Any baggage in excess of 2 tons 2 cwts. will be charged at excess luggage rates.

4. All goods are carried from Iddo (Lagos) to Zaria, Rahama and Kano at the same rates by the all rail route as by the river and rail route, and every facility is provided at Iddo for the handling of heavy and bulky articles of machinery, etc.

The rate per ton for machinery from Lagos to Rahama, or from Forcados to Rahama, is £18 3s. 3d., and for ore from Rahama to Lagos or Forcados, £13 17s. 6d.

For further particulars apply to the—

**GENERAL MANAGER, NIGERIAN RAILWAY, LAGOS;**  
**TRAFFIC SUPERINTENDENT, NIGERIAN RAILWAY, LAGOS;**  
or to the CROWN AGENTS FOR THE COLONIES, Whitehall Gardens, London, S.W.,  
from whom a descriptive pamphlet may be obtained.

# “HANDBOOK OF THE BRITISH COLONIAL EMPIRE.”

BY

W. H. MERCER, C.M.G.,

*One of the Crown Agents for the Colonies ;*

AND

A. J. HARDING,

*Of the Colonial Office.*

---

“ Whilst the ‘ Colonial Office List ’ is issued mainly for the use of the official world, the present volume is intended primarily for educational purposes and for the use of those desiring succinct and reliable information regarding the history, trade, government, and commercial development of the various outlying portions of the Empire. A large amount of useful information upon those subjects has been gathered together by the Authors, who, owing to their official positions in the Colonial Civil Service, have had exceptional opportunities for obtaining the latest and most authentic details regarding the present administrative and commercial state of all parts of the Empire. The book is well suited for educational purposes, and might with advantage be introduced not only into the schools of the United Kingdom, but adopted by Colonial educational institutions in order that students in any single portion of the Empire may know something of the history, character, and condition of all its widely scattered parts.”

*Journal of the Royal Colonial Institute.*

\* \* \* \* \*

“ The book is intended for educational purposes and is so attractively written, and contains such a fund of information, that it cannot fail to become popular.”

## EDITORIAL NOTES.

---

MR. BORDEN'S speech on the part to be taken by Canada in the naval policy of the Empire was the culmination of a long and earnest discussion in the Dominion. The subject was a very prominent one at the last elections and the whole country rang with the arguments. After the elections the question became less of a party matter. Few can doubt that Canada's interests in the high seas are identical with those of the United Kingdom. The continual growth of her maritime trade makes the maintenance of the Imperial Navy more and more important to her. The decision of the Canadian Government to recognise this position by the gift of three battleships marks a great advance in the solidarity of the Empire. Not long ago Dominion statesmen justified the naval abstention on the ground that Canada had provided means of transport of troops from east to west by the Canadian Pacific Railway. The present danger, however, is very different from what was contemplated then. It is put, with a directness which indicates the master hand, in the Admiralty memorandum (Cd. 6513). It is with no little gratification that the country has almost simultaneously received the offer of the Malay States, at the gate of the seas on the other side, not merely for the value of the gift, great as that is, but for the devotion shown by the native rulers to the cause of the Crown.

In this country colonies are mostly judged from their exports, and the brimming figures of wool and wine and the products of field and dairy from Australia convey the impression of a country which is pre-eminently agricultural. But the statistics tell a rather different story. The actual occupations of a people are best shown by the amount paid in wages, and in Australia the largest sum is that expended in metal works and machinery, and the second largest goes to clothing and textile fabrics. These facts help to explain the enormous preponderance of the population in the principal towns as against that in the country. They are largely due to the economic policy under which manufacturers are strongly protected, subject to their paying their employés rates of wages in which the profits made are in effect taken into account. The modern developments of agriculture also contribute to the process. An enormous amount of food is sent in to the towns to be prepared in factories for export, and the improvement of agricultural machinery is stimulating an engineering industry of which Australia has good reason to be proud. No doubt at the back of all this the strength of the country lies in its agricultural and pastoral resources, and the governments recognise the importance of opening up new districts and bringing in labour for them.

---

In the report to the Board of Trade on the trade of Australia for 1911 the British manufacturer comes in for the usual punishment for neglecting his opportunities and allowing foreign competitors to oust him. A percentage of over 61 per cent. of the imports, however, does not seem a bad performance, and a good show is made in the lines which Great Britain specially cultivates, and of which machinery and textiles are conspicuously the most important. It is observed that the position of the British manufacturer as a supplier of agricultural implements is unsatisfactory. His United States rival sells more than twice as much. But it may be remarked that an export trade is, as a rule, only a development of a domestic trade, and that a country cannot be expected to make for export, on any great scale, articles which are not in demand locally. The agricultural conditions of the United States are much more like those of Australia than ours are, and it is not surprising if that country turns out articles such as Australia wants more successfully than Great Britain. The general opinion in Australia is that the British manufacturer does not supply according to the requirements of the market. That this is not due to want of skill is shown by the fact that in machinery, a much bigger matter, Great Britain turns the table entirely. But no doubt better business could be done if the practice of the United States and

Germany were followed in appointing skilled and energetic agents. Our manufacturers are certainly behind the times in this matter, and the fact is sometimes attributed to their conservative character. A more concrete reason is the practice of relying on the London export houses, who, it is believed, would resent attempts to set up separate agencies in the colonies. The Board of Trade, however, is doing good work in facilitating the appointment of agents in Australia.

---

The Federal Capital City, to give it its full title, of Australia offers a large scope to the designers. It is not a case of providing merely for the public buildings but of planning the whole of a city, with provision for railways, tramways, parks, ornamental waters, places of amusement, and "sports areas," and with due regard to hygiene, prospect, and future expansion. One hundred and thirty seven designs were sent in in the competition, and it is hardly necessary to say that the judges did not agree as to which was the best. The site is flat and very well watered.

---

Eventually the Northern territories of Australia will see the introduction of the camel as a means of transport, and it is likely that this well-tried animal will be found eminently useful. Already there are over a thousand in Queensland and the number is rapidly increasing. The territories will certainly require many novel propositions for their development and at present Australia is too busily engaged on lucrative business which it understands to go so far afield. Nevertheless, in the future, the possession of this tropical district will be an enormous boon.

---

In Queensland the production of sugar appears to have settled down to a steady figure. There are 4,238 proprietors engaged in it, and the whole Australian production amounts roughly to six-sevenths of the quantity required for local consumption. White labour in 1911 produced 94.42 per cent. of the cane, so that the policy of granting a bonus where such labour is employed is successful at any rate in the immediate object. The bonus paid was £498,868, representing 1,448,778 tons of cane. Each acre crushed yielded 16.02 tons of cane, and 1.81 tons of sugar.

---

A noteworthy fact in the Australian "universal training" scheme is the extremely low percentage of "junior cadets" who are found on medical examination to be unfit, temporarily or otherwise. Up to the end of June 1912, it was 2.3. It was higher but still very low for senior cadets, viz., 7.6. These figures, which may well provoke envy in older countries, are the more significant as the obligatory clauses have been, owing to the

expenses attached to the initiation of the scheme, at first confined to the large cities and the more populous of the country towns. Four hundred and forty six training localities, however, had been established by that date, and the total number actually in training was 89,074. This is a good start, and it would have been a little better but for the fact that many magistrates dismissed cases in which prosecutions were instituted for neglect to attend parades. This was on the ground that the year was not then completed and that offenders would have plenty of opportunities to comply with the act before it was. The authorities complained that these decisions were unsound, as absence from any one statutory parade is an offence and the magistrates had no right to assume that there would be "plenty of opportunities" afterwards.

One of the economical lessons which all the world is learning, is that agricultural welfare rests with the small holding. The United States have been a country of large holdings, but the opinion is growing that they are a mistake. The best results are got from a man who owns no more than he can properly manage, and with the advance of scientific farming this quantity is continually growing less. There is no country in the world where the lesson is so much wanted as South Africa. In the Transvaal the average farm is 5,000 acres, against 143 in the United States, 63 in Great Britain, and 14½ in Belgium. The vast stretches of veld have been in this sense a mischief. Often all that the 5,000 acre farm shows is a poor cottage, a few starved cattle, a mealie patch, and some five acres of pasture. There are companies with vast territories which hardly show a trace of intelligent cultivation. There has been a sort of land hunger which has drawn all classes into great schemes which have gone far beyond the possibilities of the population. "The South African Agricultural Journal" gives evidence of what the result is. "It stands for poor farming, persistent crop failure, poverty, and national stagnation." One of the best object lessons is given by Belgium. There is a common opinion in this country that the sub-division of land in France and Belgium has been carried too far. There may have been some grounds for this view when agriculture was less scientific, but there are none now. Belgium contains the poorest land in Europe, but, with the single exception of wheat, it produces the best yields per acre in Europe. The best conditions of success are (1) small holdings, (2) freehold or at least long leasehold tenure, (3) co-operation. It is not easy in South Africa to secure these conditions within reasonable distance from a railway, but the necessity for small allotments is obvious and the Government has appointed a commission to consider the whole question. Apparently no great expansion of the mining industry

is in prospect, and the best hope for the employment of a white population lies in small farms. For this task two operations will be essential—the deep bore and dry farming. The average depth of bore in South Africa is 140 feet, and the cost about £55. The example of Australia is extremely encouraging in this matter. There the cost of sinking an artesian well is higher, about 20s. per foot, and the depth greater, extending to almost a mile, but the good done is incalculable.

---

Mr. Sothern Holland's report on the trade of South Africa contains some suggestive observations as to the value of the native as a purchaser of imported articles. There is no precise way of ascertaining what proportion of these goods is bought by the native and coloured population, but at an estimated figure of 3s. 6d. a head in the Cape Province and 2s. elsewhere, the value comes to £6,351,580. This basis of calculation is conservative, and, in any case, the amount is sure to increase rapidly. Whenever it is open to him to do so, the native is now beginning to do skilled work and shows himself a competent workman. Every year education and increasing contact with civilization add strength to this movement, and an enormous new field is opening out for imported articles. Thus the vast numbers of South African natives are acquiring a new economical value. It is true that everything that is possible is done to reserve skilled work for white labour, and the steady advance of the native artisan will be watched with much suspicion and apprehension. But it will be largely realized as the country progresses that the black man's gain is not the white man's loss, and that all work enriches the whole country. The natives in any country cannot be expected to acquire new tastes and wants while he retains primitive habits of life, and the best way of inculcating a proper appreciation of the white man's wares is to make a good workman of him. In no long time at the present rate of progress the buying power of the South African native will become so great as to constitute a new force in both commerce and politics.

---

Up to the present the natives in our possessions have worked on their holdings individually, and when any scheme requiring capital and combination has been introduced it has been European. It may be expected that as the natives assimilate advanced ideas they will begin to form companies and embark on large undertakings themselves. It is perhaps surprising that so little has so far been done in this direction, but a noteworthy start has been made in South Africa by the formation of a Native Farmers' Association, which has purchased and stocked some 13,000 acres. There are twelve directors, and the memorandum of association

sets out that the objects of the Company include teaching natives the advantages of farm life, as contrasted with the evil influences of the towns, and gradually introducing improved methods of farming and stock-raising. The enterprise emanates from the Transvaal, and if it is successful it is likely to be followed by many others. Ideas run fast through the native races, as is shown by the rise of the Ethiopian Church, provided they are clear and definitely indicate an attainable advantage. The opportunities in South Africa are of course enormous. In most places agriculture where practised at all, is of recent origin, and as the virgin soil has easily produced mealies or Indian corn little else has been thought of. Later on it will be found necessary to study a rotation of crops, and with the increase of stock suitable food products will be required. All this means a great amount of work, and there will be openings for combination, both in the Union and Rhodesia, such as the coloured races have never had elsewhere. Development on these lines will have a profound effect on the racial character.

---

The South African Defence Act, the provisions of which were summed up in a previous number, will have an important influence on the country apart from its military value. It will do much to consolidate the two white races. Companionship in arms does more than anything else to create the feeling of brotherhood. The differences between Dutch and British, as individuals, were never deep, and now that the political conditions which kept them apart are removed the process of coalescence will go on fast. Self-government enables the population to deal as a whole with matters which inevitably created racial parties so long as influences from outside were at work. The party divisions of the future will probably represent generally the agrarian and the mining interests, and, though these at present largely follow racial lines, in course of time there will be a strong element of each race in both camps. A great evolution is now in the making which will make South Africa a vastly different country from what it has been in recent years.

---

The anti-trust legislation in the self-governing dominions has been collected and given to Parliament (Cd. 6439). In Canada the remedy against a combine which causes detriment to consumers or producers is to admit the articles affected duty free or at reduced rates of duty so as to give the public the benefit of reasonable competition. The measure is based on the belief that protection encourages the limitation of competition and the formation of trusts, and this was put in unstinted terms by the Minister

of Labour when he said: "The Government in a protectionist country by its fiscal policy makes the whole country a huge trust, that is to say, puts blue-coated, brass-buttoned gentlemen on the shore to shut out foreign competition. To that extent the country becomes a huge trust, and it resembles a trust in this, that it takes from its consumers very much more money than what it gives in return is worth." In Australia the act is directed in effect against combines which resort to "unfair competition." Here, as is natural in a protectionist country, the evil is considered to be, not that there is too little competition, but that what there is may be unfair. Various instances are given of unfair dealing, but as the Act is a criminal one exact evidence would be necessary and there would be much practical difficulty in working the measure. A long government enquiry has been going on which illustrates this. The object is to ascertain whether there is a meat trust in Australia, a matter over which public opinion is greatly stirred. There is abundant evidence that the Americans are endeavouring to establish a market there, but the existence of a combine for this purpose is stoutly denied, and clearly for criminal purposes stronger proofs would be necessary than that which satisfy a commission. The New Brunswick Act is limited to telephone, water, heat, light and other public services, and constitutes a board to regulate charges in such cases; it was quickly followed by a charge of excessive rates against a telephone company. The New Zealand Act prohibits the sale by a trust of certain articles at a price which gives more than a fair and reasonable rate of commercial profit. Thus in Canada the apprehension is that the trusts may raise prices too high, while in Australasia it is rather that they may make them too low. The movement against trusts is however, common to both, and is likely to be maintained till experience shows what is the most effective policy.

---

The collection also includes the Post Office Administration Act, 1911, of South Africa, which prohibits a mail contract with any person who is connected with any combination deemed detrimental to South African trade or industries, or who offers a rebate in consideration of getting the customer's entire shipments. These provisions were aimed at a single case, and now that the mail contract has been settled and the Union Castle Company has abandoned rebates they have for the time being no further application. But there is a strong sting in the further provision under which dock, and other dues and railway rates, may be differentiated against any such person as above described. This extends the war against rebates from the company which gets the mail contract to all others which trade with South Africa. There

are five other shipping companies, and a form of agreement has now been settled on the basis of definite rates and without rebates.

---

In an article in the "National Review," Mrs. Conyers Alston, in the course of an interesting description of South Africa, remarks that: "South Africa, paradoxical in this as in so many other directions, remains a protest against Buckle's theory of climatic and geographical influences, for the Dutch children of South Africa are an extremely sober, not to say heavy, little people. No fairies lurk in the South African bluebell, no pixies haunt the caverns and the rocks, and birds and beasts do not talk." But South Africa is not really peculiar in this matter. The fairy tales have not come from the sunshine of the South but from the gloomy woods of the North. They represent the spirit of romance and sentiment which has sprung up in an atmosphere of vague outlines and changing colours. They are not at home on the hard clear veld, and whatever literature for children or adults South Africa may produce it will certainly not be such as grew up on the Rhine or on the Thames. There will be no Spencer, Shakespeare, or Goethe in it. The myths or folk-lore of such a country are the summary of its worldly wisdom rather than the creation of imagination and sentiment, and its future literature will inevitably be shaped in the same way.

---

Rhodesia is benefiting considerably from the growing prosperity of South Africa. Prosperity, unfortunately for new-comers, sends up the price of land, and this process is going on all over the South, but Rhodesia can still offer the attraction of cheap land and easy terms, and settlers are coming in fast—many of them having sold holdings down South to take advantage of the lower prices. The result is that an agricultural development is taking place which is not equalled anywhere else in South Africa. Unimproved land can be obtained from about 4s. per acre, and though the price goes up with irrigation or proximity to railways and settlements it remains very reasonable. There are also arrangements under which occupation is permitted with an option for purchase which is open for 10 years or more. The British South Africa Company itself sets an example to the settlers by its own farms, which are conducted as commercial undertakings and constitute a good model; thus the agriculturist in Rhodesia has not only the help of the Agricultural Department as a scientific mentor, but also that of the Company in the capacity of a fellow worker. A very good class of settler is being obtained, and the standard of social life is remarkably high.

In Nyasaland satisfactory progress was recorded in 1911-1912. The weather was bad for cotton, but it is fortunate that when this is the case tobacco flourishes. The annual report observes that the two crops are admirably calculated to balance each other, the one being as much benefited by excessive rain as the other is injured by it, while a normal year should produce good crops from both. Tobacco needs less labour than cotton, and is of the two perhaps the crop less liable to complete failure, and it is possible that it will ultimately take first place as the Europeans' standard crop in this country. Among natives, on the other hand, the cotton industry is every year obtaining a firmer hold and nothing but a very heavy fall in the price of cotton is now likely seriously to check it. The product is suited as few others could be to the native's present stage of development, and though he has yet much to learn as to its cultivation and grading, he can produce an excellent quality of cotton in quantities which pay him well. The system of cotton markets now being instituted by the Government in the principal native cotton districts will promote competition and secure for the native the best prices for his produce.

The decay of the power of native chiefs and the tendency all over the Protectorate to the splitting up of villages into small family groups continues: this tendency is to some extent gratifying in that it originates in the native's sense of the complete security under the existing Government and goes far to guarantee a peaceful and contented future for the native population of the Protectorate. It becomes increasingly clear, however, that some paid native local authorities are required who shall be responsible to the District Residents for the good order and administration of their villages or areas.

The financial burden thrown on the Protectorate by the guarantee of interest on the capital needed for the Zambesi—Port Herald section, and by the redemption of the subsidy lands pledged to the constructors of the Shire Highlands Railway, is a heavy one; moreover, the actual process of construction may have the effect of raising the price of labour and thus adversely affect local industries; but the community realises that the solution of the commercial difficulty is justified.

---

The report of the Nyasaland Native Civil Service Committee deals with a question of interest to many crown colonies, viz. the conditions on which natives can be employed as civil servants. At present the native staff in Nyasaland, numbering 152, serves under temporary agreements, and has no regular scale of pay or pension rights. They have, it is stated, acquired their education and training in a rather haphazard fashion either by means of a Mission school or during the course of their employment in

Government service. Nevertheless, they are, generally speaking, a useful body of men capable of improvement; they take a cheerful interest in, and are quick to learn their work but their usefulness is impaired owing to a limited knowledge of English and lack of opportunity for suitable training prior to entering the service. Except in a few instances, native employees know very little English and are not the best type obtainable, which is explained by the fact that so many natives holding high school certificates go to South Africa in search of better pay so soon as they leave school or after a few years in local employment.

The Committee were of the opinion that the institution of an organised Civil Service, the entrance to which would be by competitive examination after a few years' training in a Government school and improved conditions of service in the way of a regular scale of pay and provision for old age, would not only improve the standard of usefulness of the native staff, but also secure and retain the services of the best educated men who at present leave the country.

The proposed terms are:—

- (a) on entering the training school, 5/- per month food allowance.
- (b) as 4th grade clerks ... .. £12 to £15.
- as 3rd " " ... .. £17 to £21.
- as 2nd " " ... .. £24 to £36.
- as 1st " " ... .. £40 to £60.

Ultimately this scheme would prove economical, as it would cover duties which would otherwise have to be performed by Europeans or Indians. An important feature of it is that, before entering the proposed Government training school, candidates would be required to sign agreements to serve for five years, including two to be spent at school.

It appears from the Colonial Survey Report, 1911-12, that in that year 30,000 square miles were topographically surveyed in British Africa. Eight sheets of Uganda, covering an area of 30,000 square miles, were published, representing the largest block of topographical mapping in tropical Africa which has yet been issued, and indicating very clearly the great advance made in recent years in the extent and accuracy of the surveys of the continent. The delimitation was completed of the frontier between Uganda and the Congo, in the 'Mfumbiro district, and also the Uganda-German East African boundary to the east of Mount Sabinio.

A meeting took place in June, 1911, between representatives of the Belgian and British Governments to discuss the procedure and methods of work to be employed on the Rhodesia-Congo boundary commission. The commissioners left Europe in July,

1911, and met at Sakania on the 1st September, 1911. This frontier is over 1,100 miles in length and it is estimated that the work will extend into 1914, and the result of their labours should add largely to the geographical knowledge of this portion of the Empire.

Preliminary arrangements have been made to appoint commissioners to delimit the boundary between Rhodesia and the Portuguese colony of Angola. It is hoped that the Commissioners will rendezvous at the junction of the Congo-Zambesi watershed with the 24th meridian east of Greenwich on or about the 21st March, 1913.

The boundary between Southern Nigeria and the German Kameruns, lying between Yola and the Cross River, has been ratified since the close of the year under review, and it is hoped to send out a commission, under one of the officers employed on the original boundary commission, to mark out the new boundary on the spot.

A commission left Sierra Leone in 1911, to delimit the new boundary between that colony and Liberia. Owing to unexpected difficulties, the commission made practically no progress and returned to Freetown.

---

In many parts of West Africa it might easily be inferred from appearances that land should be plentiful and cheap, but it will be found that the native will tell you that there is little to spare. There is some truth in this, as a population which would be scanty in a civilised country may be dense when methods of cultivation are wasteful and require a great amount of room. In addition there is often great unwillingness to sell. In an interesting report, which has appeared in the "Southern Nigeria Gazette," Mr. A. J. Findlay remarks of the district of Aba, that the landowner evidently clings tenaciously to his land even although he derives no benefit from it and never will so long as it is under bush. Thus the impression that there is abundance of land is a false one, as it is for the purposes of a buyer scarce and high-priced. The result is that it is difficult to effect improvements. The natives of the oil-palm districts rely on palm oil for what money they require, and for food he is content to grow yams and such produce for a few years and then to allow the land to revert to the bush. A permanent crop, such as cocoa or rubber, does not appeal to him. It is not likely that there will be much change in this respect till the oil-palms are fully tapped.

---

The French territory in Central Africa, in the region known as "Ouhangui-Chari-Tohad," is interesting to us because its history is closely linked with that of Nigeria and because difficulties similar to ours have been encountered. The French have every reason to be

proud of the heroism which has been shown in the struggle with Rabah and the Senussites. The territory stretches from the German Cameroons and Lake Tchad to the Egyptian Sudan, and only a conventional line separates it from the desert on the north. The work of pacification in this vast region is still far from complete, but it has gone far enough to produce great changes in the population, which has been recently estimated at 2,545,000. This population is roughly divided into two groups, the fetish-worshipping races of the south and the Mohammedan races of the north. Before the arrival of the French the one class were the continual prey of the other, and to escape slavery or massacre were constantly flying to the mountains or forests for shelter. This process has gone on for centuries, and probably to this cause are largely due the smallness of the population and the arid and sterile condition of the country. The slave hunters are still represented by nomad Berbers, who preserve their hold of Borhou and Tibesti and who, being well armed with modern weapons, are no mean antagonists. The colonial authorities are anxious to crush these bandits, while in France objections are urged to further operations in a country which does not seem economically promising. Probably, as in similar situations of our own, the problem will be solved by a gradual process. For the present the difficulties of the French come from the Mohammedan races, and the result is that Islamism is not regarded by them with tolerance and even appreciation common in our colonies, but is looked upon as mischievous and dangerous.

---

Reports on all sides testify to the spread of Mohammedanism in our possessions, and the usual explanation is that this religion allows polygamy. But this consideration cannot appeal to the majority of men and does not explain the enthusiastic devotion of great numbers. There are other causes at work, and one which makes the propagation of the faith easy is that the religion is not represented by any church in our sense. There are no priests or officials. Births, deaths and marriages call for no intermediary between Allah and the faithful. There being no ecclesiastics there are no rites or ceremonies or sacraments. There are various religious orders and persons who exercise a great influence by virtue of mystical exaltation or severe asceticism, but they are not a necessary machinery though they readily rise up when the conditions call for them. An impressive feature of the religion is the open-air celebrations, in which people of all ages join, giving full rein to their ecstasies and often torturing themselves before the public gaze as they move on; these spectacles, while leaving a profound impression of horror on the ordinary European, have an enormous influence on less civilised nations. With them the religion, unaccompanied as it is in these

forms by any machinery for the teaching of dogma, blends easily with the superstitions from which they start. Education is generally strictly limited to reading the Koran; it borrows nothing from modern knowledge and leaves the population deplorably ignorant. The French authorities are supplying the deficiencies by building on the existing foundation. The Franco-Arabian schools provide for the teaching of the Koran by natives all the morning, while the afternoon is devoted to the usual primary education in French. But nomad marabouts are severely warned off French territory.

---

From time to time there have been visions (in the French press) of a great native West African army, and some disquietude has been caused by the possibility of such a force and the uncertainty as to how it might be used. The large populations that could be drawn on and their reputed warlike qualities made the task seem easy. But after some fifteen years' experience it appears that there are serious difficulties. The natives discover that trade or agricultural work is more profitable and less painful than regimental life. In the heroic period, when the French conquests were in progress, it was fairly easy to get recruits, especially as in such times it was reasonable for the warriors to expect a certain amount of loot; but now that this advantage has been lost and columns are seldom on the march the monotony of garrison life becomes an affliction and the recruits drift away. The training of reserves is also peculiarly difficult, because it takes the native a long time, as he does it, to get to the appointed place. It is considered that mobilisation for the defence of Dakar would take three months. Colonel Mangin, in the estimate which originated the idea of a great French West African army, considered that 40,000 voluntary recruits could be obtained each year, but the Governor-General, M. Ponty, has stated that it would not be possible to exceed a levy of 8,000 to 10,000 men without risking a check to the development of French West Africa, and without using compulsion. Complaints have been made, and to some extent recognised by the Administrations, that the recruits have been obtained by objectionable methods. In short the native who was accustomed to serve his chief readily in times of trouble will not serve the French Government when nothing which he has is threatened. "C'est purement et simplement le rêve des troupes noires dissipé."

---

In Ceylon the census of 1911 has disclosed a growth of the capital which has outstripped all expectations. The population of "Old Colombo" is now 201,380. The growth is, however, in a sense artificial, and the Superintendent remarks that "the permanent population of Colombo may be said to be the stranger within her gates." The natural increase only accounts

it is reckoned, for about 8 per cent. of the total increase, leaving 92 per cent. to be accounted for by immigration. The population is increasing by a third, at least, in each decade, to say nothing of a daily passenger population. This means an extension of the suburbs, especially as a large part of the new population will not be satisfied to live in overcrowded quarters. The consequence is that public works schemes, such as that now in hand for the drainage of the town, will have to be considered with a view to a considerable enlargement of the area.

---

The trade of Fiji in 1911 exceeded the largest previous value by more than a quarter of a million. A survey is to be made of native lands, and this will, no doubt, be useful and beneficial in the administration of the lands which will be leased by the Government on behalf of the native owners. In past years a great amount of somewhat academical literature was written about the alienation of native lands in Fiji, and a policy of restriction was followed; but it is now realised there, as elsewhere, that if the country is to be developed there must be practicable means of obtaining land, and the system has been altered to enable the Government to make grants. The construction of a railway from Suva through the Rewa Valley has been under consideration. An important change in the constitution has been made, two elected members of the Legislative Council having been appointed members of the Executive Council. There will certainly be no lack of work for this body, a very extensive programme having been set out in the Governor's address to the Legislative Council.

---

The meeting of the Central Quarantine Authority in Barbados in August was disturbed by the fact that British Guiana thought it sufficient to agree to the suggested alterations to the Quarantine Convention and Regulations and did not send a delegate. It was considered at the meeting that in consequence of this the Authority was not properly constituted. In the scheme laid down by the Secretary of State, it was provided that the Authority should include one delegate from each of the Governments adhering to the West Indian Inter-Colonial Sanitary Convention. It was argued at Barbados from this that the attendance of a delegate from each of those Governments was essential to the proper constitution of the Authority, and the members decided that they could sit only as individuals and send in their opinions merely for what they were worth. No doubt the absence of an important member of a body may have the effect of restricting discussion or decisions, but it seems to be a new doctrine that such absence invalidates the proceedings of the others. This would be the case when the express consent of

each member is necessary, as in the case of a trust, but in deliberative assemblies of every kind the majority decides, subject to the constitution of a quorum or to any specific provisions applicable, and it is immaterial if any members are absent. It was apparently thought that the absence of any provision for a quorum made it necessary for each colony to be represented, but it may be submitted that a quorum represents only a minimum number and that the only effect of not providing for a quorum is that the body can act on the powers however small the attendance. However, a very useful discussion took place, the most important new proposition being that suspected cases of infectious or contagious disease should be notified by the colonies. This is the usual practice now, but it would be a step further to make it obligatory. It was also proposed to make it compulsory, where there are plague-infected rats, to prevent access of rats to ships or to secure their destruction on board. The inter-colonial schooner traffic is very big, and distances between the islands are quickly covered when the wind is fair, so that unless some such provision is made it is only a question of time when the colonies will be infected with plague through the importation of rats from Trinidad.

---

In Jamaica the year 1911-12 recorded a high water mark in the values of the imports and exports, and the impression is that the general revival of trade has elements of comparative permanence in it. The November storm unfortunately did very serious damage, but such misfortunes, regrettable as they are, do not affect the essential elements of the island's prosperity. They have to be looked upon as occasional risks such as most undertakings are exposed to, and should be provided for, as has been done in Jamaica, by some form of insurance. Appeals to philanthropy in such cases do not fail, but they tend to set up impressions which exaggerate the damage and the risks, and thus do harm to the colony. Some instructive figures are given in the annual report as to the effect which the tariff reductions had on consumption, and it is clear that the increase of consumption was very considerable. This is not solely a question of price, for an article's cost may go up in the country of origin, but this is a gradual process; a reduction of duty produces an immediate effect, as the merchant is encouraged to import more and aim at a wider distribution, which may remain established when the price advances.

The Government railway shared in the general prosperity, yielding a net earning equivalent to a dividend of £3 9s. 9d., and certainly shewing very efficient management.

---

The legislation passed in Jamaica to deal with persons who steal growing crops from the field has received a good deal of

attention, as it is an attempt to check by special methods an abuse which may become very serious but which easily escapes detection and punishment. The Journal of the Jamaica Agricultural Society gives an interesting account of the "Authorized Persons" who are specially empowered to arrest offenders who are caught in the act or reasonably suspected. It states that "prædial larceny, or the stealing of growing crops from the field is a form of theft very common there; in other countries where there are more towns other kinds of stealing, such as breaking into houses or burglary, are most common, but there crops are often grown far back from houses, without any protection; no hedge, no wall, often no wire fence even, and so products are very easily stolen without much chance of the culprit being caught in the field; crops too are such as can be easily sold in small quantities, and are often such as can be used for food right away without other preparation than cleaning or peeling and boiling. The plan of having authorized persons is an attempt to check prædial larceny by appointing representatives of Agricultural organizations such as Branch Societies, authorized to stop any persons found carrying produce under suspicious circumstances and ask an explanation of how the article or articles were come by. This is an addition to the law which permitted previously only authorized constables to arrest people for prædial larceny if they were actually found in the field in the act of stealing. Here we have now a set of private persons authorized to stop persons suspected of stealing crops; and if the circumstances are sufficiently suspicious to arrest the person. Any person who is in honest possession of anything can and should readily explain. Some mistakes will be made sometimes, in a perfectly honest person being so stopped, but these will be exceptions and uncommon. The authorized persons are usually men of discretion and judgment, are expected to be so, and would not stop anyone, or make an arrest without being very sure of the circumstances being very suspicious. Usually prædial thieves are habitual; only in times of severe stress as during a long drought does the stealing of food crops become rampant. Now these authorized persons under the law appointing them, are not policemen in any way; they are not under the control of the Inspector-General of Police, or under the authority of the local Inspector, Sergeant, or Corporal of Police as Authorized Persons. If an authorized person breaks the law himself, of course he can be dealt with like an ordinary individual. If, however, he misbehaves in connection with his duty as an authorized person, he cannot be dealt with like a district constable or one of the police, by the Inspector-General fining him or dismissing him. Authorized persons are not policemen. They are nominated by Agricultural Societies for appointment,

and these Societies are expected to understand the importance of this matter and only nominate such persons as are of good character, well-behaved men interested in their appointment and likely to be vigilant. It is advisable, too, that these men should in all cases be members of an Agricultural Society: it would be wise if those proprietors who have nominated men and sent the names to the Agricultural Society for recommendation, would also consider the advisability of getting the men they propose for appointment to become members of the nearest local Agricultural Society, where there is such a Society at hand. And it would in all cases be wise for any Branch nominating men in future, to have their nominees attend a meeting and have their proper duties explained, what they are expected to do, and may do under the law. Some branches ask their authorized persons to attend a Branch meeting once every quarter, and report on what they have done in the way of their duties. This is a very commendable practice."

The annual report remarks that: "The employment of "authorized persons" appears to be acting as a check on prædial larceny, less on account of the amount of arrests effected than on account of the greater apprehension diffused in the minds of the prædatory class by their knowledge of the vigilance of persons habitually living among them other than the ordinary police.

---

The speculations as to the effect of the Panama canal on trade routes are usually based entirely on calculations of the distance which can be saved, and no doubt this is the principal consideration. But it is not by any means the only one, and even it will be discounted to a substantial extent by the canal tolls. After the distance, the most important point to a ship is the traffic which it can pick up en route. The Suez canal not only shortened distances for many important lines but gave a more busy and remunerative route. But this will hardly be the case with the Panama canal. Thus the vessels which ply between Great Britain and Australasia via the Cape get the substantial advantage of the South African traffic, and it is significant that in recent years this route has gained at the expense of the Suez canal. Next comes the matter of coal and water, and for these purposes the South African ports will have a great advantage. It seems probable that with the progress of South Africa this Imperial route between Great Britain and Australasia will hold its own. Probably some concessions will be made at the South African ports to encourage shipping.

---

The key to the character of a colonial administration is contained in the annual estimates of expenditure, and these display

a great variety of objects. We have never, however, except in the case of Malta, which supports an opera house, but which is hardly representative of British customs in such matters, come across an instance of a financial provision such as appears in the budget of the government of Madagascar. This is for a *corps de ballet*. Our treasurers seem to overlook entirely this and the like requirements of civilisation. It is not so in France. It is true that "*la cour des comptes*," which no doubt displays the same pettifogging instincts that characterise similar bodies in our own system, has commented severely on the sums spent in Indo-China on subventions to theatrical companies, but this outburst is apparently provoked by the excessively large amounts. The drama follows the French flag, and no colony is complete without it.

---

The Secretary of State has decided that on the next revision of the Colonial Regulations the term "Crown Colony" is to be eliminated. The editors of the Colonial Office List have from time to time received complaints, the informality of which did not interfere with the vigour of their expression, of the application of this term to certain of the West Indian colonies: but, as their functions in such matters are of course limited to recording the decisions of the powers that be, they could only return the uninspiring reply that the category was official. The inclusion under one head of the colonies which have independent legislatures and of those which have not has become more inappropriate in recent times in consequence of the addition to the empire of great territories which are still in an early period of development so far as constitutions are concerned. In these cases the policy must be largely directed from home, but it is certainly desirable to distinguish such places clearly from those which have long enjoyed representative institutions.

## THE MANOR OF MARYLAND.

"A Colonial Governor in Maryland; Horatio Sharpe and his Times." By LADY EDGAR. (*Longmans Green & Co.* 10s. 6d. net).

THE Colony of Maryland was constituted by a charter as a property to be held from Windsor Castle in free and common soccage, "by fealty only for all services, and not in capita, nor in knight's service, yielding therefore unto us, our heirs and successors, two Indian arrows of these parts, to be delivered at the said castle every year." The people were granted participation in making the laws and exemption from taxation by the Crown. The province in fact was a palatinate, an institution created by the Merovingian Kings of France, under which in course of time exclusive powers, almost kingly in character, were bestowed upon great vassals. It is easy to see at this date that the great measure of independence given to the American proprietary colonies from the start launched them well on the way to full self-government. This, of course, was far from being the intention at the time. The idea was simply feudal. The charter was of a type familiar in England. The Lord proprietor could coin money, create courts, appoint judges, pardon criminals, and exercise all the royal rights enjoyed by the Bishop of Durham within his county palatine. While such a charter created a sort of hereditary monarch, it conferred great rights on the people under his jurisdiction. Thus the Maryland charter declared that no tax or custom should be imposed on the settlers by any British authority, and laws were to be made by the proprietor with the advice and assent of the freemen or their deputies. It was followed by the "Conditions of Plantation," laid down by the first proprietor, Lord Baltimore, under which lands in fee were conveyed to "adventurers." Thus the constitution was largely democratic, the lord having in effect a power of vetoing legislation. The feudal system in fact, though its remains at this day are popularly associated with aristocratic privileges, in its day lent itself readily on British soil to liberal institutions, as it fully recognised the value and rights

of the vassals. The charter gave to the place in question what Great Britain as a whole had not got, viz., a written constitution. The model, under which the lord proprietor or the governor representing him and the officers of state appointed by him stood apart from the popular assemblies, is preserved in some of the West Indian constitutions and in that of the United States.

The proprietary rights inevitably dwindled with the growth of population. An absentee proprietor was in no position to contend with a spirited body of colonials who stood constantly on their rights, and the tendency was for him to leave matters alone so long as his pecuniary rights were respected. The proprietary idea was, however, in due course attacked from another quarter. When the British Parliament began to attempt control over the American colonies, the charters stood in the way. They were then "subjected to inquisitorial torture"; on one excuse or another the policy was to revoke them and to turn the proprietary colony into a "royal province." The real question became one between Imperial control and independence. The early conflict with the Colonies was caused largely by this revocation of charters. This step opened the door to the imposition of taxes and eventually brought about the revolt. The petty tax on tea which figured as the cause of war might have been endured but for the substantial fact that the right of self-taxation had been given and then taken away.

The case of Maryland was somewhat peculiar in that the charter, though at one time revoked, was at any rate to some extent restored. This exceptional result was due to the astuteness of the proprietary family with the authorities at home. In other respects the settlement shared the story and characteristics of its neighbours, and, though Lady Edgar does not attempt to give a complete narrative, her account of one of the most interesting governors, compiled as it is largely from private sources, gives a remarkably vivid picture of the contentions of the times and of the views held at home and in the colony. Colonel Horatio Sharpe reigned for sixteen years, from 1753, and, as Lady Edgar remarks, this period covered some of the most eventful days in colonial history. From the very commencement of the settlement a struggle had gone on between the proprietor and the settlers. For one thing the Baltimores were then Roman Catholics, and most of the members of the upper house were of the same religion, relatives and trusty friends of the proprietor. But the Protestants were in a majority of more than ten to one, and these were not days of toleration. The flight of King James II to France was the signal for an anti-papist agitation in most of the American colonies, and in this Maryland was conspicuous. It was in fact a revolution, bloodless and successful. King William supported the colonists and Lord Baltimore's political control was

cancelled. About a quarter of a century afterwards, however, the province was in a sense restored to the grandson of the deposed proprietor, but the lost ground was never wholly recovered. It cannot be said that the Council and Assembly under the new style established a creditable record. They passed several intolerant Acts which were disallowed by the Crown. It is true that they established the Anglican Church and levied an annual poll-tax of forty pounds of tobacco for the support of the clergy; but it is recorded that as the quality of the tobacco was not specified the few clergymen in the province came near starving. However, they did establish schools, of which there were none under the old regime.

Colonel Sharpe arrived as the representative of the proprietor at a time when the Colony was hard pressed by both the French and the Indians. As in England, it was the wars that developed the powers of the people. The Governor of Maryland had to go to the popular assembly for supplies, and it was the same in the other colonies. Co-operation was clearly necessary, and so early as 1754 a congress of the colonies adopted a form of union, drawn up by Benjamin Franklin, which provided for a council representing all the colonies and a president. Nothing came of this proposal as it was considered too democratic by the home government, but it contained the germ of the American constitution. Meanwhile, the home government decided to send out two regiments of foot to oppose the French. An order, which had a serious consequence, was given that officers of the provincial troops should have no rank when serving with officers commissioned by the Crown. A young provincial colonel of promise, named George Washington, would not accept this regulation and retired into private life with a grievance. There was no difficulty in getting volunteers for service, but the assemblies, particularly in Maryland, Pennsylvania and Virginia, persistently refused to grant supplies for the maintenance of the troops, and it fell to Governor Sharpe to propose that the British Parliament should pass a Bill making it obligatory on the colonies to contribute to the defence of His Majesty's dominions. He suggested a stamp duty on deeds, and this was the origin of the Stamp Act which ten years later convulsed the country. He received, however, at the time no help in this quarter, and had a vast amount of trouble with the Assembly, which would only vote money in a way to which the Upper House would not agree. The taxes which the Lower House proposed touched the proprietary estates, and while on the one hand it was contended that these should bear a fair proportion of the cost of defence, on the other it was claimed that they should be exempt. The Assembly took a view of the matter which would nowadays be generally considered reasonable, but in those days privilege was strong and it seemed to the Governors odious that taxation should cover all persons alike, that the collection should be in the hands of

the people, and that the troops should be virtually under their command. This was quite contrary to the proprietary idea and to the mental habits of the gallant soldiers who were sent out to administer the government. Eloquent appeals were made to the patriotism of the Maryland Assembly, but the supply bills remained saddled with conditions that the Governor could not accept, and eventually the companies were without pay and were granted furlough for an indefinite period. Certainly the Governors were in a very unenviable position between the home government and the proprietor on the one side and the sturdy colonists on the other. The struggle between the proprietary interests and the local opinion was similar in character to that which in our own time has occurred in Rhodesia, but its importance was enormously heightened by the severity of the long-drawn contest with the French. At that time, some hundred and fifty years ago, France claimed the whole of the vast area lying between the Gulf of Mexico and Hudson Bay, and England held only a narrow strip along the Atlantic coast. The English, it is true, were enormously superior in numbers, for they were about eleven hundred thousand, while the French were about sixty-six thousand, but the latter were soldiers to a man, under one leadership, and with the Indians for allies. Eventually in Pennsylvania the Governor submitted to the Assembly's conditions, and assented to a supply bill which taxed the proprietary estate. This resulted at once in a large increase of the troops provided by that province, but Governor Sharpe in Maryland resented the concession as an act of weakness. The situation there, however, was saved by the tide of war rolling to another scene. The great struggle was fought out by the St. Lawrence and was practically settled by the fall of Quebec in 1759.

In 1764 the home parliament passed the Stamp Act, a measure by which it was intended to raise money towards the cost of defending and securing the colonies in America. It was, however, received with so much indignation in Maryland that it was never possible to give effect to it. Soon it was repealed, and a great wave of enthusiastic loyalty marked the gratitude of the American people. It stands out clearly from the correspondence, which valuably supplements the meagre records of the parliamentary speeches, that it was fully realised in this country that the Americans claimed what they looked upon as their birthright, namely, that the people had always kept the purse, that the Commons in the language of every bill of supply gave and granted, and that the King returned thanks. As colonists by settlement they claimed the benefit of the common law and established rights. From a technical point of view it could be and was argued that the House of Commons could pass bills of supply for all the dominions and that it was not essential that the colonies affected should be

directly represented in the House. But the instances of taxes levied without representation were few and exceptional, and the American colonies make a totally different class. The repeal of the Stamp Act, however, was soon followed by a revenue act imposing duties on glass, paper, tea and other articles. This act went through parliament without eliciting the vigorous debates which had marked the passage of the Stamp Act. It was soon afterwards decided to take off the duties, except that on tea, "to mark a principle." To this one case the home government stubbornly adhered in spite of the protests and opposition in the colonies, and the result was the war.

Thus Maryland, like Virginia, began its career as a manor, and based its claims on the rights granted to it as such. But on American soil a rapid change of spirit manifested itself. It was not in human nature for settlers to be attached to an absentee landlord, who not only drew a revenue from the place but endeavoured to shape its policy and control its acts in order to secure his pecuniary interests. Almost from the first the settlers stood out for the right to direct taxation as their forefathers had done at home. The trifling duty on tea was an incident which only became important because a great principle was at stake. To this question of principle the proprietor and his representatives were singularly blind. The only definite plan which they produced for resisting the assembly was one propounded by Cacilius Calvert for distributing so many places as sheriffs, rent farmers, etc., among the members of that body that it would be rendered "not only silent but tame enough to bear stroking, and tractable enough to follow any directions that may be thought fit to be given them." It is true that Governor Sharpe did not consider this egregious scheme practicable, but he did not object on any moral ground. He pointed out "that a great influence hath at times been gained by the British House of Commons by such means is certain, but it cannot be thence inferred that the same might easily be done here." The misfortune was in fact that there were not the same opportunities for bribery in Maryland as there were at home.

Probably the revolt would have come sooner but for the French war. While the contest against France for the possessions of the country was being waged the constitutional question could not come to the front. It is one of the ironies of history that twenty years after the French had been driven out as enemies, they returned as allies of the colonies and with them drove out the British. It was with some reason that Cornwallis' army marched out of York to the tune "The world turned upside down."

The impress of the past is still strong on Maryland. As an example of the original English town Annapolis is unique in the United States. The very furniture of the Government House

remains. In the hall is the table at which the Governor dined ; in the corner stands the harpsichord ; the punch bowl is in its place. Whatever the political feelings, Annapolis was always a gay place, and the Abbé Robin has left it on record that there was more wealth and luxury there than in any other American town. The settlers had no yearnings for the idyllic life ; their habits and amusements vied with those of London. The town, little touched as it has been by time or circumstances, is still redolent of these memories and of the manners of a society ruled by British Governors.

## REVIEWS AND NOTICES.

**A Colony in the Making, or Sport and Profit in British East Africa.** By LORD CRANWORTH (*Macmillan & Co., Ltd.* 12s. net).

UP to the present British East Africa is associated in the popular mind mostly with big game. It is true that in the most available districts the game is gradually disappearing. Considering the amount of sport which has been enjoyed this is not surprising. But after all the country is naturally very well adapted for game, and the herds have, after severe trials, a great power of recuperation. If ever any animal has been made the subject of special attention, it is the lion in East Africa. But his numbers keep up, if they do not actually increase. In two large reserves a great quantity of game is sheltered from the attacks of the sportsman. It seems probable, therefore, that animal life will remain a permanent attraction of the Protectorate. But in the meantime an industrial community is growing up, slowly but with every element of permanence, and between this class, which on a whole aims at making the country habitable and productive, and the class which regards it as a field for sport, there is conflict.

Lord Cranworth represents both parties and holds the balance impartially. His book will be read with interest by those who want a description of sport. It is distinguished from the many volumes which have been devoted to this engaging subject by the amount of specific information which is given, and which is as encyclopædic as is possible in the space. On the other side he shows a keen appreciation of the agricultural life, and enters fully and sympathetically into the question of local politics. There are strong feelings in the Protectorate on certain matters, and it cannot but be useful to have these explained by a writer who, while perfectly frank at all points, desires to be fair to all parties. No doubt there was a sort of

opposition between officials and colonists from the start, and there may be some grounds for the statement that the officials as a class "resented" the coming of the first pioneers. It was long before the days of the Colonial Office, but it can easily be surmised that the officials were not ready for the incursion. The Uganda Railway was built to carry out British obligations under the Brussels Act. It was in effect due to missionary influences, and its primary object was to put down slavery. The case was unique. In every other instance the railway has followed settlement. Here it went first. The result was that the country was opened up before the administration could make preparations. In particular, time was required for a survey. Then the land differs greatly in quality and value, and much experience was necessary before anything like a fair arrangement could be made. Let it be remembered that, on the other side in Northern Nigeria, it is now recognised that prospecting and licence-granting have gone on too fast. No doubt there have been many hard cases in East Africa, but the matter is now well in hand and in 1911 great progress was made. Lord Cranworth recognises the difficulties though he makes us realise the troubles of the settlers. In the matter of the rents charged by the Government he takes a strong line in which he is undoubtedly supported by the public opinion of the Protectorate. It is generally good for a department to see itself criticised and Lord Cranworth's criticisms of the Foreign Office and Colonial Office in this matter are given with a force of style which commands attention. It is not for us to attempt to say whether he is right or wrong, and we will only suggest that there were some reasons for the policy decided on. The subject on which local opinion has expressed itself most strongly against the home authorities is that of the land laws, the particular case being the revision of the Crown rent after certain periods, to wit, thirty-three and sixty years. This provision Lord Cranworth emphatically condemns. He states that "In their antagonism to this point the farmers and townsmen are for once unanimous; and it must be confessed that it is almost incomprehensible that the opinion of those who have special knowledge, and who alone are affected, should be held absolutely valueless. The argument of the farmer is this: I take up 5,000 acres of land, the possibilities of which are unknown and which is accordingly valueless. My neighbours and I spend time and money in experiment and find out that it will grow coffee, wattle, or sisal. By our efforts the unimproved value of this land becomes £2 an acre. As a reward for my efforts I am to be fined £500 per annum! It is pointed out that when unearned increment was introduced into England, on not one but on a thousand Radical platforms it was argued that the duty was only

fair where it arose from extraneous circumstances, and that to penalise a man for the improvements his own industry had effected would be grossly unjust. What was grossly unfair to the voting community in England is good enough for the voteless people of British East Africa." As to this it may be remarked that, while undoubtedly the farmers in the Protectorate deserve the fullest possible encouragement and protection, the Government has also to consider the future interests of the possession. The land may be for the present "unknown and accordingly valueless," and even a rent of halfpenny an acre may be sufficient to pay. But things do not remain like this very long. As the settlement of the country proceeds—which settlement was only possible in consequence of a state work, the Uganda Railway, to say nothing of other government assistance—the value of land inevitably rises. Is it contended that the first occupant should take the whole of this added value? Is the Government, which after all for this purpose is only the community at large, to get nothing out of it? Opinions may differ about the details, but the principle of charging a very low rent for Crown Land at first, and of increasing that rent if the increase of population and market makes the land more valuable, can hardly be so radically unsound and unjust as Lord Cranworth represents. The farmer's own improvements to the land are fully provided for. They are to be taken out of the case in the re-assessments. What is left is the difference between the "prairie" value and the value as increased, after a term of years, of the land by itself. Some of this increase will certainly be due to the work of the farmers themselves in making experiments and observations, but it is equally certain that, if East Africa progresses as we all believe it will, a large part of it will be owing to causes which are beyond such work and which represent the advance of the whole community. This was the reason for the legislation, and we do not recognise the grounds mentioned by Lord Cranworth, and very properly dismissed by him as inadequate, as having played any part in the discussion of the matter. The object lesson which was in view was that provided by Australasia, which is now repurchasing or retaxing great areas of land which were disposed of on improvident terms. Lord Cranworth quotes, as the first argument in favour of the revision, that long before the end of the thirty-three years the Protectorate will be in a position to make or repeal any land laws it may choose. Possibly when that happy time comes—and if it implies the establishment of a strong white community in East Africa we hope it will come soon—the future Government will not be particularly anxious to renounce its rights. It is even conceivable that it may find room for some gratitude to the department which reserved them.

**Guiana: British, French and Dutch.** By JAMES RODWAY, F.L.S.  
(*T. Fisher Unwin*, 10s. 6d. net.)

In the early days of American settlements Guiana appeared very attractive. Tobacco was the valuable product, and British, Dutch and French fought for the hot and well-watered territory between the Orinoco and the Amazon. The Pilgrim Fathers thought of going there, and if they had carried out this idea history would have been written very differently. Eventually the Dutch accepted Surinam in exchange for New York, and at the time it was thought no bad bargain. Fortunately, the English, as compared with their colonising rivals, the Dutch, generally hit upon territories where the white race can increase and multiply. As it proved, the difficulties of planters in Guiana were always very great. To this day cultivation only covers a few strips about three miles deep along the coast and river banks; the interior is in much the same condition as in the case of Raleigh. The country is magnificent and full of possibilities; the difficulty is the want of labour. Here, as is now largely the case in West Africa itself, the negro does not increase, and the only hope of development rests with the coolie. But, at any rate, British Guiana pays its way, while Surinam makes a heavy drain yearly on Holland. Profits are hard to make, but the exports of sugar keep up. The planters are the backbone of the country, and, considering their numbers, keep up a remarkably high standard of civilization. The time cannot be far off when the abundant resources of the possession will be more fully exploited. Within the last four years or so the collection of balata has risen so fast that it is now the third most important export industry in the colony, and this industry should be permanent. It is recorded in Mr. C. W. Anderson's excellent report on the forests of British Guiana that tracts of Crown Lands on which the balata trees were first tapped a quarter of a century ago are still being worked and continue to yield supplies of balata. The timber trade should be extended, for there is hardly any industry in which profits are so certain if reasonable foresight is used. The increased price of tropical products generally should stimulate enterprise, and at this time the case of rice, which has gone up abnormally, may be mentioned. The cultivation of the oil palm should, as the Governor has pointed out, be successful. There is no lack of suggestions for improvements: some advisers rely on canals, others on roads, others on railways. There is a case for all, and it is to be hoped that full public discussion will soon enable the colony to decide how to begin and how far to go. Some of the schemes which have been started in this country with reference to British Guiana have not been felicitously planned, but there can be no occasion for slipshod methods when so much is done to supply information. In this colony, as in many other places, the cry is "back to the land." There are thousands of square miles of

Government land available, though in districts which are at present out of the way, and there is plenty of land in private hands which can be bought cheap. But the rising generation shows the usual tendency to dislike field work, and Georgetown is overcrowded with the mercantile class. The climate operates against work. Where there is no winter, and fruits and vegetables ripen twice a year, there is no incentive to thrift. This is true more or less of all West Africa, but in Guiana the negro seems to be less capable of continuous work than even in West Africa. Future agricultural development depends on the East Indians, of whom there are now over 100,000 in the colony. This race comes from the tropics, but from a country where, on the whole, the land is poor; thus they had through centuries acquired the habit of patient work. When such development is in prospect, it may be justifiable to incur the heavy cost of improving the bar at Georgetown, but such schemes are so difficult and uncertain in their results that it is impossible to consider the problem too carefully.

Mr. Rodway's work, which forms one of the "South American Series," is very well planned. It gives a description and history of all three Guianas, and, as may be expected from the writer, the account of industries and ways of living is given with full command of the subjects and in very readable style. We are glad to see his statement that the selection of East Indians is now well done, and that it is quite a pleasure to see the arrivals from a coolie ship. This emigration is carefully watched in India and is from time to time the subject of criticism; we trust, therefore, that Mr. Rodway's account of the treatment and status of the immigrants will receive notice there. The following passage may be quoted as an example:—

"Coolie riots are now largely a story of the past, but they must not be forgotten. The causes were almost entirely disputes about wages; they may be compared to the strikes so common now in Europe and the United States. Some have been serious, but hitherto have always been confined to a particular estate. Combination was conspicuous within that area, but never became universal in British Guiana. Armed police and even soldiers have been necessary at times, but the row was soon over. In no case was there any renewal of the disturbance; arbitration by the immigration officials always settled the matter. 'Sammy' is open to reason, and has great respect for the 'coolie papa,' as they call the chief of the department. The danger always lies in a misunderstanding; the planter has therefore learnt to be very cautious in his dealings, and to see that there must be no mistake in the pay-sheet. Nothing serious has occurred for nearly forty years, but now and again an overseer is assaulted, or a gang may be seen marching off to the immigration agent to make a complaint that wages are too little. The matter is at

once taken in hand, and the agent's decision is considered final by both planter and coolie. These decisions may appear at times somewhat arbitrary, but the authorities are prepared to enforce them, even going so far as to demand the discharge of an overseer, and in one case, at least, of a manager. The proprietor is bound to submit, otherwise the coolies might be removed; this would, in many cases, mean utter ruin."

The East Indian in fact dominates the situation. The special attentions of the Government are for him, and it is a notable fact that the death-rate on the plantations is now less than that of the general population.

---

**Trails, Trappers, and Tender-feet in the New Empire of Western Canada.** By STANLEY WASHBURN (*Andrew Melrose*, 10s. 6d. net).

The deerslayers and pathfinders whose exploits entranced our boyhood have been steadily moved further and further west, and now their last foothold is at the edge of the Rockies. Even these resorts are now threatened by the advance of the railways, or, as it is locally expressed, "steel." The endless miles of trail, the strange wildernesses, the foaming rivers and distant peaks, which have been sacred to the Indian, the trapper and the explorer, will soon be made familiar in many places from the observation cars. The C.P.R. led the way, and now the Grand Trunk will break in on a vast expanse of new ground. A few years ago this latter Company was in a dismal condition. The patriarch of Canadian railways was sinking into a condition of something like decay, and the result appeared in suspended dividends. The story of the rise of the Grand Trunk from this position is one of the most striking in railway history. It has been mostly due to the invigorating influence of American methods. Mr. Hays, of the Wabash Railroad, came across to apply the plan which has been found successful in the United States, and which consists simply in making a good road and providing an attractive service. That the policy paid was soon seen in the announcement of a dividend. But this was merely a prelude. The road was one on which three-quarters of the freight of Canada originated, but much of this slipped over to other and competing lines. It did not carry to destination. The logical remedy was to build from coast to coast, and after much opposition Mr. Hays carried this scheme through. There is now under construction a line extending from Monoton, in New Brunswick, to Prince Rupert, in British Columbia, a distance of 3,545 miles. The work is to be first-class from the start, on the principle that it costs about three times as much to rebuild an operating line as it does to make a good one from the beginning. Thus on the mountains

there is no ascent exceeding more than 26 feet to the mile. Compare this with the C.P.R., built at a time when it was considered good enough to get over at any grade. There the grade at the Kicking Horse Pass was 116 feet to the mile, and three enormous locomotives were required to push half-a-dozen freight cars over. The result was a dream of delight to the tourist but it was bad business with the engine and coal bill, and in recent years the grade has been reduced by gigantic loops, but even now the gradient is three times as stiff as that of the Yellowhead Pass taken by the Grand Trunk. The agent by which a moderate grade has been secured is dynamite. On the last stretch into Rupert a shelf sixty miles long has been blasted out of the solid rock, and on this piece alone 2,000,000 shots of dynamite were exploded.

This line when finished will be the principal road to the east from England. Prince Rupert is 500 miles north of Vancouver and the journey to Japan and China will be appreciably quicker than by the Vancouver route. The work is advancing rapidly, and presently vast areas, hitherto useless, will be brought into the zone of international commerce.

The advent of this undertaking gives an unusual interest to such a book as Mr. Washburn's. The part of the wilderness of which he writes is already melting away before the explosive and the sledgehammer. Nothing can affect the grandeur of the scenery but the simple life and primitive traffic are going. Mr. Washburn's record will be the last one of the handful of men who roam within these mountain fastnesses "with hearts of Vikings and the simple faith of the child." To anyone who can appreciate the gladness and serenity of such a life his pages will strongly appeal. They do not profess to relate existing adventures or great achievements, but they are full of interesting incidents and of the spirit of romantic exploration. We may quote one description as an example of mountain territory: "If there is any country in the world to-day that stands as a sample of the primeval, it is this same valley of the Fraser. Giant cedars that measure six and eight feet across at the butt and soar 80 feet clear to the first branch on the largest trees. . . . The whole floor is sown with rotting trunks that must have been moulding for centuries. I don't know how long it takes a tree to rot, but it must require some time for a tree four or five feet through to mould to such an extent that you can dig through the brown decay with a shovel. In these spots one can walk for half a mile on tree trunks and never touch the earth by ten feet. Ten good men with sharp axes could not cut a mile of trail a day where horses might travel." It may be observed that these great forest deposits are only possible in temperate climates. In tropical countries they are seldom allowed to remain. The ants see to that.

**The Virgin Islands.** By W. C. FISHLOCH (*Waterlow and Sons Ltd.*).

This unpretentious but well written handbook will, it may be hoped, prove serviceable in drawing attention to these attractive islands. They have had palmy days, but suffered as much as any place from the abolition of slavery. Before that event the yearly exports alone amounted to £164,128; in 1900 the whole export and import trade was valued at only £6,199. With these figures before him, it must have cost the author something to admit, as he does, that slavery cannot be defended even on economic grounds. No doubt adhesion to this principle is *de rigueur*, but economic truths often take a very long period to work out, and in the meantime exact much patience from the believers. The implied condition in the case of the abolition of slavery was that time should be allowed for a race which had been accustomed to work under masters to be educated to work for itself. More than a hundred years passed before much was achieved in this direction. The policy of education was not taken actively in hand till the Agricultural Department was established in 1900. Now the Islands are doing well, and with the development of the cotton, limes and coco-nut industries, they are likely to enter on a new era of prosperity. They will in time, no doubt, get more benefit from one invariable asset, the climate, which, from a medical point of view, is claimed to be equal to any in the West Indies. When the centre of gravity of the British Empire has shifted to Canada, which, we are told is now a matter of easy calculation, the Virgin Islands will be a popular resort. We trust that they will even then retain that simplicity of life which now enables the whole Presidency to be controlled by one policeman.

---

**West Indian Tales of Old.** By ALGERNON ASPINALL (*Duckworth & Co.*).

Mr. Aspinall looks forward to the approaching time when the Caribbean Sea, instead of being a sort of cul-de-sac, will become one of the world's principal highways, and bring in a great influx of visitors to the West Indies. The new order of things should greatly enlarge the number of persons who take an interest in the history of the islands, and it was a good idea of Mr. Aspinall's to minister to such demands by collecting a number of romantic incidents, which, it need hardly be said, he sets out in eminently readable style. First comes the story of Benbow the Brave, and then one of the most remarkable episodes in colonial history, the fate of Governor Parke. Parke was Governor of the Leeward Islands and behaved in an outrageous manner: he was recalled by the King but did not obey, and a mob broke into the house and killed him. Rodney's great victory over de Grasse, by which Jamaica and other islands were

secured to Great Britain, is duly told; also the affair with the Spaniards at Chaquaramas Bay, Trinidad, and other incidents of the numerous international struggles which the islands have seen. Places which have seen so much wild work must, of course, crown these experiences with a few tales of mystery and the supernatural, and these are represented by the Legend of Rose Hall, at Montego Bay, which is distinguished by the occasional visits of the ghostly form of a former mistress who was (apparently very properly) killed by her own slaves.

---

### Federated Malay States Railways.

An attractive pamphlet has been issued at Kuala Lumpur for the information of travellers. There are now many inducements to make a tour of the Peninsula, for in addition to business matters there is big game shooting, the best snipe shooting in the world, and over 2,000 miles of fine roads for motoring. In fact the pamphlet concludes with the cry "Malaya for Motorists." The descriptions of places of interest, by Mr. C. W. Harrison, supply exactly what is required for a first impression.

---

### Bulletin of the Imperial Institute (VOL. X, No. 3). (*John Murray, by post 2s. 9d.*).

The leading article in this, the third quarterly issue, is on the improvement of cotton in India and sets out the steps taken to remedy the defect of short staple cotton. Teas from Southern Nigeria are pronounced to be of very promising character, but the proportion of tannin is high. The Falklands furnished a satisfactory sample of copper ore, and if such ore can be found in large quantities a new era would be open to the islands. Recent agricultural developments in Uganda are explained in detail: of all planters' crops the most desirable is judged to be coffee, the export of which will grow greatly. A review of the coal resources of the Crown colonies embraces an account of recent discoveries in Southern Nigeria; the lignite of this country is of good quality and will be very serviceable made up into briquettes.

---

### Reports of the Wellcome Tropical Research Laboratories

(*Baillière, Tindall & Cox*). Fourth Report, Vol. A. Medical, 21s net.

Vol. B, General Science, 18s. Supplement "Review of some of the more recent advances in Tropical Medicine, 15s.

The fourth report carries on the record of the research work conducted in the Sudan into many varied and deeply interesting problems. The supplement contains a very full and clear summary of recent investigations in all parts. In addition to the purely medical matter there is much information of general interest about the natives and their customs.

## BUSINESS NOTES.

### Oil.

THERE have been sharp fluctuations in the price, and this is inevitable with this article as the production is uncertain owing to the occurrence of gushers. The demand is affected by this uncertainty, as manufacturers dread unexpected changes of price more than anything else; but on the whole the price continues to rise, and probably the large speculative element in the business contributes to this result. The Standard Oil Company endeavoured to conquer the world's markets by selling kerosene for export at low prices, but it failed to stop enterprise in Europe and a group of interests was formed to operate in competition. Their principal producer is Russia, where there are more than a hundred English petroleum companies. At the beginning of 1912 the Standard Oil Company was formally dissolved, and the various concerns which then became independent raised the price, being encouraged to do this by the prospect of the great navies being fed with oil instead of coal. This rise was followed by activity all over the world in boring for new supplies and developing the old.

Unfortunately much money has already been lost on these enterprises, the usual error being to trust to surface indications of petroleum without regard to the general geological character of the region.

In formulating an administrative policy with regard to oil it is necessary to consider this peculiar character of the principal undertakings. It is desirable to prevent, if possible, the supplies of a colony falling into the hands of a monopolist undertaking; on the other hand it is unsatisfactory to allow them to be acquired by small concerns which cannot properly exploit them. The negotiations with regard to Trinidad concessions and agreements are governed by these considerations.

**Rubber.**

The Director of Agriculture in the F.M.S. expresses the opinion that one hundred trees to the acre should be the maximum number, and that eighty are ample. He states that the cultivation usually given to rubber trees is hardly worth the name, consisting usually of a scraping of the soil to remove the weeds, and that once a year at least the soil should receive a thorough cultivation to a depth of at least four inches. Then during dry weather the trees would not suffer as they do now, as the soil water would not evaporate so quickly. Such a system, combined with a good leguminous cover crop, would improve the growth immensely. The Department is experimenting with a large number of cover crops, the ideal being a rapidly growing plant which quickly shades the soil sufficiently to keep down the weeds, with a short life so that within the year it can be cut down, dug in and re-sown. Experiments are also being made with manuring and tapping, and valuable results will no doubt be obtained from these systematic observations, but unfortunately they require several years.

There was recently every prospect that the total production in Malaya would exceed the estimate prepared in 1911.

The latex tubes of a rubber tree are a path by which food material is conveyed to the plant, and this conveyance is interfered with when the tree is tapped. It is therefore advisable, the curator of the Seychelles Botanic Station points out, to tap the tree moderately and to adopt a system which would give the highest yield with the minimum of injury within a certain period of time. Professor Fitting, in Java, has proved that the reserve food of *Hevea* becomes poorer after a certain period of tapping and he advocates the system of resting the trees to allow the tree to store food in the wood behind the strip last tapped. If there is no period of rest the tapping in the second period is started at a disadvantage as compared with the previous period. It is useless going on tapping all the year round. In another way the importance of resting is well illustrated in the experiments at Heneratgoda. The first ten tappings for example gave 197 grammes in a period of 140 days and the last ten tappings 70 grammes only. On the same tree where the other side of the tree was tapped without a resting period, the first ten tappings of the second period of 180 tappings gave 118 grammes (instead of 197) and the last ten tappings 26 grammes (instead of 70). In a full herring-bone tapping at Heneratgoda in 1905-06 it was shown that 840 tappings (if that were possible) would have been required to produce the same yield as the first 57. In presence of these figures it is easy to decide on the best method of tapping. The way of inoising or excising (pricking or paring), the system planned must vary according to the age and resistance of the

trees and to the yield obtained in the minimum time. In Seychelles where the trees are young and the soil comparatively poor, except in drained marshes and alluvial flats, it seems advisable to tap the trees as soon as they measure 17 inches at three feet from the ground and tap them only during a short time after the rainy season. Owing to the conditions of the market the highest yield should, however, be contemplated and the system suggested would be: three cuts half spiral are made one foot apart on one side of the tree and tapping by excising made every day or on alternate days for two months, then tapping should be shifted to the other side of the tree and continued for two months. These two sides of the tree at three feet from the ground should be tapped in such a way as to remove the whole bark in two years with the necessary periods of rest. Then the upper three feet of the tree should be tapped in the same way. After four years the renewed bark should be tapped and the same course followed. The idea of shifting the tapping from one side of the tree to the other is based on experiments carried out in Ceylon which tend to show that the composition of the latex obtained is of more uniform composition than when the same side of the tree is tapped over a long period, the composition of the latex being in that case considerably poorer in caoutchouc at the end of the period. Further, it should not be forgotten that the tapping over a long period on the same side cuts off the roots from the crown on that side for the whole of that time. The circumference of the tree can without inconvenience be divided into four parts or three parts and tapping done on the one-third or quarter in one year system, but where there are long periods of drought tapping has to be done within a short period and a system adopted which would appear too drastic in places where tapping goes on all the year round. The same remark applies to every day tapping instead of every alternate day and as all systems have advantages and disadvantages, the system adopted should combine the maximum yield and the least injury to the tree as far as food reserve is concerned, provided no renewed bark is tapped when less than four years old. The whole question is dependent on the age and resistance of the trees. With those of a certain age, forty inches circumference, the bark area on every day tapping by  $V$ 's which extend half round the circumference, six feet above ground, is removed only after 610 successive parings. The problem is to combine the tapping system in such a way as to remove the same area in a number of days which is large enough to avoid interference with the health of the tree. In experiments made by Dr. Lock the yield from the renewed bark after two years seems to compare favourably with that from any of the preceding areas of old bark. The percentage of

rubber in latex is found to be higher when a change is made to a fresh tapping area, there is a constant yield after six months tapping in all rows, the yield being of course smaller in the case of those more frequently tapped.

### Banana Cultivation.

Mr. H. Q. Levy, in the "Journal of the Jamaica Agricultural Society," gives the following calculation of cost and returns per acre of a field of plant bananas cultivated a few years ago, on a "red dirt" soil of fair fertility, without manuring, and planted  $14 \times 14$ , two separate seed suckers to each hole.

440 stems giving 70 per cent. payables, equal 308, average £9 per 100 ... ..	£27	8	0
Forking common pasture, per square, 4s. 2 0 0			
If guinea grass pasture add 2s. 3d. per square for hoeing up the grass.			
Lining, per acre, 2s. ... ..	0	2	0
Digging holes 2 feet 6 inches $\times$ 18 inches $\times$ 18 inches, 222 per 100, 3s. 6d.	0	7	9
Suckers delivered, 400 average at 5s. per 100 ... ..	1	0	0
Dropping suckers for ... ..	0	6	0
Planting ... ..	0	5	0
Supplying ... ..	0	1	6
Mulching with guinea grass, cutting, carrying and spreading. If bush mulch be used, the cost will be about £1 10s. more ... ..	3	0	0
Weeding twice, 20 squares, per square at 9d. ... ..	0	15	0
Pruning ... ..	0	4	0
Cutting and heading ... ..	1	0	0
Carting 8 miles to wharf, 440 stems at 1½d. ... ..	2	15	0
			11 16 3
Profit per acre ... ..	£15	11	9

These figures help to explain the value of the banana to Jamaica. Some alarm has been caused by the discovery of disease in the island, but it does not seem to have extended much.

### Coco-Nut Trees.

Probably the finest specimens are those grown by the Germans in Samoa—a ten years' work. Here no one is allowed to make copra without a special permit, and the holder of this must follow published regulations. One object is to prevent the use of nuts insufficiently ripe, and in effect only those are allowed that

fall naturally from the trees. But it is more profitable to extract the oil on the spot, rather than make copra, in order to feed stock when circumstances allow, for this is one of the best foods and is growing in favour; it is also more and more in demand for vegetable butter, confectionery, and the best kinds of soap.

There is a rivalry in the market between this oil and the palm-oil of West Africa. But the former is the best, as it is free from certain objectionable acids and other substances found in the latter. Another rival has, however, made its appearance in an unexpected quarter. This is the homely tomato, the seeds of which, it appears, yield an oil resembling cotton-seed oil. It is being produced in Italy and other countries will follow suit.

It used to be a familiar belief that coco-nuts after falling from trees travelled from shore to shore on the currents to flourish again in distant lands. Recent investigations, however, seem to make it necessary to discard this amiable theory. The envelope is provided by nature to break the shock when the fruit falls, but it is not adapted for floating and there are no known cases of its distribution by the marine method.

Mr. Dupont speaks well of the Ceylon native system of manuring, which gives more rapid results than ploughing within the manuring area. A radius of two feet is left untouched round the stem, then four or five feet wide of a shallow trench is dug, the bottom sloping away from the tree and as deep as the root system will permit. In seedy soils the trench can be dug six inches, but in laterite or rocky soils where the roots congregate near the surface it is better not to dig so deep. The trench is forked and the manure mixed with the soil thoroughly. This manuring area is thus carefully treated every two years and maintained in a fine state of tilth. It is considered that by lacerating with a plough the roots die and thus ploughing is avoided within this manuring area. However, ploughing is done outside the six feet radius where no manure is applied.

---

### Coffee.

The "Journal of the Jamaica Agricultural Society" states that coffee can be grown on almost any soil, but to make the cultivation pay it should be confined to such soils and situations which are naturally adapted to its growth, viz., those of white limestone formation, i.e. the so-called "red dirt" lands, those of yellow limestone formation, viz. a top layer of black, and a subsoil of yellow clay, so long as they are not so heavy as to border on what is called the "soapy" condition, and clays of sandstone formation. Marly, gravelly, light sandy or badly "washed" hillsides are not suitable for coffee cultivation, and therefore should be rejected.

The "red dirt" soils require practically no drainage, except in the form of "blind" trenches, on steep hillsides, to prevent excessive washing, and the carrying away of valuable plant food. On the other hand, to obtain good and lasting results from all clay lands, especially those of yellow limestone formation, the fields *must* be systematically and deeply drained. Most excellent coffee can be grown between rocks, where the pockets of soil are deep, for the coffee plant, having a long tap root, requires a good depth of soil for its full development.

Never burn the dry leaves, bush, logs, or in fact any decaying vegetable matter off the land on which you are about to plant coffee, this specially applies to "red dirt" soils. The catch crops may benefit from such treatment of your land, but the coffee will feel the bad effects for years afterwards, and it will cost you much money and extra labour to renew the humus thus destroyed.

If the soil be poor, fly penning, bushing, and the use of stable litter, or some other form of manuring must be resorted to before you start planting operations. It is also desirable, no matter of what class your land be, to give it a thorough forking at least a foot in depth.

The coffee plant thrives best, and a better grade is produced, at high elevations, ranging from 2,000 to 4,000 feet above sea level, but it may be grown with great success at even 1,000 feet, so long as the trees are not exposed to high winds, and are partially shaded. Below that elevation, although the tree thrives in protected valleys, there is considerable risk in its successful cultivation, and the quality of the bean is always inferior.

### Inspection of Export Fruit.

There can be no doubt that compulsory inspection of fruit for export proves beneficial to the grower. The "Cape Agricultural Journal" sums up the advantages to him as follows:—

- (1) If he sends for shipment 1,000 boxes of over-ripe fruit, these may be detained by the inspector and sold locally at a profit (such a case actually occurred at Capetown last season) whereas had such fruit gone forward he would have been subject to considerable loss.
- (2) An inspector sees the various styles of packing, is conversant with the best and able to advise growers how to pack their fruit properly.
- (3) An inspector knows and can instruct the growers exactly at what stage of ripeness the different kinds of fruit must be packed.
- (4) An inspector should have the right to confiscate any boxes of fruit which are fraudulently marked.

- (5) An inspector is able, during that portion of the year in which no fruit export is going on, to visit the fruit exporting districts and give instruction in correct methods of fruit growing, packing house arrangement, pruning, and one-hundred-and-one other things which he is in a better position and should be better able to understand than anyone else.

The shipping companies benefit from inspection in that they know that the goods consigned in their ships are in good order, that there is no possibility, or at any rate only the remotest contingency, of the fruit being rejected on arrival at its port of destination. In the earlier days of the development of the banana trade from the West Indies to Bristol and Liverpool on more than one occasion whole ship-loads of bananas were condemned as unfit for human food and landing denied them. No other course was open than to put back to sea and jettison the entire cargo. To-day, when there is inspection, no such danger exists. Inspectors do not pass fruit for export in an unfit condition, consequently shipping companies must of necessity be in favour of inspection and some of them are willing to institute preferential rates on fruit which has passed the inspector.

Further, under the usual fruit trade regulations in existence in all the principal exporting countries in the world, standard size fruits are exported in standard size boxes. This is a benefit to shipping companies, in that they are able to stow their cargoes in the cool or other chambers of the ship to far greater advantage than would be possible if an indiscriminate assortment of packages of all sizes were offered for shipment. It should be part of the inspector's duties to see that these standard sizes are observed.

The dealer "at the other end" is happy when he gets regular consignments of correctly graded, well packed fruit, in good condition, free from waste. It means that his work is lessened, his sales more readily made, and that his customers are satisfied.

The soundest guarantee which can exist that fruit shall arrive under such conditions is a satisfactory inspection by a duly qualified officer. It means money in the dealer's pocket.

---

### Angora Goats.

It is incomprehensible, if the habits of this species of goat are considered, that it is not made more use of by settlers in clearing the ground of undergrowth, as at the same time it provides a valuable marketable commodity in mohair, and the flesh is a very fair substitute for mutton. The prices for these animals vary considerably, showing that care given to them will be well repaid.

### Coal in Southern Nigeria.

The Imperial Institute report on the mineral survey of Southern Nigeria states that the results obtained during 1910 largely extended our knowledge of the economic mineral resources of Southern Nigeria. The important lignite (brown coal) and sub-bituminous coal deposits occurring in the country have been referred to in previous reports, and further valuable contributions are now made to our knowledge of the extent and quality of these fuel resources, which are likely to be of great importance in the future industrial development, not only of Southern Nigeria but also of the whole of West Africa. In the Udi district extensions of the seams occurring in the Ofarn river were met with, but they were not so thick as in the Ofarn sections. Workable seams of good coal were found in other districts, and west of Nike the coal seams are continuous over a considerable strip of country. The coal in the Udi district is black and fairly compact and of a type intermediate between lignite and ordinary bituminous coal.

It is certainly much to be hoped that a satisfactory supply of coal will be worked in Nigeria, for while supplies from this country cost something like 45s. a ton, railway enterprise is heavily handicapped and with it the development of the country. So long as the bar at Lagos remains difficult the price of coal will be high, and it is probably the fact that even at the present figure there is not much profit in the business.

It is intended to make further search for coal in the Udi district nearer the Niger, and the direction of the proposed railway will depend on the results of this investigation.

---

### Electric Light.

Messrs. Preece, Cardew & Snell have advised that the "Lister-Bruston" automatic electric light plant is a simple and efficient system, and quite suitable for lighting a Government House and the surrounding buildings, providing petrol can be obtained.

The "Lister-Bruston" system was put on the market about two years ago, and a considerable number have been installed in England for country house lighting and for export abroad.

The essential portions of the plant consist of a slow-speed petrol-driven engine, belt connected to a direct current dynamo, a small storage battery, and various relays and other gear which form the automatic features of the plant.

The plant is so arranged that after a certain number of lights are turned on, or after the battery voltage has fallen to a definite amount, the battery starts the engine by means of the dynamo working as a motor. When the engine is up to speed, the engine

starts to work and charges up the battery, and supplies current to the lamps. After the lights are turned off, the engine automatically stops.

The set size "D" is big enough to supply 125 lights of an average capacity of 25 watts, provided *that not more than one-half the lights are in use at one time.*

The plant should be installed in a room about 12 ft. by 18 ft.

The above plant will use about 35-50 gallons of petrol per month, according to the hours of lighting required.

While the "Lister-Bruston" system is entirely automatic, it of course needs a certain amount of attention for cleaning, filling up with oil and petrol. A man with a fair amount of electrical knowledge would have to be engaged to instal the set, lay the cables between the buildings, and wire the lighting points in the buildings.

The dynamos supplied with the "Lister" sets are usually wound for 50 volts; if, however, the buildings are scattered over say a quarter of a mile, the dynamo will have to be wound for 120 volts, so as to avoid considerable drop in pressure. The sizes of the cables supplying the various buildings will have to be carefully calculated, to ensure that the voltage drop from the dynamo to the lamps in each building does not exceed 15 volts.

So that these calculations can be made, a map should be supplied giving the following information:—

- (a) The position of the dynamo room.
- (b) The position of each building and the number and candle power of the lights required in each building.
- (c) The roads under which cables can be laid from the dynamo room to the various buildings.

For the lighting of such a building as a new Government House the plant and materials will cost about £180.

If there is any difficulty in procuring a sufficient quantity of petrol for the "Lister-Bruston" sets, a paraffin engine can be supplied instead; this, however, while not affecting the cost of the scheme will do away with the advantages and automatic features of the "Lister-Bruston" system, and the whole of the time of the electrician would be required in order to charge the battery and keep the plant in a satisfactory condition. The battery would have to be considerably larger and the cost of its upkeep and renewal would be considerably greater.

---

### Stamping Presses.

Automatic recording stamping presses are constructed to be worked by hand, by stampers responsible for their use, and so worked they are excellently suited for stamping, economically

and safely, deeds, instruments and forms in comparatively small quantities. But they are not suitable for stamping forms, such as those for cheques, receipts and policies, which it is necessary to stamp in large quantities. In the United Kingdom stamping of this kind is carried out by fast running power-driven machinery to which recording mechanism is not affixed, and to which it has not been found practicable to apply it successfully without much more trouble and cost than the use of the mechanism could, even if successful, obviate. Control upon stamping of this class is secured by a system under which the stamps are issued by one staff and stamped by another, and other checks are used.

A self-inking machine without recording mechanism suitable for hand stamping, under proper supervision, of forms for cheques, receipts, bills of lading, etc., can be supplied for about £58. Automatic recording mechanism can be affixed and affords a valuable auxiliary check upon the stamper, but responsible supervision while stamping would still be necessary.

### The Cement Gun.

This is an apparatus which has been used on the Panama Canal for applying concrete to any surface. As soon as water touches cement combination begins, and in the "gun" the combination of cement, sand and water begins at the nozzle and is completed during the discharge, which is effected by compressed air through a hose. All superfluous air and water are expelled by the discharge on the surface to be coated. The results appear to be good and the method will no doubt be widely adopted. The New York firm of Westinghouse, Church, Kerr & Co. report the following conclusions from a series of tests:—

"In all of the tests made the product of the Cement Gun showed superior to good hand-made products of the same kind. The degree of superiority varied between wide limits.

"In tensile strength the gun-work excelled hand-work in every case by amounts ranging from 20 per cent. to 260 per cent.

"In compressive strength the excellence of the gun-work was even more marked, ranging from 20 per cent. to 720 per cent. better than hand-work.

"In the matter of surface permeability the gun-work absorbed from  $\frac{7}{10}$  down to  $\frac{1}{30}$  as much water per hour per unit of area as the similar hand-made surfaces.

"As regards absorption of water the hand-made mortars took up from 1.4 to 5.3 times as much as the gun-made mortars.

"The percentage of voids of the gun-made products range from 22 per cent. to 87 per cent. of that of the hand-made product.

"The adhesion of the gun-applied mortars was on an average 11 per cent. better than that of hand-work."

### How to make Concrete Waterproof.

This is an important matter for public works where there is exposure to water, and much depends on the character of the concrete. It should contain a large proportion of fine materials, which make it less permeable than large substances do. There are many waterproofing materials on the market, but they do not make up for unsuitable materials.

---

### Bricks,

The Ceylon Railway construction engineers have made bricks from cement and sand. They cost Rs. 28 per thousand. No special plant is required. The mixture is five of sand and one of cement. As little water as possible is added and the mixture is put into wooden moulds. The mixture is well rammed into the mould and the top scraped off on a level with the top of the mould. It is then turned over on a small piece of flat wood, the thumb screws of the mould loosened and the side and bottom of the mould removed. The brick is then exposed a fortnight to air. A coolie with a boy can turn out 25 to 30 bricks per hour if the sufficient amount of sand and cement mixture is available beside him. The process would be useful in other places where these are the most available materials.

---

### Paper from Sugar-cane Megasse.

Plants are in the market for obtaining a pulp, which is said to be like those made from esparto, from megasse. It is claimed that the material is suitable for grease-proof wrapping papers, and for papers for illustrated magazines, as a large quantity of china clay can be carried in a megasse sheet and the paper can be highly finished.

Esparto grass is at present about £5 per ton, and esparto pulp about £15. The substitution of megasse might open up a great field to sugar-producing countries.

---

### Compressed Paper Grain-holders.

An invention which seems to contain great possibilities for farmers and planters was described to the Victorian commission of enquiry on the marketing and storage of wheat. It consists of a cylinder of compressed paper, big enough to hold as much grain as 15 or 20 bags, and it is claimed to be almost twice as strong as steel. These cylinders would be filled on the farm, and loaded

on to ordinary waggons, and thence into specially made or even ordinary trucks. Storage sheds would be no longer necessary, and the only elevators needed would be the Government ones at the sea-ports where the grading might be done. The cylinders are damp and vermin-proof, and grain stored in them would not deteriorate. They are easily handled, and uniform in size and weight under all conditions. Their life is estimated at ten years; they are cheaper than bags, and might be sold to farmers on the instalment plan. A wheat container to hold a ton would cost £1 5s.

---

### Fire Float.

In harbours this machine may be very valuable for the protection of shipping and docks' warehouses. At Cardiff the Watch Committee decided some months ago, on the recommendation of the head-constable, to add a fire float to the equipment of the fire brigade. Messrs. Merryweather & Sons were entrusted with the order and the vessel has been delivered at Cardiff. The float has a pumping capacity of 1,500 gallons per minute, and her dimensions are such as to enable her to go through all the canal locks and tunnels, so that in case of an outbreak the steam-engines could be supplemented by the new apparatus. The boiler, which is fired with oil fuel, drives both the propelling and pumping engines. A speed of six to eight miles an hour can be attained.

---

### Alcohol for Fuel.

The increasing price of petrol is standing in the way of the use of motor tractors for agricultural purposes in the colonies. The best hope is industrial alcohol. The materials for this product are those which are rich in carbohydrates, and of these one of the best is maize, which contains 70 per cent. of soluble carbohydrate. In Demerara alcohol has been produced from the refuse of the sugar factories at 4d. per gallon. Engines constructed for kerosene can usually work with alcohol without any adaptation, and the storage of alcohol is much less dangerous than that of petrol. Alcohol has not the same value per horse power that petrol has, 1·8 times as much being required, but in places where maize or sugar are plentiful it could be produced at a much lower cost, and no doubt means will be found to permit of its employment.

### Third International Road Congress.

This will be held in London, opening on June 23rd and lasting six days. It includes two sections, each divided into two sub-sections:—

#### FIRST SECTION.

*Sub-section A.*—Construction and maintenance of roads outside large towns.

*Sub-section B.*—Construction and maintenance in large towns.

#### SECOND SECTION.

*Sub-section A.*—Traffic and vehicles.

*Sub-section B.*—Administration, finance and statistics.

One object is to collect the results obtained in every country from the tests of materials used for road making, and colonial officials who are interested in such works would no doubt benefit by attending the congress. A full programme has been arranged, and, as usual with scientific societies, the social and recreative arrangements have not been overlooked.

The Nyasaland Public Works Department report mentions the excellent work done by a light, 6-ton roller manufactured by Messrs. Aveling & Porter, and imported early in 1909. This has been working almost continuously since, and has not been one day out of action through need of repair or accident, and only now does it require to have some of the boiler tubes expanded. It has still the original treads on the wheels although it has travelled between 1,500 and 2,000 miles rolling in new metal. It is fired with wood and so long as this is comparatively dry there is no difficulty in keeping up a 150-lb. pressure per square inch of steam. The consumption of firewood is just over two cubic yards for a 10-hours' day.

---

### White Ants and Buildings.

Observations collected by the "South African Agricultural Journal" show that in order to circumvent white ants there are only a few rational points to be observed in designing buildings.

In the first place the foundations should be constructed and carried up sufficiently to give a clearance of two to three feet between the ground and the floor-joists, and there should be a sufficiency of large ventilators so as to admit the free entrance of light to all parts. Where it is desired to have tiled or flagged floors as in kitchens, pantries, bathrooms, and for verandas, these should not be built upon soil filled in between the supporting brick or stone piers, but should rest upon concrete beds supported by ironwork. Similarly, the piers erected to support fireplaces

should not be in the form of hollow brick boxes filled with earth and the debris of building operations. They should be empty and with openings to allow the light penetrating beneath the house to filter in, or the fireplace can be supported upon an arch of brickwork. In short, it should not be a difficult matter for the merest tyro at architecture to design a house to meet these simple requirements without adding materially to the cost of house building, more especially when so many elaborate, expensive, and futile precautions are evolved.

In the building of wood and iron houses the illustration given is almost sufficient of itself. That is to say, raise the building well off the ground upon piles of wood—such as jarrah, which is not attacked—or on pillars of brick or stone. In the setting of such stone or bricks, sand and cement mortar should of course be used, not dargai, which even when “pointed” with cement is a way in for white ants. Where bricks or stone or termite-proof woods are unobtainable then the wood that is selected should be thoroughly treated by soaking some days in arsenic solution, and then when dry well tarred or creosoted before implanting in the ground. As a further protection they may be set in cement, the cement being sufficient to remove the wood several inches from the soil all around and below. In such houses of course similar precautions have to be taken to insulate the bases of any steps leading to either veranda or doors.

That constant interference with them does drive ants away must be admitted. Amongst their other peculiarities they seem to like quietness, and much occupied houses are often deserted by them for quieter pastures. This is illustrated by a number of cases where families have gone away for a month or so and left the house closed up and on returning find the termites have been at work. A more striking example of this is not to be found perhaps than the immunity of kaffir huts, every particle of which is attractive food and whose grass walls touch the ground, and yet deserted huts are eaten. This is also the case with the wattle and daub and grass habitations of the Indian coolie. These are put down in the midst of termite fields and are scarcely touched, but when left uninhabited are quickly swallowed up.

## ENGINEERING NOTES.

### Ceylon.

It is hoped that the protection works between Galle Face Curve and Wellawatte will be finished by March, 1913, and thus enable the double line throughout between Slave Island and Mount Lavinia to be opened for traffic.

The choice of a route for the projected extension of the 5 ft. 6 in. gauge railway from Bandarawela to Badulla demands careful consideration. One route recently surveyed is  $20\frac{1}{2}$  miles long, and the estimated cost of the line £402,000, or nearly £20,000 a mile. These figures suffice to show the difficult nature of the country traversed. Certain alterations in the alignment have been suggested however which, it is hoped, will affect an appreciable reduction in the cost.

The assistant engineers engaged on the construction of the Chilaw Extension are being provided with motor bicycles to enable them properly to supervise their sections.

In November, 1911, a Railway Traffic Commission concluded that the lines were inadequately equipped for the work they had to do, this being due partly to the unprecedented rapidity with which large areas of land had been opened up by cultivation and partly to the enhanced wealth of the population as a whole. The Commission put forward a programme which was considered sufficient to meet all requirements during the next five years. For this and other purposes a loan of Rs. 15,000,000 has been sanctioned. Eighteen locomotives were ordered last October, the work being distributed among four firms.

### Lagos.

In 1911 the revenue was £307,092 and the expenditure £176,961. There was a substantial increase in the earnings, which were, as in the case of previous years, mainly due to the increased traffic over the so-called Commercial section, which comprises the first 200 miles of the Railway. Trade on the length of 107 miles beyond had not

yet sufficiently developed to contribute in any adequate measure to the gross earnings. The reduction of the proportion of expenditure on gross revenue to 57·62 per cent., and a return of 4·38 per cent. from the net revenue on capital applied on Open Lines may be regarded with considerable satisfaction. At the beginning of the year, however, the trans-Niger Section, Jebba to Minna, was officially opened, and as it must take some years for the traffic on this length of 160 miles to develop, both the proportion of expenditure to earnings and the return of net revenue on capital applied will be correspondingly affected. But at Minna the junction with the Baro-Kano Railway is made, and hence the earnings derived from through traffic will undoubtedly considerably benefit the whole undertaking. The cost of the trans-Niger Section, including the North Channel Niger Bridge and the train ferry and slipways at Jebba which, from the 1st January, 1912, must be added to the capital applied on the Open Lines, amounts to £899,491, and for the re-alignment between Iddo and Ibadan which at date (April) is approaching completion to £199,072 or a total additional capital of £1,098,563, should the whole of the cost of the deviations be charged to Capital Account.

Such returns, Mr. Glasier observes, are a guarantee to Government that, when the first few lean years after construction have passed, railway undertakings in Nigeria, built with due regard to commercial as well as political considerations, will pay the full interest on the money borrowed to construct and equip them, in addition to the enormous advantages which are indirectly conferred on the country. Whilst it is true that the Commercial Section—the first 200 miles of the Lagos Railway—is the main source of revenue and pays largely for the remainder, yet it is able to do so and to prosper at the same time, owing to the steady and satisfactory increase of its earning power. Before many more years the Northern Lines will themselves become self-supporting, and hence there is every reason to believe that the vigorous policy pursued during the past few years of exploiting Nigeria by railways can be continued without imposing an undue burden on the general revenue of the country. The construction of the Niger Bridge is proceeding steadily.

---

### Sierra Leone.

The revenue in 1911 was £107,621 and the working expenditure £69,818, giving a profit of £37,803. The capital (loan) account was a little over a million, and the total capital expenditure has been

£1,114,481. The result, therefore, was not so good as on the Secondee railway, but it is very satisfactory, and it is probable that a much larger revenue will be shown for 1912.

The railway department now possesses three concrete block machines, and in the year 18,462 blocks were made and used. Buildings of concrete blocks are cheaper and more quickly built than in laterite rubble.

An extension of the railway from Rowalla to Makene has been decided upon. As in the case of the existing lines, 30 lb. B.S. rails and steel sleepers will be used. It is hoped that the line will be open for traffic by July, 1914, and that the cost will not exceed £61,400, exclusive of rolling stock. Construction will be in the hands of Mr. F. A. Target, who had charge of the line to Rowalla.

---

### **Accra Harbour.**

The breakwater at Accra has been completed for the sanctioned length of 1,050 feet. It is proposed to add another 250 feet and to construct a wharf and other works for the improvement of the harbour. The estimated cost is £72,000, which covers the provision of additional pumping plant as it has been found that the existing plant is hardly able to cope with the quantity deposited annually by the sea, viz., 165,000 tons.

---

### **Accra Water Works.**

Owing to the great depth at which the rock lies it has been decided to abandon the proposed dam across the Densu Valley in connection with the Accra Waterworks. Instead, a low level reservoir of 45,000,000 gallons capacity will be made in the valley.

---

### **Secondee Water Works.**

Good progress has been made and operations on several cuttings had been started by October, and rail-laying was started. It was expected that if the rails were ready the work would be finished by the end of the year.

---

### **Bathurst Water Supply.**

The report of the engineer despatched to Bathurst to report on the improvement of the water supply has been received and gives interesting matter. The town of Bathurst lies on St. Mary Island at the end of a long, low, sandy promontory, the highest level on the island being only ten feet. Part of the present

supply of the town is drawn from public and private wells and the balance from private tanks into which water from the roofs is drained. Neither of these systems can be recommended for an extension of the supply. The shallow wells form admirable breeding places for mosquitoes, while, owing to the absence of a sewerage system, the water in the wells is badly contaminated by soakage from the surrounding soil. The system of conserving rain-water is impracticable on a large scale on the score of cost.

In view of these difficulties it has been necessary to seek a river in the vicinity with the necessary yield for a pipe-borne supply. Such a river is the Lammin, which it is proposed to tap at a point distant from Bathurst some eight miles in a direct line. This short route, however, crosses extensive mangrove swamps over which the pipe line could not be carried except at a prohibitive cost. It is proposed to overcome the difficulty by pumping the water to a reservoir of three days' capacity to be constructed on high ground near Cape St. Mary whence the pipe line can be carried over a good road into Bathurst. £22,500 is the approximate cost of this scheme which would solve the problem of the water supply for both Bathurst and Cape St. Mary. These proposals have been approved, and it is hoped to commence operations at an early date.

---

### Freetown.

Several inconvenient shortages during the "dries" have proved that the water supply of Freetown needs attention. The reason for such shortage is easily expressed. The present reservoir holds two full days' supply, whereas during the "dries" the daily supply is only two-thirds of the consumption. An adequate supply would be assured if it were possible to dam the Congo Valley. This, however, is not feasible. The cutting of trial trenches at the only possible site for a reservoir has revealed a general fissuring of the syenite bed. Unfortunately, this general shattering of the rocky bed is common to all the rivers around Freetown.

It is therefore necessary to find other means of supplementing the present supply. This can be done by tapping the three branches of the Babadori river which, it is thought, will yield a minimum of 288,000 gallons a day. This augmented supply will be gravitated to the existing reservoir at Tower Hill, the capacity of which is to be increased to 1,000,000 gallons. Such a scheme, estimated to cost £15,000, would seem to ensure an adequate supply for Freetown, and also enable ships to obtain cheap water, an important means of expanding trade. Various suggestions have also been made for improving the supply of the Hill Station, outside Freetown.

The proposals outlined above have been approved by the Secretary of State, subject to possible modification of details.

---

### **Bahamas.**

The question of improving the harbour at Nassau has been again revived. It is proposed to cut a sleeve-like channel about 2,000 feet long and 30 feet deep through the coralline bar. In addition it may be necessary to dredge a channel in the sand of the harbour to an equal depth unless the strong tides flowing through the proposed cutting render the dredging unnecessary. The cost of such a scheme must of necessity be heavy, although the estimates framed at present are very conflicting. The best plan would be to send an expert to the spot to examine and report fully. It could then be judged whether the expenditure is warranted by the advantages to be derived.

---

### **Uganda.**

A short line on the metre gauge is about to be constructed from Kampala to Port Bell on the Victoria Nyanza, a distance of  $7\frac{1}{2}$  miles. Produce is at present carried by a monorail. This, however, is costly and inefficient, and the aid of the Government motor service has to be called in to supplement its efforts. The line will be laid with the standard Uganda Railway 50lb. F.F. rail but steel sleepers will be used, experience on the Jinja Kakindu (now Busoga) Railway having proved that local timber is useless for the purpose. It is proposed to employ eventually internal combustion engines on this short line, but probably a start must be made with the steam locomotive, as present experience hardly warrants the adoption of the petrol engine. The work will be carried out by the Public Works Department.

It may not be generally known that the European system of railway timing is in force on the Uganda Railway. This progressive line has just issued a very handy time and fare table. The booklet gives particulars of steamship connections and a great deal of information valuable to the prospective visitor to East Africa.

Ten Mallet locomotives have been ordered for the Uganda Railway from the North British Locomotive Company at the price of £49,320.

---

### **Kilindini Harbour.**

Mr. Wilson (of Messrs. Coode, Matthews, Fitzmaurice & Wilson) is leaving in January for East Africa to study the conditions obtaining at Kilindini in order to devise a broad scheme for the

improvement of the port. The £100,000 provided for the deep water pier is not a great amount for such a purpose, and a careful enquiry is necessary to decide what can and should be done.

---

### German East Africa.

About the middle of July Dr. Solf, the minister of colonies, arrived to inaugurate the opening of the line from Dar-es-salaam to Tabora. 655 kilometres have been constructed in four years—a very good performance. The cost per kilometre is said to have been about 100,000 marks, that of Uganda having been 126,000. The trains now penetrate for 850 kilometres into the interior, and before the end of 1913 will reach Lake Tanganyika. Dr. Solf also went up the Uganda Railway from Mombasa, visiting Nairobi, Port Florence and Entebbe, and has no doubt stored up many materials in his mind.

---

### Trinidad.

Work on the Caparo Valley extension to Rio Claro is progressing steadily. The railway runs almost its entire length through forest and cocoa plantations, so that every yard of it has to be felled and cleared, the felling over a great deal of the length being of the heaviest description. The dry season of 1912 was an abnormal one, and while it was excellent for the earthworks the scarcity of water for the labourers necessitated carrying water from Port-of-Spain (about 50 miles) daily by rail, and thence distributing it by motor trolley to the gangs. Bush fires in consequence of the drought also caused some trouble.

The construction of the 16-mile extension from San Fernando to Siparia has been much impeded by legal difficulties in connection with the Cipero tramway. After protracted negotiations the tramway passed into the hands of the Government on the 1st of July last. As labour is more plentiful in this part of Trinidad it is hoped that good progress will soon be made. In November the sea wall was being constructed at a good rate. The steel-work of the bridges was in course of erection by the East End Foundry.

On the Tabaquite Rio Claro line the earthwork was almost complete in November.

---

### Port of Spain Harbour.

Various reasons have led to a reconsideration of the schemes suggested in 1902 for improving the harbour at Port of Spain. Chief among these are the approaching completion of the Panama

Canal, the development of the oil industry, and an increase of trade resulting from the railway extensions under construction. Without this assistance the port has made steady progress, the total volume of trade for 1910 showing an increase of forty per cent. over the figures for 1902.

The chief features of the 1902 scheme now under consideration are a quay wall 2,500 feet long with the usual accommodation, a 27-foot basin having an area of 70 acres, and an approach channel two miles long. The cost will probably be in the neighbourhood of £600,000. As the trade of the port is at present carried on by lighters some opposition to the new scheme is to be expected from these interests. Moreover, the proposal to defray the annual charges on the requisite loan from general revenue does not find much favour in the Colony.

---

### Grenada.

An engineer is proceeding to Grenada to study the present condition of St. George's harbour with a view to its improvement. Having regard to the unsatisfactory condition of the existing frontage and the necessity for an improved depth in the harbour, it seems indisputable that improvement works should be undertaken as early as possible, and the first step is the preparation of a suitable plan capable of future extension.

---

### Tanjong Pagar Dock Board.

The various half-yearly reports of this board are usually received in advance of those from any of the Colonies. The report for the six months ending 30th June, 1912, has come to hand recently. Although the net revenue for this period shows a slight falling off from the previous half-year it represents, nevertheless, an increase of £13,800 over the average for the preceding thirteen half-years. After paying interest on loan funds and providing for renewals and reserve the Board are enabled to carry forward a balance of over £9,000. The report states that the progress of the Wet and Dry Docks and other extensions on hand has been eminently satisfactory during the period under review, the contractors having pushed on the works with vigour.

---

### Fiji—Suva Drainage.

No time is being lost in carrying out the scheme for the drainage of Suva. The resident engineer, Mr. M. A. Ravenor, and his assistants have arrived in Fiji where they are now engaged on the preliminary details. Owing to the congested state of the manufacturin markets, care was taken to order at an early

stage the special machinery required with the result that it should reach the Colony in ample time. The estimate for the total scheme amounts to £28,370.

---

### Suva Harbour Improvements.

The original scheme for the improvement of Suva Harbour contemplated reclamation work by means of a sand pump dredger. It is now found that most of the necessary material can be obtained from Crown and other land in the vicinity. As a result of reclaiming from the land the wharf front will be extended 66 feet further seaward and thus provide a greater depth of water. It is hoped that a great part of the reclamation and the erection of a new wharf thereon will be completed during 1913 or, at the latest, early in 1914.

---

### Railway for Fiji.

Mr. R. S. Routh, late chief engineer of the Assam Bengal Railway will arrive shortly in Fiji for the purpose of examining and reporting on the proposed Suva-Rewa railway scheme. The line will run, as its title implies, from Suva northwards up the Rewa valley. A survey for the line has been made and the surveyor's report with the necessary plans will be ready for Mr. Routh on his arrival in the colony.

A trial is being made on the Nigerian state railway of the "Galloway Hill" patent furnace, by which it is claimed that considerable economy of fuel is effected. It has recently been tried on English railways.

---

### Telephones.

The telephone industry is extending very satisfactorily in Great Britain. The absorption of all the telephone systems by the Post Office has had a considerable effect in this direction, as this department invariably gives a large preference to British manufacturers for all apparatus and plant required.

The direct encouragement of the Post Office has enabled British firms to take up the manufacture of telephone plant and apparatus on a larger scale, and the competition in the home market forces them at the same time to improve their workmanship.

The result is that at the present time it is possible to obtain from four or five independent British factories apparatus of purely British manufacture equal in every respect with the best Continental or American work. The large orders placed within the

last year or so with the Peel-Conner works, Siemens Bros., Western Electric Co., British Insulated and Helsby Co. (now known as the Automatic Telephone Co.) and British L. M. Ericsson Co. shew that in the opinion of the Post Office, each of these companies is capable of supplying equally good plant at practically identical prices.

---

A parcel was recently sent from Singapore to London which was the object of extraordinary care. Special arrangements were made to ensure that the seals on it should not be broken by the customs authorities, and an official certificate of the contents was given for this purpose. This was not on account of its intrinsic value: the contents were nothing but ordinary mud. They were, however, material as evidence in the action of John Aird & Co. v. the Tanjong Pagar Dock Board, the stupendous case which no doubt when decided will be instructive as to the responsibility of governments for any particulars which they give for the guidance of tenderers.

## MEDICAL NOTES.

### Native Medical Theories.

In many respects there is a general uniformity of character among uncivilized races, though in details, extraordinary divergencies arise. The savage does not concern himself with matters which do not affect him personally. He has no particular desire to understand the mechanical productions of civilization, and such things as gramophones and cameras are lightly dismissed as natural phenomena which neither require nor admit of explanation. But he is extremely curious and suspicious where his own person is concerned. Thus in medical treatment, beyond the usual native "dopeing," it is observed in the Welcome Tropical Research reports, he always suspects an ulterior motive, and drugs, pills and tabloids in particular, are to him minutely mysterious applications suggestive of magic. The stethoscope conveys the conversations of conflicting demons within his interior. The hypodermic syringe, with its potent dose, must needs transmit a spirit (probably evil) to his body. A surgical operation with its lethal sleep and cruel instruments means death, mutilation, and resurrection in one. On recovering consciousness he strongly suspects not only a damnable inquisitiveness on the surgeon's part, but probably the removal of some vital organ, the loss of which he will detect and regret anon.

Disease to the savage mind is due to supernatural influences—to evil spirits, usually the ghosts of dead ancestors, who still lurk in an after-life, animating animals, hiding as snakes in the long grass, or writhing in storms and ever seeking to trouble those still in existence. The natural result of this theory of the origin of disease is to prevent any attempt at diagnosis or treatment. One consequence is that the death rate is very high, especially among males, so that eventually the surplus of females over males becomes very large, and this in primitive communities makes polygamy inevitable.

The supernatural view of disease lends itself to numerous "cures," by methods in which deception is obvious, and it is not necessary to conclude that the native doctor is a wilful humbug on these occasions; and certainly there are diviners and devil-dancers who go through an amazing amount of physical exertion, which seems to show that they are in earnest. The native believes with a whole-hearted faith in the doctrine that "prevention is better than cure," and his way of acting on it is to use charms, generally on some fanciful analogy between the substance chosen and the power to ward off some disease; but many also are chosen because of their attractive appearance, like the mascots of modern society. Such mysterious articles as a sardine tin-opener and a sparklet bulb have been known to figure in this medico-magical category. On this basis one cannot expect much from the drugs which are used for medical purposes, though some of the vegetable preparations relieve pain. There is no real surgery, but splints for fractures are common to most primeval peoples and are an obvious resource.

Most such peoples are voracious for meat, and indulge in orgies when they get it. Frequently, it happens that game can only be caught during part of the year, in the dry season, and if there are no domesticated herds—and where there is tsetse there cannot be—cannibalism easily arises, and is encouraged by the belief that to eat the flesh of enemies makes the consumer war-like and wise.

Death is looked upon with great awe, as there is no understanding of the natural causes. It is considered a visitation of the evil powers, and on some occasions the whole village may migrate to get out of the way of further mischief.

---

### Climate and Clothing.

The authorities collected in the "Wellcome Tropical Research Laboratories Review," incline to the view that the ills of tropical life are not due to the sun's actinic rays, and that therefore it is useless to devise clothing suitable for excluding these. Body temperature is intimately connected with the amount of water in the body and its excretion from it, and a hot moist temperature increases the amount of water and therefore heat production. Excess of water causes (1) intermittent pyrexia, (2) increased blood destruction, (3) abnormal forms of corpuscles, (4) increased pigment, (5) enlargement of the spleen. Acclimatisation in this respect is not possible. One result of these findings is that a "braicing" climate, so much desired by men from the tropics, "may result in their finding themselves braced into their coffins," they should avoid cold and damp, and if they are in a cold

temperature it is essential that they should have plenty of sunshine. For the dysenteric, extreme cold is almost as harmful as extreme heat. Recently, red or black undergarments were being boomed for tropical wear, as a means of protection from actinic rays, but there is now a reaction against this theory. Tests in the Philippines indicate that the climatic effects are produced entirely by moist heat without the aid of the sun's actinic rays. The general conclusion is that for thick clothing white stuffs are always the best, and also for thin clothing if it fits tightly to the body, but that if loose a dark colour is best because the heat absorbed by the stuff does not warm the body by contact. The best clothing is one of loose stuff, with large sleeves and easy at the neck. When the sun is very strong it should be of light exterior and dark inside. It is a mistake to aim at light weight in clothes; thick reps and drills are superior to thin materials.

---

#### Sleeping Sickness, Bulletin No. 39, Vol. 4.

It is observed that owing to the difference in width of their respective belts the carrying area of *morsitans* is much more extensive than that of *palpalis*, so that depopulation is a serious matter. The depopulation of the fly-belts alone means the removal from the water-side in the case of *palpalis*, the removal to it in that of *morsitans*. While the prophylaxis of trypanosomiasis in *palpalis* areas must be one of two extremes—local clearing or total depopulation—a middle course seems to be best when dealing with the disease carried by *morsitans*. As also the extent of the carrying area depends on the amount of traffic through the belt, prophylaxis in Nyasaland means, in addition to the removal of all villages from within the fly-belt, the closing of all roads that pass through it.

The first requirement is the delimitation of the belts proper. This can only be done by entering them from various points and noting where flies are first found in any numbers; it should be done fairly early in the day before much traffic has passed. The next proceeding is to remove all villages isolated in the bush and to concentrate them on the rivers or Lake-shore. This, as a rule, does not present any difficulty. In any case many of the new settlements will be just outside the fly-belt; steps must therefore be taken to drive the fly from the neighbourhood of such villages. It is essential that the land be not only cleared but put under cultivation by cotton, ground nuts, maize, etc. These plantations should be contiguous and should surround the village. It would seem, writes Dr. Sanderson, that *morsitans* does

not return to country lying fallow; in course of time, therefore, the extent of a belt might be gradually diminished and wide swathes, more or less following the course of the river, be driven through it. It is his experience that the carrying area of *morsitans* can be strikingly decreased by the closing of roads through the belt. Owing to the difficulty of diagnosis it will not be easy to frame efficient rules for the safeguarding of the southern fly areas. The gland palpation method does not seem applicable. No labour recruited in Rhodesia or Nyasaland should be permitted to travel by any road which passes through *morsitans* areas. During the clearing and planting of the fly-belt some natives will undoubtedly be infected; these will be discovered by the patrols instituted by the author. He considers that prophylactic measures should be carried out in all *morsitans* areas, even though no cases have been found.

---

The Bulletin, No. 40, corrects an impression which has gained ground that the disease is transmitted from man to man by *G. morsitans*. It states that the human trypanosomiasis of Rhodesia and Nyasaland is transmitted by *G. morsitans* but this disease is considered by the Royal Society's Commission in Nyasaland to differ from *T. gambiense* infection, to which alone the term Sleeping Sickness is applicable. There is no evidence that *G. morsitans* transmits Sleeping Sickness in nature. Taute transmitted it thus in a laboratory experiment, but it does not necessarily follow that this is a natural method or one occurring outside the laboratory. *G. morsitans* naturally infected with *T. gambiense* have yet to be found. There is at present no reason to think that administrators, when they devise measures against Sleeping Sickness, need concern themselves about any other species of tsetse, if they have *G. palpalis*.

---

### Segregation.

In the same report attention is called to the imperative necessity for the segregation of Europeans, the ideal being that there should be a clear space of at least a quarter of a mile round any area where Europeans reside. Offices and factories must of course be built within the business areas, but it is strongly recommended that no Europeans should be allowed to reside in native towns if they are not already established there. On this point Dr Rice observes:—

“My experience in West Africa has taught me that, apart from a certain type of Government official, more happily becoming extinct, the bitterest opponent of sanitation is the local mercantile agent. He may live in a native town, but his quarters are usually palatial, whilst those occupied by his assistants are often such as, could the

shareholders at home realise their condition, they would blush to pocket their dividends.

"It is possible that this reluctance on the part of the local agent to advise his firm to build suitable residential quarters outside the native towns may, in some part, be due to financial consideration. I presume the interest on the capital sum so expended would be an annual charge to expenses, which would diminish the sum of the profits, to a percentage of which the local agent looks to augment his income.

"Then, again, the trader's great argument against living outside the town is that it is necessary for the safety of his store that Europeans should live on the premises. No doubt the merchants of the City of London advanced the same arguments long ago, but I scarcely think that in the principal towns of the Gold Coast such a reflection upon efficiency of the police force is justifiable, and the argument is stultified by the fact that in the more primitive out-stations, where police supervision is naturally less efficient, the factories are often in charge of a native agent.

"I am inclined to think, in the absence of legislation, we shall not make any great progress in this matter until the Directors at home have been brought to realise the conditions under which their employees live, and that, in the long run, capital expended in providing them with healthy quarters outside the native towns would be found to be well invested."

Shareholders' blushes will probably be spared from the fact that they are not likely to know anything about the matter. The subject is one for local investigation and treatment, and till the natives recognise that a sanitary inspector is something better than a "malignant type of police officer" the policy of segregation is sound. The old and honoured practice on the Gold Coast has been to build houses as densely congested as possible. Wherever there is room a house is built, and it is immaterial that it touches another or fills up a passage or yard. The natives are used to this mode of living and like it, and it will take many years of work to introduce a better system.

---

### Yellow Fever in West Africa.

A few years ago it was commonly denied that yellow fever existed at all in our West African territories, and now it is sometimes enquired why, if yellow fever does take place there, are the outbreaks so limited. In the Medical Report of the Gold Coast Dr. Rice deals with the question as follows:—

"One would like to reply, that the cases are diagnosed promptly. Preventive measures, such as evacuation of the infected area and

isolation of contacts, are at once put into force, and the campaign against the stegomyia mosquito has done much to reduce the number of the definitive host. All these things are true, and there can be no doubt that the promptitude with which the various outbreaks of 1911 were suppressed was, in a large measure, due to them; but that is not all.

"We cannot pretend that prior to 1910 any of the above conditions obtained; the notification fear was universal; infected areas were not evacuated, nor were contacts isolated, and the stegomyia campaign had not begun, yet outbreaks occurred from time to time, but in no instance did one approach in character the historical epidemics of the West Indies and South America.

"The explanation I submit is:—

"(1) The comparatively small non-immune population.

"(2) The fact that the non-immunes live in houses or bungalows often widely separated from one another, and hence in West Africa the disease is apt to attack the occupants of certain houses or bungalows and is a house or bungalow disease, as contrasted with the West Indies and South America, where, in times of epidemics, it affects whole streets or districts.

"All the cases amongst the non-immune, six in number, diagnosed during the year ended fatally—a mortality rate of 100 per cent.

"Such a death rate, compared with that obtaining in other parts of the world, forces one to the logical deduction that, as far as the non-immunes are concerned, only the fatal cases are diagnosed, possibly many mild cases go untreated."

### East Africa.

There has been a considerable increase in the number of cases of malaria, and it is not clear what the cause is. It has been suggested that Government Officials brought from malarial districts have had malarial relapse in the colder climate, but this would not account for the whole of the increase.

The first case of plague seen in Nairobi since 1906 occurred in May. Many infected rats were found and several more cases occurred. Buildings in the bazaar containing foodstuffs contained, as was to be expected, nearly all the rats and a large proportion of the cases. Mombasa preserves its immunity, probably owing to its higher temperature, as in India plague is a cold weather disease and is checked when the mean daily temperature passes above 80° F.

### Northern Nigeria.

The sanitary condition of Northern Nigeria, an area considerably greater than twice that of the British Isles, raises a great number of questions which can only be dealt with very gradually, but many of the native customs have the rare quality of being of great assistance to sanitary activity. Thus the natives, it is observed in the medical report for 1911, prefer to have their markets out of the towns; they are fond of open spaces and wide thoroughfares, and they generally dig their wells—many of them very deep—at a considerable distance from human habitations. It may be added that the useful office of scavenger is performed by the vulture, which is accordingly protected. There is very little refuse, for the natives use up practically everything. They have lost the art of making burnt bricks, and most people live in ramshackle grass hovels which require continual renewal. Probably before long they will learn to burn lime and make burnt bricks, and a great improvement will then set in, but at present much skill is bestowed on mud working, the building is quickly made, and the results on the whole better than might be expected. The questions of water supply and sewage disposal arise everywhere, but no general plan could be settled until it is decided whether Zungeru is to remain the headquarters station, which now appears likely to be the case.

---

### Mauritius.

The death rate in 1911 was 33 per cent. Out of 12,204 deaths 4,313 were due to malaria, or at any rate to the weakening of the resisting power caused by repeated attacks of malaria. The next highest diseases are pneumonia, tuberculosis and debility (? ankylostomiasis), and the Director of the Medical Department considers that 58.5 per cent. of the people who die in Mauritius die from preventable diseases. Evidently with proper sanitary reform the present high death-rate could be considerably reduced. There is a good deal of lunacy among the non-white population, attributable to poverty, drink, ganjah smoking and heredity.

---

### Ankylostomiasis.

It is stated in the Jamaica medical report that since Dr. Turton reported three years ago on the prevalence of ankylostomiasis in his district it has become increasingly evident to him that this disease is responsible for a far greater amount of disability—of chronic ill-health—among the labouring population of his side of the parish than any other single cause that he can name. It is the mild infection that seems to be so insidious in its effects before the grave and unmistakable symptoms show themselves. Over and over again

within the last few years he has seen cases of chronic "debility" without any marked symptoms clear up and recover rapidly on the discovery of a very mild infection followed by specific treatment. One occasionally sees a whole family affected in greater or less degree. He writes thus of the district as only being within his own knowledge.

But he has examined every child admitted to the Industrial school during the past year: these came from every parish in the Island, and it is a rare thing to find a child from any one of the country districts that is quite free from this infection. This is of course the result of the absence of any proper system of dealing with the excreta, the earth becoming foul, re-infection occurring, and the disease spreading. Then comes physical disability, and so poverty; from this to prædial larceny is but a step and the children left to find for themselves become a curse to their neighbours by reason of the depredations—for they must steal or starve. So the vicious circle of poverty and disease becomes established, with crime as an incidental. His strong conviction is that this disease is responsible for much of the petty crime of the country districts of the Island.

It seems highly probable that hookworm infection acting continuously and unchecked through long periods is the chief factor in the production of infantilism so often met with in this population and a frequent cause of difficulty in childbirth. Observations in the southern States of America, India and other places where the disease is endemic have shown that it is producing definite physical and mental deterioration such as skeleton dwarfing and intellectual dulness, and there is reason to believe that these changes are inheritable.

The infected prisoners practically all came from moist agricultural districts; some had worked in cane or banana fields.

---

This disease is also dealt with in a Nyasaland report, which states that:—

"Hookworm disease (Ankylostomiasis) and other helminthic infections have been known to exist in various parts of the Protectorate; and at the Transvaal mines it was found that about 50 per cent. of Nyasa natives, both British and Portuguese, were subjects of this complaint.

"Ankylostomiasis is a complaint which is prevalent in various parts of the world, and the disease has been recognised as one of the main factors in bringing about a condition of lassitude, which in many cases amounts to a positive disinclination or unfitness for work.

"It is therefore evident that all who are interested in the native directly, or in his labour, should take such steps as are

practicable for the prevention of spread of the disease and of its obtaining a footing where large numbers of natives are employed by the various planting communities and transport companies.

“First in order is the question of prophylaxis. Natives should be provided with deep trench latrines, and all excreta voided on the surface should be collected and buried in pits. The serious nature of the disease, the facility with which it spreads, and its prejudicial effects on the physique of the workers being recognised, it is clear that it will repay planters and others to devote particular attention to this necessary measure of prophylaxis, and to expressly set aside one or more of their labourers for scavenging work. Residents of districts are in a position to point out to chiefs and headmen of villages the danger of hookworm disease, how it is caused, and the manner of its spread, and to endeavour to instil into the native mind the necessity for having proper latrines attached to every village, so as to obviate the danger arising from surface soil pollution. Town Councils should provide an adequate number of sanitarily-constructed latrines for the use of natives, on the pail system; and all nightsoil should be daily removed and buried in deep pits or, preferably, destroyed in an incinerator. It is only by the adoption of concerted measures such as are here outlined that further spread of the disease can be checked.”

A technical report on the disease is added by Dr. H. S. Stannus.

---

### Nastin Treatment for Leprosy.

A report by Dr. Hood, of Southern Nigeria, states that this treatment has been carried out with fair regularity but that the results have not been very encouraging. The Deycke system was tried at Yaba Leper Hospital, and although improvement—perhaps due to cleanliness and good feeding in the hospital—appears to have taken place in some of the patients, only one case was discharged as cured. The details are given in a Colonial Office paper.

---

### Carbolic Acid as a Larvicide.

Paraffin is generally useless on ponds as it will be quickly blown to one side by a strong wind and evaporated before it can asphyxiate. Crude carbolic acid, it is stated in the “Annals of Tropical Medicine” (Liverpool), has been used with complete success in British Guiana.

In most of the small pits, when treated with carbolic acid, the larvæ were seen to die in about an hour, but in the case of pupæ the time was much longer (frequently as much as twenty-four hours), but usually when examined carefully the following day

after treatment no larvæ or pupæ were seen alive. The observers were inclined to the belief that, in the case of a temporary small collection of water, if crude carbolic acid is applied it does not evaporate to any large extent but concentrates as the puddle dries up, and further, that, having dried up, the ground is sufficiently impregnated with the carbolic acid to render water deposited later by a shower of rain fatal to larvæ. Sufficient data have, however, not yet been collected to make an authoritative statement on this point. A dilution of 1 in 20,000 is efficient as regards all larvæ inside two hours, but in the case of pupæ a much longer time is required—probably owing to the fact that pupæ possesses a thick chitinous shell and have no alimentary canal into which to take the poison.

For use one teaspoonful was allowed to every two cubic feet of water or one ounce to 16 cubic feet; this gives a dilution of about 1 in 16,000, and allows a fair margin of safety to cover errors in calculation.

The crude carbolic acid containing all its impurities, such as cresol, rosolic acid, oily and tarry substances, is much more efficient than the purified, more highly soluble product, possibly owing to its sticky nature making it more adherent to the larvæ and pupæ, also no doubt in a few cases blocking up the syphon tubes.

---

### Izal.

The consumption of Izal in the colonies is very great, and has no doubt contributed greatly to improved sanitary conditions. The manufacturers, Messrs. Newton Chambers & Co., Ltd., of Thorncliffe, near Sheffield, have been honoured by a royal warrant appointing them manufacturers of disinfectants to His Majesty the King. The business was founded in the days of George III. by ancestors of the present principal proprietors. For nearly 120 years it has progressed from strength to strength until to-day it employs upwards of 6,000 workers in its coal mines, in its iron foundries, and in the manufacture of Izal.

Newton Chambers & Co. first turned their attention to the making of disinfectants in the days when carbolic acid was still regarded as satisfying the utmost requirements of sanitarians. It is constantly said of British manufacturers that, unlike their German competitors, they have been slow to adopt scientific methods. That reproach certainly does not apply to the makers of Izal, who for many years past have conducted patient research work, chemical, physical and biological, in their laboratories at Thorncliffe. In addition to their permanent staff they have also sought the advice of the ablest consulting chemists and

bacteriologists in perfecting their products. It is worthy of note that the Company were the first manufacturers of disinfectants to insist that the testing of germicides must be by bacteriological as well as chemical methods. On the occasion of a recent visit to Thorncliffe, Sir James Crichton-Browne, F.R.S., said that the country owed a debt of gratitude to Messrs. Newton Chambers and Co. for converting what had once been regarded as a waste product into Izal, "that worthy and formidable weapon for battling against the bacillus."

---

### Mosquitoes and Trees.

Mr. Rodway in his book on Guiana mentions the effect of trees on mosquitoes. "Mosquitoes seem to be less troublesome of late years in Georgetown since the sanitary arrangements have been improved, and especially since street avenues have been planted. Some have gone so far as to say that trees harbour mosquitoes. Possibly they do afford cover for them and thus in a way prevent their taking refuge in the houses. Our experience of over forty years is that these pests take refuge in bushy places to leeward of a swamp when there is a breeze, but otherwise they prefer open places. In a low country like Demerara trees are important agents in preventing pools of stagnant water from remaining long within reach of their roots. They not only drain the land but also raise it a foot or more for as large an area as the branches extend. When Georgetown was almost wanting in trees yellow fever was rampant, but it has not appeared since systematic street planting was properly carried out. There is a great difference in the condition of the street parapets of late years, partly on account of the planting and partly from better draining. Formerly they were oozy in wet weather and the feet would sink in water, now we can tread firmly without wetting our boots. Such ooze was no doubt congenial to mosquito larvæ. This matter may seem trivial, and yet it is so important that it has received the attention of the Government and the municipality as well as the medical profession everywhere throughout the Colony."

---

### Entomological Research Committee.

Correspondence has been published (Cd. 6,429) on the work of this Committee. The president, the Earl of Cromer, explained what has been done in the collection of specimens and study of insect fauna. An idea of the magnitude of the task is given by the fact that the collection comprises about 190,000 insects, of which 56,000 are disease carriers.

## COLONIAL STAMPS.

Owing to the closing down of the mill at which all the water-marked paper has hitherto been made for the Crown Colonies, the necessary paper will, for the present, be supplied by the mill which is manufacturing that used for the Indian Stamps, and will be of the same character as that in every respect except the watermark which will remain as hitherto. Copper-plate printed stamps will continue to be printed on heavier paper, and no change will be made in the coloured papers of all of which a sufficient supply exists to last for some time to come.

The following changes have occurred since our last issue :—

THE BRITISH SOLOMON ISLANDS PROTECTORATE has adopted the new D.L.R. Postage Key-plate for its  $\frac{1}{2}$ d. and 1d. stamps and has been supplied with two new values from the same key-plate, i.e. : 3d. and 11d., both printed on unsurfaced paper.

CAYMAN ISLANDS.—Farthing stamps have been supplied printed from the old D.L.R. type of postage and revenue key-plate instead of the copper-plate design, and 1d., 4d. and 6d. stamps with the new portrait have been despatched.

CYPRUS.—10 paras and 2 and 12 piastres stamps have been supplied with the new portrait. The overprints and colours are the same as before.

EAST AFRICA AND UGANDA PROTECTORATES.—The following new high value stamps have been supplied, i.e. :—

100 rupees with red centre and black border on red paper.  
500 rupees with green centre and red border on green paper.  
Both values are printed on surfaced paper.

GRENADA has been supplied with a complete set of stamps printed from the new D.L.R. Postage and Revenue keyplate. The values and colours are the same as the issue with the ship design, but the colours are reversed in the case of the 2s. value so that the major part of the stamp may be in doubly fugitive ink, and no £1 stamp has been printed.

HONGKONG.—1, 2, 4, 6, 8, 10, 12, 20, 30 and 50 cents and 1, 2, 3, 5 and 10 dollars stamps with the new portrait have been supplied. The colours are as before, except in the case of the 6, 8 and 12 cents values which are in the colours allocated to 1½d., 2d. and 3d. respectively, and the 1, 3, 5 and 10 dollars values which are in the colours of 2s. 6d., 8s., 10s. and £1 respectively.

New border plates have been used for the 1, 2, 4, 8 and 10 cents and the 1 dollar values, showing the values in Arabic numerals in the two lower corners, in accordance with the rules laid down by the Postal Union Convention, as well as in words as before.

JAMAICA.—Four more values have now been supplied, printed from the Nyasaland type of keyplate, i.e. 1d., 2½., 4d. and 6d., all in accordance with the Universal Colour Scheme.

The only values which do not now show the King's portrait are the ½d. and 5s. values (Arms) and the 2s. value (Queen's Head).

ST. VINCENT has been supplied with ½d., 1d., 2d., 2½d., 3d., 4d., 6d. and 1s. stamps with the King's Portrait and printed by the copper-plate process and also with 2s., 5s. and £1 stamps of the existing Arms design but printed in two colours on white paper as follows:—

2s. Centre blue. Border purple.

5s. Centre red. Border green.

£1. Centre purple. Border black.

SEYCHELLES.—12, 18, 30, 45 and 75 cents and 1 rupee 50 cents and 2 rupees 25 cents stamps with the new portrait, but otherwise exactly similar to the existing series have been supplied.

SIERRA LEONE.—½d., 1½d., 2d., 2½d., 4d., 5d., 6d., 7d., 9d. and 10d. stamps of the old type but with the new portrait have been supplied, the last three being new values. The 4d. and 5d. values are now printed on unsurfaced paper.

3d., 1s., 2s., 5s., 10s., £1, £2 and £5 stamps (also postage and revenue) have also been printed. They are of a large size and show the King's Head in an oval surmounted by a crown in the upper half and the badge of the Colony in a circle below, the portrait and badge forming the keyplate. The 10s., £2 and £5 are new values, and the colours throughout the series follow the Universal Colour Scheme with the exception of the £2 value to which no colour is allocated on that Scheme. The colours of the £10 stamp have, accordingly, been used, but the colours of the centre and border have been reversed, as indeed they have throughout the large series in order that the major part of the stamps might be printed in doubly fugitive ink.

STRAITS SETTLEMENTS.—1, 3, 4 and 8 cents stamps have been supplied with the new portrait.

TRINIDAD.— $\frac{1}{2}$ d., 1d.,  $2\frac{1}{2}$ d., 4d., 6d. and 1s. stamps have been supplied, printed from a new keyplate and a new set of overprint plates. The overprint plates now bear the name of the Colony, with the addition of Tobago, as well as the values. The central figure remains the same. The values are, in all cases, printed in Arabic figures, in order to comply with the rule laid down by the Postal Union Convention. Hitherto the value was only thus expressed in the case of the  $2\frac{1}{2}$ d. stamp.

TURKS ISLAND.—Stamps of all the existing values have been supplied with the new portrait. They are in other respects the same, although they have been printed from entirely fresh plates, but the 1s. stamp is in yellow on white paper.

---

The "Stamp Collectors' Annual" is as usual a very useful and interesting volume. Georgian stamps, of course, bulk largely and for those who did not see our April number there will be found an illustrated reprint of it.

"Cayman Islands" is the latest "Melville" Stamp Book and it in no way falls behind its predecessors in attractiveness. The history of these stamps would have been somewhat meagre and uninteresting had it not been for the overprinting around which so hot a controversy raged a few years ago—a controversy which is again revived in a special chapter in this book.

"THE STAMP COLLECTORS' ANNUAL," edited by D. B. Armstrong, published by H. F. Johnson, 44, Fleet street. 1s. nett.

CAYMAN ISLANDS by Fred Melville, published by Melville Stamp Books, 47, Strand. 6d. nett.

---

### Notice.

FALKLAND ISLANDS.—The Victorian stamps, of which only the 1s. and 9d. values remain on hand, will be withdrawn from sale on the 31st January.

## RECENT TRANSFERS AND PROMOTIONS MADE BY THE SECRETARY OF STATE.

Mr. T. de M. L. BRADDELL (Attorney-General, Straits), Chief Judicial Commissioner, Malay States.

Sir T. CROSSLEY RAYNER (Attorney-General, British Guiana), Chief Justice, British Guiana.

Mr. J. J. NUNAN (Solicitor-General, British Guiana), Attorney-General, British Guiana.

Mr. W. R. TOWNSEND (Circuit Judge, Sierra Leone), Attorney-General, Gold Coast.

Mr. R. E. STUBBS (First-Class Clerk, Colonial Office), Colonial Secretary, Ceylon.

Mr. A. C. HOLLIS, C.M.G. (Secretary for Native Affairs, East Africa Protectorate), Colonial Secretary, Sierra Leone.

Mr. W. TELFER CAMPBELL (British Agent and Consul, Tonga), Colonial Secretary, Gambia.

Mr. H. E. W. GRANT, C.M.G. (Colonial Secretary, Leeward Islands), British Agent, Tonga.

Dr. J. T. C. JOHNSON (Senior Medical Officer, East Africa Protectorate), Principal Civil Medical Officer, Hong Kong.

Mr. S. B. GOSLING (Assistant Postmaster-General, Gold Coast), Postmaster-General, Southern Nigeria.

Mr. F. A. STOCKDALE (Assistant Director, Department of Science and Agriculture, and Government Botanist, British Guiana), Director of Agriculture, Mauritius.

Mr. R. J. CHURCH, A.M.I.C.E. (late District Engineer, Railways Open Lines (Capital Works), Southern Nigeria), Deputy General Manager, Gold Coast Railways.

- Captain J. L. BERNE (late of the Sierra Leone Battalion West African Frontier Force), Assistant District Commissioner Somaliland.
- Captain G. P. OMMANNEY (Company Commander, Southern Nigeria Regiment, West African Frontier Force), Assistant Commissioner of Police, Gold Coast.
- Dr. A. H. B. PEARCE (Medical Superintendent of Holberton Hospital, Lunatic and Leper Asylums, Antigua), Colonial Surgeon, Falklands.
- Dr. J. T. SMALLEY (Government Medical Officer, Fiji), Medical Officer, Hong Kong.
- Mr. G. C. DU BOULAY (Chief Clerk, Post Office, St. Lucia), Clerk to Governor, Seychelles.
- Mr. W. F. O'TOOLE (Second Class Supervisor of Customs, Gold Coast), Supervisor of Customs, Second Grade, Southern Nigeria.
- Mr. A. C. BURNS (Clerk to District Magistrate, St. Kitts), Supervisor of Customs, Second Grade, Southern Nigeria.
- Mr. H. BLACKMORE (late Normal and Agricultural Master, British Guiana), Headmaster, Primary School, Gold Coast.

## Note for Nyasaland Officers.

With special reference to the new East African leave regulations, the question of passages for Nyasaland Officers has been considered and the following decisions arrived at:—

1. Nyasaland Officers will be allowed to choose either the Suez Canal route or the Cape route when travelling between the Protectorate and this country.

2. If they select the former, they will be treated in exactly the same way as Officers of the East Africa Protectorate and Uganda, i.e. they will be allowed for the voyage the time actually taken from the date of embarkation until the date of disembarkation.

3. If they select the Cape route, they will ordinarily travel by a mail steamer between Southampton and Durban, using the Intermediate steamers only for the journey between Durban and Chinde. They will, however, only be allowed to travel by a mail steamer which is scheduled to connect with another steamer at Durban, e.g. the mail steamers leaving Southampton on the 23rd of November or 21st December.

4. If they prefer to travel by an Intermediate steamer all the way, they will be allowed to do so, on the understanding that the Government only provides them with a ticket for the Intermediate steamer, i.e. they cannot be granted the difference in cost between the Mail steamer passage and an Intermediate steamer passage, and that any time spent on the voyage between Chinde and Southampton in excess of 29 days will be reckoned as "leave in England."

# ALBION

## COMMERCIAL MOTORS For the Colonies.

**Vans, Lorries, Tipping  
Waggons, Tower Waggons,  
Government Waggons,  
Ambulances, 'Buses,  
Charabancs.**

Where roads are rough and the nearest repair shop is many miles distant — when soundness of material and quality of workmanship are liable to be put to the test at any moment — there and then the Albion with its studied simplicity and superb construction proves the wisdom of choosing a car built by the leading makers of Motor Waggons in the British Empire.

Many Governments, Contractors, Private Owners and Trading Firms at Home and in the Colonies, have proved to their own complete satisfaction that under the severest conditions the Albion is the ideal car for absolute reliability, and low running and maintenance cost. Every week orders and repeat orders from all parts of the globe bear testimony to this indisputable fact.

**MOTOR VEHICLES  
FOR ALL PURPOSES.**

Load Capacity, 10 cwt. to 4 tons.

**NO HITCH OR BREAKDOWN  
WHATEVER.**

Copy of letter received from Messrs. J. S. Fry & Sons, Ltd., the well-known Cocoa and Chocolate Manufacturers, of Bristol and London.

"We have much pleasure in stating that the 16 H.P. 2-ton Motor Van purchased from you in September, 1911, has given us every satisfaction. It ran 10,000 miles during the year and we have had no hitch or breakdown whatever. It answers our purposes extremely well."

## EDITORIAL NOTES.

---

A GREAT number of suggestions have been put before the Dominions Royal Commission, and there is no lack of variety in the subjects submitted by the witnesses for its consideration. To a great extent the evidence is directed to the question of securing greater uniformity in the commercial laws and practices of the Empire, and there can be no doubt that this object is generally desirable. On most, if not all, the matters referred to in this connection there is already in existence a large amount of official literature, but it remains true that in many cases progress is slow or non-existent. Mr. Geoffrey Drage, who has taken a wide view of the field, ascribes this to an imperfection in the administrative machinery. The Colonial Office, he states, has not had the driving power to force these subjects through, either with the Parliament at home or the Parliament of the great sister States. He suggests that there is a huge "no-man's land" of Imperial work of special importance from the point of view of trade, which no one is employed in thinking out, and upon which one department will not enter because it might encroach on another. This view leads up to the suggestion that there should be a new department, on which the Dominions will be

represented, and which would "co-ordinate" the departments concerned. The suggestion is interesting, but the ground should be made sure before a new machinery is introduced. We venture to doubt the existence of the "no-man's land," which is made the basis of the reasoning. As a matter of fact, all the specific matters referred to by Mr. Drage have been abundantly canvassed. The difficulty is not so much that there is no department to deal with a particular question as that there are several; the offices not only cover the ground, but in a sense overlap. No doubt mistakes have been made at times, but no instances are given which suggest to our minds ignorance or oversight. Mr. Drage cites two cases: Delagoa Bay, the importance of which, he says, "escaped our statesmen," and the British Guiana-Venezuela boundary case, where "there was a no-man's land between the Foreign Office and the Colonial Office, and a question as to where the documents were relating to the boundaries. That was found to be a no-man's land between the two departments, and I believe the documents were mislaid." The theory that documents were in "no-man's land" is rather suggestive of "Through the Looking Glass"; as Sir Rider Haggard remarked, "they cannot have been in the street." Probably the foundation for the story is that a valuable document was in the course of the enquiry discovered at the Record Office, where it had been since 1820, and where it had been indexed in a way which was calculated to conceal it. But no documents were "mislaid," and the document in question was in fact found as a result of a search of possible materials. It is difficult to see what Mr. Drage's new department could have done more than was done. It might possibly have done less. Mr. Drage's two cases are in fact thin material to support his great proposition. In each of them we went to arbitration, and it is not seriously argued that our cases were badly presented.

The plain reason why it is difficult to secure uniformity in trade matters in the different parts of the Empire is that there are everywhere different views and interests. The present system secures full opportunity for discussion, as may be seen from the published accounts of the steps taken by the Imperial Secretariat since the last Conference. The suggestion that the "driving-power" of the Colonial Office should be increased in some way obviously invites criticism. These matters must be dealt with by the Colonial Governments, and no Colonial representation on any body here will ever induce them to waive their rights or delegate their functions. This is abundantly seen from the position which the Dominion representatives in this country habitually take, and from the proceedings of the last Conference.

The subject of a State trans-Atlantic cable comes a good deal to the front in the evidence taken by the Dominion Royal Commission, but we do not find that any definite estimates were offered of the financial results. We have pointed out before that the business of the Pacific cable is not enough to support a trans-Atlantic line. At present all the Atlantic companies are interested in getting business for the Pacific line, and all their numerous offices, as well as the Post Offices, act as collecting stations for it. Mr. C. Bright gave evidence that if there were an Imperial Atlantic cable it would be a great advantage to the Pacific Cable Board, as at present they have not and cannot have a collecting office anywhere in the United Kingdom. He understood that the Board's agreements with the Atlantic companies prevent such an office. This is a misunderstanding; there are no agreements to such an effect, and the Board is perfectly at liberty to set up a collecting office anywhere. Nor is there any reason to suppose that the Atlantic companies would resent such a course. The Board has been so far satisfied to rely on the machinery supplied by the Atlantic companies and the Government. This may be right or wrong, but certainly the Board is free in the matter, and we do not follow the argument that the absence of a collecting office of its own is "one of the great defects" requiring a State Atlantic cable. If such a cable is established, the Board would certainly have to provide its own collecting stations, as it would enter the field as a rival to the companies and would lose all the help which it now gets from them. Whether there is a case for an Imperial Atlantic cable is for the "high contracting parties" to decide, but it should be recognised that under the present system the Atlantic companies are interested in supporting the Pacific cable, and have made valuable concessions to it.

---

Many doubts have been expressed with regard to the Australian defence scheme, but it is clear from the figures that the youths are coming forward with remarkable willingness. In Queensland all the youths who are liable have joined, to the number of 2,124. In New South Wales the number of 6,361 was only 96 short of the highest possible, and similar results have been obtained in South Australia and Tasmania. In Western Australia there was only one defaulter. The poorest result was in Victoria where the senior cadets, numbering 5,186, were 209 short. The material is often rough and unappreciative of discipline, but this was to be expected, and the course of training will make a vast difference as the lads realise the meaning and importance of what they are taught. There is unquestionably a growing feeling in Australia that, as the country grows in prosperity

and wealth, it becomes more and more necessary to provide for its defence. In New Zealand the policy of the Defence Amendment Act, 1912, seems to have commanded general approval. It is necessary, if the obligation to undergo training is set up, to provide penalties for disobedience, but politicians do not like to provide for imprisonment of the ordinary kind in such a case, and the original act did not prescribe imprisonment in so many words although the procedure laid down would lead up to it. The amending act invents the penalty of military custody, which allows the defaulter to carry on his occupation but puts him through his training.

---

The Australian Royal Commission on food supplies is to have its proceedings cut short. The Minister of Justice had remarked that at the present rate of progress the Commission would finish in five or six years. The cabinet therefore issued an instruction to the chairman to conclude the enquiries by May 31st. It is no doubt exceedingly difficult to get at the facts in such matters, as industrial combinations do not by any means proclaim their arrangements from the housetops, especially in places where attempts to establish monopolies are indictable offences. The phenomenon from which a sagacious public infers the presence of a combine is a rise of price, but in law this is not proof. In the Coal Vend case, Mr. Justice Isaacs considered that the rise in price could only be attributed to an intention on the part of the defendants to use their combination to compel the public to pay an exorbitant price for coal, but on appeal this decision was upset. The burden of proof was on the Crown, and it could not be assumed in the absence of proof that the price was excessive. The higher court even held that nowadays cut-throat competition is not necessarily good for the public, and there is much modern legislation which seems to incorporate this view. However, in future cases of this kind the Crown in Australia would stand in a better position, as by an amending act the defendant, when an agreement of the kind specified has been proved, will have the onus of establishing that there was no unlawful intent and no detriment to the public. But it will still be necessary for the Crown to prove the existence of the agreement and in future it may be expected that companies which act on an understanding will not parade any written documents. There is in fact, as a rule, no need for anything in writing, as it is to the interest of each party to abide by the understanding so long as the others do.

---

The breaking up of the European bounties on sugar by the Brussels Convention has been discussed from many points of view, but we think that the effect on Australia has hardly been noticed

here. It enabled the Government to reduce the duty. The Commonwealth Government in 1901 considered that German beet sugars could be landed in Australia at some £10 per ton below the prices at which home grown sugars were selling in Australia. The import duty on beet sugars was therefore put at £10 per ton. This meant that at that time the consumer in Australia was required to pay £10 per ton more for his sugar than he would have paid had those German beet sugars been admitted free. But the consumer in Australia was prepared to pay the large additional price to keep alive the Australian sugar producers. It was a protection of some 80 per cent. given to the home grower.

The present active import duty is £6 per ton, and it was by this amount that the Commonwealth Government provided that the price of Australian grown sugars should be kept up for the protection of the home producer, and which extra price the home consumers have at this time to pay for their sugar. The duty of £6 per ton means, approximately, two thirds of a penny per pound. At an average consumption of 100 lbs. per head, the extra cost of sugar to the consumer is 5s. 6d. per person, or some £1 8s. per family of five members per year. In the aggregate, it amounts to some £1,200,000 per year for the Commonwealth. This amount is to be accepted as the extra price that the consumers of Australia are required to pay for their sugars under the import duty, unless it can be shown that that extra price is lessened by some other incidence.

There is a bounty of £3 per ton on sugar grown in Australia by white labour, and an excise of £4 on that grown by black labour. This leaves a protection of £2 on the latter, which is something of an anomaly, considering the sacrifice made by the country to make sugar a white industry. It is curious that, while the bounty has reduced the sugar grown in Queensland by black labour to 10 per cent., it has had no effect in New South Wales, where the proportion of labour remained the same as before the legislation. It seems clear that the bounty is necessary if the white production is to be kept up. One reason put forward for maintaining if not increasing it, is that abuses used to occur in the treatment of Kanaka labourers. This used to be suspected at the time, but there was always a difficulty in getting the facts. A recent report published by the Commonwealth remarks as follows:—

“Many, and honorable producers, will employ the alien for cheapness. Others, in addition to the reason of cheapness, will take the alien because they do not like the white man; and because they can more easily control the alien and deprive him of those considerations which the white man calls his ‘rights,’ but which the alien may lose for the want of a facile recourse to the law of the land. The

examples of violation of the provisions of the Queensland Pacific Islanders Act, which provided that the Kanaka should not be employed 'except in tropical or semi-tropical agriculture'—all these indicate the haste with which the cheaper alien would be used to supplant the white man, and not only in agriculture, but in other branches of occupation, in which during the past eight years the white man has had no competitor. Fair-minded and honorable employers would strive to engage labour at the lowest cost, but they would treat the labour reasonably, as they did prior to Federal legislation. Some others, we are warranted in believing, would also do as they did before. They would secure the alien at the very lowest rate, and, in addition to giving him less compensation than his due, the alien would most probably have to submit to treatment such as is on record as prevailing, at given places, before Federal legislation came into operation."

---

The Australian Royal Commission, which has recently reported, recommends that a customs duty should be substituted for the above-mentioned duty and bounty. This Commission was appointed largely in consequence of complaints of the influence of the Colonial Sugar Refining Company, which has large interests in Australia and also in Fiji. As to this matter, the Commission finds that the dominant position of the company enables it to control the price paid to the grower, and to exclude effective competition, and recommends that the price to be paid to the grower should be fixed on a sliding scale following the price of refined sugar. The creation of a monopoly is no unusual result when outside competition is shut out, and popular discontent at the results is inevitable. The remedy favoured by the Labour Leaders is the nationalization of the industry, but the Commission declares against this as regards sugar.

---

The terms on which Crown lands may be alienated have been much under discussion lately and it is interesting to see how the problem is being dealt with in the Northern Territory of Australia. It is necessary in the first instance to make some distinctions in respect of the quality of the land, and in the new scheme the primary division is, as usual in Australia, into pastoral and agricultural, and a third class is for mixed farming and grazing. Pastoral land is sub-divided into three classes, and can be taken up in large areas, viz., 300 square miles for the best, 600 for the medium, and 1,500 for the third class. In agricultural land the maximum of the first class is 1,280 acres and of the second 2,500. In the mixed class the limit for the best land is 12,800 acres, and for the second class

38,400. These appear to be liberal figures and for first class land represent larger concessions than were allowed in the original scheme ; but of course the vast extent of the territory invites liberality in this respect. It is, however, to be remarked that leases in perpetuity are abolished, and lands of the first class are held for 21 years, and others for 42 years. The Government is thus securing the "unearned increment," which is fairly certain in time to be a substantial asset, and the periods are shorter than those fixed in East Africa.

---

Comparatively young colonies are expected to show a greater number of men than of women, an excess the other way being a sign that the rough pioneering is accomplished and that the population has settled down to civilised habits. This stage has now been reached in parts of Australia, where in Victoria, South Australia and Tasmania there is a majority of women. Western Australia lags behind in this respect, there being two single men there to every single woman, and here the marriage rate is lowest ; it is highest in South Australia, where there are nearly two more marriageable women than men in each 100 of the population. Mining is responsible for the disproportionate number of men in Western Australia, but when any special immigration for such purposes ceases the usual result soon asserts itself.

---

The South African Land Settlement Act of 1912 will probably have a great influence on the development of the country. Under it the Minister of Land can acquire land, to help "closer settlement," by purchase or exchange, and in particular he is empowered to do so at the request of any applicant who is prepared to contribute at least one-fifth of the purchase price. Where no such contribution is made, the applicant must be qualified to utilize the land and must work it beneficially ; during the first year no rent is required, for the second and third, 2 per cent., and for the fourth and fifth, 3½ per cent. of the purchase price. He has the right of purchase during the five years. If not less than ten years have expired from the date of the commencement of the lease, and all instalments and other moneys due to the Government have been paid, the colonist is entitled to obtain a Crown grant. A Crown grant is the same as freehold, with the exception that the Government reserves the mineral rights and certain minor matters relative to servitudes, roads, outspans, and the payment of taxes. A settler may at any time pay in sums of over £100 to the credit account of the purchase price of his holding. But if, on the other hand, he does not wish to secure a Crown grant on the completion of his ten years, he can continue half-yearly payments at

4 per cent. for twenty years, which, added to his first five years' lease, will enable him to obtain full title to his farm after a period of twenty-five years. Holdings may be offered for allotments to applicants overseas through the High Commissioner in London.

---

The difficulty will be to find the land. It has been pointed out in South Africa that 95 per cent. of the land in Australia is Crown land, while in South Africa it is practically all private property and that, therefore, expropriation will be necessary. In practice, however, this point has already been reached in Australia and New Zealand. It is not a question of having land somewhere but of having land in convenient positions. If expropriation is necessary in Australia it is certainly necessary in South Africa, where, as we have remarked before, the farms are usually of enormous size, and are not and cannot be properly developed by the owners. The difficulty, will, no doubt, be found to be smaller than would appear on a first view, and in the competition for settlers it is necessary to make the attempt. The Government proposes to apply £750,000 this year for the purpose, and it will be money well spent.

---

There is no reason why, if land is made available in this way for closer settlement, a great pastoral industry should not spring up in South Africa. The recent achievements of Australia are conspicuous. But there a cow can be bought for £8, which would cost £30 in South Africa. There is more than one cause for the difference, but the principal is that Australia is healthy for cattle, and South Africa, at any rate till recently, has not been. In Natal the farms were swept by the tick, till the farmers took a lesson from Australia and adopted the dipping process. Eventually South Africa will become the greatest cattle country in the British Empire, and this will be due to arsenite of soda.

---

Another industry in which Natal could do exceedingly well is tea. The Natal tea is said to be the healthiest in the world, as it contains the least tannin. But at present the industry is stationary. For tea picking the Asiatic is so far indispensable: his particular temperament, to say nothing of his long training, fits him admirably for the work, and the Zulu is a poor substitute. The result is that the Natal planter turns to sugar. There are now some 65,000 acres under sugar cane, and a production in value of about £1,500,000 a year. Sugar in this climate takes two years to mature, but the small holder does very well with it. Some day tea may be put on the same level, if someone will invent a tea-picking machine. It is

reported from America that after an expenditure of a quarter-of-a-million dollars the E. Clements Horst Company have invented a successful hop-picking machine, and if this could be done for tea an enormous benefit would be given to the British Empire.

---

The progress of the South African freights arrangements is a matter of interest to all countries to which shipping facilities are important. The campaign of the Union Government was really against the combination of Steamship Companies, and the Post Office Act was successful in bringing about the discontinuance of rebates. The combination however has not been broken up; in fact it appears to be stronger than before, for it is reported that an understanding has been arrived at which embraces every British and German shipping line engaged in the South and East African trade. This understanding, as usual in such matters, is apparently founded on a partition of spheres of influence: the British lines securing the British cargo for South Africa, the German the Continental cargo for East Africa. This makes for high rates. The British lines in place of the rebates are relying on a form of agreement, which it was originally intended all shippers would have to sign. But the question has been raised in South Africa whether such a proceeding on the part of the Union Castle Company would not be in contravention of the mail contract, which provides that the Company shall not offer to any person any rebate or discount on conditions that such persons shall ship goods by the ships of particular lines to the exclusion of others. It is probable however that the Companies will avoid coming to close quarters with this issue by not penalizing the shippers who do not sign the agreement. They remain masters of the situation so long as they hold together. It is noteworthy that the arrangement depends simply on an understanding. There is no binding agreement which could be seized upon by any one as proving an intention to establish a monopoly. Whether the understanding will be effective as a means of keeping up the rates depends on the question whether there will be any substantial competitors from outside. The withdrawal of rebates and penalties makes the freight market theoretically open, but this may only be so on the surface. It is open to any outside company to come into the business and cut rates, but no company will take lower rates than it can help, and if a successful attempt is made to secure freight by offering lower terms, the end is that the new company is taken into the combine. This happened in the case of the Houston Line, which set up a competition with the Conference Lines and which accordingly the South African Governments were anxious to encourage, and the result was that the Conference

Lines became stronger than ever. In effect this is what is happening to steamship business all over the world.

---

There is no direct communication between this country and the Bahamas, so naturally the United States secure most of the trade. The United Kingdom makes a very fair show under the circumstances, but Canada is a very poor third, the exports to the Dominion being only, in 1911, £29,349, as against £98,975 to the United States. The Canadian trade, however, showed a substantial increase over that of the previous year, and in a colony which has been the first to suggest political incorporation with the Dominion it may reasonably be expected that the increase will continue. Probably development would be easier if the staple articles were better prepared for the market. When colonial products are of uncertain quality they tend to fall into the hands of a few brokers and prices suffer accordingly. The market is naturally firmer when the quality is known to be good and fairly uniform, and this is the reason why government inspection and grading are being more and more adopted. Sisal is the mainstay of the colony, though sponges reach a higher value, but much improvement will have to be effected before a firm market can be secured. This is what the Commissioner of Long Island says about it:—

“Sisal, after all, is the most important plant. It is cultivated more extensively than any or all of the above named, and gives better and surer results. It suffers less from drought or neglect and can be reaped at will.

“Yet the most thriftless and wasteful cannot cut, clean, sell, and squander away his entire crop in a day. The people of this district have realised its value and are daily extending their cultivations. The fibre is pronounced good and obtains a ready sale at a fairly good price sometimes. Yet nothing is being done to foster the industry or enhance its value. It rather seems as though all concerned have made up to do all in their power to depreciate its value. They cut the leaf before it is ripe, allow it to lie in the sun for days until the fibre is discoloured, they soak it in all sorts of dirty pools, they only half clean it, then when half dried they bundle it together and present to the buyer who packs and exports it to foreign markets. They contrive to get rid of it, and so things go on. The properly matured and cleaned fibre presents an altogether different appearance and would certainly attract attention and tend to an advance of price.

“I persuaded the people here into exercising more care and attention on this industry in the hope that their efforts would receive encouragement from the buyers, who, I hoped, would see what could

“be done and would be done if a difference was made in the price of good and bad stuff. Numbers united and resolved to put none but carefully-prepared fibre on the market and for a few months it gave one pleasure to see them vieing with each other in the handling of the leaf from the tree to the buyer’s counter. Two or three cargoes resembling very nearly the machine-cleaned stuff were sent to Nassau and sold but no difference was made in prices. Outsiders jeered saying that they got just as much for the ordinary rubbish as was paid for what so much care was bestowed upon. Results—the good work discontinued, the old methods returned to, and hand-cleaned sisal is daily becoming worse. The public ought not to be allowed to ruin so valuable an industry. The Government ought to put on restrictions ere it becomes too late. There is no other way of saving the industry and we cannot afford to lose it.”

The export of the fresh fruit has almost entirely ceased, although a prominent buyer is now trying the experiment of shipping a cargo to the United States. The importation of new stock, a chemical analysis of the soil, and expert advice as to suitable fertilizers are urgently needed, and it is hoped the Legislature will take this matter seriously in hand next session, especially as there is now no Board of Agriculture in the Colony.

---

In Jamaica some districts suffered severely from drought in the autumn, and the people experienced great hardships; indeed it was reported that some cases had occurred of death by starvation, an extraordinary occurrence in such a climate, and, though the report was officially contradicted, there were admittedly some deaths from under-feeding, and the question of relief required immediate attention. Another misfortune was a five days’ hurricane, accompanied by a tidal wave, which swept the entire western end of the island—the severest visitation of the kind since 1744. But Jamaica has a wonderful power of recovery from these troubles.

---

The West African Currency Board, which has recently been constituted in London, has adopted a design for the new silver coinage and will take steps to have a supply minted, but there is no great demand on the West Coast for silver till October. One object of the scheme is to obtain the profit which is now made in respect of the difference between the bullion and face value of silver coin. During the last 26 years West Africa has absorbed over 6½ million pounds (face value), and it is clearly to the advantage of the colonies that the profit on this large and constant supply should go to them instead of to the Treasury. No doubt an alteration of currency is a

delicate matter, and some misgivings have not unnaturally been expressed in commercial quarters. But it will not be in any way difficult to ensure that the coinage shall be in as good a position as regards convertibility as at present. This will be done by the establishment of one centre in each colony which shall be bound to issue drafts on London in exchange for silver, whether it is West African or United Kingdom coins, which is paid in at that centre, and by the maintenance of an adequate reserve in London. The profits on the minting will be devoted to that reserve until it is large enough to cover any demands. It is expected that the new coins will readily be accepted by the natives in most districts. In the slack season a considerable amount of silver comes in to the Bank of British West Africa, and on such occasions the Bank will take the opportunity to repatriate United Kingdom coin to the extent that the Royal Mint is willing to accept it at face value. The result will be gradually to establish the new currency. For the convenience of travellers who have some of the local coins in their possession on arrival in this country, arrangements will be made for the exchange of such coins at London and Liverpool.

---

In Northern Nigeria it is the dry season that is inconvenient to the tin industry. In many cases the work has to be suspended for lack of water. The lack of timber in the country adds to the difficulty. The original difficulty, that of transport, has been greatly reduced by the Bauchi light railway and the improvement of the roads, and the journey from this country to Naraguta, which used to take up nearly forty days, can now be done in twenty-one. The natives move to the mines when the rains are over, and return home when they begin again, a movement which is not altogether convenient for the mines. So far the Hausas have fallen in most readily with the ways of the white man, but the pagan tribes, which constitute the largest part of the population of the Bauchi plateau, are beginning to imitate them, though it will take a long time to overcome the shyness which is a result of their ancestral habits. They are a strong and patient race, and if handled judiciously will eventually become a very useful asset for the industry. The output from alluvial increases steadily, and last year amounted to over 3,000 tons, about twice as much as in 1911. There is now good reason to suppose that the fields have been only very partially prospected, and with the improvement of transport, better methods will be introduced. The prospects for the price of tin are good, though there has been a set-back lately. It depends largely on the constantly growing demand for petrol tins. No other material is suitable for this

purpose, and one company which is putting up works in Wales has begun by ordering one million tins.

---

Extensive improvements are contemplated in Sierra Leone, the most important being an Export Wharf, which would cost quite £250,000, and sanitation works at Freetown, estimated at £170,000. Extensions of the railway in various directions are also proposed. These works would be spread over several years, and the increasing revenue of the colony appears to make it possible that they could be carried through with the annual surplus funds.

---

French Equatorial Africa, often rather misleadingly called the French Congo, has made great strides in the last three years, and is now looking forward to a loan which will enable it to make fuller use of its resources. The economical history of the possession is instructive. The first period of its existence, from 1885 to 1899, was one of inactivity, the "scramble for Africa" being followed, as soon as the exciting international questions were over, by prolonged indifference. Then began the practice of making vast grants of territory to companies, an easy policy when the Government wishes to avoid the usual obligations, and in a short time two-thirds of the possession were conceded in this way. One reason for this step was the coming of foreign enterprise, to check which it seemed necessary to create definite rights for French subjects. No doubt the companies brought in capital which otherwise would not have been forthcoming and so started the commercial movement. But it was soon found that they stood in the way of the organisation of the country. The Government could not take in hand the improvement of the natives or prevent abuses. In 1910 a great effort was made to retrieve the situation. The result was to induce eleven companies to consent to a reduction of their leases to ten years from that date, and become simply commercial bodies. Moreover, a vast amount of land was surrendered, and more is to come after short intervals. Apparently the policy of the Government is to offer the companies inducements to compromise in the shape of better administration in their territories, and it is anticipated that the remaining companies will soon come into the arrangement. No doubt the authorities have managed the matter adroitly, as no compensation in money has been paid. The road is now clear for state railways and other developments, and an extensive programme has been prepared.

---

The Uganda annual report remarks that the opening of the Busoga Railway, the first railway in the Protectorate as now

constituted, marks a most important step in advance. The railway opens up the large and fertile cotton-growing areas of the Eastern Province around the borders of Lake Kioga, and the steamer service on this lake is being largely increased to meet the growing traffic. This service will be connected with Lake Albert by a motor road, and it will then be possible to go from Mombasa to Nimule or to the western border of the Congo by train, steamer, and motor without recourse to travel by "safari." It has been shown that Uganda can produce valuable crops, and the problem to be solved now is to provide for the transport of cotton, coffee, and other products at reasonable rates to the Uganda Railway system. The Imperial loan of £125,000 is to be spent entirely on the improvement of internal communication. A most important result of the extension of wagon, motor, and railway transport will be the release for more productive labour of the thousands of natives who are still employed in the wasteful and expensive system of human portorage.

The growing interest shown in Uganda by planters has been a most marked feature of the year. The number of estates has rapidly increased and the demand for land exceeds the immediately available supply. The natural result has been an appreciable increase in the price of agricultural land. The natives realise the value of the land in their possession, and though they have not the capital or the knowledge to develop it at present, are by no means eager to part with it.

---

In East Africa the condition and stock of game in the two reserves are satisfactory—an important consideration to a country which relies much on the sportsman. In the Northern Reserve and the Northern Province generally there are large numbers of rhinoceroses and elephants, and now that the system of government purchase of old ivory has been stopped the prospect of the preservation of elephants are good.

During the past year landholders who own land in good game districts have adopted the custom of leasing the shooting over their farms to visiting sportsmen or have charged a certain sum for a particular animal. In this way a visitor is able to obtain a great deal of shooting and a fair variety of trophies at a very much lower figure than the £50 sportsman's licence. This money goes into the pocket of the landholders instead of into the Government revenue, and as thus a great inducement is held out to landholders to protect the game on their land, this custom is to be cordially welcomed as being greatly in the interest of game preservation.

---

The glories of East African sport have been put visually before the British public at an ancient house of entertainment now known

as the "Holborn Empire." Mr. Paul J. Rainey, an American sportsman, conceived the novel idea of penetrating into equatorial Africa to hunt that monarch of beasts, the lion, with a pack of hounds. While Mr. Rainey was anxious to accomplish this, he also had the hope that he might bring back to the people something new in the shape of knowledge of animal life, and with this object, carried with him elaborate moving picture apparatus. The safari was formed at Nairobi, and the expedition seems to have been completely successful. There can be no doubt that the kinematograph is the most effective way of describing a colony, and it will be used more and more for this purpose. The following extract from the programme will serve as an example of the scenes exhibited.

"VI.—THE LION HUNT.—Pet monkey playing around the camp—The hunting dogs allow him to pull their tails and climb all over them—He annoys Mr. Rainey and his friends while they are at dinner, and they chase him to the roof of the tent with a seltzer bottle—Masai Chiefs arrive with notice that lions are in the vicinity—Start of the lion hunt—The trailing dogs set out followed by the hunters on horseback—They locate the scent and start off at top speed—Exciting chase—Lion finally brought to bay by the dogs in a thicket—Battle between the dogs and lion—He is routed and runs to another thicket, where the dogs hold him—View of the lion."

A similar attraction will soon be found in a government office. By way of advertising Australia and its resources, it is proposed to incorporate in the Commonwealth Building a biograph theatre, in which the films screened will be exclusively those depicting Australian scenes.

---

In the Federated Malay States the opium farm system has been abolished and the sale of chandu (prepared opium) made a government monopoly. The facilities for smoking have been much curtailed and the consumption of the drug has fallen nearly 50 per cent. since 1908. Nevertheless the new arrangement has greatly benefited the Government revenues. This is due to a variety of causes, amongst others, the enormous increase in the Government selling price of chandu, the cheapness of raw opium, the increase of population, the high price of tin, and the profits made in the rubber boom of 1910. In 1911 the revenue derived from opium was \$6,841,235, or more than one-sixth of the total revenue. It is very satisfactory that so far the repression of the traffic has not injured, but, on the contrary, helped the revenue, but this source of profit will soon be largely reduced and probably eliminated altogether eventually. The higher standard of administrative morality has

also been exemplified by the decision to suppress gaming, the public revenue from which, in 1912, was expected to be the very respectable sum of \$1,851,820.

It is one of the difficulties of a high class policy that it has to suppress those habits which form the most convenient object of taxation. The gamblers do not object to the tax, but it is very different with the more respectable exploiters. Thus the Government has been severely assailed for imposing "heavy taxation on a permanent agricultural industry," which is, of course, rubber. This complaint was made in particular by a company which is paying a modest return of 75 per cent. What happens is that the producers, after paying the Government exaction of £3 an acre, make a profit out of it of some £60.

In Mauritius the 1912 sugar crop has been somewhat disappointing, the output being, in consequence of wet weather, substantially less than in 1911. A more ominous matter for the future is the enormous production of beet sugar in Europe, which, excluding Russia, exceeded six million tons—nearly double that of 1911, and the great drop in price, following from this, from 15s. per cwt. to 9s. 6d. The price of beet sugar, however, affects Mauritius less than many other places, as she has convenient markets in India and South Africa, the new crop promises well, and the price has hardened. The colony has, unfortunately, lost one of its most useful and popular men by the death of Mr. Maurice Ulcoq.

---

Malta has a greater density of population than any other country in the world, and as its industries are small and the depôt and coal trade are diminishing, there is a considerable emigration. This is aided by two private organisations, subsidised by the rich Maltese. Most of the emigrants go to North Africa; there are 15,000 in Algeria, 12,000 in Tunis, and 7,000 in Egypt. In Algeria they have contributed greatly to the commercial development, and some have distinguished themselves in the service of public functions. France has every reason to congratulate herself on these accessions, and it seems regrettable that British colonies have taken so little trouble to obtain labour from this source. Some Maltese have gone to Western Australia and have created a favourable impression there.

---

The moral of the Tanjong Pagar case is that the authority which invites tenders for the execution of a work must be careful not to make any statements for the guidance of the contractor which are not known to be absolutely correct. It is the ordinary course for the

authority to state what it knows about the circumstances, with the proviso to the effect that the contractor must not accept the statement, but must ascertain everything for himself. There is no intent to deceive and no suppression of facts in such a proceeding; the authority honestly sets out what it believes to be the case, and warns the contractor that he should form his own unbiassed opinion. But in practice it is often the case that the tenderer neither does nor can do this. He cannot possibly form an opinion without going to the expense of himself making separate investigations, an operation which would cost a good deal of money. In such circumstances the contractor is generally content to rely on the information received, and to run the risk of any inaccuracies, and it is generally thought that the contractor can only recover damages for any misrepresentation if such misrepresentation is fraudulent. Some doubt has been cast upon this view by the arguments put forward in this case, where it was suggested that if the contractor could prove that he was in fact deceived, however innocently, he could claim damages for any loss incurred. Whether this suggestion has any foundation in law still remains to be definitely decided, as no judgment was delivered in the Tanjong Pagar case, but in view of the doubt it may now be a better policy in similar cases to entrust a firm of contractors with the work of making the preliminary tests and to give that firm the order if the work is decided upon and the price tendered seems reasonable. This prevents any misunderstanding, and in such engineering matters little if anything is lost by selecting an approved firm instead of inviting competition.

---

It sometimes happens that a Colonial Government would be willing to assist in the education of the sons of officers who have done good service but have been unable to leave their families in possession of sufficient means of providing a first-rate education. A difficulty of this kind has brought about a rather peculiar arrangement with Christ's Hospital, under which the sum of £500 has been paid by the Government of the Straits Settlements and the F.M.S. to secure the means of presenting boys properly qualified for admission to the school. The money has to be paid in the name of some person who becomes a Governor; and the Secretary of State has nominated a member of the Colonial Office for this purpose, who will be officially insured for £500, so that in the event of his death another Governor could be recommended for election.

The school is in a healthy position and gives an excellent training, and it is to be hoped that the example set by this case will be followed by others.

The Marine Insurance Fund administered by the Crown agents on behalf of certain governments continues to make steady progress, and the past year, which was a disastrous one to underwriters generally, has shown satisfactory results. Prominent features of the business transacted have been the prompt settlement of small and irritating claims which in the past have been the source of much correspondence, and the payment, as an act of grace, of a large number of claims which contained no evidence to show that the loss or damage was caused by a peril insured against—claims which most insurance companies would decline to meet. The liabilities under this latter head have amounted to as much as £1,670 in two years. Rather heavy losses have been sustained by the breakage of cast iron pipes on the West Coast of Africa, but this has been counteracted by the absence of any claims of importance from the East, where the immunity from loss has been remarkable, having regard to the numerous severe gales encountered.

Altogether, the scheme has, so far, met with undoubted good fortune, and it is hoped that the time is not far distant when all governments participating will realize material benefits in the shape of reduced premiums, attended with full protection.

NOVA SCOTIA IN 1813.

---

At the beginning of 1813 Moscow was in flames, and the downfall of the terrible Bonaparte had begun. The French war at this period was brought home to Canada by the occasional arrival of a captured ship, but the great events were far away at the time when the news of a European battle took more than two months to reach the other side of the Atlantic. A much more important matter was the war with the United States, in that year at its height. The political and social conditions of this momentous period are vividly set out in a number of passages which are reproduced by the "Acadian Recorder" of Halifax, on the occasion of its centenary. The "Recorder" may well be congratulated on being able to carry back its records to such interesting material, and to a time when the population of Canada was only 375,000, and that of the United States 8,000,000, while Australasia had not yet received a single white settler. It is interesting to note that, though the whole civilized world was in a hurly-burly of war, the "Recorder" at the very commencement struck a bold and sanguine note. The editor affirmed that the British Empire never stood upon more extensive and firm foundations of solid greatness than at that most eventful period: "We cannot extend our views round the wide circle of her distant possessions without finding some animating prospect, or some circumstances to alleviate the evils necessarily resulting from a state of warfare." No doubt the strong martial spirit of the time had much to do with this feeling, but there were some very material considerations in its favour. Great Britain's naval successes had cleared the seas for Colonial produce; the Baltic had been opened, India secured, and the West Indian Islands strengthened for commerce. Naval operations meant active business for such ports as Halifax, and the agriculturists inland profited by the demand for supplies. Before the American war Nova Scotia depended largely on the New England States for flour and provisions, but the

interruption of intercourse was, as it proved, bad for New England and good for Canada, as it stimulated production, and in no long time the Maritime Provinces made themselves practically independent in this respect. In 1812 the sole exports from Nova Scotia were of timber and dried fish, for, as usual with young settlements, industry was confined to the most obvious products of the country, and the war contributed to enlarge the enterprise of the colonists. Then there were the profits from privateering and the sale of captured ships; on one day, the 9th of April, 1813, no less than 33 French or American vessels were sold at auction with their cargoes. The Maritime Provinces also entered fully into the spirit of the wars, and furnished many recruits for His Majesty's ships; four or five of these rose to be Admirals. That their help was officially appreciated is shown by the spirited invitations addressed to them, which indeed might be commended to the present Admiralty for imitation if needs be. We quote specimens of this rollicking century-old style.

"NOW OR NEVER."

"All able-bodied seamen and sturdy landmen, willing to serve His Majesty and enrich themselves, are invited forthwith to enter His Majesty's ship *Tartarus*, Captain John Pascoe, fitting with all expedition to take more American Indiamen. She will be ready for sea in a few days. Those fond of pumping and hard work need not apply. The *Tartarus* is as light as a bottle; sails like a witch, scuds like a mudian, and lays too like a gannet, has one deck to sleep under, and another to dine on. Dry hammocks, regular meals, and plenty of grog, the main brace always spliced when it rains or blows hard. A few months more cruising, just to enable her brave crew to make yankee dollars enough to enable them to marry their sweethearts, buy farms, and live snug during the peace that is now close aboard of us."

"His Majesty's and Provincial Bounties.

"Able seamen	£10	5	0	sterling
"Ordinary	2	10	0	
"Landmen.	1	10	0	

"God save the King."

"Halifax, Feb. 16, 1813."

"ALL TIGHT LADS.

"who are willing to serve His Majesty in that fast-sailing, excellent sea-boat, the *Canso*, of 12 guns, commanded by Lieut. Croke, now fitting out for a short cruise, to protect the trade of the British Provinces and pick up a few straggling American Bordeaux men, will meet with an honest, hearty welcome from a sailor's friend, by applying on board that vessel at the naval yard.'

## "WHAT SHOULD SAILORS DO ON SHORE."

"While King, Country and Fortune point to the ocean! His Majesty's schooner Pictou, of 12 guns, commanded by Lieut. Stephens, as fine a vessel of her size as ever floated on salt water, wants a few jolly spirited fellows to complete her complement for a short cruise, who may all fairly expect to dash in coaches on their return, as well as other folk! Apply on board at the naval yard. May 21, 1813."

Truly Halifax was in the movement, as it would probably be again in the case of a great war. The "Recorder" sums up the state of things thus:—"Merchantmen and transports, convoyed by frigates, appeared in the harbor and disappeared. The stir and movement in our waters was incessant and this accompanied by the firing of salutes or gun practice, kept the little world of Halifax constantly on the qui vive. The population, gathered in from the four corners of the earth, was largely cosmopolitan. The prisoners of war, the crews of captured vessels, sailors, marines, soldiers, fishermen, traders, officials—all on the move, made the Grand Parade, Water and Hollis Streets lively, and filled the taverns and drinking places. Such an increase of population trebled the rents and doubled the price of provisions. British gold was never more abundant. War hath her victories no less renowned than peace, for out of the tempers and confusion of war more than one Halifaxian emerged with a comfortable fortune."

A great number of prisoners were taken, both French and American, and many of these were allowed to hire themselves out to farmers and other employers, and settled down. All this increase of activity told heavily when the war was ended. Canadian trade with the United States was practically stopped in the years 1812, 1813 and 1814, but in 1815 it was seven times as much as it had been in 1811.

For all this public feeling was very bitter against the United States. Bonaparte was looked upon with reprobation but still as a sort of exotic phenomenon, while the people of the United States were kith and kin, and the hardest language was reserved for them. An editorial of the "Recorder" in 1813 no doubt represents the popular view. "It will not be soon forgotten that in the year 1812 America enlisted under the banner of the second Attila, and declared war against her kindred and friends. Some excuse might be found for the nations in Europe who have submitted to the Usurper's power; from the influence of example immediately before them, from various local interests connecting them with their prostrate neighbours, and indeed, some from their inability to escape the pangs of

the oppressors; but America, separated by a wide ocean from a people totally different from her own in manners, customs, habits and language; America, whose government professes to be in its nature as widely opposed to France as vice is to virtue; with no local or natural attachments, or congeniality of any kind whatever; for America to join such a nation, governed by such a man as Bonaparte and take a part in his vile schemes of fraud and violence, to assist in oppressing those whom he oppresses, and at last to lift her puny arms against the unconquered and unconquerable champion of the civilised world. How can such egregious folly and wickedness be possibly accounted for, but from motives the most dishonorable in the persons entrusted with its government, and the most pitiable blindness in the people who trust them."

The American war, however, was conducted, as James Munroe, the United States Secretary of State, stated it was the desire of his country that it should be, "with the utmost regard to humanity." There was a good deal of the sporting spirit in it, and both sides scored successes over which a great amount of jubilation was displayed. There was not much else than war news to interest the worthy citizens of Nova Scotia at this period, for they stood aloof from the racial troubles which distracted Canada and proceeded gradually on their way to self-government without any turmoil.

News from abroad usually came by men-of-war, and in those days must have been exciting notwithstanding the fact that it was some ten weeks old. When a European paper arrived, which was a rare event, it was usually taken to the principal Coffee House and read out there. The burden of the European stories was Bonaparte, but the war with the United States supplied more absorbing material, and at the beginning of 1813 Canada was rejoicing over the surrender of General Hall's army to General Brock at Detroit; as to which the British general proudly explained in his despatch how 2,500 troops had surrendered to him, when he had not more than 700, including militia, and about 600 Indians. The proprietor of the "Recorder" showed from the first the enterprise characteristic of his class, and caused, in fact, some resentment by rowing out to meet the ships and intercept the news.

The social customs were much the same as at home, accentuated by the strong emotions of an exciting period. The leading feature was strong drink. "'Rum' was spelled in large letters as an esteemed article of commerce and consumption. The junk or case bottle was on almost every table. Spirits were served out regularly to the army and navy. There were no Temperance Societies. When the people jubilated, strong drink entered largely into their

enthusiasm ; when the orators of the day made speeches, they did so with the moral support of 'good old Jamaica' ; toasts were drunk publicly, almost at street corners, by the greatest in the land, and the 'ardent' was brought out at a family social gathering as a basket of apples would be now. Old inhabitants tell of the punch-bowl being passed around at church-choir practices. It was no disgrace to be drunk ; some of the historical anecdotes of the great statesmen of less than one hundred years ago are prefaced with the intimation of their having been 'as full as a tick' on the occasions. There was, too, a great deal of company kept, all over the peninsula ; and the public dinners of that day would be considered 'terrors' in the present generation. They lasted frequently for ten or twelve hours, and, as a speaker at a later banquet remarked, it was customary to send a boy around to unloosen the neckcloths of those who reclined under the table as a result of too deep potations." In such matters, as in many others, the young country faithfully copied the old. The colonists were, in a sense, fortunate in having the West Indies close at hand. At one time 80,000 gallons of West Indian rum were produced yearly by the Halifax distilleries. No doubt the habit of drinking was largely a concomitant of warfare ; the disbursements to soldiers and sailors were heavy, and the money was spent in the liquor shops. When Wolfe was in Halifax, drilling his men for the last attack on Louisville, he complained in his despatches of the inefficiency of the service owing to the almost universal drunkenness of the men and officers. However, at the beginning of the nineteenth century the consumption of alcohol was diminishing, and a change for the better had set in. It was quite time. Since the battle of Trafalgar in 1805 there had been many stains on our naval reputation. Much was done to restore the old pride when in 1813 the *Shannon* brought the *Chesapeake* into Halifax. The fight had lasted only thirteen minutes, but it had been truly terrific : in those minutes 252 men were killed or wounded.

Considerable attention, on the other hand, was given to education. A public school had been established in Halifax with the help of a curious expedient, to wit, a public lottery with 5,000 tickets at £1 each, of which the very reasonable sum of £750 only was to be taken for the building. In 1813 there came into operation the Common School Act of 1811, under which free instruction was given in elementary schools, and grammar schools were founded for higher work.

Religious education was undenominational, the Bible being read but without note or comment. The higher education was provided

by King's College at Windsor, which received a provincial grant of £444 a year and £1,000 from the Imperial Government, but only four or five students joined in a year. Certainly education, toleration and civil order were honoured, and the annals of Salem, N.E., were held up as a "melancholy illustration of a singular anomaly, that of persons flying from persecution becoming the most bitter persecutors themselves." No such feeling showed itself in Nova Scotia, and there was in these early days a respect for law and a security of life and property which have remained characteristic of the country to the present day. To maintain religious habits there was a statute providing that "a person absenting himself from public worship for the space of three months, without proper cause, if the head of a family, shall pay a fine of five shillings," and children were also liable to be fined for the like offence. A warden and constable walked through the town to enforce this rule, as is still done in the ancient universities of this country. It is not clear whether the obligation extended to members of all denominations, but it would not have been of much use otherwise, as Nova Scotia rejoiced in an extraordinary rich collection of religious persuasions. This fact, no doubt, contributed to toleration, not so much because the churches approved of the principle as because, under the circumstances, it was the only *modus vivendi*. The only body in those days in America which stood for religious freedom and separation of Church and State was the Baptists, the first of whom in the Maritime Provinces were Germans. Perhaps the advocacy of these principles has had much to do with the steady progress of this body in the New World. In the United States there are now 6,000,000 members, while in Europe the whole congregation is about one-tenth of this number.

Notwithstanding the wars the Nova Scotians kept up an active social life and maintained the customs of the mother country. In the height of the military excitement the conveniences were observed. The following advertisement from a February, 1813, number of the "Recorder" may be quoted as an example of the persistency of human nature in such matters: "In the spring I expect to be replenished with a larger variety of useful merchandise; all warranted of the best British manufacture; and in addition to the description of goods already submitted to your inspection, I propose a brilliant little selection of early London spring fashions in millinery and dresses, ladies' slate coloured kid shoes, Jean and Nanking lacing boots, silk and cotton hose, straw bonnets, coloured worsted and white cotton fringes, cambric and other gloves, lace veils, sewing silks and cottons, elegant tortoiseshell and other hair combs,

a little of good perfumery, some pretty beads and necklaces, gentlemen's braces, gloves and sundry other articles of utility and fashion, all of which (if I am rendered so happy as to have them preserved from the enemies and the dangers of the seas) I am determined on selling as reasonable as the heavy expenses of importation will possibly admit."

To-day the men of Boston and other cities of the United States invade the Province in thousands every year; but they are welcomed, for they come as tourists, to enjoy the beautiful forests and shining waters of a restful land.

## THE POLICY OF EMIGRATION.

There are two conflicting points of view with regard to emigration from this or indeed any country. On the one side there is the consideration that the departure of a large number of workers represents an economic loss to the land which they leave. On the other, there is the benefit which these workers may gain by removing to another place where their opportunities are better. One may be said to be the national point of view, the other the individual, and whatever may be the details the distinction runs through all the controversies on the subject. Thus the official view in this country is on the whole that the emigration is sufficiently large and is in no need of further encouragement, while a great number of philanthropic bodies are constantly working hard to assist men, women and children to get away to countries where they will presumably have a better chance.

The main causes of migration in all ages are poverty and unemployment. In hard times it is a necessary remedy. Thus it was at a period of great distress that Parliament voted the sum of £50,000 to send 5,000 people to South Africa. These people could not be used at the time in this country, but what they were worth is shown by the fact that they turned a wilderness into a garden. But this was ninety-two years ago. During this period conditions have become more stable and emigration more easy. The outgoing tide is now, or will soon be, according to high authority, as large as is compatible with safety. Mr. Burns, in giving evidence before the Dominions Royal Commission, stated that the Mother-country cannot safely go beyond 300,000 emigrants a year, this figure representing 60 per cent. of the natural increase of population of the United Kingdom by births over deaths. In 1911, the emigration numbered 262,000, of whom 80 per cent. went to the Colonies. In 1912, the figures were much the same, but as the steamship accommodation

improves they will probably go up. It is argued therefore that as the emigration is so good it is sufficient to let well alone. On the whole the Labour Party takes this view. They consider that the man who leaves the country does so because he cannot stay, and that the proper remedy is to seek means for enabling him to stay. Thus Mr. Burns gives as one reason why further state aid should not be given to emigration, the vast indirect expenditure which this country incurs on health, sanitation and education, through which a million lives have been saved in the last ten years, of which number a very large proportion has gone to the Dominions and other countries. The County Councils appear on the whole to be of the same opinion. These authorities are empowered to borrow money for emigration purposes but apparently they have never done so, but consider that the emigration is sufficiently great as it is. The only direct help given officially is that represented by the working of the Unemployed Workmen's Act, 1905, under which about £200,000 has been spent from rates and government grants in the emigration of 21,000 persons. This is not a large sum for seven years, but none of the departments see any necessity for further expenditure. So far as emigration is assisted, the work must be largely one of selection, and for such work government offices cannot be said to be particularly well suited, while philanthropic bodies are. Thus the emigration of women and children has increased to an extraordinary extent and Mr. Burns observed that, having regard to the personal and distinct relationships which occur in connection with these classes, such emigration is better left to those private and voluntary organizations that are now doing this work so well. There are nearly 2,000 agents in the United Kingdom engaged in emigration business. They may make deceptive statements, but it is believed that such cases are not numerous compared with the bulk of emigration, and the Emigrants' Information Office is always ready to give advice.

On the other side there is a strong body of opinion that the emigration is even now not sufficient and should be stimulated by some additional means. Two considerations are at work here—a belief that in certain respects the country is overcrowded, and a desire to strengthen the Colonies with a British population. There can be no question that a man who emigrates generally finds a more interesting and profitable career, but the immediate point is whether it is for the good of this country that he should be tempted to go. It appears to be generally agreed that the agricultural districts are being sufficiently exploited, but the idea is entertained that there are large numbers of people who have been attracted to the towns and who are going more or less to the wall there, or at any rate

deteriorating physically. Thus in London the weekly excess of births over deaths is about 1,000 every week. It is argued that no multiplication of small holdings, or other agricultural development, can keep pace with such an increase. At present in the large industrial towns there is practically no surplus labour, and the tendency is to further expansion, but this argument does not appeal to those who give weight to the evils attaching to life in great towns. They do not want to keep a large reserve of labour in this country, however convenient it may prove on occasion, because this reserve is practically in the big towns, and represents men and women who will suffer sometimes from unemployment and at all times from overcrowding. That there is a strong belief among close observers that there is a large class for whose conditions emigration is the best remedy is shewn by the numbers of active workers who have formed themselves into societies to promote emigration. This consideration is helped by the argument that the process builds up the Empire with a British population. It is true that the Empire is not a unit commercially, and Great Britain could not be expected to regard with complacency a drain which would enrich the Colonies to her own loss. But it is not the best who go, and when emigrants prosper, as usually they do, there is an economic gain to the Empire of which the Mother-country gets a part. It is objected that whatever room would be created here in this way would be filled up by poor emigrants from abroad, and in this there is considerable force, but it may be replied that the new-comers are in due course converted into good British subjects and are available to strengthen the supplies for home and colonial demands.

Thus one view is that the State has now no inducement to subsidise emigration. The workers may better themselves by going, but that is their affair; the State does not benefit and may lose. The other is that there is a large surplus population, which should be helped to go in the interests of the general community. The problem turns on the question whether the alleged large surplus population is a fact. The question might readily be answered in the affirmative if the very poor and unfit were to be considered, but this class must be ruled out; the Colonies are not for them. Of skilled labour there is no substantial surplus. Between these two there is the able-bodied but unskilled class, which, from a variety of causes, including the rapid introduction of labour-saving machinery and defective training, shows a more or less constant surplus. This class is very suitable for the Colonies and would supply increased numbers of emigrants if State aid were given. Thus Australia gets as many emigrants as she wants. This is because the Governments pay part of the

expenses. This enables them to select the emigrants themselves, and they do not particularly want the societies or the services of any British office. The Agent-General for Western Australia put this very clearly as follows:—

“ My experience (perhaps I have been unfortunate in connection with private societies) is that they try to get away the sort of individual you do not want. They are mostly philanthropic institutions, and a man who is rather a nuisance to the neighbourhood they want to get out there. I am not strongly in favour of them. My experience has not been altogether satisfactory. It has been very limited. But the interests of the Government and the society are usually not in common ; and where you have to pay the piper and assist a man, you want the best article you can get. The imperative condition of the Government side of the work founded on the interests of the State is that only particular classes of emigrants can be assisted, whereas in the case of private societies it is largely a question of philanthropic interest, and the relief of persons who are in a more or less destitute condition, and whose experience of work in this country is not such as to fit them for the different and more arduous conditions of Australian life.

“ 2135. The next question is with reference to the suggestion for a central department in the United Kingdom. It has been suggested that a central department should be formed in the United Kingdom, to deal with all matters connected with migration from this country, now falling under the purview of the Home Office, Colonial Office, Board of Trade, Local Government Board, Emigrants' Information Office, etc. In view of your actual experience of the work of the various Government offices now concerned with migration, have you any views as to the establishment of such a department or any suggestions as to its work or functions?—You will understand I feel very strongly that the persons who are selecting and regulating the emigration should be people with absolute local knowledge. Consequently I do not know that it is going to be of any great advantage. That is how I feel about it. I think the responsible men dealing with the work should be thoroughly experienced with regard to local conditions, and it does not seem to me that any purely British office could deal with it as well as the Dominion.”

On the other hand Canada does not pay towards passages, and is very well satisfied with the societies ; this satisfaction, however, is largely due to the children's emigration, which is a big item in the case of Canada, and very well handled by philanthropic bodies. The demand therefore for State aid from this country is practically

limited to the case of Canada, but it would be embarrassing to subsidize emigration to that Dominion and not to other places. On the whole it may be said that as regards the general body of emigrants the movement is determined, not by what the Government does here, but by the attractions which the Colonies offer. These attractions are made use of by the Colonial Governments according to the policy of the time, sometimes freely, sometimes with reservations. Thus, in November last, the New South Wales Government decided to close down upon the importation of artisans as immigrants and to assist, in future, only the immigration of wives and children of nominators. This was because a much larger number of artisans had arrived than had been estimated as required to make up the shortage of skilled labour in certain trades. In consequence, the nominated passages fell from about 370 a week in March to 180 a week. A memorandum regarding the Government policy in regard to immigration issued by the Premier stated: "When the land policy of the Cabinet has become effectual and large additional areas thrown open for settlement, then the problem of obtaining settlers and other immigrants will be carefully reconsidered in the light of the new opportunities which the large opening up of Crown lands will provide." All this means that the Colonies are virtually buyers of labour, and it is for them to fix their terms from time to time, according to their requirements. If the terms are good they will get the labour, without any Government assistance here. If they are not good, it would be mischievous to try to stimulate emigration artificially.

It may, however, be urged that there are certain classes which may be treated specially. There are so many "blind-alley" occupations in this country, and such a high standard of skilled labour that the problem of what to do with the boys and girls becomes constantly more difficult. Financial help towards their emigration was forcibly advocated by Sir A. Spicer. Then the great surplus of unmarried women makes an increased emigration of this class desirable, and there may be added the case of old soldiers who in great numbers degenerate for want of industrial training to useless positions. There is no question that such people will be, in many cases, of little use here, either to themselves or to their country—in the Colonies they will be of great use. It is in this conversion of an ineffective into an effective worker that the State encouragement of emigration finds its chief justification. Such sections of society as the above are capable of improvement, and there is abundant evidence that they do improve when they get to Colonies where land is easily obtained. The object of nations should be not so much to maintain their numbers of inhabitants as to raise the standard of living, and the retention in a country of a large class

which is doomed to live, more or less, from hand to mouth in demoralising surroundings is likely to increase the difficulties of social reform.

It may further be urged that State organization and help are justifiable in order to direct emigration to the Colonies which would otherwise go to foreign countries. The tide is now beginning to set that way, and the Emigrants' Information Bureau may fairly receive credit for some of this movement, but still some forty out of every hundred emigrants from this country pass to foreign flags. This consideration was in past years practically neglected, as, indeed, was inevitable in times when the inducements held out by our Colonies were comparatively weak. Now the inducements are much stronger, and in addition, the Dominions have grown so much in power that their good feeling to the Mother-country is a vastly more important consideration. The men and women who emigrate to a Colony are the best instruments for keeping up this feeling; they are real bonds of empire.

## REVIEWS AND NOTICES.

**A United West Indies.**—By The Hon. C. GIDEON MURRAY, Administrator of St. Vincent. (*The West Strand Publishing Co., Ltd.* 1s. net.)

THERE is general agreement that it is very desirable to secure as much uniformity and co-operation as possible amongst the West Indian islands, but differences arise as soon as it is suggested that some form of political federation would be the best means of furthering this purpose. The first essential condition of federation is the existence of a national feeling. This feeling was to be found in Australia and South Africa, and probably in both cases the principal influence in determining the policy was the desire to recognise and develop it. The mere fact that certain states have some material interests in common is not sufficient. These can be discussed in conferences *ad hoc*, and this is habitually done, not only between British Colonies, but between countries under different flags. It may be doubted whether the West Indians have a national feeling in this sense *qua* West Indians; there are on the contrary many indications that each large island has a strong local feeling in which the other members of the group are little considered. It is as well to remember as part explanation of this, that the distances between the islands are very considerable, and that the inter-colonial trade is trifling compared with that done with the outside world. Perhaps the second essential condition of federation is that there should be a personnel able and willing to carry on the political system, but in the West Indies such men are not numerous, and those who do take an active interest in administrative questions prefer those that are local. This difficulty is the same on a small scale as that which attends proposals for a representative Imperial Parliament.

Nevertheless, federation, if it could be effected, would have some valuable advantages, and such events as the Canadian Trade Agreement and the opening of the Panama Canal have given additional importance to the proposals. Mr. Murray's book is therefore welcome, as we trust that it will stimulate interest in the subject, and help to remove that indifference which he admits prevails on the part of any one island to the rest. It not only sets out the material facts clearly and succinctly, but presents the excellent features of a definite proposal embodied in a draft bill. In this it is proposed:—

(1) To appoint a Federal Council for the West Indies, on which there shall be an unofficial majority, mainly elected by and from the members of the various local legislatures.

(2) To appoint a High Commissioner for the West Indies, who would be *ex officio* President of the Federal Council, and who would be empowered to summon, in special circumstances, special sessions of the Council.

(3) To appoint a Secretary for West Indian affairs, and also a Legal Adviser, responsible to the High Commissioner.

(4) To hold sessions of the Federal Council once a year.

(5) That the Federal Council should have supreme powers of legislation in certain important matters of common interest, specifically delegated to it by the Federal Colonies, and also in subjects submitted by two or more of the federated Colonies, with respect to which the Legislatures of the several Colonies can legislate within their own limits. (The Council would, of course, in addition, have deliberative powers on any matters submitted by members for discussion in accordance with standing orders.)

(6) That the number of members for each Colony to be appointed on the Federal Council should be in proportion to population, to be revised automatically in accordance with and at each decennial official census, the quota being one member for every 50,000 population or part thereof, but no adhering Colony being represented by less than two members. On this basis there would, taking the 1911 official census, be for a commencement seven Representatives for Trinidad and Tobago, six for British Guiana, four for Barbados, three for Antiqua (one of whom should represent Montserrat), and two for each of the other federated Colonies.

(7) The Federal Council to have no powers whatsoever over taxation, including Customs and Excise, but in order to provide funds wherewith to carry out the objects of the Central Government, the adhering Colonies to surrender each year for that purpose such percentage of their Revenues as may be decided upon, not exceeding say three to four per cent.

(8) That provision should be made for the entrance into the Federation of any British West Indian Colony, not included in the original Act.

The subjects to be dealt with are as follows:—

- (a) Trade relationship between the Colonies, and between the Colonies and other countries.
- (b) Steamship communication between the Colonies, and between the Colonies and other countries.
- (c) Intercolonial and foreign mail, telegraph and telephone services.
- (d) Wireless telegraphy.
- (e) Quarantine.
- (f) Merchant shipping.
- (g) Defence.
- (h) Lighthouses, lightships, beacons and buoys.
- (i) Astronomical, meteorological, seismic, and other like observations.
- (j) Currency, coinage and legal tender.
- (k) Weights and measures.
- (l) Copyright.
- (m) Bankruptcy and insolvency.
- (n) Companies.
- (o) Negotiable instruments.
- (p) Patents of inventions, designs and trade marks.
- (q) Fisheries.
- (r) The service of civil process of the courts of any Colony out of the jurisdiction of the Colony in which it is issued and within any other Colony.
- (s) The service of civil process of the courts of law of any Colony beyond the limits of the Colony, and within any other Colony.
- (t) The enforcement of criminal process beyond the limits of the Colony in which it is issued within any other Colony, and the extradition of offenders.
- (u) Any matter which at the request of the Legislatures of the Colonies, His Majesty by Order in Council shall think fit to refer to the Council.
- (v) Such matters as may be referred to the Council by the Legislatures of any two or more Colonies with respect to which the Legislatures of the several Colonies can legislate within their own limits, and as to which it is deemed desirable that there should be a law of general application. Provided that in such cases the Acts of the Council shall

extend only to the Colonies by whose Legislatures the matter shall have been so referred to it, and such other Colonies as may afterwards adopt the same.

---

**The Handbook of Cyprus.**—By H. C. LUKACH and D. J. JARDINE.  
(*E. Stanford.* 5s. net.)

This is a new edition of a handbook which appeared in several years, the last being 1909, but it is practically a new work, and the authors have gone much beyond the usual range of such productions. Cyprus has been burdened from the commencement of our administration with the payment of the "tribute" of £92,799, which, under the Convention of 1878, was made payable to Turkey. The island was taken over in a somewhat light-hearted way, and there was a spirit of optimism at the start which showed itself in a great number of reports setting out schemes of improvements. The cold fit soon ensued when it was found that the tribute practically beggared Cyprus, and the reports lay neglected on the shelves. It may be, as the authors say, and they have official warranty for the statement, that the amount to be paid to the Porte was fixed after careful scrutiny by the British Government, but no allowance was made for the fact that this sum represented all that could be extracted from the island, and that a much greater expenditure would have to be incurred to support such an administration as Great Britain, if only in self-respect, would have to set up. The result has been that in every year but three the Colonial Office has had to apply to the Treasury for a grant to make up the deficit, and this meant that for a long period nothing could be done that was not absolutely necessary. Nevertheless, a great improvement has been effected in every direction. The population in 1878 was 180,000, it is now 274,108. "In 1878 the imports and exports amounted in value respectively to £177,651 and £157,328, as compared with £635,427 and £702,803 in 1911—which represents an increase of 357 per cent. on imports, and 446 per cent. on exports. The fact that there is hardly a village in Cyprus which has not repaired, enlarged, or rebuilt its church or mosque indicates that the villager shares with the townsman this growth of prosperity. The standard of comfort has been greatly improved, as is demonstrated by the nature of the imports and the enhanced cost of living. Power and responsibility have been given to the people through popularly elected Municipal Councils and Mukhtars. In 1878 there was not a single printing-press in the island; now no fewer than 21 newspapers are published—an eloquent proof of material and educational advancement."

It is true that the liberty of the press and the increase of education have been accompanied by much railing against British rule. The population is mostly Greek, and Greece is very near. The authors observe: "In the early years of the occupation, the British administration was welcomed as the advent of a golden age of equity, prosperity, and security. Writing on June 19, 1884, the Commissioner of Larnaca reported that on his last tour through his District the answer of the villagers to the question 'Have you any complaints?' was invariably 'What complaints should we have? God save our Queen!' But the generation that remembers the old order of things is passing away. The old evils are forgotten. The Cypriot of to-day, educated and living under conditions where every man's rights, whatever his creed or nationality, are carefully guarded, where women are safe, and justice is administered without corruption or favour, remains, in many cases, wilfully blind to the progress of which he himself is the most conclusive proof." No doubt the evils of Turkish rule are almost forgotten, but it is only fair to concede that the Greek Cypriot compares British rule, not with Turkish, but with what he could hope to get from Greece, and in such a comparison national feeling plays a great part. The case of Cyprus is, however, very different from that of the Ionian Islands. We only "occupy" Cyprus and that conditionally, and there could be no cession to Greece without Turkey's consent. It is to be hoped, therefore, that the Greek Cypriot will soon make up his mind whether, to use the author's expression, "it shall be with or without his co-operation that further steps are taken to bring Cyprus into line with the more civilised countries of Europe." They add:—

"The future of this island should be a bright one, if only the Cypriot will whole-heartedly and energetically extend to the Administration the co-operation which is sorely needed and so constantly solicited. Financially, the country finds itself for the first time for many centuries on a secure and certain basis. The revenue tends to rise from year to year; and this increase is not due to additional taxation, but to the greater prosperity of the people themselves. The spade-work, undertaken so conscientiously and performed so well by the pioneers, is now receiving its due reward; and the Surplus Balance Appropriation Law of 1912, which provided for an extraordinary expenditure of £24,600 from a surplus of £55,242 19s. 1c.p. (excluding the sum of £90,000 permanently set aside as a reserve), in addition to an increased estimate for expenditure on ordinary services of £8,878, may be fairly regarded as an earnest of future financial stability and increased expenditure on works destined for the public good. But material prosperity is not the only, nor even the greatest, factor in the civilising of a nation.

There are other and higher considerations; for it is not on an increasing revenue, on a system of perfect roads, or even on an express-train service throughout the island, that real progress will ultimately depend. The ever-increasing number of literates is a hopeful sign of a sadly-needed moral and intellectual awakening."

Education is not compulsory, but 85 per cent. of the child population is enrolled in the schools.

It may be expected that Cyprus will before long become better known, as Mt. Troödos, the ancient Mt. Olympus, the meeting-place of the gods, is really a unique attraction for residents in Egypt and the Levant. At a height of 6,000 feet it enjoys a keen pure air laden with the scent of pine forests. It can be reached from Cairo in thirty hours; the season is from the middle of June to early in October. Railway extension, as mentioned in another place, may bring Mt. Troödos nearer to the tourist world. Visitors will find everything they require in this excellent handbook, which reviews the past and describes the present with unflagging spirit. Fortunate are they who can see the panorama of landscape from Troödos. "On three sides range after range of hill-tops; to the north the majestic expanse of the Mesaoria, yellow and brown, the blue bay of Morphou, the olive-green patch where Nicosia swelters in the heat, Famagusta grey on the sky-line, and, hanging over the plain like a curtain, the mountains of Kyrenia. On the other side of the hill, where Government House lies, a new scene presents itself. The sea by Limassol and the Salt Lake glitter in the distance, and the green of a thousand vineyards between Troödos and the sea gladdens the weary eye. As the sun sets over Paphos, where Venus once and again yoked her swans to repair to her lover at Delium, this landscape with its myriad colours is almost incomparable."

---

**In the Shadow of the Bush.**—By P. AMAURY TALBOT, of the Nigerian Political Service. (*W. Heinemann.* 18s. net.)

This book is a description of the manners and customs of the Ekoi people, who are on both sides of the boundary between Southern Nigeria and the Cameroons, from a standpoint as near as possible to their own; and a large collection of stories and legends helps the reader to follow the workings of the native mind. To a European they are mostly extremely fanciful and inconsequential. Behind them is the melancholy and tragedy of the mysterious all-enfolding bush, the terror of primitive man at the dangers, seen and unseen, with which he is surrounded. The secret society is an ancient result of this state of mind, and the Ekoi country has many examples of it, the chief being the Egbo Club, which, before the

coming of the white man, ruled the country, and still has enormous influence. Very little is known of the Egbo beliefs or powers, but Mr. Talbot takes a respectful view of them, stating that "certainly a considerable amount of hypnotism, clairvoyance and spiritualism is taught, and only too many proofs have been given, that some of the powers of Nature are known and utilised by initiates, in a way forgotten or unknown to their white rulers. For instance, some of the esoteric members seem to have the power of calling up shadow forms of absent persons."

Unfortunately, while Mr. Talbot raises our expectations by this opinion, no authenticated case of performance is given. However, the religion of the Ekoi is a fascinating study, especially as it has much in common with the Egyptian. It is probably an ancient form of Minoan belief, for whereas in the representations which have been discovered of Minoan tree and bird worship, the tree is almost conventionalised into a pillar, and later as a mere pedestal for the bird, among the Ekoi it is still the real tree. We seem to touch the beginning of the belief in the following description:—

"The smallest town has its 'Juju' tree. There are many varieties of these, but each stands alone, usually in an open space before the Egbo house. They are generally bound round with tie-tie, or surrounded by a little fence festooned with linked rings of the same. On the branches of these trees hang countless nests of one kind or another of the weaver bird. Even the smallest child knows that these are sacred, for on them depends the prosperity of the town. Should they be injured or driven away the women would become barren and cattle cease to bear. The birds know that they are safe and flit fearlessly hither and hither, keeping up such a loud twittering and crying that it is almost impossible to hear oneself speak in the neighbourhood."

There is a Biblical touch in the native custom by which a man who wishes to marry an Ekoi maiden must serve her people some considerable time, usually from two to three years. Even then his possession is far from secure. "Divorce is extremely easy under native law. The most common rite for freeing a wife is to rub white chalk on both her hands. If a woman wishes to free herself without the consent of her husband, she usually rakes out the fire and pours water on the embers till they die out. She then cuts her hair and covers herself with white paint. After this, even if both parties wished it, she could never return to her husband. Such a case occurred on December 3rd, 1908, when Awaw Otu stated on oath:

"Machott was my wife. One day she pulled out the kitchen fire on to the floor, and poured water on it till it died out. Then she cut her hair and covered herself with white. This is against our rule; so now she cannot come back to me as my wife."

“By old law also, it appeared that a woman could divorce herself by giving a slave or ‘member’ to her husband instead of herself. This will be seen from the following case, which incidentally throws a curious sidelight on the relations of husband and wife:—

“On December 4th, 1908, Awato Otu stated: ‘One day I was lying down by the fireplace in my compound. My other wife asked me to come and dine. Then my wife Machott caught me and beat me, and prevented me from going to my food. She then abused me. I replied, “Look at you with a mouth as wide as a bag!” Then she said, “Here is my member Ndo Tammi. You can have her instead of me. I give her to you.”’

Viewed as Mr. Talbot views it, bush life is crowded with incident, and a cultivated interest in native beliefs must add greatly to the attraction which West Africa, in spite of its drawbacks, exercises over its visitors.

---

**History of the Basuto, Ancient and Modern.**—By D. F. ELLENBERGER, V.D.M. (*Caxton Publishing Co., Ltd.*)

This work was written by a missionary of the Paris Evangelical Mission Society, which has carried on its work in Basutoland since 1833, and the translation has been done by Mr. J. C. Macgregor, Assistant Commissioner. The history virtually stops at the year 1833, and is based largely on traditions which will soon cease to exist as such. It represents the knowledge and beliefs of the intelligent old man of the people.

Basutoland is a favoured part of South Africa, fertile and well watered, though it suffers severely at times from drought. The inhabitants, who are of the Basuto race, have been in occupation of it for some centuries, but it was only comparatively recently that they were united under one king, Moshesh. This potentate reached the apogee of his glory by a great victory over the Batlakoa in 1853, and almost immediately afterwards the Basutos came into communication with the government of the Orange Free State and the modern period began. The Basutos appear to have come in various streams from the north. They found the Bushmen in possession, but probably they were accepted peaceably as neighbours; primitive peoples do not question the right of new-comers to the occupation of land, providing they are not dangerously near, and the first quarrels are caused by raids of cattle. Later on come the contests for chieftainship, a grim business which depends for success mostly on the ability of the claimant to provide food. On the whole, however, the early history of the Basutos was fairly tranquil, and great trouble did not come upon them till the Zulu invasion burst in upon them in 1822. It

was in 1824 that an incident occurred which marked the coming of civilization. A Wesleyan missionary, Mr. S. Broadbent, had then been living for about a year with the Barolong. "He had built himself a stone house consisting of two rooms, and, in spite of the rumours of war, he remained at his post until, his health failing, he left with his wife and family in the waggon of a passing missionary on April 22. It was two days after this that the Bataung, having dispersed the Barolong and looking round for plunder, came upon this house. It was the first time they had ever seen anything of the kind, and thought it must be some sort of fort. The chief held a council of war, at which it was decided that the bravest men must advance upon it, for who knew what might be hidden inside? In such estimation was the valour of those who advanced upon the house held by their fellows, that the names of some of them have been preserved and handed down to posterity. They were Chakane, Mathabeng, Mokhampanyane, Ralepao, Mokhabe, Koloko, and others. The doors and windows were smashed in with great stones cast at them, and as no one came out, the heroes went warily in. There they found many things of interest whereat they marvelled greatly, viz. tables, chairs, beds, boxes, iron pots and pans, crockery, linen, men's, women's, and children's clothes, books, pictures, sugar, coffee, rice, and even a telescope, but this last-named article they smashed immediately, being highly suspicious of the glass at each end, which they took to be the eyes of something uncanny. A pair of the reverend gentleman's nether garments caused great curiosity: at first they thought they were a pair of bags sewn together, as indeed in a sense they were, but they could not see the use of bags like that which could hold nothing. The shoes and boots, the use of which they might have guessed, puzzled them, and they cut them up. They were delighted with the softness of the linen, and some coloured calico prints and a dog-chain took their fancy. There was a large pistol on the wall, which they took to be a whistle, but, in order to make it less cumbersome, they thought to burn away the wooden stock, holding it in the fire by the barrel. But the thing was loaded and the heat of the fire exploded the charge, which lodged in the stomach of the man who was holding it, and so he died. The table-knives were very welcome, but they had no use for pocket-knives as they could not open them.

They also found some bags of gunpowder, which some thought was seed, and some thought was medicine. They could not decide what it was until one savant threw a quantity in the fire in order to test it. They soon discovered that there was some witchcraft about it, for they were blown away from the fire, round which they were seated, and severely singed. The fire itself was scattered and extinguished by the explosion, and after the one blinding flash they

were left in darkness. From that time the house of the missionary came to be called *Ntlo ea Sethunya* ("the House of the Detonation").

The collection of traditions is remarkable for its detail, and some interesting chapters are added on customs and beliefs. A special account is given of cannibalism, which from small beginnings spread over the whole country between the Orange and the Vaal, depopulating the land and stopping all friendly intercourse between tribes and villages. Murder and robbery were the order of the day, and people dared not move about except in large armed parties. Even then, if the party were not large, it would probably prefer to travel by night to avoid enemies. But even at night the man-eaters lay in wait, and more often than not succeeded in capturing caravans.

Cannibalism, it is remarked, is a sort of mental aberration brought about by the pangs of hunger, which render a man incapable of realising the horror of it, or of anything except his own suffering and misery. Those who became addicted to it formed themselves into secret associations, as much to justify themselves as to encourage each other. These associations were numerous, and each one had its leader, who, of course, was the most ravenous and blood-thirsty of the lot. For all that it is improbable that the idea of eating their fellow-men would have occurred to the South African Bantu had the example not been set by strangers from the north. In the first part of this work it is related how the Bavenda, who came from the sources of the Kassai, practised the custom of eating prisoners of war. They kept up this horrid practice until quite recently, and news of it, no doubt, filtered through to the cis-Vaal tribes. In time many districts became infested with cannibals, and no doubt the practice was stimulated by the losses of grain and milk caused by raids. As practised by the Basuto it became madness. "All human instinct, all reason, fellowship, intellect, everything in fact which raises the human being over the brute beast, became extinct or obliterated. They practised cruelty for its own sake and the pleasure it gave them, torturing their victims in a fiendish manner before dispatching them. Children were butchered or roasted alive under the eyes of their parents, or vice versa; women in the presence of their husbands. They would bind the hands of captured people, and drive them before them as they would cattle. If any one resisted, he was killed and eaten at once, to save the trouble of driving him. The women of the cannibals were just as blood-thirsty. They would frequently accompany their husbands on the man-hunt, so as to miss no part of the feast." But, as has often been remarked, the habit is not deep-seated, and though in its day it caused a vast loss of life it entirely disappeared at the touch of civilization. The change of thought may be seen from the confession of a converted Basuto: "Oh, how vile I was! I sucked

wickedness with my mother's milk, and the depravity of my parents. Later on came the terrible wars, ruin, and starvation. I lived on roots, grass seed, and even ate pot-clay to try thereby to stay my hunger. The hand of the Amangwane was heavy on the land; all the tribes were at war with each other, and every one was a fugitive. Day by day men began to eat men, and I too tasted human flesh. From that time I shunned my fellows, dreading to be eaten too. What horrible days followed that on which I cut off the arm of my mother's brother and cooked and ate it! I also ate my father's brother, every bit of him, and many others. Even as Ezekiel saw in a vision the dried bones of a whole nation draw near to each other and assume form, so, with terror, do I see the bones I have picked reunite with their fellows and rise up in judgment against me." Notwithstanding this grievous lapse the Basutos were extremely polite and had numerous and precise rules of etiquette. In fact their formalism was extraordinary, and is a strong example of the fact that uncivilized nations are most fettered by custom. Their wit and wisdom is collected in a great number of maxims or proverbs, many of them so far fetched as to be rather cryptic to the European.

Mr. Macgregor apologises for the imperfections of his translations, but whatever they may be, his rendering is admirably clear. The book, as he observes, will be the last word on the ancient history of the Basuto.

---

**The Land of the New Guinea Pygmies.**—By CAPT. C. G. RAWLING,  
C.I.E., F.R.G.S. (*Seeley Service & Co.* 16s. Net).

New Guinea now offers greater opportunities to the explorer than any other part of the world, for much of it still remains unknown, while the collector finds abundant material. This work is the result of a British Ornithologists' Union expedition to a part of the Dutch section of the island, where the great central range of mountains comes near the coast. New Guinea has long enjoyed a reputation for cunning and brutality, and many are the stories of treacherous murders, the outrages being usually followed by cannibalism. It is said that the prevalence of this custom is due, in the majority of cases, simply to the liking for human flesh; sometimes an enemy is eaten as an act of revenge, but there is no idea that in so doing the good qualities of the deceased are acquired. There is related a story of how a Bonarua woman dug up her recently deceased husband to feed a friend. This act caused much indignation at the time, not so much because there was considered to be anything wrong in the eating of the flesh when exhumed, but because the men of the tribe

disliked the idea of being devoured by their own wives. There is however hope for the natives, as they display that inestimable quality, keenness for trade. At first a boat could be bought for a knife or a handkerchief, but towards the end of the visitors stay the price had risen to two axes. European commerce however is likely to cry a halt before the pests of this part of New Guinea. Mosquitoes abound in clouds, but are outdone by leeches, which dangle from every leaf and branch and drop on the unsuspecting wayfarer. "Their bites often result in nasty sores which, in this damp climate, do not readily respond to doctoring, and sometimes become so bad as to necessitate the sufferer being invalided out of the country. So insidious is the attack of these hateful creatures that one is often unaware of their presence till a stream of blood welling through the clothing shows that one of them has been sucking blood from a vein, in which case a bandage must be applied to stop the bleeding.

The worst of all places for them to attach themselves is the eyeball. So light and unsuspected is their attack that on several occasions two or three crept between the eyelids without their presence being detected, and the first intimation received was the blurring of the vision. It is almost better when this happens to let them have their fill of blood and drop off when satiated, than to remove them by force, for less damage is done thereby to the flesh, but in either case very severe inflammation of the eyes is the result. But even these wretches are not the worst, the pride of place being taken by the bluebottles, which are of immense size, exist in millions and devour everything that can be eaten. "A nice land indeed," sums up the author.

However, the country is admirable for the collection of naturalists' specimens. On one occasion the market was particularly brisk. A native was secured to obtain a human skull. "For this he was to get a knife and handkerchief. The prospective desecrator of graves—for I looked upon him as such—at once walked to the bank opposite the village and, with a voice which could be heard by every soul, brazened forth the fact that we were collecting human skulls. I did my best to prevent this outburst, but it was too late. In a moment the village was in an uproar, but to our intense surprise, instead of any hostile demonstration taking place, at least a dozen men emerged from the huts, each with a skull tucked under his arm. Down the beach and through the water they raced to our tents, each striving to be the first to dispose of his relic, delighted at the idea that trade goods could be so easily obtained and no manual labour required in return." Some hints which would be useful to future explorers are given as to the value of trade articles. Knives are sought after, but as no one wants

many the demand soon ceases. The only article which never fails is, it is satisfactory to record, cloth, and here quality and condition are immaterial. The most disappointing article was the looking-glass. "It was not that the men did not want to have a look at themselves, but that they did not seem to want to do it more than once. I would be the last to suggest that they were deficient in looks, or that vanity went for nothing with them, but however little pleasure they themselves received from the experiment, it was to us a never-failing source of amusement. The candidate in the beauty competition, for such it seemed to be when an expectant crowd had collected round, settled himself on his haunches, and when comfortable, confidently raised the glass before his eyes. This invariably led to the development of a broad smile—the first impression was good. But the longer he looked and the more carefully he examined himself in detail the more disappointed he became. The smile vanished, giving place to a look of surprise, and then, as the defects of hair, eyes, and nose became impressed on his mind, the confident air changed to one of disapproval. With a sigh the glass would be passed to the next competitor, who would be fidgeting in rear, eagerly awaiting his turn." The book abounds in interesting descriptions of the country and its inhabitants, and the title hardly does it justice, as only a comparatively small space is devoted to the account of the Pygmies. A suggestive chapter is given in which it is submitted that the various tribes of Pygmies scattered about the East and Africa are the descendants of one ancient race.

---

**Les Lois et l'Administration de la Rhodésie.**—PAR HENRI ROLIN.  
 (Etabliss. Emile Bruylant, Brussels. 12 francs.)

This large volume contains the fruits of a very wide and painstaking enquiry. The legal position in Rhodesia presents some curious points to a foreigner. In Southern Rhodesia the Cape law was established; in Northern Rhodesia the English law. The first step was the result of the influence of Cecil Rhodes, and the constitutional differences between the two provinces must be borne in mind; at the same time it may be admitted that such a fundamental legal difference is very peculiar. Apart from this the author has some forcible observations on this time-honoured British practice of professing to apply the laws of an old country to a new one where everything is different. It is true that the laws are only applied so far as they are not inapplicable, but the task of deciding what is applicable makes the judges to a great extent law-makers. The South African Company is described as essentially capitalist, and the

author expresses doubts whether its rule is entirely satisfactory from the point of view of the well-being of all the inhabitants. He argues that the Imperial Parliament has no control over the policy followed; it does not take part in making the laws, nor does it control the finance. The only role which it fills is to hear complaints of "atrocités," but it is contended that it is little competent to deal with these and its intervention is of little efficiency. The company has wisely left it practically to the "men on the spot" to make the laws and direct the administration. The author considers that, at any rate recently, it has been liberal so far as the whites are concerned, but that it has failed to construct a policy in the interests of the blacks. He admits, however, that there are no "atrocités," and his point seems to be that, as the company claims the land, it should take steps to form a class of native proprietors, after the manner adopted in the Cape under the Glen Grey Act. Whatever may be thought of the author's views on these questions of policy, his account of the legal and administrative machinery is remarkably ample and clear.

---

**The Organization of Imperial Studies in London.**—By SIDNEY Low. (*Henry Frowde, Oxford University Press.* 1s. net.)

This is a plea for a School of Imperial Learning, which is to undertake, not only teaching, but also research. Mr. Low observes that the Colonial Office, "conscious of the limitations of the English public-school system, takes some steps to furnish its future pro-consuls and magistrates with a certain amount of necessary information," but it must be admitted that these measures are of a very mild and partial character in comparison with the training which is given in France and Germany. The vital difference is that our instruction is only provided for men already appointed to the Colonial service, and these can spare little time for it; abroad the instruction precedes appointment, and substantial time is allowed for it. However, Mr. Low does not propose that the course should include technical and industrial subjects, as it does at Hamburg and Paris; and in this he is certainly right so far as any serious requirements are concerned, as technical posts are given for qualifications which require a regular professional course for several years. It is true that every governor and many of the higher officials of the Crown Colonies have to pick up some knowledge of civil engineering, geology, agriculture, and other such matters, but they do not put themselves forward as experts, nor is it desirable that they should. The subjects selected by Mr. Low are (1) Indian History, (2) Colonial History, (3) the Laws and Institutions of the British Empire,

(4) Imperial economics, and (5) Imperial ethnology and geography, and his idea is that the Colonial Office should require its probationers to qualify in these subjects before taking up their appointments or within a specified period after doing so. As he observes, the London School of Economics has shown that there are plenty of young bankers, merchants, financiers and manufacturers, who are eager to combine the practical work of their professions with a knowledge of its higher principles and wider relations, and he believes that a School of Imperial Studies would have the same experience. No one will dispute the fact that it would be an advantage if our young colonial officers could start their careers with a better knowledge of the subjects which will come into their work. The difficulty is to make a selection which will be appropriate and also fit into reasonable space. Much of the knowledge which is most appropriate, such as that relating to government accounts and finance, cannot well be acquired from text-books, and it would be difficult to find competent teachers. The limitation to Imperial laws, economics, etc., seems to shut out foreign materials, or at any rate, to relegate them to the background; but a colonial student of some particular question will often find greater help from a foreign country than from any other British possession. Mr. Low, however, might reply that these are matters for research, and as this Journal itself represents an effort, very imperfect, to collect from various colonial sources items of common interest, we appreciate the value of the proposal to place Imperial studies on a more stable basis.

---

**Bulletin of the Imperial Institute, Vol. X., No. 4.** (*John Murray.*  
2s. 6d. net.)

It appears that the quality of Gold Coast cocoa has improved considerably in the last two years, since exporters had adopted the practice of fermenting the beans; the fermented product realises at Hamburg from 1 to 2½ marks more per 50 kilos than the unfermented cocoa. An account is given of samples of crude petroleum obtained at Bonyere in the Axim district, and yielding oils of commercial value. An examination has been made of the Nyasaland cottons, where the only types now favoured are the Egyptian, at elevations below 2,000 feet, and the American, at higher positions. By careful selection of "improved" American Upland varieties, a type of cotton has been evolved which has now become acclimatised and is recognised as a distinct commercial variety under the name of "Nyasaland Upland." At the present time this cotton is regarded as the best grown in Nyasaland from Upland seed, and is valued at 2d. or more

above that of "middling" American. Of the total area under European cultivation in the Protectorate in 1912, 23,300 acres were devoted to Nyasaland Upland and 755 acres to Egyptian cotton.

A very full review is given of recent papers and literature dealing with tropical products.

---

**The Oil Palm and its Varieties.**—By I. H. I. FARQUHAR, B.Sc., N.D.A., Conservator of Forests, Southern Nigeria. Edited and Revised by H. N. THOMPSON, Chief Conservator of Forests, Southern Nigeria. (*Published by the Crown Agents for the Colonies.* 3s. net.)

The exports of oil and kernels in 1910 from Southern and Northern Nigeria reached the value of £4,193,049.

There is no doubt, it is stated, that the merchants buy all the oil and kernels the natives bring them, and this is a large proportion of the available supply within such areas as are served by easy land and waterways, but a large number of palm trees are not worked for oil and kernels, especially in the districts of Kwale, Aboh, Asaba, and to some extent in those of Warri and Sapele. This, however, is not as large a number as many people would make believe, and the statement of palm fruits and nuts rotting on the roadsides often refers to those that are spread out on the roadside to dry before cracking them for kernels, the surface of government-made roads being a good drying ground for that purpose. A very large amount of the total palm oil available in Southern Nigeria is made use of, but this cannot be said of the available supply of palm kernels, which is not utilized to any such extent; however, the output of oil and kernels has increased enormously of late, chiefly owing to the opening up of waterways, markets, and roads, and to the settled condition of the country.

The waterways are the most important carriers of oil products, and they have been much improved by the Marine and Political Departments. Their continued improvement, combined with the employment of craft for travelling on them, will do more than anything else to increase the output of oil and kernels. The Okrika and Bonny people, who are keen traders, are most anxious to have a waterway cut through to the Imo River at Obibo, which will save them many miles of a rough water journey, and open up the Imo River and its numerous creeks, and a rich country to healthy rivalry and competition.

The presence of the railway is not likely to increase to any extent the amount of palm oil in the future, but a large increase in the export of kernels should be expected.

To increase the export of the palm oil products, cheap, plentiful labour is needed. It will become more plentiful with an increase in

population, whilst for the present hand machinery for the preparation of oil and kernels, which will liberate labour for other works, is most needed ; hand oil presses, nut-cracking machinery, decorticators, etc., the use of which will also improve the quality of the palm oil products.

At present insufficient available labour is a cause adversely affecting the palm oil and kernel industry. Southern Nigeria being a new and progressive country, the calls on labour are so many and varied that the latter is diverted to the works which attract the labourers most, and the old palm oil and kernel industry, being so well-known, is not now so attractive as the newer and less known forms of labour. These present more attraction for the workers in steady, constant work, regular hours, regular and fixed pay, and more enlivening surroundings than the collection and preparation of palm oil in the bush, carrying the produce to the markets and pulling the produce long journeys in canoes, either as a member of a house working for the head of the house, or as a labourer to a middleman, chief or private native individual.

The native, in addition, is not yet accustomed to the change brought about by the abolition of slavery and the setting up of the form of Domestic Government in its stead, which is designated as the House Rule. He has also not got accustomed to the number of free men about, and the power of money to command such men as labour, and from their economical use amass more money.

Mechanical transport, and mechanical means for preparing oil, will liberate labour as nothing else will, and if an increase of population follows, labour difficulties in the future should not be unsurmountable.

To obtain the best results the oil palm requires a heavy well-distributed rainfall of from 70 to 100 inches per annum, and a moist, fairly equable climate with a deep holding soil ; these conditions are found in the deep alluvial humus-covered soils of the forest regions and along the coast inwards for a distance of from 70 to 150 miles. These conditions prevail further inland still, along the valleys of rivers and streams which the oil palm follows into all parts of Southern Nigeria, though steadily diminishing in numbers as it recedes from the coast.

The rainfall of the localities referred to is practically the same along the shores of the lagoons as it is three or four miles farther back, where the ordinary variety of the oil palm grows so luxuriantly. The real factors that here determine the vigorous growth of the oil palm are the increased richness of the soil, due to the presence of decaying organic substances derived from the vegetation growing on it, and the simultaneous increase in the amount of water held in suspension by the soil.

These considerations explain the absence of the plant from the dry, open districts of the hinterland, where, owing to the destruction of the forests for farming, and the prevalence of "bush fires," the organic matter in the soil has been reduced in quantity, and the regulation of the supply of moisture in it has been so disturbed that at one time of the year there is often too much, and at other times too little of it to suit the majority of plants. The actual amount of rainfall in these districts is frequently quite sufficient to ensure luxuriant vegetation if a larger percentage of the rain-water could be held in suspension by the soil during the rains, as is the case with forest-covered soils. On the Gold Coast there has been a decline in the export of palm oil, probably caused by the rise of the cocoa industry. The oil palm begins to bear in four years under favourable circumstances; the palm is in full bearing at twelve and continues so for about fifty-five. It has been suggested that it should be grown in Malaya and other places, but no place seems so suitable to it as West Africa. A clear account is given of the tree and its products.

The report brings out the importance of mechanical means of preparing oil, and it is to be hoped that if, as is likely, serious competition arises in other parts of West Africa, the British possessions will not be left behindhand in this matter.

---

#### **Forests of British Guiana.**

Two reports have been issued by the Department of Lands and Mines at Georgetown. They are by Mr. C. W. Anderson, I.S.O., F.G.S., F.R.G.S.; one is a general account of the forests of the easily accessible districts, and the other is devoted to the North-Western district of the County of Essequibo. A very clear description is given of the sources of supply, and it is to be hoped that the information given will stimulate enterprise.

---

#### **Insects Injurious to Economic Products.—By C. C. GOWDEY, B.Sc., Government Entomologist, Uganda.**

This useful paper describes the insects which attack the various staple products and the method of dealing with them. Mr. Gowdey, explains that generally one of four methods is adopted in combating any insect pest. First, the application of a stomach poison on the food for those insects which chew and swallow solid food. Most stomach poisons act as irritants, causing inflammation of the alimentary canal and the ultimate death of the insect. Second, treating those insects that suck the juices of plants with a contact poison.

Third, the use of a gas or vapour for killing insects which are so located that they cannot be reached by any other means. Fourth, the employment of cultural methods for those insects that cannot be attacked by any of the preceding methods.

The majority of stomach poisons and many of the contact insecticides are applied in the form of a fine spray on the foliage or other parts of the plant. It consists of diluting the insecticide to the proper strength with water and applying by means of a spray pump.

At times both a stomach poison as well as a contact insecticide can be applied in the form of a dust spray. It consists of dusting the insecticide on to the plants. In applying an arsenical insecticide in this manner it is usually diluted with flour, or some similar material, which can be easily dusted on the plants. Experiments do not justify the use of dust sprays in preference to liquid sprays.

Descriptions are given of the various substances used.

---

### **Panama Canal.**

The 1911-12 report of the Isthmian Canal Commission will be studied with interest by engineers, as it gives a very full account of the work done. Some places in the West Indies are looking forward to a share in the supply of coal on the new route, but a fairly liberal preparation will be made on the spot, as provision is being made for 16,000 tons of coal at the Atlantic terminus and 8,000 at the Pacific. There will be three dry docks and ample repair shops. The sanitation work has been remarkable, but there is no ground for an impression which has become general that there has been an extensive clearing of land. Out of 278,848 acres in the zone less than 1,200 have been cleared, and thus almost the entire territory is in its original state as regards bush and jungle.

## BUSINESS NOTES.

## Rubber.

PRICES in 1912 were on the whole a little lower than in 1911, and this may mark the process by which rubber is, according to many authorities, to drop gradually to 3s. a lb., or less. It is becoming increasingly plain that the future rests with plantations, as they can in the east produce at 1s. a lb., which at anything like the present price yields an extremely high profit, and would easily bear a drop to 2s. 6d. It does not seem likely however that any great change will occur for three or four years, but many new plantations will then be actively producing and a critical period will occur. The new Brazil law, especially the reduction of the export tax, which is at present 22 per cent. of the value and is to be brought down gradually to one half that amount, will no doubt stimulate production, but the great cost of labour and the difficulty of collection militate against any great extension.

It has been estimated that the world's production of wild and plantation rubber, in the 12 months ended with June 30, 1912, amounted to 93,669 tons, as compared with 79,302 tons in the previous year and 76,026 tons in 1909-10. The world's stocks of rubber on July 1, 1912, are reported to have been 10,181 tons, as against 12,563 tons on the same date in 1911. The considerable expansion in consumption in 1911-12 is attributed largely to the lower level of prices prevailing during the year.

Samples have been sent home of rubber prepared by a process for which a patent has been granted in the Malay States, and which imitates the native method of making fine hard para. The latex is coagulated in thin layers by the action of smoke and heat alone, and no chemicals are used. The breaking strain appears to be nearly equal to that of fine hard para, but the loss in washing and drying is higher, being 3·3 per cent.; the resin content is considerably higher. The rubber would not, it is believed, command a higher figure than other grades of smoked sheet on the market.

---

In the West Indies it is calculated that a man can tap 25 trees per day, and that he will get four ounces of rubber per tree, or say

six pounds altogether. The man's cost may be put at 2s. a day, so that the cost per lb. is 4d. In Malaya the cost of tapping appears to be increasing, and is now over \$1 10 cents. a day.

---

### Coffee.

In the Journal of the Jamaica Agricultural Society, Mr. H. Q. Levy, Agricultural Instructor, advises a distance between the trees of at least 8 by 8 feet. He observes that this space will look rather wide for the first few years, but later it will be found just barely sufficient to accommodate the growth of healthy trees, and in the case of "long top coffee" after the lapse of eight or ten years, even that distance will be found too close for the best results. Indeed, for "long top" 10 by 10 is better. In Costa Rica and other large coffee producing centres, the trees are never planted closer than ten feet apart, many wider; the result is a healthy, wide spreading tree, bearing its crop year after year, not only on the tops of the trees, or on the outside of the fields, but each individual plant fulfills its function, by carrying its crop evenly scattered over the whole tree. In this way the planter gets the full benefit of the time and labour expended on his cultivation.

Planting is often done crudely, and it should be borne in mind that the coffee tree is a surface feeder and should not be planted deep, but so that when the soil is put in it will not cover the highest root deeper than half-an-inch.

---

### Cotton.

In South Africa, as in the West Indies, the planters' dread is destruction by pests. In some cases the loss has been 75 per cent. The most important pest is the Spring Cotton Boll Worm, and, unfortunately, it seems impossible to deal with its depredations directly. However, a successful attempt has been made to grow cotton at Rustenburg, and it appears that the plant resists drought well. In such places cotton may enjoy fair exemption from pests, and, if so, the vast Kalahari Desert will become one of the greatest cotton fields in the world.

---

### Teff.

This hay crop was introduced to the world by Kew Gardens. The seed came from Abyssinia. It grows quickly and resists drought. It has been a success in British Guiana and Australia. It thrives in dry sandy regions, but cannot compete with Lucerne when there is enough rain for this crop. Under good conditions it matures in two months from seed, and the yield is very heavy. The use of it is spreading in South Africa, and it is likely to cause a great development of the dairying industry.

**Insecticides.**

Serious damage has been done to sugar cane plantations in Mauritius by a beetle to which the name *Phytalus Smithi* has been given and which is fully described in a report by Mr. D. d'Emmerez de Charmoy, Curator of the Museum. The same beetle is found in Barbados, but is apparently kept in check there by a parasite, and the scientific method would be to combat the pest by introducing this parasite. The following report on the results of various insecticides is of general interest.

"*Paris Green*" (*Arseniate of Soda*). Larvæ introduced in soil containing 2 per cent. of this substance were apparently quite unaffected.

"*Vaporite*." This substance, recommended by Mr. E. Green, the Government Entomologist of Ceylon, gave very good results when tried experimentally in the laboratory, but when applied on a large scale in the fields, although under various conditions and with every precaution to ensure success, it gave no practical results.

"*Cyanide of Potash*" was also of no use as it only killed the larvæ which came into actual contact with the chemical while those at a distance escaped altogether; besides the quantity of cyanide to inject the ground thoroughly would be such as to bring the cost to about Rs. 350 per acre.

"*Durandine and Pretroleum Emulsion*." A 1 per cent. solution of the former and a 7 per cent. diluted solution of the latter gave very good results, but the price is prohibitive.

*Sulphydes*. Various preparations of these were tried and found ineffective.

*Pretroleum and Creoline*. An emulsion containing these two substances gave the best results, not only by reason of its insecticidal power but also of its relatively low cost, which on an average would be Rs. 100 per acre, unless of course the transport of the necessary water has to be reckoned with which would render the operation more expensive.

The following is the formula for this mixture: Dissolve 500 grams of common soap in nine litres of boiling water. Add gradually eighteen litres of pretroleum, stirring the while until the solution acquires a viscid consistency. To 800 c.c. of this emulsion add 200 c.c. of creoline or to 700 c.c. add 300 c.c. of phenyl. To either of these mixtures add a hundred times their volume of water and the solution is ready. It requires on an average about ten litres for each cane hole.

**Concrete.**

The President of the Concrete Institute in his address pointed out that if cement is to be kept up to its full strength it is absolutely necessary that when it is received on the site of the works it should be stored in air-tight wooden bins: and if this is done cement may be kept for many years and be just as good after the lapse of time as it was when freshly made, whereas if the cement be stored in sacks, and even a very small amount of moist air plays upon them, then the cement is rapidly hydrated and cakes in the sack. If, as is often the case, this cement be rubbed through a sieve, it becomes almost absolutely useless for purposes of concrete-making. He mentioned the case of a contractor who bought cement in the month of October. The whole winter was a bad one, and he had very little opportunity of using the cement. It was stored in a shed through which the wind could blow freely, and he was rather astonished when the spring came and the cement was used that it would not set. He then wrote to the manufacturers, and when the matter was investigated the true cause of the mischief was found out.

---

**White Ants and Bottles.**

Considerable loss is caused in some countries by ants devouring the corks in bottles. The simplest plan is to take the bottles out of their wrappings and stand them up; the insects cannot then climb up them. Another plan is to capsule the bottles and then dip them in boiling wax.

---

**Motor Fire Engines in Sydney.**

Sydney prides itself on being one of the first cities of the world to adopt motor fire apparatus, and Superintendent Webb, the chief officer of the fire brigade, speaks highly of the satisfaction given by such machines in actual service. The latest consignment has just been shipped from England, and comprises three petrol pumps of the Merryweather "Hatfield" type, each driven by a powerful four-cylinder motor, and capable of delivering 400 gallons per minute. The Sydney brigade also possesses two other Merryweather motor fire appliances, the first being a chemical engine supplied in 1904, and the second a salvage van supplied in 1907. Sydney continues to lead the way in the Antipodes, and its fleet of motor fire appliances far exceeds that of any other Australian brigade.

---

**Stamps.**

Much excitement has been caused in the philatelic world by the report that the royal cipher watermark used for the stamps of Great Britain would be employed for future issues of British Colonial stamps. There was, however, no truth in the rumour, and it is difficult to account for the publication of such reports.

The next issue of MALTA 4d. stamps will be in a dark green colour. The St. Paul's shipwreck design will be used for the 10s. stamp only, and the 1908 Nyasaland King's Head Model H "Postage Revenue" design for the 2s. and 5s. value. The Grand Harbour design, now used for the one farthing stamp, will be applied to the 4d. value instead, and the one farthing stamp will be in Model D unified issue.

BRITISH GUIANA.—Two and twelve cent. stamps of the new design are being supplied.

GOLD COAST.—Stamps of values from  $\frac{1}{2}$ d. to 20s. are being supplied of the new design.

## ENGINEERING NOTES.

### South Africa.

THE outstanding feature of the railway returns for 1911 has been the continued increase in passenger traffic, reflecting clearly the enhanced prosperity of the country as the result of the exceptional expansion in trade which took place in 1910. It was hardly to be expected that this expansion would continue at the same rate during 1911, and this has proved to be the case, for whilst in 1910 the total revenue-earning tonnage increased by nearly 20 per cent. over the preceding year, the increase for the year under review is not quite  $3\frac{1}{2}$  per cent. This indicates that, while the volume of trade has been well maintained, the country is passing through a comparatively quiescent period after the exceptional activity which characterized the year of Union, thus justifying the opinion expressed last year that "before any further general advance took place there was likely to be a lull."

One of the principles laid down by the South Africa Act is the provision to be made out of earnings "for the necessary outlays . . . for depreciation," and it is to this principle that the recommendation of a Select Committee is intended to give effect. By the establishment of a Renewals Fund, fed by regular annual contributions from revenue, each year will bear its own proportion of the depreciation that is continually going on, and it will be possible, even in times of financial depression, to carry out the necessary renewals as and when required, without burdening the State with fresh loan expenditure or the revenue of a particular year with heavy special disbursements which it might not be able to bear.

It is in fixing the scale of depreciation, that is, the amount that should be contributed yearly in respect of the various classes of assets, that the difficulty arises. The working life of a particular asset depends upon such a variety of circumstances that it is practically impossible to arrive at strictly accurate rates which will represent the annual depreciation that takes place in every case.

The best that can be done, therefore, is to estimate the life of each class of asset as nearly as possible in the light of the experience already acquired, and fix average rates at which the annual contributions should be made until the experience of future years proves such rates to be sufficient or otherwise.

Much has been said and written in regard to the effect which the present rates from the ports have on the cost of living at the principal inland centres, more particularly Pretoria, Johannesburg, Bloemfontein, and Kimberley, but a reduction of even 50 per cent.—were it practicable—in the rates on the majority of imported articles of every-day consumption, such as groceries, jams, biscuits, tea, and coffee, would hardly be more than a farthing per pound, and, instead of benefiting the consumer, would, in the majority of cases, merely go to swell the profits of the middleman.

On the other hand, reductions in the rates on such commodities as coal, paraffin, cement, timber, galvanized iron, and agricultural machinery should be of benefit to the actual consumers, particularly in the inland districts, and it is mainly in this direction that the important reductions in rates have recently been made.

These remarks are applicable to many other railways.

With the rapid increase in the size and power of railway locomotives of recent years the problem of mechanical stoking has engaged the attention of locomotive engineers, especially in the United States of America, and several more or less satisfactory contrivances have been evolved. Tests made in South Africa have demonstrated the usefulness of such an appliance, and as it becomes necessary to provide still larger engines, there is no doubt that a suitable mechanical stoker will become more and more a necessity. The one now being experimented with on these railways is an advance on any previous type tried, but further improvements are necessary before it can be said to be of practical value. When oil fuel is available at a cost which will compare with coal, locomotive work will be much simplified, and it is hoped that oil will yet be found in payable quantities in Africa south of the equator.

The locomotives ordered during 1911 include several of special design, notably the 12th class 4-8-2 heavy goods engine, fitted with the Schmidt superheater. This engine, designed by Mr. D. A. Hendrie, Chief Mechanical Engineer, is the best and most powerful of its type that has yet been introduced, and will prove most valuable for heavy traffic on sections where it is suited to work. It will be the heaviest non-articulated engine (91 tons 16 cwt. in working order) working on any line of less than 4-ft. 8½-in. gauge, and has been designed to haul a heavy load at a slightly higher speed than is possible with the present Mallet engines, although the latter are capable of hauling the heavier load.

It is, however, by no means certain that an increase in the speed of mineral trains is altogether desirable. The increased cost of maintenance of the permanent way, which the running of heavy loads at high speeds always entails, is generally found to outweigh any advantage that can be derived from a slight increase of speed in moving traffic of this class. The solution of the problem appears to lie rather in the direction of the development of the articulated locomotive or some other type of engine which, while not exceeding the maximum axle load laid down, should have a much greater tractive effort, and be capable of hauling still heavier loads, although at a comparatively slower speed.

The advancement in the power of locomotives during the past fifteen years has been very great, but until recently no marked increase has been made in the tractive force of the different types, each type showing a small improvement on the preceding one, with the result that there are now over one hundred different designs of engines on the South African railways.

Of late years the telephone, as a substitute for the telegraph, has come more and more to the front in railway working, not only as a means of providing a source of communication between the principal stations, but also for the transmission of the necessary "line clear" and other messages for the control of train movements. Experiments are being made with one of the latest selective calling and control systems, as largely used throughout America, the intention being to extend this, or a similar system of telephones, throughout the Union, linking up the principal points of distribution and curtailing telegraph working as far as possible.

It is now the practice to use the telephone, instead of the telegraph, for working trains on branch lines, and a considerable saving is effected in the first cost of the installation, as well as in the subsequent maintenance charges.

It is often noticeable that road motor transport does not pay of itself, but it opens up new districts and prepares the way for branch railways: "The principle point is this, that even if there is not a lot of money in such experiments for the railway companies, the effect of such services, if they be properly backed by the residents whom it is intended to benefit, is that the whole district becomes 'bettered.'"

---

### Ceylon.

In view of the projected further extension to Pelmadulla, the completion report on the line from Avisawella to Ratnapura has been received at an opportune moment. The first portion of land was handed over to the construction staff in December, 1908, and the line was finally opened for traffic on the 18th April, 1912. This period—over three years—seems excessive for 27 miles of 2ft. 6in. track.

The explanation given is the heavy broken nature of the country traversed. The trace was uniformly difficult, cuttings and banks of 35 feet and upwards being regular features. Where these banks were formed on paddy land, very long leads had to be allowed. This fact, coupled with the constant settlement of the banks, caused the item "earthworks" to show a considerable excess. This subsidence of embankments on paddy lands is often extremely troublesome in Ceylon. As an instance, a certain bank on the Matara Railway, only four feet in height above the surface of the ground, necessitated the deposit of material sufficient to form a normal embankment 30 feet high, the displaced soft material being forced up in ridges parallel to the railway on either side. The heavy rainfall of the district caused much trouble with slips and washaways.

Throughout, the line is laid with  $46\frac{1}{2}$  lb. rails taken from the Northern Railway, where the 80 lb. section is being substituted. The sleepers were supplied by the Forest Department, and consist mainly of palu, satin and milla woods. With the exception of the 3.59 curve leading into Ratnapura Station, the sharpest curve has a radius of 4.78 chains, and the steepest gradient is 1 in 80.

As usual, the cost of land was under-estimated but, nevertheless, the line has been built within the revised estimate of £191,000, which works out at £7,100 per mile. The whole of the works were carried out by petty contractors and departmental labour, many Singhalese being recruited locally. As is customary on the railways in Ceylon, station names and similar notices are painted in three languages, English, Singhalese and Tamil.

Profiting by the experience gained on this difficult line more rapid progress should be made with the extension to Pelmadulla, which is to be entrusted to the same staff. This extension will run through the most extensive and prosperous rubber district in the island.

---

### Indo-Ceylon connection.

Through communication between Ceylon and India, via Mannar, should be established shortly. The line from Madawachchi to Talai Mannar and the piers at the extremity of Mannar Island are practically completed. Nor are the South Indian Railway authorities behind with their part of the programme. The first of their fleet of three turbine steamers was launched recently at the Glasgow shipyard of Messrs J. & A. Inglis, Ltd. The journey by these steamers from Dhaneshkodi on the Indian side to Mannar will occupy 75 minutes, and will be remarkable by reason of the certainty of a smooth water service throughout the year. This protection is

rendered by the reef known as "Adams' Bridge," steamers being able to choose whichever side affords protection from the prevailing monsoon.

The new bridge at Kalutara, on the Ceylon sea coast line, was opened to traffic on 25th November last. The new structure, which has been designed for railway traffic alone, comprises eight 150 ft. spans in comparison with twelve spans of 100 ft. in the old rail and road bridge. The latter has been left standing and will be turned over entirely to the road traffic which of late years, owing to the growth of the railway traffic, had been denied access to the bridge during four hours of the day.

---

### Wood v. Steel Sleepers.

Local woods have, during past years, formed a considerable proportion of the sleepers used on the Ceylon Government Railways. The Forest Department has now intimated that the supply is practically at an end. In this circumstance several courses are open for adoption. The Government may, and probably will, decide to import either wood or steel sleepers. At the present time Karri and Jarrah appear to be the favourite timber sleepers and have given very good results. Steel sleepers were tried in Ceylon in 1894, but the cost was so high that the order was not repeated, and that at a time when the cost of material was much lower than it is at present. Timber prices, also, have been steadily advancing so that, doubtless, the Government will thoroughly reconsider the question before reaching a decision. A possible alternative is the reinforced concrete sleeper which could be made locally by machinery. Although concrete sleepers might be cheaper, it is doubtful whether they would conduce to smooth running.

---

### Colombo Harbour.

It has been decided to place the administration of the Port of Colombo under a Port Commission. The post of Harbour Engineer, who will be one of the members of the Commission, has been given to Mr. A. D. Prouse, the Resident Engineer.

Considerable success has attended the deposit of wave-breaker blocks along the outer face of the South West Breakwater at Colombo. The blocks are so effective in dissipating and breaking up the sea that foot traffic is rendered practicable, even during the south-west monsoon. This block-work protection is now to be continued along the remainder of the Breakwater, thus increasing to a considerable degree the effective wharf frontage of the harbour.

---

### Dredgers.

A bucket-hopper dredger, of 1,200 tons capacity, for use at Colombo, has been ordered from Messrs. Fleming & Ferguson, at a

figure in the neighbourhood of £70,000. The vessel is to be self-unloading, and will have a speed of ten knots when fully loaded. With the new craft at work, a large part of the harbour will be dredged to a depth of 36 feet, this being the depth to which the Suez Canal will have been dredged early in 1914. Bearing in mind, however, the great increases in the draught of vessels within recent years, the new dredger will be capable of working to a depth of 45 feet. This seems to allow an ample margin.

A smaller bucket-dredger, of 400 tons capacity only, has been ordered from Messrs. Lobnitz & Co. for service in Bermuda. She is designed to dredge to a depth of 34 feet.

---

### Malay States.

1911 was again a satisfactory year. A striking feature was the great increase in the number of passengers carried—namely, 10,347,896, compared with 7,262,830 in 1909, an increase of 42.47 per cent. in two years. Goods traffic increased from 653,663 tons in 1910 to 780,780 tons in 1911, or 19.4 per cent. These increases have taxed the capacity of our rolling stock to its utmost limits, and a large programme for additional stock will be necessary to keep pace with the development of traffic. The gross earnings from all traffic increased by 20.28 per cent., working expenses increased by 4.3 per cent., the net earnings increased by 45.9 per cent. The dividend earned was 6.03 per cent., being the highest since 1903.

During the year exploration and survey work was for the most part in Kelantan territory. On account of the very difficult country met with north of Tembeling, it was found necessary to undertake careful trial surveys of two routes, viz., one east of Gunong Tahan and the other west of Gunong Tahan. The permanent survey of the east route up to the Pahang-Kelantan boundary, and 34 miles of trial survey in Kelantan had already been completed. A flying survey of the west route had also been completed up to the Pahang-Kelantan boundary. During 1911, the trial survey of the east route has been completed to Tanah Merah, 89th mile from the Pahang-Kelantan boundary. The trial survey of the west route from the boundary near Pulau has also been completed (with the exception of five miles) to the 86th mile, where it joins the east route. From this point the trial survey has been run to Kampong Laut—opposite Kota Bahru, the capital of Kelantan. The permanent survey from Tumpat—the port of Kelantan—to Kota Bahru has also been commenced, and will join the trial survey at Kampong Laut. The work of the surveyors was greatly hampered by the exceptional wet weather and sickness.

It is stated in the Kedah report that in 1911 negotiations were entered into between the Kedah Government and the Federated

Malay States with a view to the continuation of the railway from Bukit Mertajam through the Province to the Muda river and from thence across the river through Kedah to Alor Star.

Although negotiations are not finally completed yet, it is settled that this line shall be carried to Alor Star with a probable future extension to Perlis, and the survey of the route is already well in hand. The line will be built at the sole cost and risk of the Federated Malay States Railway Administration, who will also have the running of the line after it has been constructed. The revenue derived from the line will be the property of the Railway Administration.

It is believed that the line to Alor Star will in a few years become one of the best paying parts of the Federated Malay States Railway System.

---

### Canton-Kowloon.

This railway has been constructed in two sections: one, eighty-nine miles in length, in Chinese territory, from Canton to the Shum-chun River, the northern limit of the British leased territory in the Kowloon peninsula; the other, twenty-two miles long, through the latter territory to Kowloon. The former section has been built by the British and Chinese Corporation; the latter by the Colonial Government.

The Chinese section of the line crosses the East River at Sheklung. The cultivated ground throughout the East River valley length is 7 ft. to 11 ft. 6 in. below the highest known flood. For purposes of cultivation the whole area is protected by high bunds or banks. Formation was carried 2 ft. 6 in. above the highest flood record for thirty years, which gave a bank averaging for many miles 14 ft. high, and at approaches 24 ft. or more. These banks have been protected against wave and flood-erosion by stone pitching. In times of excessive flood many miles of this portion of the line will be a causeway through open water 8 or 10 ft. deep. Its security will be aided materially by proper maintenance of the pitching; while the fact that floods rise slowly and backing up takes place evenly on both sides of the bank gives additional security.

The minor bridges and culverts and all the large bridges but three were built in cement concrete. Good cheap cement and good sand were procurable locally; but the objection of the Chinese to quarrying their native hills gave rise to considerable difficulty in obtaining stone, and granite for the larger bridges had to be brought from Hong-Kong, although good local stone was plentiful.

The steelwork for the bridges was designed by the consulting engineers to the British and Chinese Corporation (Sir John Wolfe Barry and Mr. A. J. Barry), and was built in England under their

inspection. It was designed generally in accordance with the standard Indian practice, but for a standard loading 10 per cent. above the Indian standard loading of 1903, having regard to the probable requirements of the future.

---

### East Africa.

The annual report for 1911-12 states, of the Uganda Railway, that the capital cost of the system, excluding suspense account, now stands at £5,456,381, and including cost of steamers on Lake Victoria and works added from funds provided in the annual estimates, amounts to a gross total of £5,753,476. In addition, £98,486 was drawn against the completion of the Busoga Railway, which, although open for traffic and showing promise, will not be completed till the rails reach the terminus at Namasagali, the port a few miles lower down the river, and one more suitable for Nile navigation, than Kakindu, the terminus originally proposed.

During the year under review, the total revenue earned amounted to £360,224, as against £300,116 in 1910-11, showing an increase of 20 per cent., and the total expenditure of £228,852 as against £201,596, an increase of 13½ per cent. The profit is £131,372, as against £98,519 in the previous year, and the net increase is £32,853, or 33 per cent. This must be considered satisfactory, and shows that the development in traffic is progressive and fully sustained.

The railway accommodation has been overtaken by the traffic. Towards the end of the year a great amount of produce was held up at the ports on the lake. At Kisumu alone, it was reported that there were 1,500 tons, and some of the ocean steamers had to leave without full cargoes. More rolling stock is being provided, but the process takes time.

---

### Nyasaland.

The British Central Africa Railway Co., Ltd., is arranging that when it has completed the railway between Port Herald and the Zambezi under its concession from the Portuguese Government, the Shire Highlands Railway Co. shall operate and maintain it. There are obvious conveniences in the administration of this line in connection with the existing railway.

It has been arranged that the Nyasaland Government will not exercise its right of expropriation of the railway before 1 January, 1937.

---

### Nigeria.

In connection with the Durbar of the Northern Nigeria Emirs which was held by Sir Frederick Lugard at Kano on the 1st of January, the railway share of the transport arrangements consisted

in conveying 2,734 passengers, Chiefs and their followers from territories adjacent to the line, in 61 high-sided bogies and other vehicles. Twenty-two vehicles were also sent to Kano containing troops, and 16 vehicles with Europeans.

All these vehicles were made up into special trains, and in addition to these, a considerable number of passengers travelled by the ordinary trains.

The numbers that assembled to greet the Governor were computed to be 20,000 horsemen and 40,000 foot, and to those who had never seen before gatherings of the Mahomedan peoples of Central Africa the sight was absolutely unique.

The record trip so far on the railway was made in connection with the Durbar. A special train left Kano with Southern Nigeria officials at noon on Saturday and steamed into Iddo, 712 miles, by 7.30 a.m. on Monday morning. This is quite respectable going in any country.

A really extraordinary rush of traffic has taken the railway by surprise at Kano, as, although it was fully expected that Kano trade would develop rapidly, it was hardly anticipated that during what is practically the first full season of the line being really open for traffic, a trade in ground nuts would spring up which would severely tax the resources of the railway, in addition to the large amount of other traffic, which is expected about this season on the southern section. The European merchants from Lagos have now fully realised the possibilities of the interior and all the principal firms have now established themselves at Kano. It is expected that both the lines to Baro and Lagos will be fully occupied in dealing with this traffic for the next two or three months.

The palm kernel crop this year is apparently a somewhat doubtful quantity owing to the excessive dry weather and prolonged harmattan. There is very little oil yet in the nuts and very few purchases have been made so far of oil, by at any rate one of the leading firms dealing with this trade. Of course there is a large reserve of unharvested last season nuts which may come in even if this year's crop does turn out to be short.

It has been decided to take in hand an extensive remodelling of Iddo Yard in order to provide the very much needed extra facilities for dealing with traffic at this port. The work is far from easy as the available "good" land is very restricted.

The extension of the Bauchi line from railhead to Bukuru has already been commenced. This line will of course solve many vexed transport problems.

The amalgamation of the railways has taken place, and from 1st January, 1913, all the railway accounts are dealt with by the Nigerian Railway accounting staff, and as a matter of convenience

through the Southern Nigeria Treasury. Southern Nigeria is debited with payments, and any financial adjustments required pending amalgamation of the possessions are to be carried out locally.

An increase in nett revenue of £20,000 is shown in the interim report on the Lagos-Minna section for the first half of 1912. This is very satisfactory considering the small traffic on the new Jebba-Minna extension which was opened on the 1st January, 1912. Goods traffic accounted for most of the extra revenue, the season having been a good one for palm kernels, oil and cotton, all of which show increases. It is instructive to note an addition of 65 per cent to the number of third class passengers, principally owing to a reduction in fares.

Much better progress has been made of late with the construction of the important bridge over the south channel of the River Niger at Jebba. Passengers and rolling stock are at present transported by means of a ferry. The new structure comprises seven spans of 183 feet overall, and is probably the largest bridge in the whole of West Africa. Several of the piers and one abutment are finished completely, while the remainder of the work is in a forward state. April, 1914, is the date officially given for completion, but every effort is being made to finish the bridge by the end of the current year. As the northern channel of the Niger is spanned already, the completion of the new bridge will result in joining the two sections of the 800-mile railway which stretches from Lagos to Kano, thereby greatly increasing its value from a strategic standpoint. Moreover, the bridge will effect a considerable saving in time, as the present transport by means of the ferry is, naturally, a lengthy operation.

The 2 feet 6 inches gauge line from Zaria to the tinfields of Northern Nigeria is being extended from Rahamma, its present terminus to Bukaru. This new length will pass close to Naraguta, which is in the centre of the chief tin producing area. The gauge of this line will be altered gradually to 3 feet 6 inches. The desirability of avoiding a break of gauge was fully realised at the construction stage. Lack of funds, however, then made the question one, not of alternative gauges but of a 2 feet 6 inches line or none at all. Fortunately the bridges, culverts, etc., were made suitable for the wider gauge so that the conversion process should not be difficult. This work will be taken in hand at once on the section from Zaria to Duchi-N-Wai, a distance of 42 miles.

---

### Lagos Harbour Works.

Satisfactory progress was made with the Moles in the second half of 1912, bringing the length of the East Mole to 8,009 feet and that of the West Mole to 1,072. Additional plant for the output of stone is on order and will greatly expedite the work next year.

The increased volume of the ebb tides due to the larger fresh water discharge during August, September and October led to an increase of draught and the direct or weather channel again opened, but owing to an exceptionally low rainfall the "fresh" discharge was considerably less than usual, and it was only possible to raise the draught gradually.

The order for the reclamation craft has been placed with Messrs. Fleming & Ferguson, and it is anticipated will be ready in July next.

---

**The Railway Systems of West Africa.** By CAPT. H. O. MANCE, D.S.O., R.E.

This lecture has been reprinted from the Journal of the Royal United Service Institution. Capt. Mance had a great part in the construction of the Baro-Kano Railway and was almost the only man who foresaw the rapid development of its traffic. The paper sets out the general factors which govern the location of railways in West Africa. It will usually pay quickest to build railways in more populous districts, and it is pointed out that Nigeria is by far the most densely populated part of West Africa. It may be politic to undertake a route which is more costly to construct by reason of physical difficulties, in order to attain lower ultimate expenses. The additional expenditure may be devoted to obtaining a shorter line through more difficult country, or to reducing the ruling grade. It is hardly necessary to point out that the added charge on traffic due to interest on increased capital expenditure remains constant, and the extra cost per ton mile therefore becomes less as the traffic increases, so that at a certain stage of development this extra cost is more than covered by the reduction of working expenses. A happy mean in this respect has been attained in Northern Nigeria on the Baro-Kano Railway. Here expenditure was not stinted where necessary to obtain the best possible grade, but in other respects a cheap line was constructed capable of being improved as traffic increases. This type of line is destined to play an important part in the development of West Africa.

A very useful account is given of the French and German Railway enterprises, as well as of the British. Capt. Mance considers that, even without artificial improvements to navigation, the Niger will be a formidable competitor of the Lagos Railway. Forcados, the ocean port for the Niger traffic, is a good harbour, accessible over a 19 ft. bar. From this port two independent lines of sternwheelers serve the Niger and Benue. Baro, the starting point of the Northern Nigerian Railway, has always been accessible during two and a half months by steamers drawing 11 feet and conveying 1,000 tons of cargo for nine and a half months by sternwheelers drawing four feet and conveying 200 tons of cargo; and all the year round by launches drawing two feet. The author discusses various extension

schemes and the influence on railway policy, which the foreign lines will exercise. As to Southern Nigeria he observes that the dense population will no doubt justify the construction of local lines not forming part of the main arteries of communication with the interior. To the east of the Niger a line some 60 miles long has been surveyed to connect Onitsha with the Udi coalfields, which are believed to be of considerable value. This line, if built, must obviously also connect with other future lines east of the Niger. A future line might run from Warri *via* Benin, with cross connections between the western line and Onitsha, Lokoja or Baro. Nor is it likely that the densest population of all round Ikot Ekpene will be left undeveloped; and whether this area will be best served by a line from a secondary coast port such as Bonny or Opobo, or by a line from the head of the permanent Cross River navigation at Itu, will be an interesting point.

---

The importance of improving the Lagos bar is shown by the terms of the recent coal contract, under which the rates of freight vary considerably according to the draft of water.

---

### Labour on the Gold Coast.

Mr. G. Marshall Harris, who was employed on the construction of the Accra Akwapim Railway, made some interesting remarks anent labour conditions on the Gold Coast in the course of an address to the members of the Institute of Civil Engineers of Ireland. The paper was reproduced in a recent issue of "South African Engineering," from which the following is taken:—

"After the arrival of the first party (*i.e.*, to construct the railway) considerable difficulty was experienced in getting together any local labour at all, and it was not until, at great expense, a large party of "boys" was brought down under a twelve months' agreement from the Kru coast that a start could be made. This agreement, or indentured labour, served a good purpose at the time, as it inspired confidence in the local "boys," who, when they had observed that payments were regularly made, came on in as large numbers as required, and they subsequently proved to be the better labourers. Among the West African natives are men gifted with intelligence of a high order, and in Accra are to be found craftsmen of nearly every kind, who, with a little direction, are capable of turning out excellent work. The ordinary labourers take to pick and shovel work well. They will not, however, under any circumstances, use wheelbarrows; everything is carried on their heads.

"Female labour is available, and was largely used in carrying of all kinds, including the water for the concrete, the concrete when mixed, and the earth from the cuttings and for the banks. The

women are very satisfactory, and are, as a rule, more industrious than the men. They will not, however, go far from the towns or villages. The earth is carried in baskets holding about 55 lbs. when heaped up; the usual average working quantity would be between 30 and 40 lbs. Native-made baskets can be procured readily; they are made from a strong vegetable fibre plaited, but they are neither so strong nor so well liked by the natives themselves as specially imported English baskets. These are of a wicker-work construction, and last much longer than the native baskets. Both the water and the mixed concrete are carried in ordinary galvanised iron buckets. One or two head women go with each gang of twenty or more. They usually give a hand in lifting the loaded baskets on to the carriers' heads. The boys do the pick and shovel work, fill the baskets, make the concrete, and fill the buckets. If ahead of their work, they will often help the carriers to get their loads up. A head boy or a second head boy will not, however, give any such assistance in the same way as a head woman will. If there is no other assistance at hand, the carriers help one another, and will stoop down with their loads on their heads to assist each other.

“Most of the stone-breaking for the concrete was done by female labour. The women are particularly fond of this work, though not very expert at it. They are, however, more satisfactory at the stone-breaking than boys, as they like the work and are more industrious. The women like working, and are keen on making money, but they are independent of this class of labour. There is no poverty in the country; neither men, women nor children need go hungry. The ordinary rate for women is 1s. per day, and for boys from 1s. 3d. to 1s. 6d. Skilled native labour is dear: good carpenters get up to 5s., blacksmiths and fitters more than this. The ordinary labourers come from various tribes, speaking different languages. Nearly all speak and understand a kind of English, only to be learned on the coast.

“The ordinary hours of work were from 6 a.m. to 11 a.m. and from 1 p.m. to 5.30 p.m. Saturday was a half holiday, work ceasing at 1 o'clock. This made a 54-hours' week. The boys are slow and lazy, and require a great deal of supervision; but some things they will do very well if left to themselves, when they know exactly what they have to do, as when lifting or shifting heavy articles without tackle. In such cases plain directions, with a promise of a shilling or so, or of an hour off when the work is done, give the best results. Nothing is gained by the white man trying to drive them. This must be done through their headmen. In keeping them in good humour lies the secret of getting good work out of them. They very rarely get hurt, notwithstanding the dangerous methods of working

and the careless and unnecessary way in which they expose themselves. Slow in thought and movement as they are, they are quite wonderful in their appreciation of impending danger, and remarkably quick in avoiding it."

---

Six sheets of a Secondee Town Survey have been printed by Messrs. W. & A. K. Johnston, Edinburgh, and maps are being printed of Coomassie, Tarquah, Dunkwa, Winnetah, Saltpond and Kibbi.

---

### **Freetown Jetties.**

A considerable extension of the lighterage accommodation at Freetown has been approved and is being put in hand at once. The two existing jetties will have their effective berthage lengths of 67 feet doubled and a new jetty with 120 feet of berthage on either side will be constructed at the eastern end of Government Wharf. In order to disturb as little as possible the trade of the port, the new jetty will be built before the extensions are taken in hand. In all probability the larger scheme for an export wharf at Fourah Bay will be deferred until these jetty works are completed.

---

### **St. Helena.**

The wharf wall at Jamestown is badly situated. This is true in a double sense, for not only is the structure sadly in need of repair but it is also badly placed in that it faces north-west and is thus exposed to the full force of the Atlantic "rollers." An engineer has been sent out from England to consider the best means of effecting permanent repairs. To effect even temporary repairs has proved hitherto, to be beyond the resources of the Colony as regards skilled labour. Consequently, any scheme devised by the engineer will have, in all likelihood, to include the supply, from England, of the requisite labour, plant and materials, except sand and stone.

---

### **Trinidad.**

The cost of the proposed Port of Spain station will substantially exceed the estimate, but the Committee to which the question was referred was of opinion that the entire scheme should be carried out. The present accommodation is inadequate for even the existing traffic, and as the colony in the course of a few years may become an important oil exporter it is prudent to allow for expansion.

---

### **Cyprus.**

Mr. F. Bedford Glasier has visited Cyprus to report on the railway (gauge 2 feet 6 inches), and reports that the cost of construction at £1,641 per mile was distinctly low and that the supervision was careful and efficient. The line however is subject to severe competition by jack donkeys and camels, mule and bullock carts. The

third class fare is at the rate of two-thirds of a penny per mile, and it may be politic to reduce this to attract passengers. The competing cart traffic takes all commodities at the same charge as the line, and at present full trainloads are not secured. An extension to Evrykhou has been proposed (15 miles) as likely to increase the traffic; this would also give easier access to Troödos, which is 23 miles from Evryhbou. Larnaca has claims to be connected by rail with Nicosia, but being an open roadstead it does not possess the natural advantage of Famagusta, which was the ancient port of the Island till in 1571 the Turks closed it for strategical reasons, and it has not participated in the large increase of trade which has taken place during the last six or seven years.

---

### Wireless Telegraphy in Trinidad.

It is stated in the annual report that uninterrupted communication was maintained during the year between the wireless stations at Trinidad and Tobago, which are owned and operated by the Government, and the transmission of messages was not materially affected by atmospheric disturbances. The Trinidad station is situated at North Post, some 9 miles from Port of Spain, communication being maintained by telephone.

Frequent communications were held with the United States Naval Station at San Juan, Porto Rico, distant some 550 nautical miles. Communication has also been held occasionally with the Direct West India Cable Company's ship-to-shore station at Bowden, Jamaica, distant 950 nautical miles, but the power of the installations both at Trinidad and Jamaica is not sufficient to ensure reliable results over such a distance. Messages were also exchanged under favourable conditions with Royal Mail Steamers up to 1,200 miles. During the day time communications were exchanged with H.M.S. "Aeolus" at every West Indian Island south of, and including, St. Kitts, and during the night messages were exchanged with her at Jamaica, Great Cayman and Bermuda.

The installation of a higher power ship-to-shore station at Port of Spain, with an apparatus of a more up-to-date character, has been decided on and will be undertaken during the current year. This will put an end to the present inconvenience inseparable from a station nine miles distant from headquarters, and the higher power of the new station will render communication easier and more certain.

The expenditure on wireless establishments in the colony during 1911-12 amounted in all to £1,075, while the revenue (including £100 paid by the Government for the transmission of the daily telegraphic news bulletin to Tobago), was £439. The number of messages passed at the Trinidad station was 1,461, and at the Tobago station 546. It is evident that a light power installation such as the

present one cannot be expected to pay. It fills up a gap in the cable system, but could not compete with it.

---

It is not the case, as reported, that His Majesty's Government have contemplated any scheme for the erection from Imperial funds of a wireless telegraph station in the West Indies.

---

### Automatic Telephones.

According to Messrs. Preece, Cardew and Snell, the use of automatic systems for telephone exchanges is undoubtedly extending not only in America and Great Britain but also in Europe, while the Governments of Australia, New Zealand and South Africa have lately decided to install trial plants. It has not been demonstrated clearly so far that an automatic system is more economical than a manual system, but there is good reason to believe that such may be proved to be the case. It is noteworthy that, with one exception, namely Cuba, the automatic system has been tried only in temperate climates. It is to be feared that the satisfactory working of such exchanges would be interfered with by the hot damp atmosphere of the tropics and, more particularly, by the profuseness of the vegetation. The latter is a great drawback because all automatic systems are similar in that the subscriber's lines are permanently connected to the main battery. If, therefore, any wire comes into contact with the branches, or even leaves of trees, current flows through the line and part of the automatic apparatus, thus causing the apparatus to operate, possibly disturbing connections already made, or adding impulses when not required and making wrong connections. It is, therefore, absolutely essential that all lines are either kept entirely free of vegetation or placed underground.

The two systems which have been most used are those supplied by the Automatic Telephone Company and Siemens Bros. Both the systems, which are based on the fundamental Strowger patents, are now working in London, a 200-line exchange at the General Post Office and a similar one at Siemens' works. Possibly the Siemens system, which is in use all over Germany and Austria, is the more likely to succeed in the tropics, because in this system the various relays and other important apparatus are mounted on separate bases, easily removable from the frames, with the result that they are easier to clean, to inspect and to keep in working order. On the other hand the American system has been at work in Havana on the Island of Cuba for the last eighteen months or two years, and, so far as is known, is giving satisfaction. Where the automatic system is adopted in the tropics the Government should insist on the Contractors supplying a trained mechanic to take charge of the installation, and undertaking the maintenance for three years.

### Contingencies.

It is of the highest importance that the item "Contingencies," which invariably appears in estimates for the construction of railways and similar undertakings, should be strictly reserved for contingencies. This term properly covers works found to be necessary and ordered to be included subsequent to the preparation of the estimate and of such a nature as cannot well be charged to any sub-head. A case has arisen recently in which a resident engineer had debited Contingencies with excess expenditure on Bridges and Telegraphs. This is a bad policy, for the reason that it destroys all record of the actual cost of the several items of construction. This is information which may be of the greatest value when further works of a similar character come to be undertaken in the locality. It is true, and rightly so, that the engineer in charge of a work abhors excesses, but it is recognised that estimates, even when endorsed by experts, are not infallible. When it is found on completion that the savings on certain sub-heads, assisted, if necessary, by the surplus left over from Contingencies, balance the excesses on other items, so that the work as a whole has been constructed within the estimate, the result must be deemed satisfactory.

---

### Wireless Telegraphy in the Falklands.

Seldom has expenditure been justified so promptly as in the case of the wireless station recently erected by the Marconi Company in the Falkland Islands. On the 23rd of September, 1912, the station first established communication with the outer world and only seven weeks later the operator picked up the distress signals sent out by the stranded liner "Oravia." Tugs and launches proceeded at once to the scene of the disaster, the passengers being reassured meanwhile by the promises of help which came through by wireless. All the passengers were taken off without delay. Later, the captain sent an urgent message for immediate assistance as he felt obliged to abandon the vessel. The officers and crew and a large part of the mails were then removed. Altogether 400 people were rescued and as the population of Port Stanley numbers only 900 it was a considerable undertaking to make the necessary provision. Happily it was possible, by means of the wireless, to divert one of the Peninsular Steam Navigation Co.'s liners which, by carrying on the third class passengers to South America, relieved the strain on the Islanders' resources. The remainder were taken on later to their destinations. The Governor and people may well be proud, not only of this exploit, but of having broken down that terrible isolation which, hitherto, had cut them off from the rest of the world.

### Internal Combustion Locomotive.

The South Australian Railways Commission has bought a locomotive of this kind for the haulage of traffic on light lines. The engine was ordered from Messrs. Ironside, Son and Dyckerhoff, of London, and is a 100 h.p. machine, and is capable of hauling 50 tons of loading at eight miles per hour on a grade of 1 in 70. Others will no doubt be ordered if this one is successful. They are particularly convenient on lines which are ill-supplied with water.

---

### Modern Locomotives.

The tendency on colonial railways is to increase the weight and power. Produce is more important than passengers, and ability to draw heavy loads is more important than speed on such lines. It is economical, especially when local expenses are comparatively high, to run as few trains as possible, and to make up for this by making them capacious. The practical limit is the strength of the permanent way, and it is prudent to allow for this whenever the freight traffic is likely to grow. The Mallet engines used in the United States reach an axle-weight of 50,000 lbs. It is an additional convenience that large locomotives carry big supplies of coal and water, a very important consideration in some districts.

---

### Wimperis Accelerometer.

This is an invention by Mr. H. E. Wimperis, A.M.I.C.E., M.I.E.E., of the Crown Agents' Office, and we are glad to find that it has been found successful on the South African Railways. Mr. Hoy reports on it as follows:—

“A small and inexpensive instrument, and one that should prove of great value to the Administration, has recently been purchased. This instrument—the Wimperis accelerometer—can be used for two purposes, either for recording acceleration and retardation of speed, enabling the tractive effort to be measured at all speeds, or as an equilibrator for recording the nature of the lay-out of the line and the extent to which the centrifugal force on curves is counteracted by the super-elevation of the outer rail. By its use it will be possible to determine the maximum permissible speeds, without exceeding the limits of safety, for all curves and straight track. Another useful feature of the instrument is that it detects and records all breaks of curvature, uneven packing and slacks in the track.”

---

### Percolation Tests on Cement Mortars treated with Water-proofing Compounds.

The conclusion from tests made by the National Physical Laboratory appears to be that, with a mixture of two of sand to one

of cement, and a thickness of two inches under a pressure of 15 lbs. per square inch, no advantage is to be gained by the use of a waterproofing compound.

---

### **Renewal Funds.**

These are not usual with state railways in Crown Colonies. The argument for the omission is that the depreciation is compensated for by the increase of general revenue caused by the railway. Such lines are an appreciating property. In India there are no renewal funds. But looking at a railway as a separate undertaking a renewal fund is necessary, especially during the first ten or fifteen years, when the annual cost of repairs is below what it will be eventually, and it may be advisable even in the case of a government line if it is built for a special and temporary purpose. Thus on the Gold Coast such a fund was in existence for a brief period in view of the importance of the mines, which might not be permanent, but was abolished when the growth of general trade put this consideration in the background. In self-governing colonies renewal funds are generally made obligatory, but this is part of the system for maintaining the credit of a colony as a borrower.

## MEDICAL NOTES.

### Blackwater.

The Secretary of State has asked for a special annual report on cases of this disease in the West and East African possessions, and the circular and replies are published in Cd. 6514. A report by Dr. W. M. Graham, Director of the Medical Research Institute, Lagos, published separately, discusses the evidence relating to the disease generally. The ætiology is unknown, in other words, the cause has not been discovered. It is not likely that the disease is malarial fever, with other symptoms added, for it is not always accompanied by malarial parasites. The favoured hypothesis is that "an unstable condition of the blood is produced by repeated or badly treated attacks of malarial fever, and that once this condition is produced a dose of quinine determines an hæmolysis, and this produces hæmoglobinuria." But there does not seem to be the direct ratio which one would expect in this case between the incidence and severity of malarial fever and blackwater. It may be caused by infection with a specific organism; but no such organism has been found, though a very thorough search has been made, and it does not appear that there is any incubation period within fixed limits. It may, however, be a specific disease, transmitted in some way not yet discovered, and there is a general belief that there is some link between the disease and sexual relations with native women.

---

### Yellow Fever.

The Secretary of State has appointed a Commission to enquire into the question whether yellow fever exists in West Africa, and if so, what is its relation to other fevers. The members are: Sir J. K. Fowler, M.D., K.C.V.O. (Chairman); Major Sir Ronald Ross, M.D., K.C.B., I.M.S. (retired), F.R.S.; and Professor W. J. Simpson, M.D., C.M.G.; Mr. A. Fiddian, of the Colonial Office, has been appointed Secretary; and Mr. T. F. G. Mayer, M.R.C.S., L.R.C.P., Assistant Secretary.

### Imperial Bureau of Entomology.

This Bureau has been established by the Secretary of State ; it is controlled by an honorary managing committee, which is composed of the same members as the present Entomological Research Committee ; and Mr. G. A. K. Marshall, the Scientific Secretary of the Committee, has been appointed Director. The Head Office is at the British Museum (Natural History), Cromwell Road, S.W. The funds for the purpose are contributed by the Imperial Treasury, the Dominions and many of the Crown Colonies.

---

### Sleeping Sickness.

The Liverpool Annals of Tropical Medicine, in an article on the trypanosomes found in game and domestic animals in the Luangwa Valley, North Eastern Rhodesia, estimate that the percentage of game infected was 50 at one place, and 35 at another. Different species of buck appeared to vary greatly in susceptibility ; trypanosomes were now found in zebra, buffalo, wildebeest and bushpig, and only rarely in roan, hartebeest, huku, impala and warthog. Waterbuck, eland, bushbuck and kudu were the species found to be most heavily infected. To some extent these differences may be accounted for by the habitats of the animals, as those most affected are usually found in thick cover, where they are more exposed to the bites of tsetse flies than in the open, but probably specific differences in the degree of immunity are of much greater importance. It is remarkable that all the animals shot appeared to be in perfect condition, and presented no objective signs of disease. Evidently their tolerance to trypanosomes is very great. Unfortunately this is not the case with cattle and goats.

Dr. Warrington Yorke, in his address at Liverpool delivered after his research expedition in Rhodesia, contended that the big game is the reservoir of the human infection. It is true that observations taken from domestic animals are scanty, but this is not because they do not harbour human trypanosomes ; the point is that, at any rate, in Rhodesia, the parasite rapidly destroys such animals, while the big game live on and remain a source of danger. It is of course impossible to kill off the wild animals generally, but it is suggested that they should be exterminated in certain definite districts, and that after a couple of years or so a careful examination should be made in order to decide whether this process is effective.

---

### Diseases of East Indians in British Guiana.

A British Guiana medical report shows that on the Providence Plantation the death rate of East Indians was 16.9 per thousand and the birth rate 35.3. This excellent result shows what can be achieved by the curative and preventive treatment of ankylostomiasis

and malaria, the two main causes of sickness and death among the plantation coolies. An efficient system for the disposal of night soil to a great extent prevented re-infection with the former disease, and very satisfactory results were obtained from the use of thymol, which, when continued for many weeks, cured the disease completely without producing any ill effects. A thymol pulverette, coated with chocolate, is obtainable.

### Larvicides.

In our last number reference was made to the uselessness of petroleum on wind-swept lands, and to the use of carbolic acid in British Guiana. Carbolic acid is used on the Panama Canal Zone, and the last report of the Jamaica Malaria Commission gives the following particulars of it:—

The formula of the larvacide now in use on the Canal Zone has been kindly furnished by the Chief Sanitary Officer who states:—

“It can be used effectively in moving water as well as in continuous rainy periods and can be kept standardized. It loses its larvicidal properties soon after being applied. It kills all mosquito larvæ in a few minutes, while petroleum may take half an hour or more to affect the larvæ. Unless the film of petroleum is complete it is not effective. Also the petroleum film may be blown or washed away before becoming effective, while the larvacide affects the larvæ at once. Petroleum, as used here, will often unite with algæ and form a layer which breaks up in about a week and sinks.”

#### FORMULA FOR THE MANUFACTURE OF “LARVACIDE.”

150 U.S. gallons of crude carbolic acid, specific gravity not greater than .96 and containing not less than 15 per cent. of phenols and cresols, is heated to the boiling point of water, when 200 lbs. of powdered resin is added and constantly stirred until dissolved. Then 30 lbs. of caustic soda is added. The mixture is kept at the boiling point of water and stirred until it is in solution, when tests of a small portion in a test tube are made with water until perfect emulsion is attained. The larvacide is then ready for use.

The cost of this mixture varies with the price of the carbolic, but is usually about 20 cents a gallon.

In this connection Dr. Macdonald states:—

“The cyanide floating soluble pills recommended by some authorities, and larvicides in which carbolic and similar products in crude and emulsified form are component parts, require to be carefully considered in relation to plant life as well as to the life of fish and other natural enemies of the mosquito which abound in swamps and streams. On the whole crude kerosine oil is open to

the fewest objections, and is the most easily applied. A few rags on the end of a stick dipped in the tin and splashed on the surface of the water will form a film over a large space and one man can oil a considerable area in a single day. As the larvæ take on an average from five to seven days to breed out oiling twice a week is recommended.

“There is a larvicide that is greatly ignored, which is none other than the readily available elbow grease. It has been found by observation in certain stretches of gully in Kingston where double channelling was not possible that constant policing and moving on of possible Anopheline eggs and larvæ has prevented breeding out as effectually as in the stretches where weekly changing of the channels was carried out.

“It is possible if a weekly sweeping with pepper-rod brooms of irrigation channels in plantations is consistent with economy that even kerosine might in certain situations be dispensed with.

“The main theme in mosquito limitation is *persistence*; the mosquito must have nowhere to lay its head or rather eggs; and the constant moving on will beat it in the end.”

---

### East Africa.

The annual report comments on the large number of affections of the digestive system in the coast zone. The causes of these were variously ascribed to the admittedly bad quality of the grain exposed for sale, bad cooking, the effect of the dust which pervades the town of Mombasa during the dry season, and to chills induced by the cold land breeze which blows in the early hours of the morning. Enteritis, diarrhoea and tonsilitis were on the increase, being especially prevalent in Mombasa and Malindi during the month of January. Respiratory diseases, local injuries, and ulcers accounted for a large number of cases. One of the most noticeable features in Lamu is the amount of lunacy, mostly found amongst the old Arab families. This is probably largely due to the intermarriage of families, and to bhang and opium smoking, the bad effects of which are very apparent. There has also been an increase of diseases attributable to the agency of insects, and of dysentery. The sanitation of Mombasa is very bad, but the introduction of a pipe supply should lead to a definite drainage scheme. In the mountainous zone there is more malaria than there should be. It exists in places in which it should never have been allowed to get a hold, and yearly is a cause of a heavy mortality amongst Africans and Asiatics. The reason for this state of matters is two-fold: in the townships insufficient drains, not only public ones, but the almost total absence of domestic drains connecting houses with the roadside channels; and everywhere, owing to the race for development, a tendency to disregard the

unremunerative expense that sanitary reform entails, and the unproductive waste of time involved in keeping compounds in order. The attitude of the native towards mosquitoes is, of course, perfectly hopeless.

Enteric fever again showed an increase in the number of cases over last year. Though it is always difficult to trace the source of the infection, it is thought that the majority of patients contracted the disease from drinking water from streams which were known to be polluted. Contamination of food by flies and domestic agencies, and by dust storms in dry weather, all seemed possible sources of infection. During the year Nairobi was visited by its third visitation of plague. The epidemic lasted from the 3rd of May to the 16th of September. It originated in one of the back streets of the Indian Bazaar. In all there were 39 cases, 22 of whom died. Sporadic cases occurred further down the railway line, at Ulu, but its extension was controlled. The total death rate from this cause was 56·4 per cent. Each year makes it more certain that Ukambani may be regarded as one of the endemic centres of plague in the Protectorate.

Dysentery is also rife, generally during the rainy seasons in these highlands. The same causes may be given as at the coast. There was an undue amount of chicken-pox, usually looked upon as the precursor of small-pox, of which there was, fortunately, only one case in the prison.

In the Kenia and Nyanza Provinces malaria was especially prevalent; in both it is indigenous and frequent. Kisumu experienced its usual visitation of the plague, and the death rate among the cases was 76·56 per cent. Everything that was possible appears to have been done to improve this district.

---

### Vaccine.

A vaccine farm instituted at Acra has been very successful, obtaining 90 per cent. of successes in vaccination. Lagos, however, would be the better position for such an establishment for the needs of West African colonies, as calves could be easily imported from Northern Nigeria, and there is cold storage, with greater transport facilities. The frequent failures of lymph sent overseas render such an establishment very desirable.

**Snake Bite and its scientific treatment.** By F. W. FITZSIMONS, F.Z.S., F.R.M.S. (*Longmans, Green & Co.,* 1s.)

Immediate treatment is of course necessary in the case of snake bite, and a delay of a few minutes may mean the difference between life and death. The permanganate of potash application is a first aid remedy only and cannot be relied on to affect a cure. The real

antidote to the poison is anti-venomous serum, and this has only recently been prepared in a way which secures a high degree of anti-toxic value. It must be injected as quickly as possible after the application of permanganate, but the difficulty is that it is hardly ever available when wanted. The author has patented an outfit which contains in a small space everything which is required. The first-aid apparatus part of it can be carried in a waistcoat pocket, the rest comprises the ante-venomous serum, antiseptics, syringe and needles and other items. The mode of treatment is clearly explained in the book.

---

### Drugs.

The cultivation of medicinal plants has been brought forward by several witnesses before the Dominions Royal Commission. In the British Pharmacopœia there are 147 drugs and chemicals of vegetable origin, and much special care is necessary for their proper production. Mr. J. H. E. Evans explained that the better the cultivation the greater the medicinal value of the plant, hence the higher money value. This is well shown by the comparative prices of medicinal herbs grown in England and in parts of the continent. Not only are the former richer in active principles, but they are dried and prepared for the market with more care, and also are free from admixture with foreign plants. Hence they demand in many cases four or five times the price. The cultivation of medicinal drugs is at present very largely the monopoly of countries outside the British Empire. Such cultivation, although requiring more skill than agriculture, is more profitable to the cultivators and labourers. The acreage required is not great and the crops can be handled as part of a general agricultural estate. England has been the great clearing house for the drug trade of the world; the cultivation of drugs in the Dutch and German colonies, and also in the United States of America, is, however, gradually attracting the trade away; direct transport from different parts of the world to the various centres of production has a similar effect. Cultivation in our Colonies would help their ports and shipping, as well as preserving the carrying trade for our Empire. Our Colonies also import now a great number of drugs which they could easily produce for themselves. Improvements in cultivation and increased output of material leads to the cheapening of the drug and consequent increase in use; in addition, with abundant supplies of raw material, new uses are often found for it in medicine and also in industries allied thereto. The following are instances of drug culture outside the country of origin, and prove the possibilities of using land otherwise unproductive for this purpose. Cinchona bark is the typical instance of the success which may attend

systematic and scientific drug cultivation. Indigenous to South America, attempts were made to cultivate this tree in India and Ceylon for the sake of its quinine; the efforts failed principally owing to failure to select the right species. The cultivation was undertaken by the Dutch Government in Java with the most satisfactory results, and the total output of bark from that district in 1911 was 19,000,000 lbs. The bark is worth 3d. to 4d. per lb. Coca leaves, also indigenous to South America, are now cultivated with success in Ceylon, Java and the West Indies. Had it not been for this cultivation, the supplies of this crude drug, which yields the important alkaloid cocaine, would have long ago been exhausted. Ipecacuanha, indigenous to Brazil, is now cultivated successfully in Selangor. A large proportion of our supplies come from that State. As the cultivation and collection in Brazil has recently been neglected for the more profitable harvesting of rubber, the additional source of supply is valuable, and the cultivation might be well extended to other localities. Kola nuts, yielding caffeine, indigenous to West Africa, are now cultivated in Ceylon. Cultivation and systematic collection in or near the country of origin provides us with many drugs in regular supply and of good quality. Typical examples are:—Senna leaves from India, buchu from South Africa, aloes from East and South Africa and West Indies, camphor from China and Japan, olive oil from southern Europe, sarsaparilla from Central America, nux vomica from India, opium from Turkey: various medicinal plants in Great Britain, but in limited quantities only.

Mr. E. M. Holmes, Curator of the Museum of the Pharmaceutical Society of Great Britain, stated that the conditions for successful culture can only be determined under experimental conditions, which the pioneer cannot afford to spend time on. A bureau of plant industry is therefore required to work in connection with already established botanical gardens, where the methods of reproduction by seed or cuttings, have already been ascertained. But the means of obtaining the greatest yield of products, and the problems of disease, whether insect or fungoid, require in the bureau of plant industry the services of a good horticulturist, an entomologist, and a mycologist, as well as a chemist, to ascertain the ingredients of the soil, and those required by the plant, and to obtain data as to the amount of active principles obtainable under the use of different soils and manures. These conditions have been ascertained concerning several American medicinal plants by the Bureau of Plant Industry in the United States, and experiments have been made with other plants in Germany, Austria, et cetera, and by the Dutch in Java. Various reports on the cultivation of tropical plants have appeared in the "Tropical Agriculturist" and the Kew Bulletins. A good deal of information concerning the cultivation of medicinal plants in Great

Britain has also been published in the Journal of the Pharmaceutical Society, all of which should be useful to those Colonies who wish to cultivate British plants, such as henbane, belladonna, aconite, peppermint, lavender, carraway, dill, digitalis, camomile, rose, rhubarb root, et cetera.

It would not be a difficult matter to extend the operations of the Government Botanical Gardens more to the cultivation of drugs, but the careful labour, requiring as it would, special attention and observation, would not be easy to find in the tropical Colonies. This is the difficulty in the way of producing high class tobaccos. Drugs are at present largely produced in countries where the labour is experienced and skilled for such purposes, and where great staple products do not monopolise the working population. Moreover there is little evidence to show what profit there is in the drug growing industry. Quinine, for instance, is now so low in price that the cultivation hardly pays. It used to be produced in Jamaica, but has now been ousted by products which pay better.

**RECENT TRANSFERS AND PROMOTIONS  
MADE BY THE SECRETARY OF STATE.**

- Mr. T. A. V. BEST (Colonial Secretary, Falkland Islands), Colonial Secretary, Leeward Islands.
- Capt. J. QUAYLE DICKSON, D.S.O. (Resident Commissioner Gilbert and Ellice Islands Protectorate), Colonial Secretary, Falkland Islands.
- Mr. G. A. GOODMAN (Attorney General, Barbados), Attorney General, Straits.
- Mr. E. V. PARODI (Puisne Judge, Northern Nigeria), Circuit and Protectorate Judge, Sierra Leone.
- Mr. T. W. HAYCRAFT (Police Magistrate and Coroner, Gibraltar), Puisne Judge, Mauritius.
- Mr. C. REES DAVIES, (Attorney General, British Honduras), Solicitor General, British Guiana.
- Mr. H. K. M. SISNETT (Registrar General, British Honduras), Stipendiary Magistrate, British Guiana.
- Mr. W. P. MICHELIN (Cantonment Magistrate, Ashanti), Police Magistrate and Coroner, Gibraltar.
- Mr. M. F. J. McDONNELL (Assistant District Commissioner, Gold Coast), Police Magistrate, and Inspector of Schools. Gambia.
- Mr. C. K. BANCROFT (Assistant Mycologist, Malay States), Assistant Director of Science and Agriculture, British Guiana.
- Mr. A. H. KIRBY (Scientific Assistant to the Imperial Commissioner of Agriculture for the West Indies), Assistant Director of Agriculture, Southern Nigeria.
- Mr. F. W. SOUTH (Mycologist and Lecturer in Agriculture, Imperial Department of Agriculture, West Indies), Chief Agricultural Inspector, Malay States.

- Mr. HERBERT HOLLIS, A.M.I.C.E. (First Class Superintendent of Public Works, Jamaica) Colonial, Engineer, Gambia.
- Capt. W. T. E. WALLACE (Assistant Superintendent of Telegraphs, Uganda), Assistant Postmaster General, Gold Coast.
- Mr. V. J. MONPLAISIR (Postmaster, St. Vincent), Provincial Postmaster, Southern Nigeria.
- Mr. E. J. WORTLEY (Headmaster of the Farm School, Hope Gardens, Jamaica), Director of Agriculture, Bermuda.
- Mr. H. J. SANKEY (District Forest Officer, Union of South Africa), Assistant Conservator of Forests, Southern Nigeria.
- Dr. T. H. MASSEY (Medical Officer, St. Vincent), Medical Officer, East Africa Protectorate.
- Capt. H. W. PEEBLES (late Assistant Resident, Northern Nigeria) Clerk to Commissioner, Dominica.
- Mr. LEON BELMAR (Revenue Officer, St. Lucia), Assistant Treasurer, Sierra Leone.

# BENSON'S

## NEW MODEL—EXTRA THIN "FIELD" WATCH.

BEST LONDON MADE HALF CHRONOMETER.

Breguet Sprung and Adjusted for all climates. The Best Watch for Travellers, with improvements only to be found in Benson's make. 18-carat Gold Cases, any style, rich monogram included.

**£25;** in Silver, **£15.**

An owner writes: "It is a watch of incomparable excellence."

For men of active life the "Field" is the Watch beyond all others.

The Economical and Equitable  
"Times" Monthly Payment System

IS AVAILABLE

*Illustrated Book No. 1 of Watches from £2. Chains and Rings (with size card), &c., post free.*
